Another method, which, if possible to use, is quicker, is to saturate the mould and then, after wedging the clay thoroughly, to roll it out with a rolling pin on a flat, dry, unpainted surface until the clay is an even thickness and not hard. The clay is then placed on each half of the mould and with a damp sponge gently patted into all of the irregularities of the mould and the edges are trimmed with a thin pointed knife. Then the two halves of the mould are tied together, and the sculptor works the clay back and forth across the seam inside the mould vigorously, adding small bits of clay where it is uneven. This is very important, because if the joining is not sufficient the clay will crack in the firing. The cast can be taken from the mould almost immediately, and the mould is ready to use again. With the heavier clay the shrinkage is less than with the slip. The retouching is the same in both methods.

The colour of the clay can be modified by blending a light clay with a red clay or by completing the objects in one clay and then by giving them a wash, or *engobe,* of slip of the desired colour.

Firing.—Kilns vary in their size, construction, and manipulation and have been built to burn coal, wood, oil or gas. There are updraft, downdraft, and muffle kilns, and round, square, and oblong kilns, made of brick, stone, and sheet iron. The latest development is the electric kiln. In stacking a kiln, the unglazed ware will not stick together and the pieces can consequently be allowed to touch. Figures set in the kiln for firing should be placed on spurs, or small pieces of fire brick, which raise them slightly and allow the heat to circulate all around the figures. When the fire is started it is raised gradually to allow the moisture to escape slowly so as to prevent cracking; for although a piece may have been drying for a year, it still contains from 18 to 20% of moisture.

Terra-cotta can be fired in any type of kiln, different clays demanding different temperatures. To fire heads, sketches, statuettes, animals, etc., the average clay fired to 1,800° F is sufficient. The higher the fire the denser the body, the darker the colour. For unglazed architectural decoration and for garden sculpture, the body needs to be well fired, as it will be exposed to the weather. Science has progressed in registering heat from the sight gauge to the Seger Pyrometric Cones, and finally to the automatic heat-recording pyrometer.

When the kiln has cooled, the ware is unpacked and, if the sculptor is interested in colour by glaze, he weighs out his glaze formula, grinds the glaze and applies it to the statue as a liquid, painting it on and allowing it to dry. Then it is reset in the kiln, great care being taken to prevent the statues from touching, and refired, the temperature being determined by the type of the glaze.

There is a growing interest among modern sculptors to work in clay, some carrying their work to the height of exquisite finish and others dashing off spirited sketches which in this medium express spontaneity as they can in no other material.

Among the American sculptors, Herbert Adams, Paul Manship, Victor Salvatore, Gleb Derujinski, Paul Jennewein, Bessie Potter Vonnoh, Alfio Faggi, John Gregory, Elsa Horn Voss, Janet Scudder, Beniamino Bufana, Carl Walters, and A. A. Weiman are the chief workers. They use various methods of finish. Adams and Manship treat the terra cotta individually with a wax and oil paint finish. Salvatore and Derujinski leave their work in the biscuit, while Jennewein, Gregory, Weiman, and Voss carry their sculpture to a glazed finish. The sculptors show great contrast, Jennewein and Gregory designing strong and decorative architectural details, pediments, friezes, etc., while Voss portrays animals with great charm. Rodin, Despiau, and Maillol are the outstanding figures in modern French terra cotta, and Wackerle in modern German.

The possibilities of glaze sculpture are just being investigated. The Della Robbias used it extensively, but their colour and type of glaze never varied and did not lend itself to very sensitive modelling. The modern sculptor who is interested in colour is working to make a glaze which has quality and yet is thin enough not to hide the details of the modelling. For architectural details, however, the thick brilliant glazes are suitable. (*See* TERRA COTTA, which includes bibliography; also SCULPTURE.) (M. R.)

MODELLING, PRACTICE

Modelling, as treated in this article, is that preliminary stage of a work of sculpture which involves its actual creation in a soft material and its subsequent casting or reproduction in a more permanent material. No consideration is to be given to that attribute of a piece of sculpture which is spoken of in criticism as "good or bad" modelling. The latter attribute is dependent upon those qualities which the sculptor has put into his work, such as the conception of mass, surface, texture and detail. (*See* following section, MODELLING, THEORY.)

Materials.—Formerly, sculptors often carved their works direct from the stone or wood, but the advantages of being able to take off or add on, to twist and change until such time as the work has assumed the desired form has appealed so strongly to the modern sculptor that modeling is almost universally used and the acceptance of the possibility of these changes help to bring modern sculpture to perfection just as the changes in the manuscript help to bring the writing of a book into better form. Michelangelo and other old masters often carved directly in stone, but only an artist of great vision and much training dare commence work upon a valuable piece of marble, and though work so executed may possibly gain in spontaneity it is sure at all times to lack in that thoughtful consideration which a more tractable material permits.

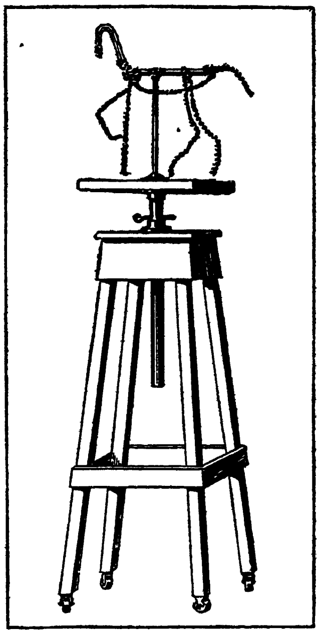
When the processes in modelling were first practised clay was used, but this material has faults in that it is difficult to keep at just the right degree of moisture, and when too dry it must be frequently sprayed with water or covered with moist rags. Wax, which came into use later, is also difficult to handle and very fragile. Thus a comparatively new substance, which is called plasticine and which is really a clay-like material of an oily composition that dries much more slowly, has come into general use, eliminating many of the sculptor's difficulties.

Conception.—The sculptor often makes a number of preliminary sketches in plasticine of the work of art he is contemplating, and as a rule he makes these sketches small enough to avoid the necessity of supports or armatures. Sometimes these sketches are made over an extended period of time and changed again and again until the general idea has "crystallized" in the artist's mind, and he has established just about what arrangement of his work is going to be best. It is often necessary to make a larger and more detailed sketch, including final corrections so that the whole may be kept in mind as his work proceeds. This preliminary work is necessary because of the fact that sculpture often involves so extended a period of time in its creation that certain considerations are likely to be lost sight of as the work proceeds.

Armatures.—On the basis of the final sketch and upon the sculptor's determination as to the size in which the modelling is to be carried out, a suitable armature or support must be constructed. For instance, assuming that the sculptor intends to model a standing figure 30 inches high, a square, iron rod, with three branches at the bottom for support, and bent at a point about 18 inches from the base to meet at a right angle the small of the back of the standing figure, is screwed to a board which is used as a base. The fixed centre of the human body is the small of the back, or the centre between the pelvis bone, and it is important that the armature at this point be so arranged that any change in the position of the arms, legs or torso will not interfere with the fundamental balance of the figure. This bent portion of the iron rod at the small of the back should be, in the example adopted, about 6 inches in length with a 2-inch upward bend at the end. Lead wire, or pipe, of ⅛" diameter should

be used, one section for each leg, one extended up to the top of the head and two more attached properly for the arms, and these lead extensions are attached to the iron support and bent in accordance with the movement of the sketch from which the sculptor is working.

Sufficient plasticine must next be applied to the armature and the work of modelling should proceed until it arrives at an approximation of the original sketch at which time a living model should be obtained and posed as nearly as possible like the sketch. From the model measurements can be taken and corrections made to bring the work closer to life and actuality. Sculptors sometimes take liberty with modelling and this is the artist's license if any advantage of general effect is obtained, but though it is not entirely essential to follow the anatomy of the model or models exactly, it is certainly very necessary that the sculptor be well versed in this part of his work and equipped with the knowledge which makes it possible for him to change the forms to advantage. It is wise to follow the model closely in the control of mass as a whole, but many of the details may be changed so that the planes and profiles are better related and more pleasing.



MODELLING STAND AND ARMATURE

When the artist feels that he has accomplished to the best of his ability the work before him, he must next consider the process of putting it into plaster, as no casting in bronze or cutting from the stone can be made from the clay model. It is advisable to have a professional moulder do this work, as even the mixing of the plaster is a skilful process and the location and arrangement of the mould sutures takes a great deal of practice. (*See* section, this article, *Plaster Casting.*)

Relief.—The sculptor, if he would be successful in modelling high or low relief, should have a mastery of modelling in the round as he is attempting in relief to give a three-dimensional effect and this involves the same understanding of mass, composition, planes and profiles as in the round. The most important question to be considered is that of the relationship of the highest points to the lowest in the background, and this must be carefully thought about and established. The background does not, however, have to be perfectly flat but may follow the general movement of the figures upon it, being deeper in some places than in others, in order to soften certain passages and aid the relief in its various planes.

Enlargement.—For enlarging to life size or greater, the modern sculptor makes use of a so-called enlarging machine of which there are several types, all based, however, upon the principle of the pantograph. For the large figure the armature is erected similar in principle to that for the small work, but is usually constructed of wood, lath and plaster so as to bring the bulk of the armature closer to the surface and in this way not necessitate the use of such great masses of clay, and thus avoid the possibility of parts falling off by their own weight and lack of proper support. For some large works plaster may be used as a modelling medium, thus avoiding the extra work and expense of the final casting.

After the figure has been so treated and carefully "pointed up," it must be gone over again carefully by the sculptor to make any minor changes which appear to be necessary when the figure is perceived in larger scale and which were not so obvious in the smaller model. Thus the modern sculptor not only makes use of all the above mediums for the betterment of his work, but also keeps the result carefully under his supervision so that it is in perfect keeping with his personality and the spontaneity of his conception. (*See* discussion of other related subjects in this article.) (L. LEN.)

MODELLING, THEORY

As sculpture is the art of form, modelling is that part of the art of sculpture concerned with the treatment and manipulation of the surface of form; also, in a secondary meaning of the word, the building up and shaping of a work of sculpture in a plastic material preparatory to casting in plaster of Paris, bronze or terra cotta, or cutting in wood or stone.

With the Greeks one of the tests of a work of sculpture lay in the animation, vibration and life of its surfaces. This is due to the modelling and in this special sense modelling may be called the art of the surface of form.

Modelling as a method of building sculpture dates from the time when men hunted the wild horse, the hairy mammoth, the reindeer and the bison in western Europe. There is proof of this to be seen to-day in the caves of France and Spain in the group of bison and the torso of a woman found there. The originals of the Greek terra cottas were undoubtedly first modelled in clay, followed by a mould from which many copies could be reproduced. The earliest bronzes were either modelled solid in wax, as was done in the half life-size figure of Gudea from Sumeria, 13th century, B.C., now in the Louvre, and the earliest Egyptian and Greek bronzes, or over a core, composed of materials similar to those used in this for casting in bronze, thereby allowing the metal to be made very thin and the statue hollow.

Modelling, considered as the art of surfaces as distinguished from the building up of a statue or other piece of sculpture, is well illustrated by the works of Michelangelo and Rodin. Michelangelo's bronzes have perished, but his works in marble show almost perfectly this special quality of modelling, as the art of surfaces; they rely, almost wholly, for their effect, power and charm on what has been done with their surfaces. The Greeks, instead of relying primarily on the surfaces, which were only part of their conception of sculpture, paid particular attention to the development of clear profiles and significant silhouettes. As a result of this practice, Greek sculpture always appears to good advantage in the open air, while Michelangelo's, with the possible exception of the "David," is confused when placed out of doors. Basing his theory and practice of sculpture on the development of beautiful surfaces and significant modelling, he paid little attention, comparatively, to the clearness of the silhouettes. As seen from a distance, his silhouettes are rather obscure, his statues more or less shapeless. To get the maximum enjoyment out of Michelangelo's masterpieces, the observer should be near enough to see and feel the projections and depressions—the convex and concave surfaces. (*See* MICHELANGELO.)

In the case of Rodin, these qualities of modelling are developed to excess, with the consequent neglect of qualities just as vital. No group of his is as fine as the figures composing it, and no figure is as good as the individual parts. We have only to recall such figures as have been placed in the squares and gardens of Paris to be aware of the difference in the effect of the same figures when seen in a museum, where all the advancing and receding planes, with their projections and depressions, become a source of keen enjoyment and result in a surface of great richness. Thus it was that Rodin instinctively created so many fragments, justifying his use of sensual and highly modelled planes against areas deliberately left rough and unfinished. A Rodin is best when it is small enough to be handled and the surface felt with the fingers, thereby getting the utmost possible enjoyment out of it. This conception of sculpture leads naturally to the "morceau" (the part or detail) and is the result of too much occupation with modelling. It is also one of the causes of the modern cult of the fragment.

In the actual manipulation of the materials used in modelling, many methods are employed, resulting in various textures of the surface. Some sculptors apply the clay, plasticine or wax in small, round pellets, called in French "modelé à la boulette." This method has been very popular since the middle of the 19th

STAGES IN THE PROGRESS OF MODELLING A PORTRAIT BUST IN CLAY

1–3. Blocking out head with the clay. A moist mass of clay about the size of the figure to be constructed is built up on an armature, and the head and shoulders blocked out

4–6. Head roughed out with the clay. Upon completing the geometric construction of the head the sculptor begins the individual details, working from full view, profile and three-quarters view

7–9. Getting the action. With the external likeness established, the sculptor now attempts to give movement to the portrait bust—a characteristic pose or expression that will interpret the personality of the model and make the clay figure a living portrait

SCULPTURE FROM THE 16TH TO THE 19TH CENTURY

1. "Perseus holding the head of Medusa" by Benvenuto Cellini (1500–71). In the Loggia dei Lanzi, Florence
2. "Evening" by Michelangelo (1475–1564), one of two emblematic reclining figures on the sarcophagus of Lorenzo de' Medici; built 1523–34 in the church of San Lorenzo, Florence
3. "Dancing," designed by Jean Baptiste Carpeaux (1827–75) for the façade of the Paris Opera House
4. "Stone Age" by Emmanuel Frémiet (1824–1910), French
5. "Lapitha and the Centaur" by Antoine Louis Barye (1796–1875), the leading sculptor of animal life in the French school
6. Sabine Houdon in 1788 at the age of 10 months, by Jean Antoine Houdon (1741–1828), French
7. "The Bronze Age" by Auguste Rodin (1840–1917), first exhibited in the Salon of 1880 when it took a 3rd class medal
8. "Man with pincers" by Constantin Meunier (1831–1905), Belgian
9. "Grief" (also known as "Death" and "The Peace of God") by Augustus Saint-Gaudens (1840–1907), American

CONTEMPORARY SCULPTURE

1. "Torso" by Aristide Maillol (1861–), French
2. "Head of a Girl" by Jacob Epstein (1880–), American
3. Bronze Indian Equestrian statue by Ivan Mestrović (1883–), Yugoslavic. In Grant Park, Chicago
4. "Apollo and the Muse" a bas-relief by Leo Lentelli (1879–), American. On the façade of Steinway building, New York city
5. "Pan" by George Grey Barnard (1863–), American
6. Portrait of John F. Braun by Charles Grafly (1862–1929), American
7. "Philomela" by John Gregory (1879–), American
8. "Comedy and Tragedy (Hamlet and the Fool)," Shakespeare Memorial, by Alexander Stirling Calder (1870–), American

century. It allows a gradual building up of the form, producing a surface that is granular and vibrating in the light, and somewhat like the effect of an Impressionistic painting. (*See* PAINTING; IMPRESSIONISM.) It developed at about the same time as the Impressionist school, and must be looked upon as an outgrowth of ideas current at that time. Other sculptors apply the clay in great hunks and masses, working it slowly into shape by putting on and cutting off until the desired form and surface are achieved. For tools, some sculptors rely almost wholly upon the hands and fingers, especially the thumb, while others use tools of different shapes and of various materials, such as wire, wood, sheets of steel, etc. (*see* section above, MODELLING, PRACTICE). With such a variety of tools, the sculptor is capable of producing surfaces varying from one as smooth as glass to one as rough and corrugated as concrete. As a general rule, sculpture of the earlier periods, and even down to the middle of the 19th century, has a smooth surface, while work done since that time runs the whole gamut from the highest polish to extreme roughness, according to the character of the subject.

From about 1850 many apparently new qualities were introduced into sculpture besides the "modelé à la boulette." Some were qualities derived from the study of ancient works and the effect of time and weather on the materials used in their construction. Other qualities grew out of the general expansion of the fields of science, art and literature. At that time all things seemed possible. There was a spirit of exploration and adventure abroad as well as an interest in the past. Men turned their minds eagerly to the past to discover many forgotten beauties. Greece and the Renaissance were no longer the whole of antiquity. Dissatisfied with the art of the academies and the failure of anything resembling a genuine tradition, men turned hopefully for aid to the whole field of the past, in all times and places, instead of the strictly limited fields they were taught to venerate; they sought for aid and inspiration in the Gothic, the Romanesque, in India, China and Archaic Greece, which, until then, were unknown or forgotten. A general expansion followed. It was realized by some that there were principles and laws underlying the practice and theory of the arts wherever and whenever found. The German sculptor, Adolf Hildebrand (*q.v.*), attempted to formulate and state a number of these fundamental laws in his book *The Problem of Form in Painting and Sculpture*. It has had a great and beneficent effect on the understanding of the arts of painting and of sculpture. Alongside of this attempt to understand and use the principles found in the arts of the past there grew up a desire to imitate. Sculptors and painters strove to work in the spirit and manner of different periods. They tried to give the accidental and picturesque effects of time and weather on bronze, stone, and wood to new work. They attempted to become reconstructors as well as restorers.

Those eager spirits who looked to the future attempted to use the results of science and observation in creating a new art. The outstanding scientific contribution was in the realm of optics; the most fruitful of results was Prof. Rood's book on the colours of the spectrum as applied to the art of Painting. It was this book which determined the course of development of the Impressionistic school led by Claude Monet. In its preoccupation with light it had a great influence on certain sculptors. They were no longer content to get effects of colour in their work by the age-old methods, but tried to achieve effects of light and colour by methods more appropriate to painting. The Italian Rossi carried this to extreme, as did Rodin. They tried to obtain colour not only by depressions and projections and the use of ornament, but attempted, by their modelling, to get the effects of light as it not only revealed but obscured the actual form. Hollows were deepened to obtain strong dark effects, and filled up to create surfaces which would reflect the greatest amount of light. Details were accentuated and suppressed for the general effects of luminosity. There are things by Rodin and by Rossi which approach nearer to the paintings of Carrière than to any sculpture of the past.

Sculpture became sketchy and impressionistic for the first time. Such works often had great charm. Effects were attempted in sculpture which had never been thought possible before. But the movement passed; it was an interesting but rather futile experiment. One of the results of the study of the arts of the past has been a renewed interest in the theory and practice of working directly in the material in which the work is to be completed. A cult has grown up of the "taille direct"; it has been elevated into a slogan of almost hieratic import. It has become so important in the minds of some of the practitioners that they would never think of working otherwise. It has become not only necessary that every stroke of the chisel be delivered by the sculptor himself, but has even gone so far that no model can be used except the living model. The block of stone or piece of wood must be attacked direct. Whole figures are cut out of the hardest and most obdurate materials without a preliminary study in plastic form being made. It is insisted that all the great works of the past were so made. Along with this has grown the belief that all work should be cut in place. It is maintained that the unity of the architecture and sculpture in the great monuments was so obtained. Much is to be said for this theory and practice. It results in a much more intimate contact between the artist and his work and, what is of much more importance, in a greater respect for the material in which the work is done. There is less of a tendency toward attempting to do in stone or wood those things which are perfectly possible and proper in bronze. Generally, a greater sense of mass is achieved, or perhaps, not so much achieved as retained. There is more of the feeling of the block in the finished work. With the Egyptians, their practice of cutting their work out of the hardest of stones (granite, basalt and diorite) with primitive tools undoubtedly determined the style of their sculpture. If the sculptor has to cut incisions in a material almost as hard as the tools he is working with, he will cut them no deeper than is necessary, and he will cut no more material than is essential to the finished statue. That some pieces were cut directly in the stone without preliminary studies and models is hardly borne out by historic facts. Too many sculptors' models in chalkstone and other easily worked materials have survived from Egypt. We seem to have no authentic plastic models of the archaic or classic age of Greece. On the other hand, consider the pediment figures and the frieze from the Parthenon; it is inconceivable that they were cut "in situ" without very complete preliminary models. The frieze was perhaps worked from a finished drawing, but even that is very doubtful, as a study of the relief indicates. It is interesting to note that the pediment figures were not cut in place but were carved and finished on the ground and then hoisted into position. As proof of this, one need only glance at the backs of the figures which went against the wall of the buildings. It is assumed by some archaeologists that the Greeks followed, generally, the practice of carving their statues directly out of the stone block; the reason given was that they knew so well their "canon" and what was to be done that they just went ahead. In the case of men doing "school pieces," this was undoubtedly so; but the creation of an original work was a totally different matter and it is just as likely that the architects of the Parthenon, Ictinus and Callicrates, went ahead without plans for their great building, as to think that Phidias carved the frieze without knowing beforehand what he was doing. The frieze, by the way, shows distinctly the carving of a number of different workmen.

During the Romanesque and Gothic periods, it seems, with the information we have on this subject, that a similar procedure was practised. Minor works are left to the master stone-carvers, but the large groups and statues are too complete, too "right in place," to have been left to the whim of the stone-carver.

During the Renaissance, where we find so many masterpieces, with complete harmony between architecture and sculpture (notably in the tombs by Mino da Fiesole, Desiderio da Settignano, Donatello and the Della Robbias), the work was generally in the hands of a sculptor. In Michelangelo we have the individualist who had difficulty in working with assistants; he found it easier to do the work himself than to put up with the slowness and irritation of helpers. He carved his figures himself directly in the marble, and we see with what results. No statue

of his, not even the "David," is completely finished. The top of the "David's" head is not finished. This lack of completeness grew out of a number of different causes, namely, his impetuosity, his impatience, and his practice of attacking the block of marble without sufficient preparation. He is recorded to have said that one should make a full-sized model first, but his own temperament forbade it in his own case. As a compensation for the fragmentary and incomplete state of his works in sculpture, we have the most wonderful and expressive marble-carving in the world. Nowhere is there such surging life, nowhere is the actual stone so transformed. His chisel cuts the marble with the creative power of a brush stroke of Rembrandt. Under his hand marble becomes truly living stone.

The modern cult of the "taille direct" shows none of this transforming power. Only too often it is used as a questionable merit to cover up incompetence, the thought being, "I cut it directly in this hard stone; therefore it must be good." The differences in modelling between carved and modelled surfaces is not as great as is generally assumed. Of course, stone should remain stone, granite should remain granite, and wood should remain wood. Certain things perfectly feasible in bronze when translated into stone or marble become objectionable because of the nature of the materials. Such things as the statues of Siva, found so often in Hindu art, with the encircling halo of flame, become atrocities when carved in stone. This grows out of the very nature of the materials themselves. Bronze, being a very tough material with great tensile strength, may be pierced full of holes provided the unity is maintained in the design; stone, having a low tensile strength, demands a treatment more in the mass.

The surfaces of stone, marble and granite, as well as wood, may be treated to show the mark of the cutting chisel or carried to the highest degree of polish. The polished surface makes a very different appeal to the eye and also to the sense of touch. Marbles, granites, and the hardiest stones, such as basalt and diorite, change colour as well when polished. The degree of smoothness or polish should always be determined by the effect desired.

It will be well to remember that bronze is always a cast material and though it has very special qualities of its own, of hardness, colour and reflecting powers, it has always been cast molten and fluid into a mould from a model. The better the casting the less work necessary on the finished statue. Details are often chased on the bronze but generally they exist in the original model and are only sharpened in the bronze. (M. Y.)

THEORY

So widely separated have become those, in this modern generation who write on art, from the artists themselves, that criticism is generally completely ignored by the latter save when they receive gratifying though really unimportant praise, and it is almost an unheard of thing for an artist to change his style because of critical suggestion. Therefore it has been thought advisable, in the planning of this Fourteenth Edition of the *Encyclopædia Britannica,* to resort to the artists themselves for the articles covering the practice of every art and to supplement this first-hand information by a few brief treatises which help to bind it together and unify its deductions.

This article, therefore, like the one on TECHNIQUE IN ART and others on DRAWING and DESIGN, is written primarily for the purpose of correlating the artist's theories, and will be of use to the student, as well as for the purpose of establishing a type of criticism making possible judgment not only of the results of an artist's labours but also of his various plans and methods of arriving at them.

The metaphysical and historical aspects of the problem are represented in this edition by the articles on FINE ARTS and on AESTHETICS. A study of the various articles written by artists in every field of the graphic and plastic arts of both fine and applied classifications stresses a contrasting view: that the artist is an analytical and reasoning being like the scientist, and that the main concern in his work is what we describe by the general term "technique." He is inspired at times just as in truth is the scientist, but, like the scientist, he must also apply himself to analytical thinking and hard labour. It is with these aspects that the present article is concerned.

Material.—One of the most important interests to the artist is that of the materials or substances with which he works and the methods whereby they can be most effectively treated. Their relative strengths are spoken of in the preceding sections on Sculpture Technique: *Modelling,* their colour against foliage or sky is treated in *Garden Sculpture,* and so from many different viewpoints it is the sculptor's concern that he be well-equipped with an experimental knowledge of textures and qualities, physical as well as aesthetic, qualities which cannot often be described in words, they are so delicate and intangible, but can only be shown in actual work; characteristics which are as true and yet as difficult to describe as the shading of a curve. If he is working in stone he must know whether it is granular, stratified, or crystalline; he must know the properties in the same manner of wood, ivory and other substances, and there is no possible way for him to find these out other than by trying them, experimenting with them, discovering their properties, just as might a scientist in his laboratory, but properties of course quite different from those which interest the scientist. In the example of Mestrović's work shown on Plate X. is well demonstrated this sculptor's masterful handling of wood, but the figure "Rhythm" by Arthur Lee (Plate IX.) shows an even greater knowledge of the quality of the material, which in this case is marble.

Not only must the texture and grain be kept in mind: in the modelling of a head the sculptor finds that the outstanding features such as the nose and ears cannot be left so thin, if the figure is to be cut in marble, as they would be, if it were to be cast in bronze, or they will appear too translucent, for marble is not so opaque as bronze.

It will be interesting for the reader to look at the other plates in the sculpture section as well as those on CHINESE SCULPTURE, INDIAN SCULPTURE under INDIAN AND SINHALESE ART AND ARCHAEOLOGY, and GREEK ART, judging which best express the material in which they are wrought and which are weak in this qualification. Thus the first step in critical judgment may be arrived at.

Finish.—The finish of the surface is a matter of great importance; it should be appropriate to the material, and at the same time to the subject portrayed. It must, moreover, be such that it creates a surface not harmful to the modelling. Many Renaissance bronzes lose all quality of their modelling because of the confusing highlights caused by their too-highly polished finish.

It is offensive to see a beautiful piece of marble capable of sustaining a fine polish, upon which have been left careless chisel marks. This indicates that the artist was either too lazy or too hurried, or perhaps too interested in creating a style of his own. On the other hand an over-polished finish upon a material which is too rough and crude to sustain it is also lacking in good taste. How is the artist to know just how deeply his carving should go; just what degree of detail to use; and what texture of surface is best suited to his work? Only through a long study of the works of others both contemporary and ancient and through many experiments of his own; and the critic judging a piece of sculpture should always think of this element as well as that of the material and judge as to whether or not the sculptor has been successful in this work.

Detail and Design.—The addition of decorative detail to a figure is a question which has been much discussed and it is well enough for the purist to point to the Greeks and Michelangelo and say: "There stands a beautiful form needing no decoration," but he certainly can never disprove the beauty, largely due to the ornamental treatment of drapery, hair, and other details existing in the best of the Gothic, Chinese and East Indian sculpture. It is true that form must grow from within, but form is only seen on the surface. A surface decoration may be quite separate and distinct in detail from the underlying form; its design and texture may have little to do with that other more powerful element, but it must never conceal the life within. Think of the beauty of the swell, only faintly suggested, of a rounded breast, or of a firmly curved thigh as revealed under

SCULPTURE EXAMPLES ILLUSTRATING MODELLING THEORY

1. Statuette of Aphrodite Anadyomene coming up from the waves; smooth, fine lifelike modelling. Probably after a type of the 4th century
2. Fragment of group in the original unfinished clay after drying. An interesting treatment in clay which would have to be somewhat changed if executed in bronze or stone. By Rodin (1840–1917)
3. "Esclave," in the Galleria dell' Accademia, Florence. Unfinished statue in marble illustrates Michelangelo's method of working directly in the marble without completed preliminary study
4. Bronze figure of "Adam" (the creation of man) by Rodin. Shows modelling of surfaces, without work on plaster or bronze
5. Statue of "Day" from the Medici Tombs. An example of Michelangelo's work done directly in marble. Note the life with which this master imbued his work
6. Bronze "Head of Beethoven," by Emile Antoine Bourdelle, 20th century; somewhat too plastic for bronze but powerfully modelled. French
7. "Jules Dalon," a portrait bust by Rodin in bronze. Example of modelling in clay, appropriate to bronze, but could only be obtained in the former medium
8. "Torso di un Fauno," late Greek fragment in marble, showing rich full modelling of forms akin to that of Michelangelo and Rubens

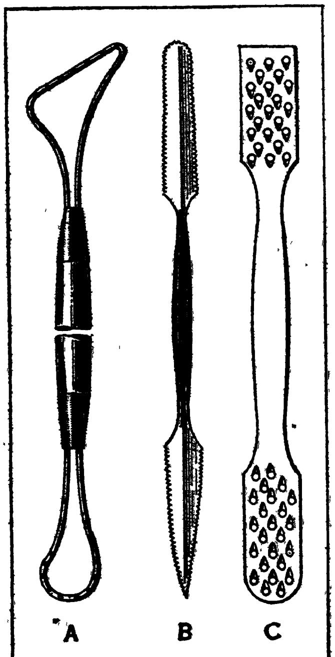
EXAMPLES OF SCULPTURE TECHNIQUE

1. "Amour et Psyche" by Canova (1757–1822), Italian. The group in marble was cut by a marble carver from the completed clay model. In the Louvre. 2. "Girl with Goat" by E. McCartan (1878–), American. Finished plaster for bronze statuette. The nicely finished treatment of the girl is in contrast to the sharp, rough treatment of the goat. 3. "L'Éternel Printemps," a marble statuette by Auguste Rodin (1840–1917), French. Rodin's voluptuous modelling of flesh is shown to advantage against the unfinished surfaces. In the Metropolitan Museum of Art. 4. "Hercules Sustaining the Universe," a sundial by Paul Manship (1885–), American. Example of decorative sculpture depending for its effectiveness upon its architectural sense and conventionalized treatment of detail. In the garden of C. M. Schwab, Loretto, Pa. 5. "Two Bantams" by Mahonri Young (1877–), American. This bronze group illustrates unity of composition by linear design. 6. "Head of Negress from Guadeloupe" by Dora Gordine, English. Shows method of modelling *à la boulette*. Exhibited in the Leicester Galleries, London. 7. "Goose" by Sirio Japanari. Example of ornate surface achieved by stressing the pattern of feathers. 8. "Bacchante" by Frederick MacMonnies (1863–), American; showing effective use of clear and unusual silhouette. In Metropolitan Museum of Art, New York. 9. Panel from "The Sea Gull Monument" by Mahonri Young. Bronze in Salt Lake City. Relief treated pictorially. Different surfaces are used to express sense of space

the draperies of surface decoration of many Greek and Chinese figures. Are they not more enchanting in a way than the more obvious beauties of the nude?

But the sculptor must not approach his problem thinking only of design, whether it be the design of surface or of structure, for his work will then lack life as did some of the Gothic, and may appear self-conscious and strained. It is better to "find" design in one's natural surroundings than to attempt to "construct" it. The observant artist often thrills with a sense of surprise and discovery at the sight of a quite accidentally occurring design which nature weaves into the tapestry of her days and nights. It may come when least expected and from the most unlikely source. It is not inspiration but the lucky chance of a certain combination of light and action and mood which must be grasped and noted at once before it is lost forever. By being always on the alert, the artist can keep himself ready instantly to take note of it. Through the accumulation of his notes he can always be equipped with a stock of designs which may be brought into his work. Korin, that great Japanese screen painter, executed in a perfectly naturalistic and direct way each fragment of nature which impressed him with its expressive design, and so the sculptor may see in the grace of a poised head, the crouch of a cat, or the shrug of a greyhound, a design which needs no enhancement; in the ruffs of fur, the ripples of muscle, the rhythm of ribs, the curling of hair, or the wrinkles of age, he can find a thousand sincere decorations infinitely better than anything he can imagine. He may find them in the folds of clothing, and even a short pleated skirt is a motive in surface decoration which the Egyptians would have employed in making a beautifully successful design.

Expression of Tool.—In sculpture the actual mark of the tool (*see* TECHNIQUE IN ART) is not so beautiful in itself, nor so sensitive a reflection of the mood and character of the artist as it is in painting. This is undoubtedly because the medium of the sculptor is a more difficult one to handle, but nevertheless the sculptor must consider this question and he must be very careful, if for instance, he is working in clay or plasticine, that his final bronze does not express the soft plastic appearance which he has imparted to the original substance, upon which he has left the casual marks of his tools or even his fingers. One cannot leave a deep thumb impression on bronze, and there is no excuse for leaving it on the clay image from which the bronze is to be cast, for this gives a false impression of the qualities of the final material in which the work of art is to be seen.



MODELLING TOOLS: (A) WIRE TOOL FOR MODELLING AND CUTTING CLAY; (B & C) TOOLS FOR PLASTER WORK

Some sculptors not only show great skill in the proper expression of their tools and the impression they make on the medium, but form a personal technique suitable to the subjects they are portraying. Thus Mestrović has developed a technique peculiarly personal and peculiarly suitable to the wood in which he often works; and Rodin not only employed a personal, appropriate and vital method of treating the smoother surfaces of his figures but also, as a gesture effective in its qualities of contrast, left rough tool marks on the surrounding stone (*cf.* Plate I., fig. 2).

The sculptor must, however, be very careful that this personal use of tools does not become an affectation. It should be natural, human and appropriate to the medium and should be chosen only because it is suitable to what the sculptor wishes to express. Modern critics would do well to point out the frequent insincere use of what might be termed personal textures of tool marks which are employed by some sculptors as a trade-mark.

Modelling.—Structural and rhythmical modelling that is true in its portrayal of the artist's theme and which conveys some of the original emotional thrill of beauty which gave to the artist the creative urge is attained only after the artist mastered and balanced his whole array of technical forces. This is well shown by Arthur Lee's figure, "Rhythm." It is this perfect conception upheld by a perfect technique which puts the breath of life into his work and even the master cannot be always sure of grasping it. But one thing is certain and that is that this life must be drawn from the great tumult of life with which nature surrounds us. Perhaps one model will not suffice for the sculptor; he may have to resort to two or three and perhaps even they are not sufficient, so that he will find himself forced to create details which he remembers from still other models, but it is certain that in the expression of this quality of vital force the artist is but the translator of an epic inscribed by the master of all master craftsmen. The "modernistic" rhythms which emanate from the finite mind of a single artist are trite and dead as compared with those which millions of years have developed in the evolution of animal and man.

Choice of Subject.—It seems strange that in these days of keen athletic youth, great action and intense living, many sculptors are still content with the portrayal of well-rounded and rather phlegmatic female figures usually reminiscent of days long past, in form, in position and in name. This is probably due to the sculptor's training in the classics and to the attitude fostered by the adoption of the term "fine arts" (*see* TECHNIQUE IN ART), but on every hand slender, beautifully athletic forms are walking, running, skating, skiing, swimming, and dancing;—doing a thousand things with a clean-cut action and beauty never attained even in the days of Greece, and closer to the modern sculptor and his public. Some sculptors have adopted this viewpoint and the alert living figures of boxers by Mahonri Young (*see* Plate VIII., fig. 5) are an example showing the tremendous possibilities, for these two figures are bound together by that intangible, though very real cord of antagonism in a primitive contest, in a way which has hardly been better portrayed. Even though the sculptor may not adopt the facts of modern existence in his work it is still possible for him to portray the spirit of this, even though the name of his subject be hundreds of years old. Edward McCartan has grasped this spirit in his figure, the "Diana with the Greyhound" (*see* SCULPTURE, Plate VIII., fig. 2), and it is not difficult to imagine this girl buoyantly walking down some familiar road and shortening the leash on her dog as she crosses at the street corner. In such manner did Michelangelo and Cellini express the spirit of the Renaissance. Even better did the Greeks record all that was beautiful in their daily lives.

But a sculptor must be careful to choose a subject which he understands and loves. His is perhaps the most enduring craft and many are the miscreations that live too long. Often without more than a few hours of thought he will start a work which will take him years to complete and which may exist for centuries. Thus sculpture must have a fundamental meaning and the artist should think of it as existing not only for his contemporaries but for generations to come. For this reason he must deal with those qualities which all men comprehend. By this it is not suggested that a meaning which is involved or literary can be employed. Such meanings are not sufficiently universal, and the contemplation which is necessary before the sculptor begins work should consist of preliminary observation, the assembling of notes made at previous times, and those trial sketches recording things which he may forget in the heat of his actual work. It is said that famous painters of the Far East often merge themselves in contemplation of the silk upon which they are going to develop a work of art, and that they do not permit themselves to make even the lightest line suggestive of the composition, for the reason that the first touch of brush to silk to a certain degree commits them, and masses, rhythms and lines can be more easily moved in the imagination before this first lightest touch has begun the crystallization of what they wish to do. Many great sculptors have weakened their work by not devoting an amount of time in considera-

tion proportionate to that expended in the actual labour. This was especially true of Michelangelo who in the great vigour of his mind sometimes created beings that seemed to wish to reach outside the block of stone. (*See* SCULPTURE TECHNIQUE: *Modeling, Theory.*)

Characterization.—After having selected the subject and model it is necessary to choose certain characteristics and to eliminate those extraneous details which do not form an inherent and component part of its being. This is the artist's privilege, nay, it is almost the heart of his work, and selection must be thought out carefully. Many modern artists are carrying this privilege so far that their work eliminates all possibility for those blending chords of characteristics that develop in a fine portrait sculpture as rightly as in organ music. Thus the "Portrait of Mme. Pogany" by Brancusi (*see* SCULPTURE PORTRAIT, Plate X., fig. 3) when compared with the other two portraits on the page, that of "Lafayette" by Houdon and that of "Admiral Farragut" by Charles Grafly, seems childlike in its simplicity. The work of the true portrait sculptor as seen in the other two, shows all the complications of the characters portrayed, but reduces them to a meaningful whole. It is difficult to understand why in these days of diversity of interest and complications of existence some artists should choose to show less in their work than did many of the more primitive peoples. Compare the Brancusi head (Plate X., fig. 3 of SCULPTURE) with Plate IX. One must agree that this simplified characterisation can hardly be more than an affectation, for the result does not gain in the distinction of design, which is demonstrated in the negro head of Plate IX., fig. 8, of SCULPTURE, and to which Brancusi's work is distinctly inferior in the portrayal of character. Thus character portrayal and accent are not caricature, nor are they the assumed attitude of a theorist.

Association With Surroundings.—Sculptors have found it necessary to specialize in certain fields, because they have found it necessary to study not only the problems of their work in itself but those which are involved in adapting it to its intended surroundings. In the foregoing articles certain broad truths have been pointed out, but the reader must realize that these are only samples of the problems which must be solved, for not only must the sculptor who is making portraits be a student of craniology, physiognomy and anthropometry, but he who is working for the enhancement of the beauty of a building must be properly equipped with a knowledge of periods of architecture and decorative styles, their reason for being and their influences. Each division in this field of art has its problems of application, whether it be portrait, architectural, garden, monumental or any other branch of sculpture, and whether it be large or small, bronze or stone, designed to be shown indoors or out-of-doors, on an eminence or level with the eyes.

Psychological Balance.—Sculptors, of all artists, feel the necessity for a proper balance, because of the enduring quality of their art, while painters are often the first to take up the enthusiasms of the day, and to drop them. In recent years there has been a great wave of interest in the subjective; man searches his inner being with interest in an endeavour to find that which he has not been able to find outside himself. Perhaps this tendency is due to the declining power of religion and it has been suggested that men are no longer moved as were those of the Middle Ages in the worship of a god and now search for a god within themselves. In art there has been a revolt against the strongly objective viewpoint of the academist, for realism was carried in the 19th century to its ultimate climax. The impressionists were not concerned with reality but were interested only in their impression of things, in catching the fleeting moment, and thus their work grew swifter and swifter in the hope that they could catch quickly passing glimpses of light and colour. Sculptors only distantly followed this movement. However, after the impressionists, various groups of distortionists who were sculptors as well as painters, carved and twisted reality until all semblance of meaning was lost and no one could guess with what model the artist had begun his work. In defense of all this, artists said that they were "expressing themselves," an argument which though not complimentary to their reason was nevertheless unanswerable, for who could tell what another saw or did not see?

This reaction against the too objective viewpoint of the 19th century is a healthy one and was necessary in the development of the evolution of art, but there is nowadays among artists a growing understanding that a readjustment will be necessary and of all artists the sculptors appreciate best the necessity of balance between the objective and the subjective, the factual and the imaginative, that which can be observed in the artist's world, and that which the inner being of the artist imposes upon it.

The primitive artist first makes as good a copy as he can of the object he is attempting to portray and then feeling a lack in its static quality resorts to various devices to indicate its movement. In doing so he combines what he actually sees, the objective, with what he feels, the subjective; and every artist does the same, for nothing in nature is quite good enough to satisfy the artist; he must improve on it a little. Nothing in nature exactly fits with the spirit of his mood and thought, and therefore he must mould it the better to suit his expression. It is this subjective quality which, along with his technique, creates what we call the artist's style, for in it we see something of the man himself; we see the object which he is portraying through his eyes, coloured by his emotions, illuminated by his dreams and enriched by his knowledge. But this style should never be consciously imposed upon the theme in such a way as to obscure it, for the artist's true endeavour is to make it possible for his fellowmen to see more clearly and with more feeling than they could without him. In order to accomplish his purpose he may make a round breast rounder to point out its roundness, or in like manner accent or suppress any quality of light or shade, strength or weakness, vigour or impassivity, any emotion, any association, or any other reaction which he may choose to employ, if the power of his work upon his fellowmen can thereby be increased, so that it enlightens and instructs them in the experience of the beautiful, and broadens their understanding. The grotesque of the Renaissance may be as great art as the placid figures of an Amida Buddha, for art, like science, is not concerned with right and wrong, good and bad. Its urge is to broaden and explain, to impart feelings which could never be expressed in words, and which may never have been felt or expressed in just that individual way before. Thus it makes us understand almost as though we ourselves had experienced all that the artist has.

The sculptor who would express heroism in a monument or pathos in a tomb, the delighted glee of a child, or the tenderness of a mother, or a blending of all these things and thousands of others must take the soul of his work from the observations of these actual elements in the faces and bodily movements of those about him. If he wishes to make his work understandable and moving he cannot impose upon it so much of his own secret personal language that it can only be understood, if he himself stands by explaining to all men who observe, down through the ages.

People mistrust emotions they do not readily understand and many of our serious plastic artists because of this personal clouding of the observations which they have made, are actually burlesquing the very emotions, an understanding of which they are so earnestly pleading for. In the tense moment of a great drama an actor can become reasonably extravagant in his gestures, for his audience, having been carried through all of the facts which the dramatist has provided, is with him. They know why he feels as he does and their sympathy leads them to be moved by acting which, if not explained, would seem ridiculous. All that another actor need do to rouse the laughter of the audience and to burlesque this tense moment is to walk on the stage and to go through the *identical actions* with no preliminary explanations. So it is with sculpture, and this may explain in part why sculptors are so loathe to take up new forms. Everyone knows who Diana is and though the work itself may not be good enough to bring to their minds at once the character of the chaste huntress it may be good enough to pass with the proper label. But, if the sculptor has the perception and insight, if he is sufficiently skilled in his technique and if he does not cloud the subject with his own too self-centred subjectiveness it is possible to find a thousand

EXAMPLES OF EIGHTEENTH, NINETEENTH AND TWENTIETH-CENTURY SCULPTURE

1. "Venus Anadyomene" by Paul Manship (1885–). A masterful expression of the material marble enhanced by the rhythmical beauty of natural form
2. "Rhythm" by Arthur Lee (1881–). One of the finest modern examples of expression of perfectly modelled natural rhythms
3. "Girl Holding Fruit" by Claude Michel Clodion (1738–1814). A fine example of the expression of terra cotta, especially typifying the period in which it was made
4. "The Bather" by Jean Antoine Houdon (1741–1828). Beautifully expressive of stone and of the period during which this sculptor lived
5. "La Pleureuse" by Auguste Rodin (1840–1917). Showing a fine contrast of textures typical of this artist's style and expressive of his direct technique in marble
6. "À la gloire de Jean Goujon" by Alfred Auguste Janniot (–). A fine example of European modernist expression in stone

DECORATIVE AND PORTRAIT SCULPTURE IN WOOD, MARBLE AND BRONZE

1. The Happy Angels, by Ivan Mestrović (1883–), Yugoslavic. A good example of the expression of the material wood
2. Greyhound, by Edward McCartan (1878–), American. An excellent example of the selection of natural rhythms. Note the lines of muscle over the shoulder and side and the rhythm of the lines of the neck carried out in the perfectly true parallel rhythm of the shoulder muscles
3. Bird in Space, by Constantin Brancusi (1876–). A simple form so subjective that it has no aesthetic meaning except to the artist
4. Homo, by Eric Gill (1882–), English. A fine simplified form expressing the quality of marble
5. American Soldier, by Jacob Epstein (1880–). Showing expressive modelling, but a texture more appropriate to clay than to bronze, the material in which it is cast

MONUMENTAL SCULPTURES IN BRONZE

1. The Colonne Vendôme, designed by Gondouin and Lepère, 1806, Paris. The column is plated with bronze ornamented with scenes from the campaign of 1805 and is surmounted by a statue of Napoleon I. 2. "Statue of Guatamalata," Padua, completed in 1453 by Donatello (1386–1466), the first great bronze work cast in Italy during the Renaissance. 3. Gilded bronze equestrian statue of Marcus Aurelius (A.D. 121–188), an example of Roman imperial sculpturing. It was erected in the Forum, after his death, and later removed to the square of the Capitol, where it now stands. 4. Statue of Bartolomeo Colleoni, in Venice, by Andrea del Verrocchio (1435–88). The pedestal was finished in 1489 by A. Leopardi (1450–1522)

SCULPTURE TECHNIQUE

BY COURTESY OF THE PATHE EXCHANGE, INC.

STEPS IN THE PROCESS OF CASTING A STATUE IN BRONZE

1. The sculptor's original model in plaster
2. Making gelatine moulds from the original, which has been first carefully divided into sections
3. Pouring heated wax into the prepared gelatine moulds
4. Assembling the wax model
5. Attaching wax pipes which will serve to carry off the melted wax and fumes during baking
6. The wax model encased in plaster for baking
7. Putting a thick layer of fire-clay outside the plaster
8. Bricking up the kiln after the model has been placed inside
9. At the end of a few days the wax has melted and been carried off through the pipes leaving a final mould of plaster. This mould is placed in a pit and solidly packed with earth
10. Pouring the molten bronze, heated to a temperature of 1,900°F into the mould
11. Removing the mould after the bronze has set
12. Finishing the completed model with a blow torch; applying chemicals in liquid form to obtain different colours (patine)

models in the world about him capable of being understood by all men through the ages, and at a glance. (W. E. Cx.)

CASTING AND FINISHING

The discovery of copper alloys is lost in the prehistoric ages. Their name was Chalcos with the Greeks and Aes with the Latins. Aes Brundusinum was the name of the alloy used in manufacturing famous Roman mirrors, and possibly the origin of the word "bronze" came from Brindisi (Brundusium), a city on the Adriatic coast of Italy where bronze was manufactured on a large scale. The origin of art bronzes or sculpture in bronze had its birth in the most remote days of human history, but after the invasion of the Roman Empire by the Barbarians, there was a long period of obscurity. It was in Italy during the Renaissance period that the regeneration of the bronzes of art took place, especially by the efforts of Benvenuto Cellini.

Bronzes of art are cast by two different methods: (1) the sand process, (2) the *cire perdue,* or lost wax process. Judging from the early specimens of bronze castings, undoubtedly the cire perdue method, or something like it, was used long before sand casting.

Sand Process.—The original model of the sculptor is moulded in an iron flask, with the use of very fine French sand (a composition of clay, silica and alumina). The iron flasks are strongly built frames made in two halves of such a perfect mechanical construction as to fit very closely with the aid of clamps and bolts.

The moulder gently hammers the damp sand against the plaster pattern, taking care of the undercuts of the model or deep recesses, by making as many as necessary small pieces of sand in such a way as to be able to release them from the original model by taking them apart without injury either to them or to the model.

After the model is released, the packed sand mould, which bears the impression of the most minute details of the original model, is recomposed and a proper sand core is built inside of it. This core is so cut that it leaves a space between itself and the piece moulds above described.

After this operation the dampness of the sand mould must be carefully eliminated by enclosing it in an oven properly built. When the mould is completely dried, the liquid bronze at about 1,900 degrees Fahrenheit is poured into the iron flasks previously recomposed and clamped together, and it will run through channels skilfully cut in the sand, going to fill the empty spaces mentioned above.

The sand is then removed, and after the bronze is cleaned with nitric acid, it will be finished and chiselled by skilful artisans.

Cire Perdue, or Lost Wax Process.—The first stage of this process, after receiving the model from the artist, consists in preparing a negative made of plaster or gelatine. This is merely a coating of the outside of the model. In this negative, which shows all the details of the model in the reverse, a wax coating is applied in a molten state with a brush until it has acquired sufficient thickness, depending on the size of the figure.

At this stage, we will have a perfect replica of the sculpture in wax, and sufficiently hard to permit handling. The artist can work on it as much as he pleases, obtaining rare results of details, which makes this process of casting invaluable. Gates and vents in the shape of wax rods are then properly attached to the wax figure.

Finally, the mould for the metal is formed by blowing or pouring inside and around the wax a semi-liquid composition, which hardens in a few minutes. This composition of silica, plaster and other chemicals can resist high temperature, and, of course, all the wax inside of it will melt away, leaving a hollow space. This operation is accomplished in large ovens, by baking the moulds over a slow fire. As soon as all the wax is surely melted away, the mould is removed from the oven and packed in foundry earth in a pit provided in the floor. The bronze is then poured from crucibles, and the molten metal will run through the gates (melted away) and fill the space left empty by the wax figure also melted away (lost wax). The figure in bronze is then removed from the silica mould and dipped in acid for a proper cleaning.

With this process, the cast bronzes require very little finishing or chiselling, and the results are far above the sand process.

The so-called "patina" (*q.v.*) of the finished bronzes is an art in itself, and the different effects of colour are obtained by a large use of different chemicals.

Bronze is an alloy of from 85 to 90% of copper, and from 10 to 15% of tin, zinc and other non-ferrous metals. The alloy called United States Standard Bronze is composed of 90% copper, 7% tin and 3% zinc. This formula is not by any means officially approved by the United States Government, and this name was given by some bronze foundrymen only a few years ago for their own advantage, and strange to say it became an official word. Almost every specification generally written for contracts of art bronzes mentions the United States Standard Bronze as stipulated.

There are hundreds of other formulas of bronze, many of which contain other metals, such as lead, silver, aluminum, etc., which should not be left apart from the specifications of art bronze.

Some formulas of famous art bronzes will show the relative compositions:

Some Greek bronzes have: copper 62%, tin 32%, lead 6%.

Others have: copper 72%, tin 24%, lead 4·6%, zinc 2%.

The famous column Vendôme in Paris has: copper 89%, tin 10% (with traces of lead, tin and silver).

The statue of Louis XIV. in Paris has: copper 91%, tin 2%, zinc 6%, lead 1%.

Statue of Molière also in Paris has: copper 90%, tin 6%, zinc 2·5%, lead 1·5%.

The statue of Frederick the Great in Berlin has: copper 90%, zinc 10%.

There should not be any cause of alarm in judging the bronzes of art from the point of view of durability, as there are millions of specimens all over the world in an admirable condition of preservation composed of every conceivable proportion of alloy.

Not long ago some bronzes were discovered belonging to an age precedent to the Incas, with an alloy of 94% copper and 6% tin. (R. Be.)

PLASTER CASTING

In plaster casting there are at least three methods of procedure, each of which is determined by the kind of mould used: (1) the gelatine mould, (2) the piece mould, (3) the so-called waste mould. The gelatine, or glue, mould is generally employed when more than one plaster cast of the same model is desired, and this we shall consider first.

Glue Moulding.—After covering the clay or plasticine model, which is to be cast, with paper, a layer of clay about three-quarters of an inch is placed over it. Next to this is made the outer shell of plaster which will hold the glue. This shell is made in sections, when the model is in the round, so that it may be removed without disturbing the model. These sections must also be carefully keyed, both to the base and to each other, so that they may be placed in their original position, leaving an even space between the model and this outer shell. This space is filled with the melted casting glue or gelatine, which is poured in through a hole made in the top. Other holes are also made in the shell to allow the air to escape as the melted glue rises in the space, and are closed with clay when the glue reaches that level. When the gelatine, or glue, is sufficiently cooled, the shell is opened and the clay, or plastilene, is cleaned from the gelatine mould. It is then properly greased with a mixture of stearine and kerosene and the mould, with the shell to hold it, is placed together again and plaster, mixed to a normal consistency, is poured into it. Care should be taken to reopen the mould at the proper time so that the heat of the plaster, while in the process of setting, may not melt the gelatine and in this way alter the mould so that the freshness of the original surface of the model is lost in the cast. In re-casting the mould should again be cleaned and greased lightly as before.

Piece Moulding.—This method is employed for the same purpose as the gelatine moulding. It gives a sharper, more accurate reproduction but requires greater skill and time, as the mould is made in many pieces of plaster, so placed and fitted

that they may be freed from what is termed undercuts in the cast. In gelatine moulding, on account of the pliability of the mould, this difficulty with undercuts is avoided. Each part of the piece mould must be made separately. The soft plaster, placed on the section of the model that can be cast in one piece, is allowed to set, after which it is smoothed and trimmed with a chisel, and the surface against which the next piece will lie, is oiled so that the fresh plaster will not adhere to it. When the model is covered, the tops of the pieces are oiled and plaster placed over them, which, when set, forms a shell to hold them in place while they are being filled with the plaster of the cast. Before casting, however, the mould must be taken apart and the clay washed from each piece. It is then soaped and oiled and put together ready for casting. After each casting the pieces should be cleaned and oiled to prevent them sticking to the cast.

Waste Moulding.—This process is used either when only one reproduction in plaster is desired or in very large work. Proper divisions are first made in the most salient points of the model by small pieces of brass, so that when the mould is finished it may be opened and all the clay removed. The model is now covered with a coating of coloured plaster which is made by colouring the water, with which the plaster is mixed, with blueing or dry colour. In the process of chipping the plaster mould from the cast, this coating warns the moulder that he is near the cast and must chip carefully to prevent cutting into it.

After the first coating of coloured plaster, about three-eighths of an inch thick, a thicker coating of white plaster is applied. When the cast is large, or when there are parts of it that might break easily, it may be reinforced with iron pipes which are fastened to it with strips of burlap dipped in plaster.

The brass has made a natural cut in the plaster mould, thus dividing it into sections. These are removed from the model, washed with water, soaped with green soap, melted in hot water and allowed to cool. Then with a dry brush all soap is carefully removed from the mould and a slight coating of olive oil is given it to insure the proper separation of the mould from the cast. The sections are now put together and held in place by burlap dipped in plaster, or tied with wire, and the mould is ready for filling. In order to remove this mould it must be chipped from the cast, because the undercutting of the cast does not allow the sections to be lifted off as in the piece-mould.

Casting.—The cast of a bust or other simple work can be made in one piece. The sections of the mould are united, and the plaster at a proper consistency poured into it. By continually turning the mould the plaster may be evenly distributed. A thickness of three-quarters of an inch is sufficient to make a strong cast, especially when it is reinforced inside with burlap dipped in plaster, or with iron pipes. Where the model is small it may be entirely filled, thus forming a solid cast.

In the case of large works, in which there is no way of moving the mould around, the cast is made in sections. When set, the sections are joined together and properly strengthened on the inside, great care being taken that all joints are clear of plaster so that they may fit perfectly.

Chipping.—Sufficient time should be allowed for the plaster to set properly, then, with a mallet and chisel the outside iron pipes are removed and next the natural coloured plaster, leaving the thin coloured coating. This should be removed with care to insure a plaster cast without a blemish. The plaster cast can be re-touched with plaster mixed to a thinner consistency than the casting plaster and care should be taken to wet the model before applying.

Tinting Plaster Casts.—Plaster is made of equal parts of plaster and water, the plaster being slowly poured into the water and given sufficient time for absorption, after which it should be stirred gently. There are various ways of tinting plaster casts so that they may resemble bronze, terra-cotta, etc. One of the most common is the oil paint method. One coat of shellac should be given as a prime. After this has dried thoroughly a coat of oil paint of brown with a little dryer is applied and allowed to dry. If a greenish blue tint is desired a very thin mixture of light green oil paint is applied to the brown coat. When this is almost dry it is wiped off with a rag, allowing the green colour to remain in the deep parts; for a metallic effect, a little gold or bronze powder mixed with dryer may be applied to the high parts. When thoroughly dry it is rubbed with ordinary prepared furniture wax. This will subdue any unpleasant shiny effect and bring the whole thing together. Similar procedure may be used with any other colour desired.

(L. LEN.)

PATINA

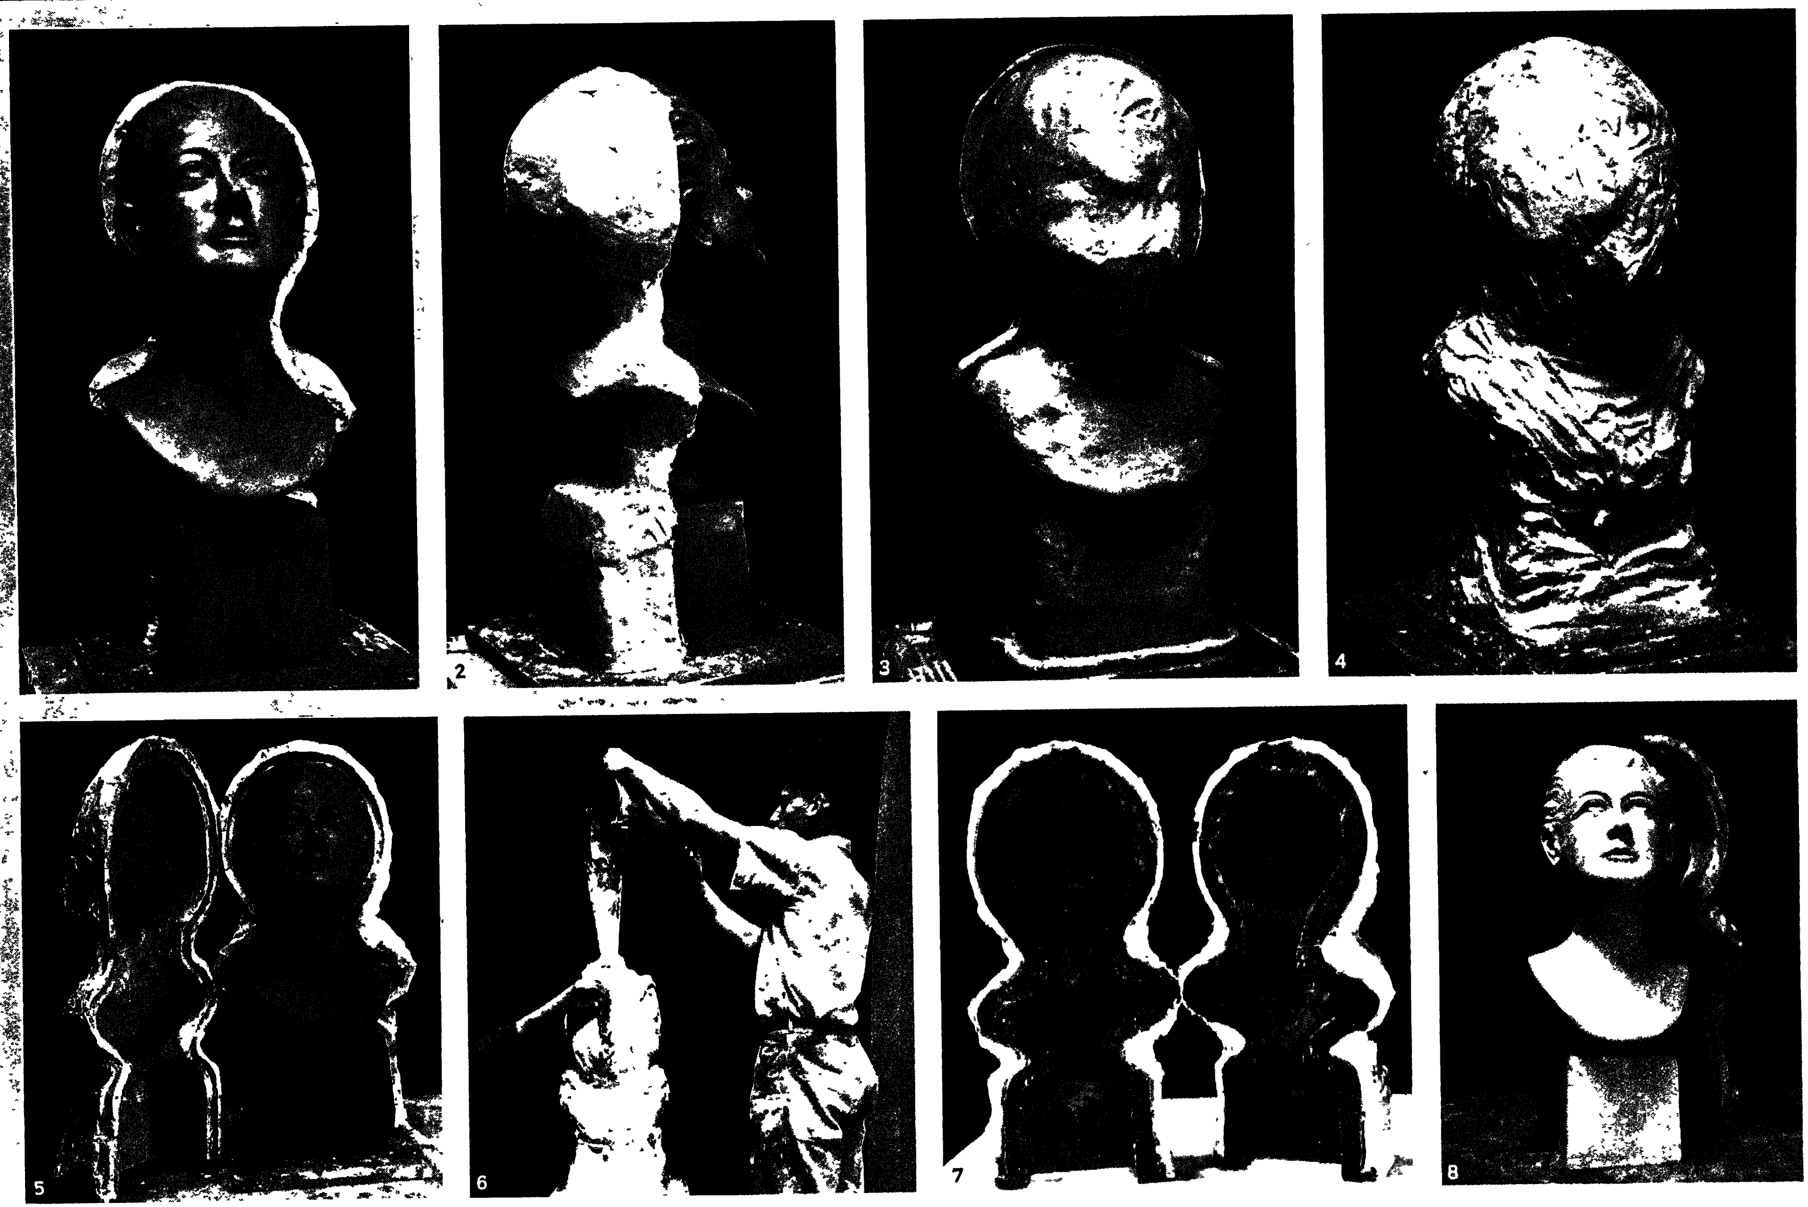
Patina, strictly defined, is an artistic product of the corrosion of copper or copper-rich alloys, notably the bronzes. It is an "incrustation which forms on bronze after a certain amount of exposure to the weather, or after burial beneath the ground. When perfectly developed it is of a dark green colour and has nearly the composition of the mineral malachite, a hydrated carbonate of copper." In the broader interpretation of the term, patina includes mineral or mineral-like coatings or deposits on metal objects of art of a large variety of shades—greens, blues, reds, greys, blacks, etc.—the deposits having been produced by either natural or artificial means.

In this article we are primarily concerned with the patina formed on bronzes, the *verde anticho* or verdigris, the usual constituent being the basic carbonates of copper, malachite and azurite. At times the patina will be distinctly red (cuprous oxide); at other times we will find it to be greyish green and frequently, as is the case with many Chinese and Japanese bronzes, it is almost black, resembling polished ebony.

A good patina of the proper composition and texture serves a double purpose. It enhances the beauty of the bronze object and secondly it protects and preserves the bronze from destruction by the very agents, such as carbonic acid, so necessary to form the patina. The second purpose of the patina, therefore, is like that of a permanent coat of protective paint.

Artistic Qualities.—Most patinas are green or greenish blue. The grey patinas are usually due to a predominance of tin oxide or lead carbonate in the crust. The black patinas are usually found on bronzes containing appreciable quantities of lead. However, there are many different intermediate shades of patina; likewise there are many different textures. The main factors that influence the shade and texture of the patina are (1) the chemical composition of the bronze; (2) the metallographic structure of the bronze, whether fine or coarse grained, presence or absence of intercrystalline impurities, etc.; (3) the location in which the bronze has remained before its discovery; and (4) the time or duration the bronze has remained in the particular location. Thus, for example, some of the finest greens are found on bronzes of pure tin-copper alloys and on objects that were fashioned of native copper. The addition of zinc and lead to the bronze darkens the shades very appreciably. A fine grained crystalline structure of the bronze favours a uniform fine textured patina. As regards location, absence of moisture and salts usually results in the characteristic bronze brown. Presence of sulphur compounds in the air to which the bronze is exposed, as for example in the path of the winds passing over active volcanoes, gives rise to very dark almost black shades of patina. Slow oxidation in alkaline soils but in the absence of carbonic acid will produce the comparatively rare red (cuprous oxide) patina. A short time in a moist salty location will produce a heavier or thicker patina than a comparatively long exposure in an almost dry location.

Durability.—Apart from the artistic quality, a patina must be durable. The major constituent of the bronzes is copper and it is primarily upon the permanency or lasting qualities of the copper compounds entering into the composition of the patina, that the formation and life of the patina depend. The permanency of the various copper compounds that come under consideration can best be judged by ascertaining the behaviour of these compounds in the crust and on the surface of the earth where they have been exposed to various corroding or disintegrating influences for millions of years as a rule.



BY COURTESY OF THE ETTL STUDIOS

THE GELATINE MOULD PROCESS OF CASTING

1. Model partly covered by clay filler. 2. Model partly covered by clay filler, seen from the side. 3. First step completed, entire model covered with clay filler. Ridge dividing front from back provides additional thickness where casing will be cut. 4. Plaster casing laid over clay filler, casing to be divided into halves where extra thickness of clay projects part way through it. 5. Front half of casing removed and clay filler cleaned out. 6. Gelatine being poured into casing after all of clay filler has been removed and the casing has been replaced around the model. Clay is placed over the vents which permit the air to escape as the level of the gelatine reaches them. 7. Finished mould with the clay model removed. 8. Finished plaster cast with front half of mould removed

Native or metallic copper occurs in Michigan, Australia and elsewhere and has been thus preserved through the ages due to the absence of corroding influences such as acidulated waters. By far the greater proportion of copper found in the crust of the earth occurs as the sulphide either alone, as chalcocite and covellite, or, more commonly, in association with other sulphides, as chalcopyrite, bornite and others. These sulphides are, however, only permanent "at depth," in the lower strata, away from corroding influences. In the upper strata where the minerals have come into contact with rain water or with moist air containing carbonic acid, the sulphides have been transformed into the more stable malachite. The very large copper deposits of the Belgian Congo are a good example of such occurrence of sulphides in the lower layers and carbonate or malachite in the upper.

Other minerals of copper that are met with in patinas are the basic chloride, atacamite, the basic sulphates, such as brochantite, the blue carbonate, azurite, and cuprite, the red cuprous oxide. All of these minerals when exposed to moist atmosphere decompose and turn into malachite. Among the valuable bronze collections, we do meet with examples of patina composed wholly or in part of one or more of these unstable compounds, *i.e.*, unstable in climates such as those of London, New York or Paris. Thus, there are a large number of instances on record where a natural blue patina (azurite) has been preserved for years by taking proper precautions. On the other hand, collectors have often lamented that a patina originally of a very attractive blue was gradually changing into a green (malachite) patina. The red copper oxide patina is highly prized. The large bronze cat, of Egyptian origin, on exhibit at the Metropolitan Museum of Art (New York) has large irregular patches of this beautiful red patina. By suitable protective measures the transition into the carbonate, malachite, can be very much retarded.

Particular attention should be paid to the basic chloride of copper, atacamite, of frequent occurrence in Egyptian bronze patinas. This chloride is perfectly stable in an absolutely dry atmosphere such as is met with in the sealed tombs of Egypt. However, as soon as this chloride-bearing patina is brought into contact with moist air not only is the transformation into malachite very rapid—very often within but a few weeks—but the chloride in presence of moisture and carbonic acid rapidly corrodes the entire bronze. A chloride, such as copper chloride, sodium chloride or ammonium chloride, is a very dangerous constituent of the patina and is one of the most active agents giving rise to the dreaded bronze "disease."

The presence of chlorides in the soil in which a bronze object lies buried will greatly hasten the formation of a patina. However, the rapid growth of a patina brings about a poor, loose structure of little or no permanence. The characteristics of the best or "noble" patina are a very slow formation, compact, solid texture, gradual transition from metal through oxide to carbonate, the malachite of fine crystalline structure, the hair line fissures of the bronze directly under the patina tightly packed with oxide or carbonate, and a smooth almost enamel-like surface free from warts and nodules.

Artificial Patinas.—The production of artificial patinas has been practised since time immemorial. Unfortunately, however, nearly every one of the hundreds of formulas prescribed involves the use of sal ammoniac or some other chloride—one of the most destructive compounds to introduce into a patina. Chlorides are very treacherous and should never be resorted to in spite of their "convenient and rapid action." Years of experimentation and testing have led us to condemn all procedures involving the use of chlorides or other strong salts. It is to be borne in mind that the ultimate compound of lasting quality which is sought after is the green basic carbonate compound of copper. The final patina produced must be free of all mineral acids such as muriatic, sulphuric or nitric since these acids will cause a rapid destruction of the entire body of the bronze.

Eliminating the mineral acids and substituting the organic acids, such as acetic, oxalic, citric and carbonic, we can produce coatings of great permanence. The artistic effects brought about are dependent primarily upon the method and means of procedure. Applying a solution of any one of these organic acids to the surface of the bronze by means of a brush seldom brings about a pleasing or attractive patina. Usually streaky deposits result. The point to bear in mind is to imitate the natural formation of the patina as closely as possible. We recommend the following procedure.

The bronze, whose surface has been carefully cleaned (*see* BRONZE) so as to expose the virgin metal or only a thin film of oxide, is placed in a gassing chamber. This chamber must be large enough so as to prevent the bronze from coming into contact with the walls. The chamber is closed on all sides, preferably hermetically sealed. The "gas" is derived from a dish of strong acetic acid situated at the bottom of the chamber. Moistening the surface of the bronze before introducing it into the chamber will hasten the formation of the copper acetate on the surface. The time of exposure is usually three to four days at room temperature. Then follows a gassing in ammonia fumes, using the same chamber and substituting a dish of aqua ammonia, concentrated, for the acetic acid. Then the third gassing is with carbonic acid taken from a cylinder. The procedure is repeated in the same rotation if a comparatively thick patina is desired. Irregular patches of blues and greens and bluish greens are produced, strikingly similar to those met with in nature. The bronze is then carefully and very slowly dried in an oven which is gradually heated up to 232° F allowing 12 to 24 hours to attain this temperature, depending upon the thickness of the patina; the thicker the patina the slower the heating.

Finally, the bronze is sprayed with a dilute solution of bees-wax in benzol and after 10 to 15 hours' drying in the air is carefully rubbed with a soft dry cloth. Lacquers are not as desirable as the bees-wax as most are not durable and fail to bring out the desired artistic effects characteristic of bees-wax. Since bees-wax is at times bleached with chlorine, the unbleached wax is to be specified.

To produce the red patina (cuprous oxide) gassing alternately in ammonia and iodine vapours may be used. We find, however, that the action is comparatively slow and quicker results are obtained by submerging the entire bronze in a suspension of precipitated chalk in water to which has been added 2 to 3% of iodine as tincture of iodine The bronze remains submerged for a period of three to eight days, depending upon the depth of colour desired. It is then dried and finished as above. The slower the patinating the more artistic the results is a good general rule to follow. (C. G. F.)

SCURVY (*Scorbutus*), a "deficiency" disease, characterized by debility, blood changes, spongy gums and haemorrhages in the tissues of the body. In former times this disease was common and very fatal among sailors. Scurvy has also frequently broken out among soldiers on campaign, in beleaguered cities, among communities in times of scarcity, and in prisons, workhouses and other public institutions. It was early recognized that scurvy and diet were connected. It is now known that the cause is deficiency of vitamin C in the food (*see* VITAMINS). This explains the occurrence of scurvy when fresh vegetables or fruit are unobtainable and its disappearance when they are administered, for these substances are rich in vitamin C.

The symptoms come on gradually with failure of strength, most manifest on making effort, and a corresponding mental depression. Then follow sallow complexion, sunken eyes, tender gums and muscular pains. This may continue for weeks, gradually getting worse, teeth fall out and haemorrhages, often of large size, penetrate muscles and other tissues. Peculiar disorders of vision have been noticed, particularly night-blindness (nyctalopia), but they are not invariably present, nor specially characteristic of the disease. The further progress of the malady is marked by profound exhaustion, with a tendency to syncope and various complications, such as diarrhoea and pulmonary or kidney troubles, any of which may bring about death. On the other hand, even in desperate cases, recovery may be hopefully anticipated when the deficient vitamin is supplied. No disease is more amenable to treatment both as regards prevention and cure than scurvy, the single remedy of fresh vegetables or some equiv-

alent securing both these ends. Potatoes, cabbages, onions, carrots, turnips, etc., and most fresh fruits, will be found of the greatest service for this purpose. Lime juice and lemon juice are recognized as equally efficacious. The regulated administration of lime juice in the British navy, which was begun in 1795, had the effect of virtually extinguishing scurvy in the service, while similar regulations introduced by the British Board of Trade in 1865 had a like beneficial result as regards the mercantile marine. It is only when these regulations have not been fully carried out, or when the supply of lime juice has become exhausted, that scurvy among sailors has been noticed in recent times.

Infantile Scurvy (*Scurvy Rickets, Barlow's disease*), a disease of childhood due to a morbid condition of the blood and tissues from defects of diet, was first observed in England in 1876 by Sir T. Smith, and later fully investigated by Sir Thomas Barlow. The chief symptoms are great and progressive anaemia, mental apathy, spongy gums, haemorrhages into various structures, particularly under the periosteum and muscles, with suggestive thickenings round the shafts of the long bones, producing a state of pseudo-paralysis.

SCUTAGE or **ESCUAGE,** the pecuniary commutation, under the feudal system, of the military service due from the holder of a knight's fee. The name is derived from his shield (*scutum*). The term is sometimes loosely applied to other pecuniary levies on the basis of the knight's fee. It used to be supposed that scutage was first introduced in 1156 or on the occasion of Henry II.'s expedition against Toulouse in 1159; but it is now recognized that the institution existed under Henry I., when it occurs as *scutagium, scuagium* or *escuagium.* Its introduction was probably hastened by the creation of fractions of knights' fees, the holders of which could only discharge their obligation in this fashion. The increasing use of mercenaries in the 12th century would also make a money payment of greater use to the crown. Levies of scutage were distinguished by the names of the campaigns for which they were raised, as "the scutage of Toulouse" (or "great scutage"), "the scutage of Ireland" and so forth. The amount demanded from the fee was a marc (13s.4d.), a pound, or two marcs, but anything above a pound was deemed abnormal till John's reign, when levies of two marcs were made without even the excuse of a war. The irritation caused by these exactions reached a climax in 1214, when three marcs were demanded, and this was prominent among the causes that led the barons to insist on the Great Charter (1215). By its provisions the crown was prohibited from levying any scutage save by "the common counsel of our realm." In the reissue of the Charter in 1217 it was provided, instead of this, that scutages should be levied as they had been under Henry II. In practice, however, under Henry III., scutages were usually of three marcs; but the assent of the barons was deemed requisite, and they were only levied on adequate occasions.

Meanwhile, a practice had arisen, as early as Richard I.'s reign, of accepting from great barons special "fines" for permission not to serve in a campaign. This practice appears to have been based on the crown's right to decide whether personal service should be exacted or scutage accepted in lieu of it. A system of special composition thus arose which largely replaced the old one of scutage. As between the tenants-in-chief, however, and their under-tenants, the payment of scutage continued and was often stereotyped by the terms of charters of subinfeudation, which specified the quota of scutage due rather than the proportion of a knight's fee granted. For the purpose of recouping themselves by levying from their under-tenants, the tenants-in-chief received from the crown writs *de scutagio habendo.* Under Edward I. the new system was so completely developed that the six levies of the reign, each as high as two pounds on the fee, applied only in practice to the under-tenants, their lords compounding with the crown by the payment of large sums, though their nominal assessment, somewhat mysteriously, became much lower (*see* KNIGHT SERVICE). Scutage was rapidly becoming obsolescent as a source of revenue, Edward II. and Edward III. only imposing one levy each and relying on other modes of taxation, more uniform and direct. Its rapid decay was also hastened by the lengths to which subinfeudation had been carried, which led to constant dispute and litigation as to which of the holders in the descending chain of tenure was liable for the payment. Apart from its financial aspect it had possessed a legal importance as the test, according to Bracton, of tenure by knight service, its payment, on however small a scale, proving the tenure to be "military" with all the consequences involved.

BIBLIOGRAPHY.—The best monograph on the subject (though not wholly free from error) is J. F. Baldwin's *The Scutage and Knight Service in England* (1897). The view now held was first set forth by J. H. Round in *Feudal England* (1895). In 1896 appeared the *Red Book of the Exchequer* (Rolls series), which, with the *Testa de Nevill* (Record Commission, re-edited as *Book of Fees,* Stationery Office 1920, 1923) and the Pipe Rolls (Record Commission and Pipe Roll Society), is the chief record authority on the subject; but many of the scutages are wrongly dated by the editor, whose conclusions were severely criticized by J. H. Round in his *Studies on the Red Book of the Exchequer* (privately issued) and his *Commune of London and other Studies* (1899). Pollock and Maitland's *History of English Law* (1895) should be consulted. McKechnie's *Magna Carta* (1905) is of value; and Scargill Bird's "Scutage and Marshal's Rolls" in *Genealogist* (1884), vol. i., is important for the later records. (J. H. R.)

SCUTARI (Albanian, SKODRA), a town of Albania. Pop. (1924) about 27,000, of whom 54% are Roman Catholics, 38% Muslims, and 8% Orthodox. Scutari lies in a plain surrounded by lofty mountains, except where it adjoins the lake. Malaria is prevalent in summer as the town is very liable to flooding, especially since the close of the 19th century, when the Drin was deflected at its junction with the Boyana. The mosques and the bazaar, lately much damaged by fire, give the town an oriental appearance, but the finest buildings are Italian, viz., the Roman Catholic cathedral, and an old Venetian citadel on a high crag. The fortress was recently almost destroyed in a storm, the pasha having fixed a brass spike to the tower containing the powder magazine. Scutari is the seat of a Roman Catholic archbishop and has a Jesuit college and seminary. Trade tends to decline and to be diverted to Salonika and other ports connected with the main European railways. A light railway was built by the Austrians from Scutari to the Voyusa during the World War and the roads were much improved during the occupation by the Great Powers after the Balkan Wars (1912–13). Grain, wool, hides, skins, tobacco, sumach, and draught horses are exported, and also large quantities of a kind of sardine called scoranza (Albanian, *seraga*) caught in the Boyana. Cotton stuffs are manufactured, and Scutari is the centre of the inlaid metal work for weapons. There are copper mines worked by an English company, and a small saltpetre factory. Textiles, metals, provisions and hardware are imported. The Imperial Ottoman bank was closed in 1915.

The Boyana is navigable for small vessels for 12 m. from its mouth, and cargoes for Scutari are then transhipped into light river boats. In the flood season goods are taken in small steamers up the Drin from the port of San Giovanni di Medua (Albanian, *Shin Ghen*), or landed at Alessio (Albanian, *Lesh*), the market and port of the Mirdite country, and conveyed thence in small vessels to Scutari. Steamers ply on Lake Scutari to and from Rijeka in Montenegro, but when the water is low, it is necessary to row out to them.

Livy relates that Škodra was chosen as his capital by the Illyrian king Gentius, who was besieged here and carried captive to Rome in 168 B.C. In the 7th century the town fell into the hands of the Serbians, but after the death of Stephen Dushan in 1355, the Balsha family, of Norman extraction, held part of Albania, with Scutari as their capital until 1394, when they sold the town to Venice. In the 15th century it became a stronghold of Skanderbeg's (*q.v.*), but on his death in 1467 reverted to the Venetians, who were, however, driven out by the Turks in 1479. In 1760 Mahomet of Bushat, pasha of Scutari, made himself an independent prince in all but name, and secured the hereditary pashalik for his family, the last of whom, Mustafa, was deposed by the Sultan in 1831. Scutari was wrested from the Turks by the Montenegrins in the Balkan Wars (1912–13) but was surrendered to an international force in the latter year and incorporated into the kingdom of Albania.

Lake Scutari, lying 20 ft. above sea level, and 135 sq.m. in extent, is almost bisected by the line of the Montenegrin frontier.

It occupies one of the depressions known as *polyes,* which are common throughout the Illyrian Karst region, and though its average depth is only 23 ft., there are a series of holes near the south-west extremity, one of which is 144 ft. deep. The Moratcha enters the lake near the Montenegrin port of Plavnitza, while the Boyana issues from its south-west extremity and flows into the Adriatic. The lake abounds in aquatic birds and fish; its brilliantly clear green waters, and its setting of rugged, many-hued mountains, render it one of the most beautiful lakes in Europe.

SCUTARI (skōō'tăh-rĭ) (anc. *Chrysopolis*), a town of Turkey in Asia, on the east shore of the Bosporus, opposite Constantinople of which it forms the 9th Cercle Municipale. Its painted wooden houses and white minarets piled upon the slopes of the shore and backed by the cypresses of the great cemetery farther inland present a very picturesque appearance from the sea. The town contains eight mosques, one of them, the Valideh Jami, built in 1547, of considerable beauty. Other remarkable buildings are the vast barracks of Selim III. and a hospital used during the Crimean War. (*See* NIGHTINGALE, FLORENCE.) The chief industry of Scutari is the manufacture of silk, muslin and cotton stuffs. The population (1927) was 155,092. The most striking feature of Scutari is its immense cemetery, the largest and most beautiful of all the cemeteries in and around Constantinople; it extends over more than 3 m. of undulating plain behind the town. Between Scutari and Haidar Pasha the British army lay encamped during the Crimean War, and in a cemetery on the Bosporus are buried the 8,000 British who died in hospital. At Haidar Pasha is the terminus of the Anatolian Railway. Chrysopolis ("Golden City"), the ancient name of Scutari, most probably has reference to the fact that there the Persian tribute was collected, as at a later date the Athenians levied there a tenth on the ships passing from the Euxine. Scutari was formerly the post station for Asiatic couriers (*Uskudar*=courier), and also, until the introduction of steam, the terminus of the caravan routes from Syria and Asia.

SCUTTLE, a term formerly applied to a broad flat dish or platter; it represents the O. Eng. *scutel,* cognate with Ger. *Schüssel,* dish, derived from Lat. *scutella,* a square salver or tray, dim. of *scutra,* a platter, probably allied to *scutum,* the large oblong shield, as distinguished from the *clypeus,* the small round shield. The name survives in the coal-scuttle, styled "purdonium" in English auctioneers' catalogues, which now assumes various forms. "Scuttle" in this sense must be distinguished from the word meaning a small opening in the deck or side of a ship, either forming a hatchway or cut through the covering of the hatchway; from which to "scuttle" a ship means to cut a hole in the bottom so that she sinks. This word is an adaptation of O. Fr. *escoutille,* mod. *écoutille,* from Span. *escotilla,* dim. of *escoti,* a sloping cut in a garment about the neck. The Spanish word is cognate with Du. *schoot,* Ger. *Schoss,* lap, bosom, properly the flap or projecting edge of a garment about the neck, O. Eng. *sceat,* whence "sheet."

SCYLAX OF CARYANDA (in Caria), Greek historian, lived in the time of Darius Hystaspis (521–485 B.C.), who commissioned him to explore the course of the Indus. He started from Caspatyrus (Caspapyrus in Hecataeus; the site cannot be identified: see V. A. Smith, *Early Hist. of India,* 2nd ed., 1908, 34 note), and is said by Herodotus (iv. 44) to have reached the sea, whence he sailed west through the Indian Ocean to the Red Sea. Scylax wrote an account of his explorations, referred to by Aristotle (*Politics,* vii. 14), and probably also a history of the Carian hero Heracleides, prince of Mylasae, who distinguished himself in the revolt against Darius (Herodotus v. 121). This work is the earliest known Greek history which centred round the achievements of a single individual. Suidas (*s.v.*), who mentions the second work, confounds the older Scylax with a much later author, who wrote a refutation of the history of Polybius, and is presumably identical with Scylax of Halicarnassus, a statesman and astrologer, the friend of Panaetius spoken of by Cicero (*De div.* ii. 42). Neither of these, however, can be the author of the *Periplus* of the Mediterranean, which has come down to us under the name of Scylax of Caryanda. This work is little more than a sailor's handbook of places and distances all round the coast of the Mediterranean and its branches, and then along the outer Libyan coast as far as the Carthaginians traded. Internal evidence shows that it must have been written long after the time of Herodotus, about 350 B.C.

Editions by B. Fabricius (1878) and C. Müller in *Geographici Graeci minores,* i., where the subject is fully discussed; *see* also G. F. Unger, *Philologus,* xxxiii. (1874); B. G. Niebuhr, *Kleine Schriften,* i. (1828); and E. H. Bunbury, *History of Ancient Geography,* i.

SCYLLA AND CHARYBDIS. In Homer (*Od.* xii. 73, 235, 430) Scylla is a dreadful sea-monster, daughter of Crataeis, with six heads, twelve feet, and a voice like the yelp of a puppy. In later authors and in art she is a mermaid, with dogs' heads springing from her loins. She dwelt in a cave in a high rock, out of which she stuck her heads, fishing for marine creatures and snatching the seamen out of passing ships. Within a bowshot was another rock under which dwelt Charybdis, who thrice a day sucked in and thrice spouted out the sea water. Between these rocks Odysseus sailed, and Scylla snatched six men out of his ship. In later classical times Scylla and Charybdis, whose position is not defined by Homer, were localized in the Straits of Messina—Scylla on the Italian, Charybdis on the Sicilian side (Strabo, i. p. 24; vi. p. 268). The well-known line, *Incidis in Scyllam cupiens vitare Charybdim,* occurs in the *Alexandreis* of Gautier de Lille, a poet of the 12th century, but the metaphor is at least as old as S. Augustine, *In Iohan. evang. tract.* 36, 9. In Ovid (*Metam.* xiv. 1–74) Scylla appears as a beautiful maiden beloved by the sea-god Glaucus and other deities, and changed by the jealous Circe (or other rival) into a sea-monster. The legend was variously rationalized.

Another Scylla, sometimes identified with the sea-monster, was a daughter of Nisus (*q.v.*) king of Megara.

See the classical dictionaries, *s.vv.*

SCYMNUS of Chios, the name assigned to a Greek geographer of uncertain date, commonly taken to be the author of a fragmentary anonymous *Paraphrasis* in verse describing the northern coasts of the Mediterranean and the shores of the Black Sea, a work which in the first edition (Augsburg, 1600) was ascribed to Marcianus of Heraclea. Meineke showed that this piece cannot be by Scymnus. It is dedicated to a king Nicomedes, probably Nicomedes III. of Bithynia (91–76 B.C.), and so would date from the beginning of the 1st century B.C. Its most valuable portions relate to the Euxine regions and to the Hellenic colonies of those shores as well as of the coasts of Spain, Gaul and Italy.

See Meineke's edition (Berlin, 1846); C. Müller, *Geographi Graeci minores,* vol. i., where the poem is edited with sufficient prolegomena (pp. lxxiv.–lxxvii.); E. H. Bunbury, *Ancient Geography,* i. 99, 100, 102, 128, 183; ii. 26, 69–74.

SCYPHOMEDUSAE, a technical name for a class of jellyfish more usually known as Scyphozoa. Jellyfish do not all belong to the Scyphozoa, others being included in the groups known as Hydrozoa (*q.v.*) and Ctenophora (*q.v.*). *See* also COELENTERATA; SCYPHOZOA; HYDROZOA; CTENOPHORA.

SCYPHOZOA, a group of jellyfish belonging to that series of animals known as the Coelenterata (*q.v.*) whose general characteristics are described in a separate article, other groups of jellyfish being dealt with in the articles HYDROZOA and CTENOPHORA. The scyphozoan jellyfish differ from all others in their anatomical characters and, speaking generally, they are larger and more substantial than hydrozoan medusae. Some of them attain extremely large size, measuring as much as 7ft. across the bell; these are the largest known coelenterates.

From the point of view of the general study of the Coelenterata the main interest of the Scyphozoa lies in their life-history. The egg sometimes develops directly into a medusa, but in other cases there is a complicated life-history, which may be exemplified by the case of the *Aurelia* (figs. 1 and 2). *Aurelia* is one of the jellyfish most commonly stranded on British shores, and is a transparent medusa usually from 3 to 6in. across in these waters. It has a rather shallow bell tinged with mauve, becoming a darker colour at the sex-glands, which show through from the inside.

It swims by a rhythmic series of contractions of the bell. The fertilized egg of *Aurelia* develops, not into a miniature medusa, but into a *polyp* of distinctive structure known as a *scyphistoma*—a small trumpet-shaped creature with long marginal tentacles,

FIG. 1.—DIAGRAM OF A JELLYFISH (AURELIA)

Above, vertical section; below, view from below, showing oral arms, radial canals, marginal tentacles, and positions of sense-organs, sex-organs, and of the four pouches of the coelenteron; (C) coelenteron, (CC) circular canal, (EC) ectoderm, (EW) endoderm, (G) gonad, (GF) endodermal tentacle, (M) mouth, (PC) radial canal, (S) sub-genital pit, (T) marginal tentacle

which attaches itself by its aboral end to a foreign support (*see* COELENTERATA where its feeding mechanism is also described, and HYDROZOA). This polyp can produce rootlets (*stolons*), from which new polyps are budded, and can also give rise to new polyps in other ways. The scyphistoma is a perennial organism, and at a given time of year may undergo a remarkable change, which varies according to whether the supply of food has recently been scarce or plentiful. In the former case it differentiates from its upper end, a disc-like section of its tissues which in time becomes free and swims away. If the food has been plentiful, however, a whole succession of such sections will be formed, one above the other like a pile of saucers, so that most of the substance of the polyp becomes converted into such. The segments separate from the parent (which in its dividing condition is known as *strobila*) successively when sufficiently developed. Each of them is found on examination to constitute a small flattened medusa with eight long arms, and is termed an *ephyra*. It is quite unlike the adult *Aurelia* in shape even now, but assumes the fully developed con-

dition by degrees from this point onwards. Occasionally a segment of a strobila becomes a polyp instead of a medusa.

Such a life-history provides an interesting example of that type of polymorphism known as *alternation of generations*. (*See* COELENTERATA and HYDROZOA.) The permanent polyp-generation alternates regularly with a relatively transient medusa-generation, and the medusae alone are sexual and produce ova and sperma-

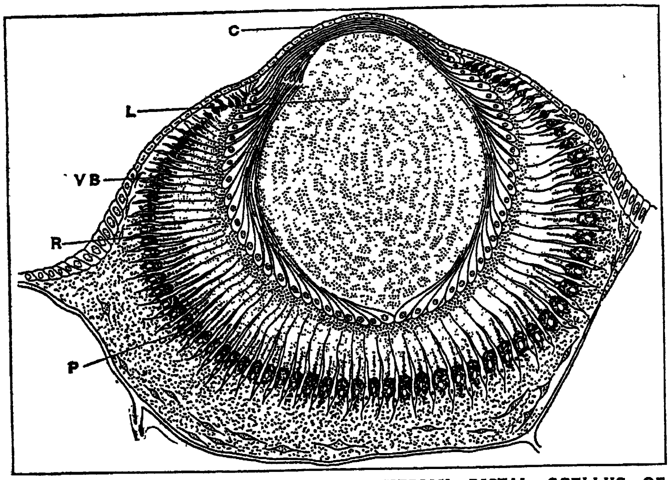

FIG. 3.—VERTICAL SECTION OF THE MEDIAN DISTAL OCELLUS OF CHARYBDAEA (ENLARGED); (C) CORNEA, (L) LENS, (R) RETINA, (V B) VITREOUS BODY, (P) PIGMENT

tozoa. The method by which the medusae are formed from the polyp, however, is a specialty of the Scyphozoa, and is quite unlike that adopted by the Hydrozoa.

The Scyphozoa constitute a large group of medusae of extremely varied and sometimes very elaborate structure. They possess in common, however, a number of features which distinguish them from the hydrozoan medusae, such as the absence of a *velum* (*see* HYDROZOA), and the presence, inside the coelenteron, of peculiar tentacles clothed by endoderm. The Scyphozoa are *cruciform* in their symmetry, that is to say, all their organs are symmetrically arranged with relation to four main radii placed at right angles to one another. Their sex-organs are endodermal. They possess well-developed sense-organs, these including not only hollow *tentaculocysts* of a distinctive nature (*see* also COELENTERATA and HYDROZOA), which occur in definite positions round the margin of the bell, but also *ocelli* or eye-spots, which attain, in the case of *Charybdaea,* an astonishingly high grade of development, possessing cornea, lens, retina, and vitreous mass, and recalling in outline the structure of a vertebrate eye (fig. 3). In certain jellyfish (Rhizostomae) a curious condition of the mouth has arisen. By basal fusion of the four long arms which depend in so many of these jellyfish from the corners of the mouth (fig. 1), the mouth itself is obliterated, and food is taken in through a multitude of pores in the surfaces of the arms, which open into canals leading to the stomach. Finally, in certain Scyphozoa (*e.g.*, *Haliclystus,* fig. 4) the animal is not a swimmer, but has a stalk by means of which it attaches itself to weed and other objects; and here the anatomy is distinctive and is rather intermediate between that of a polyp and that of a medusa.

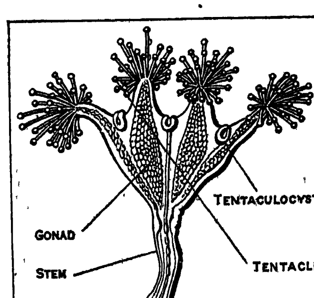

FIG. 4.—HALICLYSTUS AURICULA, A JELLY-FISH WITH A STEM AND 8 TUFTS OF KNOBBED TENTACLES

For general accounts *see* COELENTERATA bibl., and for recent lists of literature, W. Kükenthal, *Handbuch der Zoologie* (1923–25).

JELLY FISH

A medusa of the class *Scyphozoa*, genus *Chrysaora*, a common jellyfish of the North Sea

nect Scyros with him. Disguised there as a woman, in the palace of Lycomedes, to keep him back from the Trojan War, he was discovered by Odysseus, and accompanied him to Troy. Another legend deals with the conquest of Scyros by Achilles. It was taken by Philip II. and was under Macedonian rule till 196, when the Romans restored it to Athens. It was sacked by Goths, Heruli and Peucini, in A.D. 269. The ancient city was on a rocky peak, on the north-eastern coast, where is the modern town of St. George. A temple of Athena was on the shore near the town.

SCYTHIA, originally (*e.g.,* in Herodotus iv. 1–142) the country of the Scythae or the country over which the nomad Scythae were lords; that is, the steppe from the Carpathians to the Don. With the disappearance of the Scythae as an ethnic and political entity, the name of Scythia gives place in its original seat to that of Sarmatia, and is artificially applied by geographers, on the one hand, to the Dobrogea, the lesser Scythia of Strabo, where it remained in official use until Byzantine times; on the other, to the unknown regions of northern Asia, the eastern Scythia of Strabo, the "Scythia intra et extra Imaum" of Ptolemy; but throughout classical literature Scythia generally meant all regions to the north and north-east of the Black sea, and a Scythian (*Skuthēs*) any barbarian coming from those parts. Herodotus (*l.c.*) to whom, with Hippocrates, we owe our earliest knowledge of the land and its inhabitants, tries to confine the word Scyth to a certain race and its subjects, but even he seems to slip back into the wider use. Hence there is much doubt as to his exact meaning.

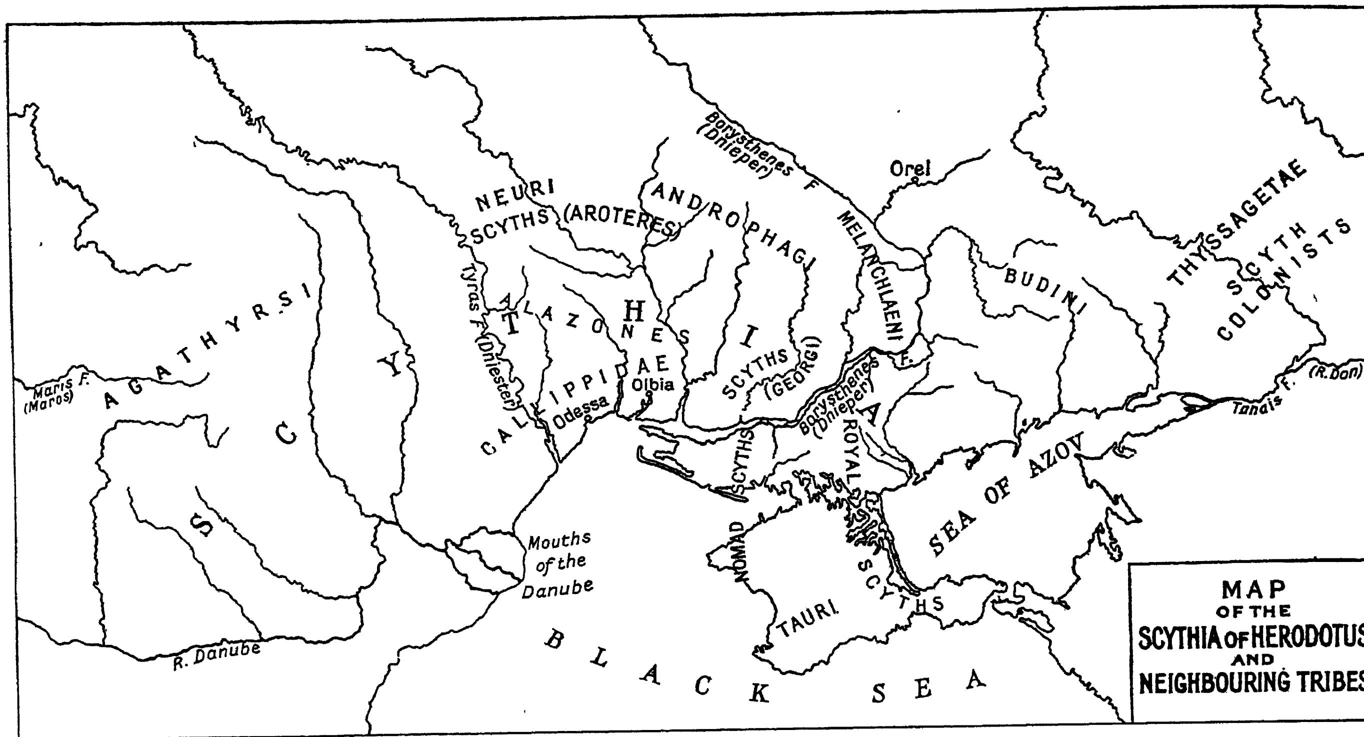
Geography.—Herodotus' account of Scythia falls into two irreconcilable parts: one (iv. 99 *et seq.*), in connection with the tale of the invasion of Darius, makes of Scythia a kind of chess board 4,000 stades square on which the combatants can make their moves quite unhindered by the great rivers; the other (16–20), founded on what he learned from Greeks of Olbia, and supplemented by the tales of the 7th-century traveller, Aristeas of Proconnesus, tallies more or less with the lie of the land. In accordance with this we can give the relative positions of the various tribes, and an excursus on the rivers (47–57) lets us define their actual seats. In western Scythia, starting from Olbia and going northwards, we have Callipidae on the lower Hypanis (Bug), Alazones (Ἀλαζῶνες) where the Tyras (Dniester) and Hypanis come near each other in their middle courses, and Arotēres ("Ploughmen") above them. These tribes raised wheat, presumably in the river valleys, and sold it for export; in the eastern half from west to east were Geōrgi (perhaps the same as Arotēres or perhaps garden cultivators not using the plough) between the Ingul and the Borysthenes (Dnieper), nomad Scyths and royal Scyths between the Borysthenes and the Tanais (Don). Behind all these stretched a row of non-Scythian tribes from west to east: on the Maris (Maros) in Transylvania the Agathyrsi (*q.v.*); Neuri in Podolia and Kiev; Androphagi and Melanchlaeni (*qq.v.*) in Poltava, Ryazan and Tambov. On the lower Don and Volga we have the Sauromatae, and on the middle course of the Volga the Budini (*q.v.*) with the great wooden town of Gelonus and its semi-Greek inhabitants. From this region started an important trade route eastward by the Thyssagetae (*q.v.*) among the southern Urals, the Iyrcae on the Tobol and Irtysh to the Kirgiz steppe, where dwelt other Scyths, regarded as colonists of those in Europe; then the traveller passed by the Argippaei in the Altai and the Issedones (*q.v.*) in the Tarim basin, to the one-eyed Arimaspi (*q.v.*) on the borders of China, who stole their gold from the watchful griffins, and who marched with goat-footed men and Hyperboreans reaching to the sea; but this is all guess work. To the south of Scythia the Crimean mountains were inhabited by a non-Scythic race, the Tauri (*q.v.*). The Sauromatae have generally been thought the same as the Sarmatae later found in their place, but Rostovtsev has raised serious difficulties.

Ethnology.—Herodotus divides the Scythians into the agriculturists (Callipidae, Alazones, Arotēres and Geōrgi) in the western part of the country, and the nomads with the royal Scyths to the east. The latter claimed dominion over all the rest. It is clear that we have to do with a mixed population called by foreigners after the ruling tribe. The evidence suggests that this tribe was itself of mixed blood. In the 2nd century A.D., when the steppes were dominated by the Sarmatae (*q.v.*), the majority of the barbarian names in the inscriptions of Olbia, Tanais and Panticapaeum were Iranian. We can infer that the Sarmatae spoke an Iranian language. Pliny speaks of their descent from the Medes. Now the Sauromatae are represented as half-caste Scyths speaking a corrupt variety of Scythian. Presumably, therefore, the Scyths also spoke an Iranian dialect. But of the Scyth words preserved by Herodotus some are Iranian; others, especially the names of deities, rather suggest a Ugrian origin. The Scyths may be regarded as a horde which came down from upper Asia and conquered Iranian-speaking people, perhaps in time adopting the speech of their subjects. The settled Scythians might be, in part, the remains of this Iranian population, or the different tribes of them may have been connected with their neighbours beyond Scythian dominion—Thracian Getae and Agathyrsi, Slavonic Neuri, Finnish Androphagi and such like. The Cimmerians (*q.v.*) who preceded the Scythians used Iranian proper names, and possibly represented this Iranian element in greater purity. Herodotus gives three legends of the origin of the Scyths (iv. 5–12); these, though they contradict each other, can be reconciled with the view stated above. The first two purport to describe the origin of a people termed Scoloti, who are said to be autochthonous and have Iranian names. Surely this is the national legend of the agricultural Scythians about Olbia, and the name Scoloti, by which modern writers have designated the royal Scyths, is the true designation of one subject race. The royal line of these is quite distinct from the true royal Scyths, who, like most nomad conquerors, allowed their subjects to preserve their own organizations.

According to the third account (which Herodotus prefers), the Scyths dwelt in Asia, and were forced by the Massagetae (*q.v.*) over the Araxes (Volga?) into the land of the Cimmerians. Aristeas says that the first impulse came from the Arimaspi, who displaced the Issedones, who in turn fell upon the Scyths. The Cimmerians appear to have given way in two directions, towards the south-west, where the tombs of their kings were shown on the Tyras (Dniester), and one body joined with the Treres of Thrace in invading Asia Minor by the Hellespont, and towards the south-east where another body threatened the Assyrians, who called them Gimirrai (Hebrew Gomer; Gen. xi.). They were followed by the Scyths (Ashguzai, Heb. *Ashkenaz*), whom the Assyrians welcomed as allies and used against the Cimmerians, against the Medes and even against Egypt. Hence the references to the Scyths in the Hebrew prophets (Jer. iv. 3, vi. 7). This is all put in the latter half of the 7th century B.C. Herodotus says that the Scyths ruled Media for 28 years, and were then massacred or expelled. The Assyrian evidence is in the main a confirmation of Herodotus.

Hippocrates says that the Scyths are quite unlike any other race of men, and very like each other. The main point seems to be a tendency to slackness, fatness and excess of humour. The men are in appearance very like eunuchs, and both sexes have a tendency to sexual indifference amounting in the men to impotence. When a man finds himself in this condition he assumes the woman's dress and habits. Herodotus (iv. 67) mentions the existence of this class, called Enarees (Ἐνάρεες), and says that they suffer from a sacred disease owing to the wrath of the goddess of Ascalon, whose shrine they had plundered. The whole account suggests a Tatar clan in the last stage of degeneracy.

The burial customs and some other institutions of the royal Scyths are certainly strongly reminiscent of those of the nomads of upper Asia. Distinctive weapons, such as a short sword that the Greeks termed ἀκινάκης, as opposed to the axes current in pre-Scythian times, are likewise oriental. Scythian art, however, may be related to a style best represented in north-eastern Europe. Yet even this art province may have extended very much farther east than it has yet been traced. The skulls dug up in Scythic graves throw no light on the question, some being round and some long. The representations of nomads on objects of Greek art show people with full beards and shaggy hair such as cannot be



reconciled with Hippocrates; but the only reliefs which seem to be accurate belong to a late date when the blood of the ruling clan was probably much mixed.

Customs.—Herodotus gives a good survey of the customs of the Scyths; it seems mostly to apply to the ruling race. They lived upon the produce of their herds of cattle and horses, their main food being the flesh of the latter, either cooked in a cauldron or made into a kind of haggis, and the milk of mares from which they made cheese and kumys (a fermented drink resembling buttermilk). They constantly moved in search of fresh pasture, spending the spring and autumn upon the open steppe, the winter and summer by the rivers for the sake of moisture and shelter. The men journeyed on horseback, the women in wagons with felt tilts. These were drawn by their cattle, and were the homes of each family. Hence the Greek epithets ἄβιοι (perhaps "of primitive life"), Ἱππημολγοί ("mare-milkers") and Ἁμαξόβιοι ("living in wagons"). The women were kept in subjection, unlike those of the Sauromatae (*q.v.*). Polygamy was practised, the son inheriting his father's wives. Both men and women avoided washing, but there was something of the nature of a vapour bath, with which Herodotus has confused a custom of using the smoke of hemp as a narcotic. The women daubed themselves with a kind of cosmetic paste. The dress of the men is well shown upon the Kul Oba and Chertomlyk vases, and upon other Greek works of art made for Scythic use. It must not be confused with the fanciful barbarian costumes that are so common upon the Attic pots. They wore coats confined by belts, trousers tucked into soft boots, and hoods or tall, pointed caps. The women had flowing robes, tall, pointed caps, and veils descending over most of the figure. Both sexes wore many stamped gold plates sewn upon their clothes in lines or semés. Their horses had severe bits, and were adorned with nose pieces, cheek pieces and saddle cloths. True stirrups were unknown. In war the nation was divided into three sub-kingdoms, and these into companies, each with its commander. The companies had yearly feasts, at which the commander honoured warriors who had slain one or more of the enemy. As evidence of such prowess, and as a token of his right to a share of any spoil, the warrior was accustomed to scalp his enemy and adorn his bridle with the trophy. In the case of a special enemy or an adversary overcome in a private dispute before the king, he would make a cup of the skull, mounting it in bull's hide or in gold. The tactics in war were the traditional nomad tactics of harassing the enemy on the march, constantly retreating before him and avoiding a general engagement. Their weapons were bows and arrows, short swords, spears and axes. The government was a despotism, but a king who aroused the extreme dissatisfaction of his subjects was liable to be murdered.

Religion.—The religion of the Scyths was nature worship. Herodotus (iv. 59) gives a list of their gods, with the Greek deities corresponding, but we cannot tell what aspect of the Greek deity is in question. He says they chiefly reverence *Tabiti* (Hestia), next *Papaios* and his wife *Api* (Zeus and Ge), then *Oitosuros* or *Goitosuros* (Apollo), and *Argimpasa* (Aphrodite Urania). These are common to all the Scythians, but Thamimasadas, or Thagimasadas (Poseidon) is peculiar to the royal Scyths[1]. They set up no images or altars or temples save to Ares only. To Ares they make a heap of faggots three stades square, with three sides steep and one inclined, and bring to it 150 fresh loads of faggots every year. Upon the top is set up a sword which is the image of Ares; to this they sacrifice captives, pouring their blood over it. The account of the cult of Ares, for whom no Scythian name is given, appears to be an addition, and the mention of such masses of faggots suggests the wooded district of the agricultural Scythians, not the treeless steppe of the royal tribe. The Scythian pantheon is not distinctive. The Scyths had a method of divination with sticks, and the Enarëes, who claimed to be soothsayers by grant of the goddess who had afflicted them, used another method by splitting bast fibres. They intervened in case of the king's falling sick, when it was assumed that some man had sworn by the king's hearth and broken his oath. If a man accused of this denied it, other diviners were called, and if these concurred, he was beheaded and his sons slain, and his goods given to the diviners. But if a majority of diviners decided against the accusers, the latter were set upon a wagon-load of brushwood and burned to death. The burial rites are the most fully described. Private persons were merely carried about among their friends, who held wakes in their honour, and then buried 40 days after. But the funerals of the kings were much more elaborate. They surrounded the dead man with everything in which he found pleasure during his life. The tombs of the kings were in the land of Gerrhus near the great bend of the Dnieper where the chief tumuli have been excavated. The body was embalmed and filled with aromatic herbs, and then brought to this region, passing through the lands of various tribes. The royal Scyths who fol-

[1]The names are read in various ways; it is impossible to establish the correct forms.

lowed the body were accustomed to cut about their faces and arms, and each tribe that the cortège met upon its way had to join it and conform to this expression of grief. Arrived at the place of burial, the body was set in a square pit with spears marking out its sides and a roof of matting. Then one of the king's concubines and his cupbearer, cook, groom, messenger and horses were strangled and laid by him, and round about offerings of all his goods and cups of gold—no silver or bronze. After this they raised a great mound, striving to make it as high as possible. A year later they strangled 50 youths of the dead man's servants (all Scyths born) and 50 of the best horses, stuffed them, and mounted them in a circle about the tomb.

Tombs.—The description is generally borne out by the evidence of the tombs opened in the Scythic area. None agrees on every point, but almost every detail finds a close parallel in some tomb or other. The chief divergence is in the presence of silver and copper objects, but making allowance for repeated robberies, the quantity of gold is stupendous and implies that the kings of Scythia controlled the inexhaustible stores of the Altai. To say that there was nothing but gold seems merely an exaggeration. Tombs to which the name Scythic is generally applied form a well-defined class. They are preceded over the whole area by a much simpler form of burial marked by the practice of staining the bones with red ochre. The grave-goods were just a few rough pots, implements of flint, stone or copper and rude ornaments of bone or copper. Yet that some were tombs of great chiefs is shown by the great size of the barrows heaped over them and the often elaborate burial chamber many contain. They have been referred to the Cimmerians, but this attribution is uncertain. The Scythic tombs can be roughly dated by the objects of Greek art that they contain. They seem to begin about the 7th century B.C., and to continue till the 2nd century. A different style of tomb, referred to the Sarmatians, begins in the East in the 5th century and gradually spreads westward. The finest of the Scythic class were opened about the bend of the Dnieper, where we should put the land Gerrhus. Others are found to the south-west of the central area, and in the governments of Kiev and Poltava we have many tombs with Scythic characteristics, but differences (*e.g.*, the fewness of the horses) which make us think of the settled tribes under Scythic domination. Others occur in the flat northern half of the Crimea, and even close to Kerch, where the famous Kul Oba seems to have held a Scythic chieftain who had adopted a veneer of Greek tastes but remained a barbarian at heart. East of the Maeotis, especially along the river Kuban, are many groups of barrows showing the same culture as those of Gerrhus but in a purer form. Very few of these barrows have come down to us unplundered, and we cannot find one complete example and take it as a type. Soon after they were heaped up, before the beams supporting the central chamber had rotted, thieves made a practice of driving a mine into the mound straight to where the valuables were deposited. It is perhaps by the collapse of such a mine and the crushing of the robber after he had thrown everything into confusion that the treasures of the Chertomlyk barrow, on the whole the most typical, were preserved to us. This was 60ft. high and 1,100ft. round; about it was a stone plinth, and it was approached by a kind of stone alley; a central shaft descended 35ft. 6in. below the surface of the earth, and from each corner of it at the bottom opened out side chambers; beyond the north-west chamber was a large irregular chamber. In the central pit all was in confusion, but here the king seems to have lain on a bier. His belongings, found piled up near the mine, included a *gorytos* (combined bow-case and quiver) and a sword sheath, each covered with plates of gold of Greek work, three swords with gold hilts, a hone with gold mounting, a whip, many other gold plates and a heap of arrow-heads. In the north-west chamber was a woman's skeleton, and she had her jewels, mostly of Greek work. She was attended by a man, and three other men were buried in the other chambers. They were supplied with simpler weapons and adornments, but even so their clothes had hundreds of stamped gold plates and strips of various shapes sewn on to them. By every skeleton were drinking vessels. A store of wine was contained in six amphorae, and in two bronze cauldrons were mutton-bones. The most wonderful object of all was a great two-handled vase standing 3ft. high and made to hold kumys. The greater part of its body is covered by a pattern of acanthus leaves, but on the shoulder is a frieze showing nomads breaking in wild mares, our chief authority for Scythian costume. To the west of the main shaft were three square pits with horses and their harness, and by them two pits with men's skeletons. In the heap itself was found an immense quantity of pieces of harness and what may be remains of a funeral car. The Greek work would seem to date the burial to the 3rd century B.C.

At Alexandropol and Solokha in the same district were equally elaborate tombs, the latter specially rich. Another tomb in this region, Melgunov's barrow, found in 1760, contained a dagger-sheath and pommel of Assyrian work and Greek things of the 6th century. In the Kul Oba tomb, mentioned above, the chamber was of stone and the contents, with one or two exceptions, of purely Greek workmanship, but the ideas underlying are the same —the king has his wife, his servant and his horse, his amphorae with wine, his cauldron with mutton-bones, his drinking vessels and his weapons, the latter being almost the only objects of barbarian style. One of the cups has a frieze with reliefs of natives supplementing that on the Chertomlyk vase.

East of the Maeotis on the Kuban we have many barrows; the most interesting are the groups called the Seven Brothers, and those of Karagodeuashkh, Kostromskaya, Ul and Kelermes, the latter remarkable for objects of Assyrian style, the others for the enormous slaughter of horses; on the Ul were 400 in one grave.

Art.—Certain of the objects which occur in these Scythic graves are of special forms typical for the Scythic area. Most interesting of these is the dagger or sword (*akinakēs*), always very short, save in the latest graves, and distinguished by a heart-shaped guard marking the juncture of hilt and blade; its sheath is also characteristic, having a triangular projection on one side and usually a separate tip; these peculiar forms were necessitated by a special way of hanging the dagger from two straps that it might not interfere with a rider's movements. Just the same form of short sword was used in Persia and is shown on the sculptures at Persepolis; the type is no doubt oriental in origin. Another special type is the bow-case (*gorytos*), made to take a short curved bow and to accommodate arrows as well. Further, there is the peculiar cauldron on one conical foot, round which the fire was built, the cylindrical hone pierced for suspension and the cup with a rounded bottom. Assyrian and afterwards Greek craftsmen working for Scythic employers were compelled to decorate these outlandish forms, which they did according to their own fashion; but there was also a vigorous native style that, more than anything else, expresses the distinctive individuality of the Scyths. The essence of Scythian art is the employment of animal figures—particularly elks, deer, bears, *felidae* and birds' heads—for the decorations of weapons, mirrors, pole-tops and horse-trappings. In every case the representation is severely subordinated to the decorative function it is to serve, and the figures are accommodated to the shape of the object to be adorned. Moreover, several motives are often blended together in a most fantastic way. Yet despite rigid stylization, the effect of this "animal style," as it is called, is to give an extraordinarily lifelike impression.

Though it uses oriental and even Greek motives, the roots of this queer compost of naturalism and stylization go right back to the carvings of palaeolithic hunters. Its immediate ancestry is to be sought in the naturalistic glyptic of the forest hunters of the so-called Arctic stone age who ranged along the border of tundra and forest from Norway eastward for an unknown distance into Siberia. In the latter region there sprang a parallel branch from the same trunk that, at the beginning of the iron age, is still very similar to the early Scythian.

In south Russia the animal style wilted under the influence of Greek culture, and, with the expansion of Sarmatians, became choked with Iranian monsters and overburdened with polychrome enamels. Yet through this medium it was transmitted to the Teutons at the time of their great migrations, and so to mediaeval Europe. On the other hand the reaction of Scytho-Siberian art can be traced to the borders of China at the beginning of our era,

and some carpets of that date, brought back by Kozlov from Mongolia, illustrate its application to textile decoration.

History.—The oldest inhabitants of Scythia were the Cimmerii; some of them were nomads, while others tilled some land in the river valleys and in the Crimea, where they left their name to ferries, earthworks and the Cimmerian Bosporus. (*See* Bosporus Cimmerius.) They were, perhaps, of Iranian race, though others regard them as Thracian. In the 7th century B.C. these Cimmerians were attacked and partly driven out by a horde of newcomers from upper Asia called Scythae; these imposed their name and their yoke upon all that were left in the Euxine steppes, but the basis of the population remained unaltered. Their tombs even occur in Bulgaria and Hungary. The new-comers brought with them new customs and a new artistic taste. About the same time similar peoples harassed the northern frontier of Iran, where they were called Saka (Sacae), and in later times Saka and Scyths, whether they were originally the same or not, were regarded as synonymous. It is difficult always to judge whether given information applies to the Sacae (*see* Saka) or the Scyths. Figures of Saka appear at Persepolis.

About 512 B.C. Darius Hystaspis (*q.v.*) undertook an invasion of Scythia which, according to Herodotus, he traversed as far as the Oarus (probably the Volga). He burned the town of Gelonus and returned to the Ister (Danube) in 60 days. In this march he was much harassed by the nomad tribes, with whom he could not come to close quarters. After losing many men, he found on his return that the Ionian Greeks were still guarding the bridge over the Ister in spite of the attempts of the Scyths to make them desert, and thus he safely re-entered his dominions. Ctesias, the Persian historian, says that the whole campaign only took 15 days and that Darius did not get beyond the Tyras (Dniester). This is also the view of Strabo. Ctesias admits, however, that the great king suffered heavy losses. The whole of Herodotus' account bristles with difficulties. A full discussion of these will be found in G. B. Grundy, *The Great Persian War* (1901) pp. 48–76. Grundy represents the expedition as a necessary strategical preliminary to the subjugation of European Greece, undertaken with the object of making sure that no large Greek communities should be left upon Darius' flank (*see* Graeco-Persian Wars). We may conclude that Darius made an attempt to secure the Danube frontier, suffered serious reverses and retired with loss.

The Greeks had been trading with the Scyths ever since their coming, and at Olbia there were many tales of their history. We can make a list of Scythian kings—Spargapeithes, Lycus, Gnurus, Saulius (whose brother, the famous Anacharsis [*q.v.*], travelled over all the world in search of wisdom, was reckoned a sage among the Greeks and was slain among his own people because they did not like his foreign ways), and Idanthyrsus, the high king at the time of Darius, probably the father of Ariapeithes. This latter had three wives—a Greek woman from Istrus, Opoea, a Scythian, and a Thracian, daughter to the great chief Teres. Scyles, his son by the Greek mother, affected Greek ways, had a house in Olbia, and even took part in Bacchic rites. When this came to the knowledge of his subjects he was murdered, and Octamasadas, his son by the third wife, reigned in his stead. Herodotus adduces this to show how much the Scyths hated foreign customs, but with the things found in the graves it rather proves how strong was the attraction exercised upon the nomads by the higher culture of their neighbours. Octamasadas died shortly before the time of Herodotus. We cannot place Ariantas, who made a kind of census of the nation by exacting an arrow-head from each warrior and cast a great cauldron out of the bronze, nor Taxacis and Scopasis, the under-kings in the time of Idanthyrsus. After the retreat of Darius the Scythians made a raid as far as Abydos, and even sent envoys to King Cleomenes I. of Sparta to arrange that they should attack the Persian empire from the Phasis while the Spartans marched up from Ephesus. Henceforward the Scyths appear as a declining power: by the middle of the 4th century their eastern neighbours, the Sarmatae, have crossed the Tanais (Don) and the pressure of the Scyths is felt on the Danube. Here Philip II. of Macedon defeated and slew their king Ateas in 339 B.C., and from this time on the representatives of the old Scythic power are petty chieftains in the western part of the country about Olbia, where they could still be dangerous, and about Tomi. Towards the second half of the 2nd century B.C. this kingdom seems to have become the nucleus of a great state under Scilurus, whose name appears on coins of Olbia, and who at the same time threatened Chersonesus in the Crimea. Here, however, he was opposed by the might of Mithridates VI. of Pontus and his power was broken, but some Scyths survived until the migration period. Meanwhile most of Scythia had become the land of the Sarmatae (*q.v.*). These were definitely Iranian; like the Scyths they were pressed towards the west by yet newer swarms, and with the coming of the Huns, Scythia enters upon a new cycle, though still keeping its old name in the Byzantine historians.

SCYTHOPOLIS: *see* Beisan.

SEA, a term used to describe that part of the earth's surface which consists of salt water in distinction from "dry land." Its major divisions, as contrasted with continents, are called oceans (*q.v.*). The scientific study of the sea in this sense is termed oceanography (*q.v.*). (*See* Sea Power; Surveying and Meteorology.)

SEABOARD AIR LINE RAILWAY COMPANY, known until 1915 as Seaboard Air Line Railway, was formed in 1901 through merger or consolidation of nine separately operated railroads, comprising approximately 1,162 m., running southward from Richmond, Va., through North Carolina, South Carolina and Georgia. In 1902, it acquired a line from Savannah, Ga., to Montgomery, Ala., with branches; and in 1903 a line from Savannah, Ga., to Jacksonville and Tampa, Fla., besides important branches. In 1915, it merged with certain other lines in North and South Carolina, and the name of the corporation was changed to the present title. Since the original consolidation, much new mileage has been acquired and constructed, the system in 1928 comprising approximately 4,500 m., running through or into the States of Virginia, North Carolina, South Carolina, Georgia, Alabama and Florida, and reaching the capitals and principal cities of these States. The Seaboard serves a rapidly developing agricultural and industrial territory and has become one of the principal trunk-line systems in the south-east. On Dec. 31, 1926, operating mileage was 4,032 m.; gross revenues for the year, $67,-024,000; on Dec. 31, 1927, capital stock outstanding amounted to $60,950,500; and unmatured funded debt $187,245,667. (R. L. N.)

SEABURY, SAMUEL (1729–1796), American Protestant Episcopal bishop, was born on Nov. 30, 1729, in Groton, Conn. He graduated at Yale in 1748; studied medicine at Edinburgh; became a catechist at Huntington; was ordained in 1753; was missionary in New Brunswick, N.J., in 1754–56; and rector in Jamaica, N.Y., in 1757–66, and of St. Peter's, Westchester, N.Y., in 1766–75. He was one of the signers of the White Plains protest of April 1775 against "all unlawful congresses and committees," in many other ways proved himself a devoted loyalist, and wrote the *Free Thoughts on the Proceedings of the Continental Congress* (1774) by "A. W. Farmer" (*i.e.*, a Westchester farmer), followed by *The Congress Canvassed* (1774). These "Farmer's Letters," which combined with the bluntness and plain speaking of the countryman, eloquence and knowledge of history, politics and constitutional law, created consternation among the radicals. The most notable of the answers they called forth was by Alexander Hamilton, *A Full Vindication of the Measures of the Congress, from the Calumnies of their Enemies.* To this Seabury

replied in *A View of the Controversy between Great Britain and her Colonies,* an acute and learned treatment of the whole controversy. When seeking episcopal consecration in England in 1783, Seabury also claimed a fourth unsigned pamphlet, *An Alarm to the Legislature of the Province of New York* (1775), which discussed the power of this, the only legal political body in the colony. On the suspicion that he was the author of the tracts, he was seized in his schoolroom, in Nov. 1775, by a mob of lawless Whigs and was kept in prison in Connecticut for six weeks; his parochial labours were broken up, and after some time in Long Island he took refuge in New York city, where he was appointed in 1778 chaplain to the king's American regiment. In March 1783, he was chosen their bishop by ten episcopal clergymen of Connecticut; as he could not take the British oath of allegiance, Seabury was shut out from consecration by the English bishops and he was consecrated by Scotch bishops at Aberdeen in Nov. 1784. The validity of his consecration was at first questioned by many but was recognized by the General Convention of his church in 1789. In 1790 he took charge of the diocese of Rhode Island also. He died in New London, Conn., on Feb. 25, 1796. He was a great organizer and a strict churchman as well as one of the ablest controversialists on the Tory side in the American Revolution.

SEA-COW, a term sometimes used for any member of the mammalian order Sirenia (*q.v.*), but properly restricted to Steller's sea-cow (*Rhytina*), a large animal, reaching a length of seven or eight metres, formerly inhabiting the Behring strait. It was killed in large numbers by the Russian sealers and whalers, and about 1868, less than 30 years after its discovery, became extinct. (*See* RHYTINA, SIRENIA, UNGULATA.)

SEA DAHLIA (*Coreopsis maritima* or *Leptosyne maritima*), a North American plant of the family Compositae, native to the coast of California and cultivated for its showy flowers. It is a stout fleshy perennial, about 2 ft. high, bearing much divided leaves and large flower-heads, about 3 in. across, encircled by bright yellow rays.

SEADIAH (or SAADIA; in Arabic Sa'id) **BEN JOSEPH** (892–942), was born in A.D. 892 at Dilaz in the Fayyum, whence he is often called al-Fayyūmī. Although he is justly regarded as the greatest figure in the literary and political history of mediaeval Judaism, nothing certain is known of his father or of his early life. Saadia's literary work appears at a time when learning seemed to be dead both in East and West. Since the completion of the Talmud very little of any literary importance, if we except certain midrashim, had been produced among the orthodox (Rabbanite) Jews, although the Babylonian schools at Sura and Pumbeditha continued to enjoy a somewhat intermittent prosperity. On the other hand, learning was cultivated among the Qaraites (q.v., *see* also HEBREW LITERATURE). In Saadia, however, the Rabbanites found a powerful champion. Almost his first work was an attack on the teaching of 'Anan, the founder of Qaraism, who lived in the 8th century. This, like most of Saadia's polemical writings, is no longer extant, but we can gather something of its contents from references in the author's other works, and from the statements of his opponents. The controversy turned largely on the calendar, which of course involved the dates of festivals, and, since the Rabbanite calendar had come down from ancient times, opened up the whole question of oral tradition and the authority of the Talmud. The conflict raged for many years, the chief representative of the other side being Solomon ben Yeruham, a virulent if not successful opponent. In 922 Ben Meir, a person of importance in Palestine, attempted to make alterations in the calendar, against the authority of the Babylonian schools. Saadia, who was then at Baghdad, warned him of his errors, refuted him in a work called *Sefer ha-Mō'adīm* (the Book of the Festivals), and finally procured his excommunication by David ben Zakkai, the exilarch or head of the Jewish community in Babylonia. The exilarch appointed Saadia as Gaon (president) of Sura, but within two years the exilarch, influenced by rival scholars, dismissed Saadia, while Saadia retorted by declaring the exilarch deposed (930). After three years of contention David succeeded in sufficiently bribing the new and needy Caliph (Qāhir, 932–934; *see* CALIPHATE), who definitely forbade Saadia to act as Gaon. The next four years, spent in retirement at Baghdad, were devoted to literary labours. Eventually a reconciliation was effected with David, favoured probably by the new Caliph Radi (934–940; *see* CALIPHATE), and Saadia was reinstated as Gaon of Sura in 938. Under his brief rule the school attained the highest reputation among the Jewish communities of East and West—but his health was broken and he died in 942.

Works.—Saadia's works were for the most part written in Arabic, the vernacular of the Jews in the East, so that after the break-up of the Babylonian schools in the middle of the 11th century, they would only be studied in Spain, the new centre of Jewish learning, and in Egypt. After the expulsion of the Jews from Spain, Arabic practically ceased to be used by them for literary purposes, and in the rest of Europe (except perhaps in S. Italy) it was never understood. Even some Hebrew works, of great interest to us now, must have been regarded at the time as of purely temporary value, such as, *e.g.*, the *Sefer ha-Mō 'adīm*, fragments of which have only recently been recovered in the Geniza at Cairo. The anti-Qaraite works against 'Anan, Ibn Sākawaihī and Ben Zūṭā, the *Kitāb at-tamyīz, Kitāb al-Shara'i, Kitāb al-'Ibbur* (calendar) and a book on anthropomorphisms, all in Arabic, are now lost and only known from quotations. So also are the refutation of the sceptic Ḥīvī of Balkh, and the *Sefer 'Orayōth* (on prohibited marriage, against Qaraites). Of the *Sefer ha-Mo-'adīm* and *Sefer ha-Galūī* (against David ben Zakkai), both in Hebrew, some fragments have been recovered recently.

Closely allied to his polemical writings are his *exegetical* works. He translated most of the Bible into Arabic, and commented on at least some of the books. The memorial edition[1] contains the (1) version of the Pentateuch (1893), (3) of Isaiah (1896), (5) of Job (1899), (6) of Proverbs (1894), the last three with commentary. The translation of the 5 Meghilloth, and of Daniel (with commentary), usually ascribed to Saadia, is not really by him, but a genuine translation of Daniel, with commentary, exists in manuscript. There is also ascribed to him a midrashic work on the Decalogue. These all, no doubt, exhibit the defects necessary to the time in which their author lived. But it must be remembered that Saadia was a pioneer. Ḥayyūj, the father of Hebrew grammar, was not yet born, nor had the scientific and comparative study of the language begun. In this respect Saadia contributed little to the subject. But both translations and commentaries are remarkable for their great learning, sound sense and an honest endeavour to arrive at the true meaning of the original. They were thus admirably suited for their purpose, which was, like the earlier Targums and the later work of Moses Mendelssohn, to render the sacred text more intelligible to the faithful generally and to check the growth of error.

The *grammatical* work called *Agron,* a sort of dictionary, is now lost, as are also the *Kutub al-Lughah* and perhaps other treatises on Hebrew grammar. The explanation of the 70 (really 90) hapaxlegomena in the Bible is still extant, and a poem on the number of letters in the Bible.

On *Talmudic* subjects again little is preserved beyond the *Kitāb al-Mawārith,* which was published as vol. ix. of the *Oeuvres complètes,* together with the short treatise in Hebrew on the 13 *Middōth* or canons of exegesis of R. Ishmael and some *Responsa* mostly in Hebrew. The translation of the Mishna, the introduction to the Talmud and other works of the kind are known only by repute.

Of the *Siddur* or arrangement of the liturgy by Saadia, a large part exists in a single manuscript at Oxford, and several fragments have been recovered from the Cairo Geniza. Numerous other liturgical poems, or parts of them, have been obtained from the same source, and several have been published in periodicals. His *Azharōth,* a poetical enumeration of the 613 precepts, in Hebrew, is included in vol. ix. of the *Oeuvres complètes.*

[1] *Oeuvres complètes de R. Saadia,* ed. by J. Derenbourg (Paris, 1893 ff.).

His *philosophical* works are (1) a commentary on the *Sefer Yeẓira,* a mystical treatise ascribed to the patriarch Abraham, which, as the foundation of the Kabbala, had great influence on Jewish thought, and was the subject of numerous commentaries; (2) the *Kitāb al-Amānāt w'al-I'tiqādāt* (*Book of Beliefs and Convictions*), written in 933, called, in the Hebrew translation by Judah ibn Tibbon, *Emūnōth we-Dē'ōth.* Its system is based on reason in conjunction with revelation, the two being not opposed, but mutually complementary. It is thus concerned, as the title implies, with the rational foundation of the faith, and deals with creation, the nature of God, revelation, free will, the soul, the future life and the doctrine of the Messiah. It shows a thorough knowledge of Aristotle, on whom much of the argument is based, and incidentally refutes the views of Christians, Muslims, Brahmans and sceptics such as Ḥīvī. From its nature, however, the work, although of great interest and value, never had the same wider influence as that of Ibn Gabirol (*q.v.*). The Arabic text was published by S. Landauer (Leiden, 1880), the Hebrew version at Constantinople in 1562 and frequently since.

SEA-ELEPHANT or **ELEPHANT-SEAL,** a genus (*Mirunga*) of seals, so named less on account of their large size than by reason of the presence of a flexible trunk or proboscis. There are two species. The Northern sea-elephant, *M. leoninus,* was formerly abundant on Juan Fernandez Island and thence northward to Lower California, but it is now very rare. The southern species, *M. patagonica,* is larger, males reaching a length of 21ft. This, too, is much reduced in numbers, but it inhabits the Falkland Islands, Kerguelen, and the Macquarie Islands and visits the Antarctic pack-ice. In both species the males are larger than the females. Sea-elephants yield valuable oil.

SEAFORD, an urban district and watering-place in the Eastbourne parliamentary division of Sussex, England, 58 m. S. by E. from London on a branch of the S.R. Pop. (1931) 6,570. In recent years there has been a considerable increase in the number of visitors. The climate is bracing, and the town is sheltered by high cliffs. There are golf links on the neighbouring downs. The church of St. Leonard is Norman of various dates, but received large additions in the Perpendicular period. In former days the river Ouse entered the English channel here, and the natural harbour so formed accounts for the origin of Seaford (Sefford, Safford, Seford), probably in Roman times, though it is not mentioned in Domesday. In the "Domesday of Cinque Ports" (which existed in the reign of Edward III., but was lost before 1728), it stood first among the members of Hastings, and was doubtless of considerable importance until about the end of the 14th century, when its rapid decline began owing to the constant alteration of the sea-coast and the decay of the harbour. In the 16th century the town was finally deserted by the Ouse, which now runs into the sea at Newhaven, 2 m. westward, and no revival of its prosperity occurred until the early 19th century, when it began to be frequented as a watering-place. Fishing has always been the chief industry.

SEAFORTH, EARL OF, a Scottish title held by the family of Mackenzie from 1623 to 1716, and from 1771 to 1781. The 5th earl, WILLIAM, joined the Jacobites in 1715, and then, having raised 3,000 men, was present at the battle of Sheriffmuir and was appointed lieutenant-general of the northern counties. He also took part in the Jacobite enterprise of 1719, being wounded at Glenshiel. In 1716 he was attainted and his titles and estates forfeited; before his death in January 1740, he had been relieved of some of the penalties of his treason, although his titles were not restored. His grandson KENNETH (*c.* 1744–1781) was created earl of Seaforth in 1771, but his peerage became extinct when he died in August 1781, although there were still heirs to the older earldom, which was under attainder. This earl raised the regiment of Highlanders, the 78th, known later as the 2nd battalion of the Seaforth Highlanders.

SEAHAM HARBOUR, a seaport and urban district in the Seaham parliamentary division of Durham, England, 6 m. S. of Sunderland by a branch of the L.N.E. railway. Pop. (1931) 19,394. The harbour was built (1828) in an uninhabited spot by the third marquis of Londonderry to facilitate the export of coal from the mines on his adjacent property. The harbour facilities were extended in 1905 and there is now a coal export of about 1,750,000 tons per annum. Besides the coal trade there are extensive bottle and chemical works. Much timber, including pit props, is imported.

SEA-HORSE (*Hippocampus*), the name for small marine fishes, in which, as in others of the pipe-fish family (Syngnathidae), the body is enclosed in bony rings, the small mouth is placed at the end of a tubiform snout, and the gills are lobate. Sea-horses, of which about 50 species are known from tropical and sub-tropical seas, are distinguished by having the head, which somewhat resembles that of a horse, set at an angle to the body and freely movable, and by the tapering tail, without caudal fin, which is prehensile and can be curled round the stem of sea-weeds, etc. They live in a vertical position, swimming by rapid undulations of the small dorsal and pectoral fins. The eggs are carried by the male in a pouch on the under-side of the tail, in which they are hatched. Their coloration, the tubercles and spines on the head and body, and the skinny flaps, tend to conceal these fishes among the weeds; the flaps are most developed in an allied genus (*Phyllopteryx*) from Australia.

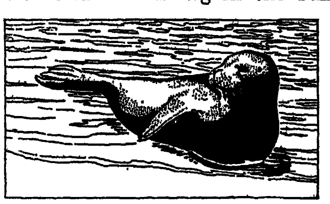
BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

SEA-HORSE (HIPPOCAMPUS)

SEA-KALE, *Crambe maritima,* a hardy perennial, a member of the family Cruciferae, which grows wild along the coasts of England, of Ireland and of the Scottish lowlands, along the western coasts of Europe, and on the Baltic, reappearing on the Black Sea. The cultivated form is extensively grown as a vegetable.

SEAL, the name applied to members of the family *Phocidae* of the suborder Pinnipedia of the Carnivora (*q.v.*) and sometimes even to all the Pinnipedia except the walrus.

Seals are all marine and swim and dive with ease. They feed on fish, crustacea, molluscs and even sea-birds and form the main food of the Eskimo, the killer whale and the polar bear. They are fond of basking in the sun on sandy beaches, rocks or ice-floes and resort to the land for breeding purposes, often in immense numbers. One young one is usually produced annually and many species are polygamous but do not form true "harems" except in the eared seals and sea-elephants (*q.v.*); the males fight fiercely for possession of the females. The young are taught to swim by their parents. When on land, the hind limbs take no part in the seal's progression. Seals are very inquisitive animals. The sense of smell is acute and the voice varies from a harsh bark to a plaintive bleat. The common seal (*Phoca vitulina*) is found on the coasts of the north Atlantic and north Pacific. In the female, the teeth are smaller than in the male. The grey seal (*Halichoerus grypus*) is larger, reaching a length of 8ft. It is confined to the north Atlantic and is rare on the American side, where it has never been seen south of Nova Scotia. It is the only seal which has its young late in autumn.



BY COURTESY OF THE ZOOLOGICAL SOCIETY, LONDON

THE COMMON SEAL (PHOCA VITULINA), A MARINE MAMMAL

See FUR-SEALS, SEAL-FISHERIES, SEA-ELEPHANT, SEA-LEOPARD, SEA-LION.

SEA LAWS, a title which came into use among writers on maritime law in the 16th century, and was applied by them to certain mediaeval collections of usages of the sea recognized as having the force of customary law, either by the judgments of a maritime court or by the resolutions of a congress of merchants and shipmasters. These mediaeval codes were preceded by the Rhodian sea law, a monument of Byzantine jurisprudence. Among the mediaeval sea laws the most important are the laws of Oléron, embodying the usages of the mariners of the Atlantic and the source of much of the English Maritime law; next the laws of Visby (Wisby).

The earliest collection of such usages received in England is described in the *Black Book of the Admiralty* as the "Laws of Oléron," whilst the earliest known text is contained in the *Liber Memorandorum* of the corporation of the City of London, preserved in the archives of their Guildhall. These laws are in an early handwriting of the 14th century, and the title prefixed to them is *La Charte d'Oleroun des juggementz de la mier.* How and in what manner these "Judgments of the Sea" came to be collected is not altogether certain. Cleirac, a learned advocate in the parlement of Bordeaux, in the introduction to his work on *Les Us et coustumes de la mer* (Bordeaux, 1647), states that Eleanor of Aquitaine (*q.v.*), having observed during her visit to the Holy Land that the collection of customs of the sea contained in *The Book of the Consulate of the Sea* (*see* CONSULATE OF THE SEA) was held in high repute in the Levant, directed on her return that a record should be made of the judgments of the maritime court of the island of Oléron (at that time a peculiar court of the duchy of Guienne), in order that they might serve as law amongst the mariners of the Western sea. He states further that Richard I. of England, on his return from the Holy Land, brought back with him a roll of those judgments, which he published in England and ordained to be observed as law. Though some writers doubt the story of Richard I. having brought back *La Leye Olyroun* to England, the general outline of Cleirac's account accords with a memorandum on the famous roll of 12 Edw. III., "De Superioritate Maris Angliae," for many years preserved in the archives of the Tower of London, now deposited in the Public Record Office. According to this memorandum, the king's justiciaries were instructed to declare and uphold the laws and statutes made by the kings of England, in order to maintain peace and justice amongst the people of every nation passing through the sea of England.

The earliest version of these Oléron sea laws comprised certain customs of the sea which were observed in the wine and the oil trade, as carried on between the ports of Guienne and those of Brittany, Normandy, England and Flanders. No English translation seems to have been made before the *Rutter of the Sea,* printed in London by Thomas Petyt in 1536, in which they are styled "the Lawes of ye Yle of Auleron and ye Judgementes of ye See." A Flemish text, however, appears to have been made in the latter part of the 14th century, the *Purple Book of Bruges,* preserved in the archives of Bruges, in a handwriting somewhat later than that of the *Liber Memorandorum.* Prefixed to this Flemish version is the title, "Dit es de Coppie van den Rollen van Oleron van den Vonnesse van der Zee." Certain changes, however, have been made in the *Purple Book of Bruges* in the names of the ports mentioned in the original Gascon text. For instance, Sluys is in several places substituted for Bordeaux, just as in the *Rutter of the Sea* London replaces Bordeaux. That these sea laws were administered in the Flemish maritime courts may be inferred from two facts. First, a Flemish translation of them was made for the use of the maritime tribunal of Damme, which was the chief Flemish entrepôt of the wine trade in the 13th century. The text of this translation has been published by Adriaen Verwer under the title of the *Judgments of Damme.* In the second place, there is preserved in the archives of the senate of Danzig, where there was a maritime court of old, an early manuscript of the 15th century, containing a Flemish reproduction of the Judgments of Oléron headed "Dit is Twater Recht in Vlaenderen." So far there can be no doubt that the Judgments of Oléron were received as sea laws in Flanders as well as in England in the 14th century. Further enquiry can trace them as they followed the course of the wine trade in the North sea and the Baltic sea. Boxhorn, in his *Chronyk van Zeelande,* has published a Dutch version of them, which van Leeuwen has reproduced in his *Batavia Illustrata,* under the title of the *Laws of West-Capell* in Zealand. Verwer has also published a Dutch text of them in his *Nederlant's See-Rechten,* accompanied by certain customs of Amsterdam, of which other mss. exist, in which those customs are described as usages of Stavoren, or as usages of Enkhuizen, both ports of active commerce in the 15th century.

A new and enlarged collection of sea laws, purporting to be an extract of the ancient laws of Oléron, made its appearance in the latter part of the 15th century in *Le Grant routier de la mer,* printed at Poitiers in France by Jan de Marnef, at the sign of the Pelican. The title-page is without a date, but the dedication, which purports to be addressed by its author, Pierre Garcie, *alias* Ferrande, to his godson, is dated from St. Gilles on the last day of May 1483. It contains 47 articles, of which the first 22 are identical with articles of the "Judgments of the Sea," in the *Liber Memorandorum,* the remaining articles being evidently of more recent origin. A black-letter edition of this work in French, without a date, is preserved in the Bodleian Library at Oxford, and to the last article this colophon is appended: "Ces choses précédentes sont extraictes du très utille et profittable Roolle Doloyron par le dict Pierre Garcie alias Ferrande." An English translation is printed in the appendix to *A View of the Admiral Jurisdiction,* published in 1661 by Dr. John Godolphin, in which the laws are described as "an Extract of the Ancient Laws of Oléron rendered into English out of Garsias alias Ferrand." This new text seems to have been superseded in a short time by Cleirac's *Us et coustumes de la mer,* to which was appended the following clause of authentication: "Tesmoin le Seel de l'Isle d'Oléron, estably aux contracts de la dite Isle, le jour du Mardy après la Feste Sainct André l'an mille deux cens soixant-six." Cleirac does not inform us from what source or under what circumstances he procured his text, nor on what authority he has adopted in certain articles readings at variance with those of Garcie, whilst he retains the same number of articles, to wit, 47. The clause of authentication cannot be accepted as a warranty above suspicion, as the identical clause of authentication with the same date is appended to the early Norman and Breton versions of the rolls, which contain only 26 articles. Cleirac's version, however, owing probably to the superior style in which it was edited, and to the importance of the other treatises on maritime matter which Cleirac had brought together for the first time in a single volume, seems to have obtained a preference in England over Garcie's text, as it was received in the High Court of Admiralty during the judgeship of Sir Leoline Jenkyns, and an English translation of it was introduced into the English translation of the *Black Book of the Admiralty* made by John Bedford, the deputy registrar of the High Court. It seems to have been Bedford's intention to print this translation under the title of "Sea Laws"; but the manuscript passed into the hands of Sir Leoline Jenkyns, who gave it to the College of Advocates in 1685. The Black Book itself, which was mislaid for a long time from the Admiralty Registry, was discovered in the 19th century and placed in the Record Office.

The parent stock of the Visby sea laws, which guided the mariners and merchants of the North sea and the Baltic, may have been a code preserved in the chancery of Lübeck, drawn up in the Old Saxon tongue, and dated 1240. On the other hand the Visby sea laws may have been a separate code drawn up at Visby. The fact of a resemblance between the two is not conclusive for all the mediaeval sea laws in general treated maritime questions, which were then of a simple nature, in much the same way.

No definite answer can be given to the question, How did this collection of sea laws acquire the title of the "Visby sea laws" outside the Baltic? Under this title they were received in Scotland in the 16th century, as may be inferred from extracts from them cited in Sir James Balfour's *System of the more Ancient Laws of Scotland,* which, although not printed till 1754, was com-

pleted before his death in 1583. The text of the Visby sea laws generally current in England is an English translation of a French text which Cleirac published in 1641 in his *Us et coustumes de la mer,* and is an abbreviated, and in many respects mutilated, version of the original sea laws. From a practical point of view the question is not of importance; the existence of this well known code is the matter of interest.

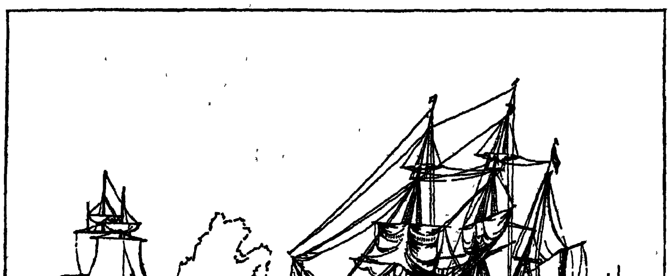
See Pardessus, *Collection de lois maritimes antérieures au XVIII.e siècle* (6 vols., 1828–45); Schlyter, "Wisby Stadslag och Sjörätt," being vol. viii. of the *Corpus Juris Sueco-Gotorum Antiqui* (Lund, 1853); *The Black Book of the Admiralty,* ed. by Sir Travers Twiss (4 vols., 1871–76); W. Ashburner, *The Rhodian Sea Law* (1909); W. S. Holdsworth, *History of English Law,* vol. i. (1922).

(T. T.; E. S. R.)

SEA-LEOPARD or **LEOPARD-SEAL** (*Stenorhynchus leptonyx*), a large seal (*q.v.*) inhabiting Antarctic regions and often reaching a length of 12ft. The variegated colours of the fur have given it its name. During the summer, the leopard-seal feeds largely on penguins (*q.v.*). It is an especial foe of the Adélie penguin; in the stomach of one killed by Levick (*Antarctic Penguins*) the remains of no fewer than 17 were found.

SEAL FISHERIES. The animals taken by sealers are members of several genera, but are alike in being gregarious in habit, and in producing their young on shore, at well defined seasons, at places which are revisited year after year. Their meat, hides, fur and blubber are of the greatest value to primitive peoples for food, for canoe making, light and heat—even the sinews are utilized as thread—and except in the Antarctic, have made them a quarry from time immemorial; but when sealing on a large scale became important as a commercial undertaking, their habits both dictated the chief methods employed and rendered them in the highest degree vulnerable. One species, the sea cow (*Rhytina stelleri*), indeed became extinct only some 20 years after its discovery, and in some regions the depletion of others led to a cessation of sealing. The first and usual method employed by sealers was to attack the herds both on the ice or, particularly, on the breeding grounds or "rookeries." In the pursuit of the fur seals of the Pacific (*Otaridae*) hunting in the open sea, or "pelagic" sealing was developed, and proved most wastefully destructive, owing to the frequency with which the dead seals sank before they could be taken into the boats; pelagic sealing, however, was first restricted by various regulations and ultimately prohibited.

Early Seal Fishing.—Seals, and particularly walruses or "morses" (*Trichechus rosmarus*), were taken in the north Atlantic,



THE WHALER "HARMONY," BUILT IN 1809, WHICH LATER BECAME A TRADER, FROM A COLOUR AQUATINT BY E. DUNCAN, AFTER W. J. HUGGINS

in the borders of the Arctic region, by whalers from the beginning of the northern whaling at the dawn of the 17th century, for their skins, blubber and tusks, the latter being a somewhat inferior ivory, and their teeth were bought also from natives. In the most prosperous days of northern whaling the whalers neglected seals, but in the latter part of the 19th century the whalers again were glad to include them in their catch. Meanwhile, sealing as a separate occupation had developed during the previous century. The skins were at that time of more value than at any later time. The chief species taken were the Greenland seal (*Phoca groenlandica*), hooded seal (*Cystophora cristata*), and bearded seal (*Erignathus barbatus*). The grey seal (*Halichoerus grypus*), and the common seal (*Phoca vitulina*), are not at present the subject of commercial exploitation, though the latter is killed by fishermen under the conviction, not at present too well founded, that it causes great depredations among the food species.

Atlantic sealing occurs in the spring and early summer, from Novaya Zemlyá to Newfoundland and Labrador. For the eastern grounds sealers sail chiefly from Norwegian ports, for the western from those of Newfoundland and the United States of America. They are not usually large vessels. It is probable that the western sealers may, in the future, be aided materially by the location of the herds by air craft. The young Greenland seals are born along the eastern grounds about the first half of March, and on the western grounds in the latter half of the same month. Some other seals keep somewhat the same season. The regulations made by most nations engaged in Atlantic-Arctic sealing are based on these facts. Newfoundland prohibits sealing before the middle of March, and all grounds as far east as Jan Mayen (and a little farther) are closed to European sealing nations until early April; further east the industry is the subject of Russo-Norwegian agreements. Atlantic-Arctic sealing is still a considerable industry, accounting annually for 600,000 or 700,000 seals.

The Fur Seal.—The fur seals (*Otaridae*) differ from those mentioned above in possessing a permanent under coating of short, soft fur, the "seal skin" of the costumier. They were opened to exploitation by the voyage of Bering in the Pacific-Arctic zone in 1741. Their migrations cover great areas, from the latitude of southern Japan on the west and from southern California in the east, to the great rookeries on Commander and Prybiloff islands respectively; late in the 19th century the latter held some $2\frac{1}{2}$ million seals, and the former over a million. Another rookery, on Robben island, in the Sea of Okhotsk, was of very minor importance. All these herds were greatly reduced, and by 1897 did not exceed 600,000 individuals in all.

The typical adult male or bull (*sikatch*) of the second group attains maturity about the seventh year, and weighs from 400 to 500 lb. It is 6 ft. in length, with a girth of $4\frac{1}{2}$ feet. The fur is blackish or dark brown, with long yellowish-white hairs, especially long and firm on the back of the neck, forming the so-called "wig" or mane. The animal stands erect and runs or "lollops" along the ground when on land. The adult female, or cow (*matka*), is much smaller, averaging about 80 lb. in weight, with length and girth in proportion. The fur is of varying shades of brown; she bears her first young at the age of three years. The breeding-grounds are boulder-strewn beaches or rocky hill slopes near the shore. On these the she-bears congregate in close-set masses called "rookeries." The unit of rookery life is the family group, or "harem," each bull collecting as many females as he can control. The number ranges from one to 100 or more, averaging about 30. The bulls reach the islands early in May and take up their places. The cows begin to arrive the first week in June. The number on the rookeries from day to day grows steadily to a climax about the middle of July, when about one-half are present, the number actually on the ground diminishing to about one-fourth at and after the close of the breeding season with the end of July. The single young, or pup (*kotik*), weighing 10 to 12 lb. and jet black in colour, is born within six to 48 hours after the arrival of the cow. Within a week the latter is served by the bull, and by the end of another week she goes to sea to feed, returning at gradually lengthening intervals through the summer to nourish her young, left in the meantime to care for itself on the rookeries. The bulls, having fasted since their arrival in May, go away in August to feed. The pups learn to swim at the age of a month or six weeks, and in November, with the approach of winter, swim away with their mothers to the south. The migration of the seals is said to keep fairly well to the 100 fathom line.

At first the catch averaged 75,000 per annum, but after about 1868 it increased rapidly, and from 1879 sailing vessels carrying numerous canoes were employed to attack the migrating seals,

which were thus deprived of their natural closed season; these vessels at one time exceeded 100 in number; some of them carried as many as 25 canoe crews. It has been estimated that by 1902 a million seals had been taken at sea, and, unfortunately, the breeding females were killed with the rest, to the great detriment of the recuperative powers of the stock. In the Bering sea pelagic sealing indeed well over half the catch was of this class. The greatest catch, however, was always on shore. From the Pribyloff and Commander herds nearly 2½ million were taken on land between 1868 and 1897.

Pelagic Sealing.—Fortunately, the conduct of the seals on land permit of the catch being made with the least possible attendant depletion of stock. The young males, or bachelors, "haul out" to rest and sleep on beaches adjacent to, but distinct from, the breeding-grounds. Here they are surrounded at night by the sealing gangs, rounded up in droves of from 1,000 to 3,000, and driven inland to the killing-grounds. The large droves are broken up into successive "pods," or groups, of from 20 to 50, of which the "killable" seals (animals of three years of age or approximating to such in size) are knocked down with clubs, those too large or too small being allowed to escape. The skins are removed, salted in kenches and, when cured, are exported.

Apart from this degree of economy, however, a long series of enactments have been made for the protection of the seals (and of sealing). The last of these, a treaty between the British empire, the United States, Russia and Japan, not only regulates land sealing, but prohibits pelagic sealing.

The fur seal (*Arctocephalus australis*) of the south was once taken at the Galapagos islands, Tierra del Fuego, Lobos islands, and this or other species at South Africa, Australia, New Zealand and many points about the Antarctic circle. In South Georgia and other dependencies of the Falkland islands it was abundant at one time, and was taken before 1793. Sealing and exploration were mutually helpful, much geographical discovery being due to whalers and sealers, while sealing, like whaling, followed exploration in other cases. Great numbers of sea leopards (*Hydrurga leptonyx*), sea elephants (*Mirounga leonina*), Weddel's seals (*Leptonychotes weddelli*) and other species were seen by early voyagers, but at first the skins of the fur seals alone seem to have been taken. One of the earliest recorded landings was that of the Argentine ship, "Juan Nepomucena," which brought in 13,000 skins in 1820. In this and the two following years over 90 vessels, roughly equally divided between Great Britain and the United States, worked the southern grounds. In the first season, catches of 18,000 were not unusual, and five British ships took 95,000 seals in all. Seal oil and blubber, particularly from the elephant seal, began to be taken. Weddel estimated that in the two seasons, 1820–21 and 1821–22, 1,200,000 fur seals were taken from South Georgia, and 320,000 from the South Shetlands alone, with 940 tons of elephant seal oil. It is not surprising that the sealing rapidly disappeared. By 1892 sealing vessels sailed from South American ports homeward with mixed cargoes; and though in the early '90s a Scottish whaling expedition to the Ross sea took 20,000 skins with four ships, by the end of the 19th century the fur seal had almost completely disappeared from the Falkland island dependencies at least. Other seals, sea elephants in particular, had very greatly diminished in number. From 1881 sealing in these territories has been regulated; close seasons were introduced, and sealing is now only permitted under licences, which may determine both the kind and number of seals taken. The capture of fur seals is prohibited, and a proposal, not yet put into effect, was made by a British inter-departmental committee for the re-stocking of the rookeries by transplantation from other southern rookeries on the line of the migrations of the stocks found in the dependencies in former times.

The Elephant Seal.—The chief modern sealing of this region, and one which has responded in a satisfactory way to the regulations which govern it, is that for the elephant seal. This seal is taken by whalers, but pups may not be taken, nor, as far as practicable, female seals—an effort to put into force the same trend of regulation as that followed in northern waters for the fur seals. There is also a close season (the last three months of the year), and closed areas along certain stretches of coast. The absence of segregation of young males on the rookeries is a hindrance to the observance of the regulations, but since their inception the numbers of the species appear to have kept up or increased. Elephant seals are of great size, the females reaching 8 or 9 ft., and the male sometimes 20 ft. in length. Pairing takes place immediately after the young are born, early in October, and the young, which are born singly, are usually weaned in November; these circumstances have determined the closed periods enforced. During February and March the large males haul out on the beaches, and are there for some time in good condition, yielding some five or six barrels of oil. In recent years the number of seals taken at South Georgia is in the neighbourhood of 3,000 per annum; there are elephant seals (except sea leopards) which never reach 100, and Weddel's seals, which seldom reach 20 and never 50.

Elliot, "Monograph of the Seal Islands of Alaska," *U.S. Fish Commission, Bulletin 147* (1882); C. H. Merriam and T. C. Mendenhall, *Proc. Paris Arbitration (1891)*; *Report* of the Inter-departmental Committee on Research and Development in the Falkland Island Dependencies (1920).

SEALING WAX. In mediaeval times, when the principal use of sealing wax was for attaching the impression of seals to official documents, the composition used consisted of a mixture of Venice turpentine, beeswax and colouring matter, usually vermilion. The preparation now employed contains no wax. Fine red stationery sealing wax is composed of about seven parts by weight of shellac, four of Venice turpentine, and three to four of vermilion. The rosins, or colophny, are melted together in a copper or earthenware pot over a moderate fire, and the colouring matter is added slowly with careful stirring. The mass when taken from the fire is poured into oiled tin moulds the form of the sticks required, and when hard the sticks are polished by passing them rapidly over fire or through a spirit flame, which melts the superficial film. For the highest qualities of sealing wax bleached lac is employed, and a proportion of perfuming matter—storax or balsam of Peru—is added. In the commoner qualities considerable admixtures of chalk, carbonate of magnesia, baryta white, or other earthy matters are employed, and for the various colours appropriate mineral pigments. In inferior waxes ordinary rosin takes the place of lac, and the dragon gum of Australia (from *Xanthorrhoea hastilis*) and other rosins are similarly substituted. Such waxes, used for bottling, parcelling, and other coarser applications, run thin when heated and are comparatively brittle, whereas fine wax should soften slowly and is tenacious and adhesive. The most important use of sealing wax, at the present time, is in the construction of dry batteries (*see* BATTERY).

SEA-LION, the name for the larger members of the eared seals (*Otariidae*) forming the genus *Otaria*. The largest species is the northern sea-lion (*O. stelleri*) from the North Pacific and Bering sea; it reaches 13ft. in length. The Patagonian sea-lion (*O. jubata*) possesses a distinct mane and small ears. The Californian form (*O. gillespii*) is much smaller, and the commonest species in captivity where it is well known for its intelligence, activity and hoarse, barking voice. There are two other species. During the breeding season the males fast for a week or ten days. The period of gestation is nearly 12 months, or, more probably, thirteen lunar months.

SEALS. The word "seal" (Lat. *sigillum*, O.Fr. *seel*) is employed as a term to describe both the implement for making the impression, and the impression itself; this article will be confined to the latter usage only, except when the seal is referred to as the matrix. In the East the age-old custom of using the seal as a stamp of authentication of a document is parallel to the western habit of inscribing a signature. However, the seal is sometimes used in Europe and America for the same purpose, especially in the case of sovereigns, courts, officials, bishops, States, corporations, etc. The subject is treated here under two heads: (1) *European*, and (2) *Japanese and Chinese*.

EUROPEAN

The practice of sealing is of great antiquity; gems and cylinder seals were used in the ancient world. But the custom died out in the West on the fall of the western Roman Empire, and except that bullae were used by the popes from the middle of the 7th century, and very debased examples by the Merovingian kings, it was not revived until the Carolingians under Pippin (d. 768). The seals then employed were either antique gems or copies, generally set in a mount on which the legend was engraved. This use of gems continued throughout the middle ages. Under the Saxon emperors the seal began to approximate the normal later type, consisting of a figure or half-figure surrounded by the legend. Apart from papal bullae, Edward the Confessor seems to have originated the pendent double seal, which was not used in France until the beginning of the 12th century.

Kinds of Seals.—At one time or another almost everyone had a seal, and while the private individual was generally content with one, sovereigns had a great seal, privy seal and signet, as well as seals for their courts and officials, and for customs and staples. Bishops and corporations had a great seal, and sometimes a seal *ad causas* for ordinary business. Bishops and other dignitaries also frequently had a secret or private seal and a signet.

The Matrix.—The matrix was usually of latten or silver, but occasionally of gold, ivory, lead or other material. To ensure the impressions being correctly centred, double seals usually had two or more pierced lugs through which pins were passed and frequently a cross or nick engraved on the rim of each half. Occasionally double seals were hinged together. Single seals were fitted with a handle, the most common being a six-sided cone terminating in a trefoil. A few matrices had the centre made to screw out about ⅛ inch, enabling the device to be used without the legend. The great majority of seals are circular, but bishops generally used a vesica form, not from any religious significance but because a standing figure could thus be more artistically accommodated. For the same reason standing figures of ladies are placed on a vesica seal. Oval seals became common in the 16th century, and square, lozenge- and shield-shaped matrices are also found.

The Engravers.—The names of several engravers are known. Roman in his *Manuel* gives a list of French engravers and in England may be mentioned Luke, who about 1180 made the seal of Exeter and by analogy that of Taunton, Walter de Ripa, the engraver of the first great seal of Henry III., Derrick Anthony, the engraver of the second great seal of Elizabeth, the design for which was by Nicholas Hilliard the miniaturist, and, greatest of all, Thomas Simon who made the seals of Cromwell and Charles II.

Material.—The impressions themselves are generally of wax, but leaden bullae were used by the popes and in parts of southern Europe. Golden bullae were occasionally employed by the popes and western emperors, while Edmund Crouchback used one as titular king of Sicily, and Henry VIII. and Francis I. for sealing the treaty of 1527.

Methods of Attachment.—Seals were attached to the deed either by impression on its face or by suspension. The former was the earlier system with the exception of bullae, and although in England suspended seals came in in the 11th century, in France impression on the deed continued till the beginning of the 12th and intermittently until its close, to be revived before the end of the 13th. For suspending seals, either a piece of the deed was cut along one edge and the seal impressed on the tag thus made, or the deed was pierced and a piece of parchment or a cord of twisted silk passed through, doubled back and joined together by the seal. Towards the end of the middle ages sealing direct on the document came into general use again.

The Counter-seal.—To make it difficult to detach a seal from its tag, it was usual to furnish at least the larger seals with a counter, that is an impression on the back. In double seals the reverse die served this purpose, but in others, the secret, signet or seal *ad causas* was generally used, and there are instances, especially among the Cistercians, of a special seal, called in the legend *contra-sigillum*, being employed. In double seals there are a few examples of an additional legend in the position occupied by the milling of a coin, and this would make detachment practically impossible.

The Legend.—The legend usually sets forth the name and style of the owner, although on small private seals it is often a motto or pious ejaculation. The simplest form is *Sigillum* followed by the name in the genitive case, but sovereigns and occasionally bishops used the nominative without the word *sigillum*. Abbreviations and contractions are usual. Occasionally the date of the matrix is included in the legend and frequently a sovereign used his predecessor's seal, the name being altered where necessary.

Roman capitals were first used, but from at least the last half of the 11th century they are mixed with Lombardic which slowly displaced them. Black letter was first used in England in 1345, and became general for a century after 1375. But Lombardic capitals were usual for initial letters during the whole of that period. When capital letters alone again became usual, it was a modified form of Lombardic that was employed, and this was only slowly ousted by the Roman, which however became the regular type after about the middle of the 16th century.

The Great Seal of England.—The first royal seal of England which ranks as a "great seal" is that of Edward the Confessor, impressions of which are extant. This seal was furnished with a counterseal, the design being nearly identical with that of the obverse. William the Conqueror, as duke of Normandy, used an equestrian seal, representing him mounted and armed for battle. After the conquest of England, he added a seal of majesty, copied from the seal of Henry I. of France, as a counterseal. In subsequent reigns the order of the two seals was reversed, the seal of majesty becoming the obverse, and the reverse being the equestrian seal, a pattern which has been followed almost uniformly down to the present day. (H. S. K.)

The Small Seals supplemented the great seal. They were not duplicates of it, nor, although in an emergency they could be used in its stead, were they intended to be substitutes. They were introduced for certain private business of the sovereign, but as the daily task of government grew in volume and complexity they widened their scope. Except in England, they were invariably controlled by chancery (*q.v.*), as, for example, in the papacy and in France. The English small seals' freedom from such discretion allowed them to evolve autonomous offices which gave rise to some of the chief ministries of State.

The first small seal to appear in England was the privy seal, *priuatum sigillum*, discernible in the reign of John. It was kept by the clerks of the king's chamber (*q.v.*), and was used principally for matters connected with that office. Besides witnessing certain of the king's letters, it ordered the issue of great seal writs and instructed the exchequer (*q.v.*) to make payments. To begin with, chancery enrolled privy seal letters but they were soon recorded in rolls of their own. The seal was transferred to the custody of wardrobe clerks in the reign of Henry III., when the king's wardrobe began to relieve the .chamber of housekeeping cares (*see* WARDROBES). During the reign of Edward I. the controller of the wardrobe assumed sole responsibility for it. In 1312 an independent keeper was appointed, and two clerks were detailed to help him. By 1318 two more clerks had joined them. Although they all remained within the wardrobe, receiving from its keeper their wages, robes and expenses, they formed a self-contained subsection. Before Edward II.'s deposition the keeper was a foremost servant of the Crown, and as early as 1330 it was promotion to resign the keepership of the wardrobe for that of the privy seal. Yet until after 1340 the keeper of the privy seal was a member of the household, though he was by then third minister of State. How far the privy seal had travelled can be measured by the Walton ordinances of 1338, which laid down that privy seal warrants were to be compulsory on exchequer and chancery for all business outside routine. The keepership gained further authority and prestige as a result of the great seal being entrusted to the keepers who went abroad with Edward III. Nicholas Carew (1371–77) excluded, the keepers were clerks until the 16th century, in the course of which lay nobles began to be appointed.

After 1350, unhampered by wardrobe interference, for from

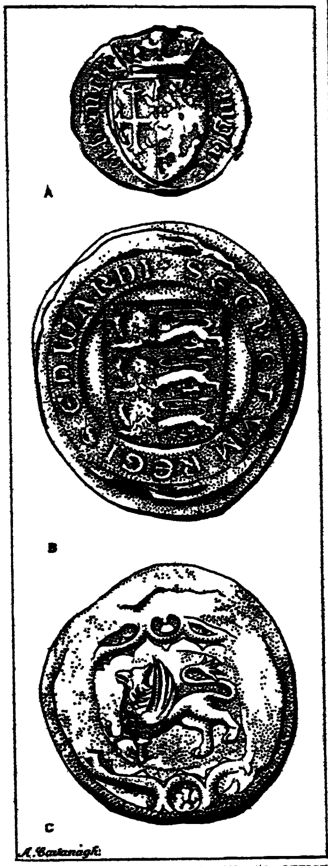
EARLY EUROPEAN SEALS, REDUCED NEARLY ONE HALF

1. First great seal of Edward the Confessor, 1043–66, the initial double pendant seal in Europe. 2. Seal of Merton Priory, Surrey, 1241. 3. Seal of Alexander Neville, Archbishop of York, 1374–88, composed of canopy with saints and angels. 4. Seal of Charlemagne as emperor, 800–814, gem in an inscribed mounting. 5. Reverse of fig. 2. 6. Seal of John Stratford, Archbishop of Canterbury, 1333–48, with simple canopy and emblems in the field. 7. Reverse of fig. 1. 8. Great seal of Edward I., 1272–1307. 9. Reverse of seal of Margaret, 2nd wife of Edward I., 1299; shield of arms hanging from a tree. 10. Seal of Otto I., as emperor, 962–973, the beginning of the normal type. 11. Seal of Thomas, Duke of Clarence, 1412; arms between ostrich plumes. 12. Margaret's seal (fig. 9), showing standing figure of a lady in heraldic dress. 13. Reverse of fig. 8. 14. Seal of William de Bohun, 1st Earl of Northampton, 1337, showing shield of arms. 15-a. Bulla of Pope Innocent VI., 1352–62; archaic style. 15-b. Reverse of 15-a. 16. Seal of John Camoys, 1300. 17. Seal of Yarmouth, England, showing patron saint. 18. Seal of Ypres, Belgium; the Cloth Hall within the town wall. 19. Renaissance seal of Cardinal Andreas de Valle, died 1553; pictorial art influence. 20. Seal of Shrewsbury, England, dated 1425. 21. Reverse of fig. 17

that year the exchequer paid practically all costs and salaries, the office rapidly constituted itself into a public department, with headquarters at Westminster by 1360. It was *extra curiam* (out of court) before the 14th century closed, the process being hastened since, once the privy seal began to walk in the footsteps of the great seal, the king preferred another small seal for his personal service. This was the secret seal, *secretum sigillum*. As in the 13th and 14th centuries the privy seal was alternatively described as *secretum sigillum*, a habit which lingered on into Tudor times in the legend on the seal, some confusion is unavoidable. But early in Edward II.'s reign there was a secret seal distinct from the privy seal. It authenticated the king's private correspondence, authorized the issue of privy seal writs, and soon was commonly used interchangeably with the privy seal as warranty for letters under the great seal. It was consigned to the care of chamber clerks, of whom the receiver was its recognized custodian under Edward III. Before the 15th century dawned, the renamed signet was in charge of a clerk of the chamber who made his own the once less specialized title of king's secretary, *secretarius regis* (*see* SECRETARY OF STATE). The secret seal aped its forerunner still more closely by preparing to become in its turn a public instrument. The term signet was applied to the secret seal as early as 1337, yet in the fourth decade of the century it also denoted a different seal. In 1354 this, and a mysterious seal called *signum* (sign) in use between 1338 and 1344, gave way to the *nouel signet* (new signet), the old secret seal in another guise. In the last 14 years of Richard II. there began to develop a signet office, staffed in Edward IV.'s time by four clerks.



BY COURTESY OF THE PUBLIC RECORD OFFICE

SEALS OF THREE ENGLISH KINGS

A. Privy seal of Edward I, one-faced; B. Signet seal of Richard II, one-faced; C. Griffin seal of Edward III, one-faced

The rise of the signet restricted the privy seal and in practice the signet was the originating force in administration. From 1540 there were two secretaries, each having two signets. The Tudors advanced the signet to the position of a prerogative instrument, and the attitude to it of the 16th century opposition to the king was not unlike that of the baronial opposition to the privy seal of Edward II. The secretaries, with their seals, gradually drifted away from the signet office, which was not, however, abolished until 1851, long after it had ceased to be of value. Each modern secretary of State, of whom there are now seven, has two or three signets for different types of transactions. These even yet show something of their personal origin, for their custodians still receive the seals from the hands of the king on appointment, and are the means of communication between sovereign and people. The privy seal, and its office, were abolished in 1884, but the lord keeper, whose duties diminished as his dignity increased, was retained and is to-day a member of the cabinet (*q.v.*). Another secret seal, the king's secret seal called the griffin, *secretum sigillum vocatum griffoun*, was used between 1335 and 1354 for business connected with chamber lands (*see* KING'S CHAMBER). It was kept by a clerk of the chamber and naturally disappeared when the estate was given up. Yet another secret seal made an appearance in 1367, but it was little used.

See F. H. O. Morel, *La grande chancellerie royale, 1328–1400* (1900); C. V. Langlois, *St. Louis-Philippe le Bel, Les derniers capetains directs 1226–1328* (1901); W. R. Anson, *Law and Custom of the Constitution* (1907–09); E. Deprez, *Etudes de diplomatique anglaise, 1272–1485* (1908); L. Perrichet, *La grande chancellarie de France des origines à 1328* (1912); T. F. Tout, *Chapters in the Administrative History of Mediaeval England* (vols. I.–II., 1920, III.–IV., 1928, V. [and last] in preparation; bibl.); F. M. G. Evans, *The Principal Secretary of State* (1923); Sir H. C. Maxwell-Lyte, *The Great Seal of England* (1926). (D. M. B.)

Other Devices.—Amongst the seals of officers of state may be noted those of the admirals, who used for device a ship, generally with their personal arms on the sail. A bishop was represented on his seal of dignity in mass vestments. Later his figure was placed under a canopy, which at first simple, gradually grew in splendour, eventually becoming the principal element in the design. On seals *ad causas* and secrets saints take the chief place, the bishop being shown kneeling below. After the Reformation the design naturally changed, scenes from the Old Testament being common, and by the middle of the 17th century a shield of arms had generally become the only device.

On the seals of cathedrals and religious houses there is often a conventional view of the church sometimes with the patron saint, or the patron saint alone. The universities show the chancellor and masters in convocation, while the colleges have patron saints and founders, a religious emblem or a shield of arms. In foreign universities the faculties and nations generally had seals, a common design being a doctor or master lecturing. On seals of towns a representation of the town itself, sometimes with the patron saint, is frequent; or the patron saint alone or some prominent building might be used, while in France it is not uncommon to find the heads of the civic dignitaries.

At first the shield appears alone, but delicate tracery panels are later introduced to contain it. Wyverns or other animals are often placed round the shield, badges were frequently added, while the shield was sometimes shown hanging from a tree or held by an angel or eagle. In addition to an heraldic seal the noble, like his sovereign, often had an equestrian seal, on which he is occasionally shown in civil costume. Standing figures of ladies, often holding shields or a hawk, and in heraldic dress, are common down to the middle of the 14th century. Persons not entitled to bear arms had usually to be content with such objects as stars, flowers, beasts and birds, while a common device for the lesser clergy was the Agnus Dei, Virgin and Child or other saints.

Papal bullae in design are *sui generis*. On the obverse are the heads of SS. Peter and Paul, and on the reverse the pope's name. Archaic from the beginning, they have so continued, in spite of attempts by Paul II. to alter and by Julius II. to improve the design.

Evolution of the Art.—At first crude and ill designed, an improvement rapidly set in and by the middle of the 13th century the art reached its highest point, the seal of Merton priory, Surrey, made in 1241, being probably the finest ever cut. At this level the art remained for upwards of a century. By the beginning of the 14th century the whole surface had become covered with ornament, and elaborate canopies crowded with tabernacle work are a common feature, so much so that the figure became subordinate. This over-elaboration, which imples no failure in technique but the contrary, finally led to the decline of the art.

JAPANESE AND CHINESE

The use of seals for the purposes of identification and ornament has existed in China since earliest times and was emulated in Korea and in Japan from the inception of her imitation of Chinese usages and manners. The word seal may be applied with equal propriety to the stamped impression and the object with which the impression is made. These impressions appear in an infinite variety of shapes and sizes, the more common shapes being square, oblong, elliptical, round and gourd-shaped. In size they run from the huge imperial seals (sometimes as large as 4⅞″ by 6⅜″) to miniature seals which are often as small as ⅛ in. square or in diameter. The ink used is usually a vermilion red, but black and purple are also employed.

Seals have two general uses: one is for identification, the equivalent of a personal signature or guarantee; the other, while it often identifies, is almost purely ornamental and has no legal significance whatever. The identification seal must bear the *hsing* (姓) or family name of its owner, and the *ming* (名), which is the equivalent of our Christian name. It must be understood that the Chinese use several varieties of individual names, so that when we translate the *hao* (號) or intimate name as nickname, we are incorrect, nickname being properly the translation of what the Chinese call *wai-hao* (外號),which is very rarely if ever used on seals. The *hao* is an intimate name often selected by the bearer himself or given to him by his friends as being appropriate to his pursuits or character. The Chinese also use another intimate name, the *tzŭ* (字) (sometimes absurdly and meaninglessly translated as "style") which is created in much the same manner as the *hao*, except that it properly carries some direct literary allusion to the *ming*, and is in its use somewhat more elegant and formal than the *hao*. On ornamental seals the *hao* or *tzŭ* may be used with or without the *hsing*, but in practice usually without. The *ming* may be employed on ornamental seals without the *hsing*. A painter is much more likely to sign his *hao* or *tzu* and stamp his ornamental seal or seals underneath his signature than he is to use his full legal name and seals.

It is very difficult to generalize about Chinese seals because of the frequent departures that Chinese writers and artists indulge in, especially with their ornamental seals. An artist may have as many as, say, 50 to 100 seals, bearing his *ming, tzŭ, hao* or *wai-hao*, the name of his studio, the name of his native district with his family name, etc. These different names, with such characters as *yin* (印), *chang* (章), *chih yin* (之印, seal of), etc., present an almost inexhaustible possibility for variations. Sometimes the identical inscriptions are duplicated or triplicated in different styles of writing. Saito Ken's *Signatures and Seals of Chinese Artists* (支那畫家落欵印譜, *Shina Kwaka Rakkwan Infu*, Tokyo, 1906), gives reproductions of 38 seals used by Tung Ch'i-ch'ang (董其昌), an artist of the Ming dynasty, and these do not purport to be exhaustive. As well as personal and official seals, there are countless seals bearing the names of temples, public offices, palace halls, personal libraries, manufactories, shops, family seals, and even, on occasion, small houses.

The materials of which seals are made are as varied as the seals themselves. Practically any hard, fine-grained stone may be used, with the semi-precious stones preferred. Metals are used also, most commonly bronze but, on occasion, gold and silver, either solid or plated. The cheapest and most common materials in general business and private use are wood and soapstone, the latter often as beautifully carved as the rarest jade.

The type of character most used is the *chuan* (篆), which we translate as "seal character," but there is great latitude in the arrangement and period of the characters employed, archaic and historic forms being very popular. Flourishes, embellishments and variations are often indulged in (in spite of the fact that the practice is frowned upon by writers on the subject), making it exceedingly difficult to read or decipher the inscriptions. *See* Hsüeh Ku Pien (學古編), *Studies in Antiquities*, a work on seals written by Wu Chi-ch'eng of the Yüan dynasty, quoted in the *Ku Chin T'u Shu Chi Ch'êng* (古今圖書集成), the K'ang Hsi Encyclopaedia. The lines of the characters may be raised or depressed, giving, in the first instance, vermilion lines against a white background, and in the second, white lines against a vermilion background. The first are variously known as *yang wên* (陽文) or "male" writing, and *chu wên* (朱文) or vermilion writing; the second as *yin wên* (陰文) or "female" writing, and *pai wên* (白文) or white writing. In describing seals, writers invariably mention which of these two styles is used. Seals usually have only one inscription, but early seals, usually made of brass, with inscriptions on both ends or on all six sides, were not uncommon.

There are references to seals in the Four Books (四書) and Five Classics (五經). The *Chi Chia Chou Shu* (汲冢周書) (history of the Chou dynasty unearthed in the 4th century A.D. at Chi, quoted in the K'ang Hsi Encyclopaedia) tells us that when T'ang (湯), the founder of the Shang dynasty (1767–1122 B.C.) deposed Chieh (桀), the last of the Hsia (2205–1767 B.C.) emperors, and convened the feudal princes, he placed the imperial seal at the seat of the emperor. The first report of the use of seals in what we would call authenticated history is in the *Tso Chuan* (左傳, the commentaries of Tso-ch'iu Ming, 左丘明, on *Spring and Autumn Annals*, 春秋 of Confucius, quoted in the K'ang Hsi Encyclopaedia) which tells us: "In the 29th year of Duke Hsiang of Lu (魯襄公, 544 B.C.) the Duke was at Ch'u (楚) for the funeral of Prince K'ang (康王). When he was at Fang Ch'eng (方城) Chi Wu Tzŭ (季武子 the minister of Lu) took possession of Pien (汴) and sent Kung Yeh (公冶) with a sealed document (*hsi shu*, 璽書) to report the matter to Duke Hsiang." We must not infer, however, that this was the beginning of the use of seals, for if it was, the philosopher Chuang Chou (莊周, 4th to 3rd century B.C.) would not have attacked its vogue, declaring that men would return to simplicity and virtue if "tallies were burned and seals destroyed." In fact, it is safe to assume from this pronouncement of Chuang Chou that seals were in general use centuries before his time, probably throughout the Chou dynasty (1122–256 B.C.).

From then on the use and classification of seals became exceedingly complicated. In general seals may be classified as *yin* (印) and *hsi* (璽). The latter character has come to be applied to the seals of the emperor and other important members of the imperial family, such as the empress, the crown prince and ex-emperors; and the former to seals of officials and private individuals, though in ancient times, as late as the Han dynasty, the two characters were used synonymously. It must be observed, however, that during the Han dynasty the distinction began to apply.

In the *Han Chiu I* (漢舊儀, a work on the organization of the governmental machinery by Wei Hung [衛宏] of the Han dynasty) the following regulations were provided for the use of seals: (1) Seals of feudal princes, *chu hou wang* (諸侯王), are to be known as *hsi* (璽), to be made of yellow gold with camel knob or handle. (2) Seals of nobles, *lieh hou* (列侯), are to be known as *yin* (印) and are to be made of yellow gold with tortoise knobs. (3) Seals of ministers or generals are to be known as *chang* (章), to be made of gold with tortoise knobs. (4) Seals of officials with a pension of 2,000 piculs of grain or more are to be known as *chang*, to be made of silver with tortoise knobs. (5) Seals of officials with pensions from 400 to 1,000 piculs of grain are to be known as *yin*, to be made of brass with nose (*pi*, 鼻) knobs.

At the present day such regulations if they exist at all are completely disregarded by the average Chinese, who uses any form he chooses on his personal seals even to representations of landscape. The broadest classification is perhaps the one followed by the *Chi Ku Yin P'u* (集古印譜, *Collection of Ancient Seals* by Wang Chang 王常, 1575) which divides all seals into two main

CHINESE SEALS

1. Ivory seal with lion handle, probably late 19th century. Inscription, Mu-Ch'en, evidently an intimate name of Chang En-Jung. 2. Contemporary soapstone seal with lion handle. Inscription, P'u Ai-Lun. 3. Late 19th century ivory seal, lion handle. Inscription, Chang En-Jung. 4, 5, 6. Set of three seals made of soapstone with lion handles. 4 and 6 give the full name of original owner, T'ai Na-Fu. 5 gives only the given name, which probably in this case was used as the tzu or intimate name. The name appears to be Manchu

categories: (1) *Kuan Yin* (官印), official or public seals, or, in other words, seals that indicate rank or office. (2) *Ssu Yin* (私印), private seals, used by individuals. Under each main classification the material and the type of knob are mentioned. Private seals may be further classified, as in the *Chieh Tzŭ Yüan Shu Hua Chuan* (芥子園書畫傳, *The Mustard Seed Garden Cyclopaedia of Painting and Calligraphy*, by Li Li-weng, 李笠翁, 1679) which gives six classifications with suggestions as to how each class is to be made: (*a*) *Ming yin* or name seal (名印) used as means of identification. Only such words as *yin*, seal (印), *hsin* (信, faith), *yin chang* (印章, seal), *chih yin* (之印) and *chih chang* (之章), seal of; *ssŭ yin*, private seal (私印) should be used after the *hsing* (surname) and *ming* (given name) without other embellishments. (*b*) *Tzŭ yin* or intimate name seal (字印), originated during the T'ang and Sung dynasties, should be used only for ornamentation and not for identification. It should not contain such words as *yin* and *hsin*. The character *shih* (氏), family, alone should be used. (*c*) *Ch'en yin* or subject seal (臣印). All under heaven are the subjects (臣) of the emperor. Therefore anyone can prefix the character *ch'en* to his name, omitting the surname. It was extensively used during the Han dynasty. (*d*) *Hao yin* (號印), another intimate name seal may include *wai hao*. Such terms as *tao jen* (道人), Taoist person, *chü shih* (居士), resident, *i shih*, retired scholar (逸士), *chu jen* (主人), master, may be used with one's *hao* or the name of one's "retreat." (*e*) *Chien shu yin* (箋書印), or letter seal. During the Ch'in and Han dynasties only the name seal was used after one's signature but lately seals bearing inscriptions such as "so-and-so discourses affairs," "so-and-so announces affairs," etc., are beginning to be used. (*f*) *Shou ts'ang yin* (收藏印) or collector's seal. This class of seals also had their origin in the T'ang and Sung dynasties. Either the name, the *tzŭ* or the *hao* may be used followed by such expressions as *chien shang chang* (鑒賞章, seal of critical examination and enjoyment), *chên ts'ang* (珍藏, treasured and guarded), etc.

The first seal to have much historical backing was the imperial seal made by Chin Shih Huang Ti with a piece of Lan T'ien (藍田) jade of rare quality, with a *li* (螭, one-horned dragon) knob and the following inscription: *Shou t'ien chih ming huang ti shou ch'ang* (受天之命皇帝壽昌, by the command of heaven, long-lived and glorious the emperor). This seal was handed down to the Hans. Since then it has come to be known as the *ch'uan kuo hsi* (傳國璽, seal of succession of the empire) and looked upon as the essential symbol of imperial authority. Six additional imperial seals were made, according to the *Han Chiu I*. The first was used for creating princes, etc., the second for letters and documents to the feudal princes, the third for orders for mobilization, etc., and the fourth for treaties, etc., with tributary States. In succeeding dynasties various forms of imperial seals were made, but it is beyond the confines of this article to enumerate them. We might observe, however, that Empress Wu Tse T'ien (武則天) of the T'ang dynasty changed the character *hsi* to *pao* (寶, treasure) and that this character has since prevailed as the name of the imperial seal with the exception of the two T'ang emperors immediately following the empress. During the reign of these two emperors the imperial seal was again known as *hsi*. We might observe further that the *ch'uan kuo hsi* of Ch'in Shih Huang Ti survived, through many vicissitudes, to the reign of Emperor Fei Ti (廢帝 A.D. 934–936) of the Posterior T'ang dynasty (後唐) who perished with the seal in the flames rather than surrender to the Posterior Chin dynasty (後晉). In 1098 a seal purporting to be the genuine *ch'uan kuo hsi* was discovered and offered to Emperor Che Tsung (哲宗) but this was later discredited as was a still later seal discovered (A.D. 1295) in the Yuan dynasty. (*See also* FAR EASTERN ART.)

See also essays, monographs, memorials, etc., by writers of the Sung Yüan and Ming dynasties reprinted in the K'ang Hsi Encyclopaedia. (A. R. PR.)

SEA-LUNGWORT (*Mertensia maritima*), a smooth, fleshy, perennial of the borage family (Boraginaceae), called also sea bugloss, sea gromwell and oyster plant. It is a characteristic maritime herb, found on rocks and sand along the northern coasts of Europe and Asia and also of North America, from Massachusetts to Greenland and from Oregon to Alaska. The plant has pale green herbage; spreading or prostrate branches, sometimes 15 in. long; and small white, rose-pink or blue flowers that bloom throughout the summer. (*See* MERTENSIA.)

SEAMAN, SIR OWEN (1861–), English humorist and author, was educated at Shrewsbury school and Clare College, Cambridge, where he took a first-class in the classical tripos in 1883; in the next year he became a master at Rossall school; and in 1890 he was appointed professor of literature at the Durham College of Science, Newcastle-on-Tyne. He was called to the bar at the Inner Temple in 1897. He was introduced to *Punch* in 1894, with his "Rhyme of the Kipperling," a parody of Rudyard Kipling's "Rhyme of the Three Sealers." He also wrote for *The National Observer* and *The World*. In 1894 he published a volume of parodies which is a classic of its kind, *Horace at Cambridge*, followed by *The Battle of the Bays* (1896), *In Cap and Bells* (1899), *Borrowed Plumes* (1902), and *A Harvest of Chaff* (1904). He joined the staff of *Punch* in 1897, and in 1902 became assistant-editor, succeeding Sir F. C. Burnand as editor in 1906. In 1914 he was knighted. His later publications include *War Time* (1915); *Made in England* (1916) and *From the Home Front* (1918).

SEAMANSHIP is the art of handling a ship or boat under any and all conditions of weather, tide, current or other influence affecting its immediate movement or safety. The term is also applied to the skill attributed to a good seaman. It should not be confused with navigation (*q.v.*), which is the art of determining the correct course of a ship from one place to another when out of sight of land, nor with pilotage (*q.v.*) which is the art of determining the correct course of a ship when working along a coast or up a buoyed channel. Nevertheless it is a companion art, for without good seamanship being displayed in the actual manoeuvring of the ship, practical effect cannot be given to the calculations and guidance afforded by good navigation or pilotage.

Good seamanship is essentially one of those accomplishments which can only be acquired by practise and that natural adaptability to the sea which is a marked characteristic of certain races, particularly the British. It cannot be taught by precept or mastered by a study of books on the subject. The capable seaman is made by long service in ships and boats at sea, where alone can he obtain the necessary experience. In an elementary form seamanship is involved in the handling of even the smallest floating craft in a manner which ensures that it responds safely and with certainty to the will of the mariner. In achievement and difficulty it increases with the conditions under which she has to be handled or the size of the vessel until it reaches a culminating point in the sailing of a full rigged ship out of harbour in a gale of wind, the berthing of a giant liner in a narrow port or the manoeuvring of a great fleet of warships.

It is a mistake to think that with the elimination of masts and sails seamanship has become a dead art. The power-driven ship of to-day may have many attributes which facilitate handling her, but ultimately she is dependent on good seamanship for her safe conduct and security afloat no less than the sailing ship of the past. The officers and ship's company of a modern steamship may not be efficient sailors in the old sense of the word, but they must be none the less proficient seamen. In sailing ships, seamanship was, and still is, largely concerned with the rigging (standing and running), the making and shortening of sail, the correct manipulation of sails and rudder for such operations as putting the ship about, wearing or club hauling (*see* NAUTICAL TERMS), and for making the best passage whether "on a wind" or "running free." But the handling of all vessels, whether sailing or power driven, requires a knowledge of such matters as the influence on their movement of wind, tide or current, their behaviour in a seaway and the various methods of tethering them to land, whether by anchor in a roadstead or by moorings to a jetty.

Seamanship also involves a multitude of other services incidental to maritime work, such as the proper loading of cargoes, shifting of weights, battening down hatches and making the ship

"snug" for heavy weather, the lowering, handling and hoisting in of ship's boats, the embarking and disembarking of passengers or other personnel, proper attention to ship's fittings, such as spreading and furling of awnings and side screens and innumerable other incidentals to life afloat.

In the case of power-driven ships a knowledge of the use of sails is replaced by one of the action of the screws. While certain general laws govern the behaviour of nearly all such ships, they vary appreciably in their response to helm and engines. However handy or unhandy a ship may be, a good seaman will get the best out of her, whether in carrying capacity, rapidity of voyage, safety in handling, or general power of manoeuvre, whereas a captain who does not know or understand his ship will often find himself in difficulties. The same applies to the good order of the ship and her fittings; a good set of seamen will keep her clean, trim, pleasing to the eye and ready for any emergency, while the ill-manned ship is slovenly in appearance and some essential for her safety or that of her personnel will be found wanting at a critical juncture.

Seamen have been wont to be regarded as a people apart and writers, like Clarendon, have believed them to be definitely jealous of and hostile to landsmen, while it was reputed to be their endeavour to preserve their knowledge as "an art and mystery." There is certainly a good deal of truth in the impression that seamen as a class lack ability to put their knowledge into words and the British navy itself has long been termed "the Silent Service." This, while it is a very proper tribute to a disinclination on the part of naval personnel to obtrude themselves and their work unduly or advertise their merits, is also attributable to the fact that, until lately, naval training did little to encourage powers of self-expression. It has now been recognised that this is a definite defect, certainly in the higher ranks, and under modern conditions the seaman must, if he is to play his part in the world, take his place with and be understood by the rest of the community. The importance of this principle particularly applies to the people of the British Empire, whose interests, and indeed existence, is so closely interwoven with maritime matters. While it is not possible for the great mass of men and women who live on shore to acquire a seaman's knowledge, facilities are increasing rapidly to enable them to gain an insight into his life and to understand what the work he is doing means to the community on land. Ocean travel, water transport generally, the press and the cinema all assist to bring a knowledge of ships and their ways to the general public. In fact the seaman is no longer one of a race apart, even if he is still and must always remain something of a specialist.

Two examples may be given of fine seamanship; one in the days of masts and sails and the other not long after the introduction of steam. On Dec. 16, 1814, a British 74 gun ship, the "Magnificent," was in danger of being driven on shore by a violent storm when in the Basque Roads on the French coast. She was saved by the skill and resource of her captain, John Hayes, who "club-hauled" his ship, thereby getting her round on to a safe tack when within her own breadth of a reef and escaping from the enemy. He was known as "Magnificent Hayes" to the day of his death. On March 16, 1888, the cruiser "Calliope" was lying in Apia, Samoa, when a storm came on and rapidly increased to hurricane violence. Captain Kane put to sea, and thanks to the good order of the engines and the fine work of her engineers, she got out in the teeth of the storm and rode it out safely at sea, whereas the shipping in harbour was blown from its moorings and wrecked. Machinery has now become the handmaid of the seaman and the engineer his indispensable colleague. (E. A.)

SEAMEN, LAWS RELATING TO: *see* LAWS RELATING TO SEAMEN.

SEAPLANE, a type of aircraft which is capable of arising from or alighting on the water. Seaplanes may be subdivided into the following classes. (1) *Float seaplanes,* in which the landing gear consists of one or more floats or pontoons. (2) *Boat seaplanes,* in which the centre portion of the structure consists of a boat providing flotation. (3) *Amphibians,* which may be of either of the above types, but with the addition of a landing gear enabling the aircraft to arise from or alight on the land as well as on the water.

Float Seaplanes.—The float seaplane in practically every case consists of a normal land type of aeroplane in which the landing wheels have been replaced by one or more floats.

The addition of floats to an aeroplane usually increases the weight of the structure by about 8 to 10% of its fully loaded weight, and this weight must be deducted from the load the aircraft would carry as an aeroplane. The air resistance of floats is always greater than that of aeroplane wheels and in consequence there is a loss in speed in converting an aeroplane to a seaplane. This loss is usually about 10% of the full speed of the aircraft.

In spite of this loss of speed, the highest speeds ever recorded have been obtained by seaplanes, and these have in all cases been of the float type. The reason for this is that aircraft having a very high maximum speed, have also a very high minimum speed —often as much as 100 miles an hour for a racing type—due to the very heavy wing loading employed. Floats can now be designed that will alight on smooth water at these speeds, and with large expanses of sheltered water available, the seaplane becomes the most suitable type of aircraft for very high speed flying.

Types of Float Seaplanes.—Float seaplanes may be of the following types:—(1) Central float, (2) Two float and (3) Three float. The central float type, having one large central float, with usually small additional floats on the wings to assist in maintaining lateral stability on the water, is now almost obsolete. In the "two float" type the floats are made long enough to give the required longitudinal stability when at rest on the water and when leaving the water the altitude of the aircraft is determined almost entirely by the dynamic characteristics of the floats. In the "three float" type static stability on the water is obtained by the addition of a small float below the tail. In taking off the water the fore and aft inclination of the aircraft is controlled by the pilot by means of the longitudinal air controls.

Lateral stability at rest in twin float or three float seaplanes may be obtained by placing the floats sufficiently far apart but these are often supplemented by "wing tip" floats.

Principle of the Hydroplane.—The float or hull forms employed are designed to act as hydroplanes when the aircraft is leaving the surface of the water, *i.e.*, that as the speed over the water increases, the hydrodynamic forces acting upon the float tend to raise the float thus reducing its displacement and consequently its resistance. The reduction in water resistance is also enhanced by the use of one or more lateral steps on the bottom of the float.

As resistance is caused by the water film drawn along by the passage of the float through the water, the step tends to break this water film and replace it by a vortex layer of water and air. As the speed of the float is increased from zero its resistance at first increases rapidly and then decreases with further increase of speed. The speed at which this maximum resistance occurs is known as the "hump" speed. This hump speed is of the greatest importance in seaplane design. When taking off from the water this speed must be passed through and, as the air resistance of the wings, body, etc., must be added to the water resistance the total resistance may be very high.

Effect of Forms of Floats.—The dynamic characteristics of the floats or hull may be varied by changes in the size of the "planning area," the position, size and number of steps, and by making the bottom float or "V" cross section. As the angle of this "V" section is decreased, *i.e.*, the form is given a deeper keel, the hydroplane effect is reduced, though the hump speed resistance may also be reduced. Tests have shown that by employing a "V" or rounded bottom, stresses due to striking the water when alighting are greatly reduced. With modern seaplanes having a high power to weight ratio, if the hydroplane effect is too great there is a danger of the aircraft being thrown off the water before sufficient speed is obtained to enable the aerodynamic controls to function.

Flying Boat.—Much advance has been made recently in the design and construction of large boat seaplanes or flying boats. Boats of a total loaded weight of up to 33,000 lb. and total horse power of over 2,600 have been built and operated successfully. Such aircraft are capable of working as independent units away from fixed bases, as they possess a high degree of "seaworthiness" when moored, have sufficient internal accommodation to enable a full crew of five or six to live on board with comfort, and can carry all necessary equipment.

In the smaller types of aircraft up to approximately 10,000 lb. total weight the float seaplane shows advantages over the boat seaplane, the body, wings, airscrew, etc., may be well clear of the water, a high positive metacentric height can be obtained by suitably spacing the two floats, and clean external lines giving a minimum air resistance can easily be obtained.

In larger types of aircraft, the boat seaplane improves on the float type. As the dimensions of the central hull increase so the seaworthiness of the aircraft is improved beyond that of the float type.

Again in the larger types, the hull replacing both the fusilage and the leading gear of the float seaplane, there is a considerable saving in weight. This saving in weight in the largest flying boats is sufficient to enable them to compare favourably with land aeroplanes of equal dimensions in regard to structure weight. In medium sized boat or float seaplanes, however, the ratio of structural weight to load carried compares unfavourably with that of land aeroplanes.

Lateral stability at rest in boat seaplanes is usually obtained by means of "wing tip" floats, though certain designers have modified this method. Dornier, for example, employs two small rudimentary wings of symmetrical section projecting from the sides of the hull at the water line, while in the Rohrback boat seaplane two fairly large floats similar to those of a two float seaplane are mounted on either side of the hull.

In boat seaplanes the metacentric height of the hull itself is very small or negative, so that additional methods, such as described above, of obtaining stability must be employed. If the hull were to be given a large positive metacentric height the seaworthiness of the aircraft would be improved, but to obtain this condition, the centre of gravity of the aircraft would be too low for air stability requirements.

Longitudinal dynamic stability in boat seaplane hulls is usually obtained by using the main step slightly abaft the centre of gravity of the aircraft and by the addition of a smaller step further aft. This small step is usually only operative when the hull is running at fairly large positive angles and is intended to neutralize any tendency to pitch fore and aft when taking off or alighting.

In boat seaplanes the engines and airscrews are situated high above the hull in order that they may be clear of water and spray, the result being that the centre of thrust is above the centre of gravity of the aircraft. This high position of the centre of thrust above the centre of gravity forms a negative couple tending to drop the nose of the aircraft when the engines are running, and a boat seaplane in trim for level flight under these conditions would tend to increase its angle of incidence should the engines be stopped, in which case a dangerous loss of speed might result. To counteract this change of trim, a negative angle of incidence is given to the tail plane which is often of cambered aerofoil section inverted, *i.e.*, with its convex surface downwards. This tail plane being in the slip stream of the airscrews, causes a positive movement with the engines running, the movement decreasing when the engines are stopped, thus counteracting the change in thrust and centre of gravity couple.

Hulls constructed of wood have developed on two lines. Firstly, the rigid hull, in which the hull is itself strong enough to withstand the impact of striking the water when taking off in a rough sea or alighting; and secondly, the flexible type of hull. In the flexible hull the impact stresses are absorbed by the elasticity of the hull structure. These hulls are usually of circular or elliptical section with the steps added by forming double bottoms for certain longitudinal sections only. (J. C. B.)

SEA POWER. The term means, essentially, the influence which a nation can exert to secure its rights and uphold its interests on the seas and oceans of the world both in peace and in war. It also implies the ability to deny the free use of the sea to an enemy. A nation which possesses a sizeable navy is often referred to as a "sea Power." It should not be confused with the one time prevalent but generally misused expression "command of the sea," or with the still popular but often indefinite "freedom of the seas." It must also be regarded as being quite distinct from the old phrase "sovereignty of the sea," which had a very definite meaning.

"Command of the sea," in a literal sense, has always been a vainglorious claim. From time to time one nation or another has secured such a predominating influence at sea that enemy ships could only venture forth with grave risk of capture or destruction, while even neutral shipping only plied its trade on sufferance; but, even so, this influence varied both as regards its extent and its duration and in no case has it been so absolute in character that it justified the use of such a term as "command."

To-day it is generally recognised that no nation has the right, nor is it practicable, to claim appropriation of the seas, as a whole, even in time of war. In time of peace the complete "freedom of the seas" is one of the unwritten canons of normal international relations; an essential condition for world wide security and all that civilisation stands for, and one which no Power would wish to challenge. In time of war, however, sea power comes into play as a force to preserve the "freedom of the seas" for friendly interests and to make them perilous for enemy interests.

This force may operate in a variety of ways, the chief of which may be summarised as follows. (1) It may safeguard friendly shipping from attack on the most frequented or important sea routes. (2) It may deny the use of the sea to the enemy for the transport of armed forces and supplies which would enable him to invade friendly territory or carry on a campaign overseas. (3) It may deny the use of the sea to shipping which would directly or indirectly assist the enemy by conveying to him essential commodities for his people's existence as well as warlike materials in raw or manufactured form for his fighting forces. (4) It may enable a nation to exercise complete control of local waters for the purpose of effecting a landing in enemy territory or of securing the approaches to friendly harbours or to a fleet base.

All these are practical forms which sea power has assumed in time of war. The right to exercise it in full has often been disputed, and efforts have been made, notably by the Declaration of Paris of 1856, and by the unratified Declaration of London of 1909, to safeguard the interests of neutrals on the seas. But the World War showed that, actually, it is exceedingly difficult, if not impossible, to make fine distinctions between articles which are contraband and those which are non-contraband and between the nominal and real ownership of shipping conveying the former, and between the ports and firms to which goods are ostensibly consigned and their real and final destinations. War on such a scale involves the entire rival nations and not merely their armed forces; this means that all commodities which sustain a nation's resistance, whether they be essentially warlike or merely of use for civil comfort, will come to be regarded as contraband. From this it follows that sea power may be directed to cutting off all possible channels of supply.

Nevertheless this does not mean that, today, there can be no International Law relating to war at sea, no Courts of Appeal for the ill-used ship owner and no Prize Courts to adjudicate on what are and what are not good and proper prizes. Such is not the case. While, in a life and death struggle, a desperate nation may defy all international codes, as Germany did in the conduct of her submarine campaign (*q.v.*) in the World War, yet, there can be little doubt that adherence to the spirit of international usages in the application of sea power, as in that of all other forceful methods, will, in the long run, prove the best course for a belligerent to follow.

Under present day conditions the interdependence of nations

in regard to their economic interests is such that no community of people, however rich or powerful, can afford to regard itself as "above the law." Such an attitude must, eventually, call down the overwhelming condemnation of the greater part of the civilised world, and this condemnation is always liable to be translated into concerted action. Britain and her allies in the World War had very great difficulty in securing recognition of their need to interfere with the free shipment to their enemies of so-called non-contraband goods in neutral vessels. At the outset of the War it had not been recognised that "business as usual" on the high seas for friends and neutrals alike would mean that vital supplies would reach the enemy by devious routes. There can be no denying the fact that at one time, British traders themselves were, probably in most cases unwittingly, assisting to supply the enemy. At any rate it was not until the United States came into the war that the strain on international relations was relieved and sea power was applied to encompass the economic extinction of Germany and her Allies with a thoroughness and intensity such as has never been achieved before in the history of the world.

There can be very little doubt now that had the British Government of the day not enmeshed itself by pronouncing its intention to adhere to the impractical terms of the Declaration of London and had it enforced rigidly on British traders the restrictions which, subsequently, it desired neutrals to observe, that the enemy would have been weakened by being starved of essential supplies much sooner than was actually the case.

The British fleet, with the assistance of the naval forces of France, Italy and Japan, could have effectually controlled the flow of supplies through every continental port, whether neutral or hostile; but lack of comprehension of the needs of a modern war and of a clear-cut policy on the part of the Governments of Britain and her allies hampered the work of their navies and complicated international relations with neutrals.

Since the war, the whole subject has been regarded as too delicate to be allowed to obtrude itself into diplomatic discussions, especially at a time when there is a general demand for peaceful relations to be stabilised as much as possible. But it is very natural that nations should continue to study their interests on the seas and desire to feel that their sea-borne commerce and the ocean routes which link them with vital sources of supply are secure. It is this anxiety about security which produces a certain nervousness and an attitude savouring of suspicion when proposals are made for drastic reductions of navies. Every sea Power has its own maritime problems and until the millennium of universal trust arrives each will require a navy suitable both in composition and in size for its own particular needs. The British Empire, for instance, is a community of nations and peoples so scattered over the whole world that their mutual support and common interests demand the complete security of the long sea routes which knit them together. Sea power to safeguard these routes is not only vital to their well being but, in the case of the people of Britain itself, means nothing less than their very existence. It is indispensable, physically, because unless sea-borne supplies to the home country are assured her people would rapidly starve and the whole commercial life of the nation would cease. It is indispensable, economically, because Britain pays for her huge imports by her exports overseas and by her mercantile marine, which is the principal carrying agency on the oceans of the world. It is indispensable, politically, because sea communications are a potent factor in the cohesion of the Empire.

The Dominions owe their growing prosperity mainly to overseas trading. The consciousness of this fact is leading most of them to take an increasing part in bearing the burden of the cost of sea security. As yet, it is difficult for a community like the farmers in the Western Provinces of Canada, for example, to realize that sea power is anything more than a name to them. Certainly an appreciation of what it means and what it is worth will not be conveyed to them by rhetorical allusions to the glories of the past. Rather is it necessary to trace the course of the products of the land which they till from the time they leave the local wagon or lorry until they reach their final market on the opposite side of the Atlantic. Road and rail are safe because a force of police exists to deter any ill-disposed persons from interfering with them. The sea-police force which safeguards the Canadian farmer's wheat on passage is the British navy and it is only by reason of the security which it gives that he can be sure of receiving the fruits of his labours.

For the policing of the seas which wash the coast of British and Dominion territory and of the long ocean routes used by the mercantile marine, a large number of warships are indispensable. These vessels must be big enough to be able to withstand anything except abnormally bad weather and they must be powerful enough to be able to hold their own, in the event of war, against enemy ships of a type which might be sent to attack trade. This sea-police force is represented for the most part by the cruiser (*q.v.*) and sloop types. The present (1928) numerical superiority in units of the British navy is mostly made up of cruisers and their substitutes; but it is a mistake to think that such a superiority constitutes an excess of sea power or a threat to the interests and security of other nations. These units are to a great extent widely scattered over the oceans of the world and could only be united into one large force at grave risk to the sea security of the Empire as a whole. It is no exaggeration to say that it would be more difficult and more dangerous for the British and Dominions naval forces to be concentrated into one vast fleet to be used for aggressive purposes than it would be in the case of those belonging to any other naval power.

The United States has a great length of coast line (over 21,000 miles apart from the Great Lakes), a large and valuable tonnage of coastal shipping and a steadily increasing ocean-growing mercantile marine, all of which must be safeguarded. Already the U.S. navy is the equal of the British one in battleships, while it is very greatly superior numerically, in destroyers and submarines. It is not unnatural, and it is certainly not a matter which causes resentment or suspicion amongst well-informed British people, that the American nation should desire some expansion of their "sea-police types" as their sea-borne trade and American owned shipping increases.

France, Italy and Japan (*q.v.*) have their own problems which they solve in their own way so far as their financial limitations permit. The two former are, of course, most concerned with their interests in the Mediterranean and their communications with North Africa. To them a large battle fleet makes less appeal than numerous torpedo craft and submarines, but both nations adhere to the battleship as being the predominant surface warship, while both find it necessary to build new and powerful cruisers. Japan has a navy second only to those of the British Empire and the United States. Her maritime interests necessarily relate mainly to far eastern waters; her own defence and her trade in the China Seas and the Pacific.

So we can picture these five principal guardians of the oceans with their fleets balancing rather than challenging each other; their sea power centring in their main fleets, each with its quota of battleships, but radiating to the distant seas, where representative cruisers and lesser craft are wont to co-operate harmoniously, no matter what their nationality, in keeping the peace and rendering the seas safe for those who pass upon their lawful occasions.

To the student of history the influence which sea power has wielded in shaping the destinies of nations makes fascinating study. He will be able to trace the part which it played in the early struggles between Rome and Carthage and between the ancient Greeks and Persians; in the Peloponnesian War; in the extension westward of Mohammedan conquest; in the crusades and in the progress of the Italian Republics and of the Ottoman Empire; in the rise and fall of one-time great sea nations like Spain, Portugal and the Dutch. But most of all must he be struck by the history of the birth and growth of the British Empire and the part which sea power has played in promoting them.

He will find an exponent of the subject in as early a writer as Thucydides. But doubtless he will consider the works of Captain Mahan, U.S.N., particularly *The influence of sea power upon history, The influence of sea power on the French revolu-*

tion and empire and *Nelson: The embodiment of the sea power of Great Britain* to be more profitable studies. If, however, he would read the story of the most titanic struggle for sea power there has ever been and if he would realise all that victory at sea meant in the World War, let him turn to more recent works such as *The official history of the war—naval operations,* Winston Churchill's *World Crisis,* or Earl Jellicoe's *Grand Fleet* and *The Crisis of the Naval War.* (*See* also, WORLD WAR, NAVAL; SUBMARINE CAMPAIGN.)

In analysing the source of sea power it will not do to regard it as emanating solely from a fighting navy nor being dependent in scope and magnitude on the number and size of warships which a nation may acquire. Another important factor is the position and number of suitably placed bases for fuelling and refitting, as these are essential if naval influence is not to be confined to home waters or dependent on the goodwill of neutrals in time of war. (*See* NAVAL BASES.) But perhaps the most potent element from an economic point of view in all that goes to give a nation power on the seas, is its mercantile marine because this represents solid wealth in the commerce which is borne across the oceans day by day and year by year and in the value of the ships which carry it. Navies, bases and all the machinery which goes to make up the defence of a nation's sea interests exist for two main purposes: to deny the seas to those who would make use of them for aggression, and to safeguard the shipping which bears passengers and freight from shore to shore. Ultimately, therefore, sea power is manifested in the use to which a nation puts sea transport in furthering its business and developing its trade and in giving facilities to its nationals to travel.

Allusion was made earlier in this article to the phrase "sovereignty of the sea." At one time the Kings of England claimed the sovereignty or dominion of the seas surrounding the British Isles, and this was recognized for a long period as involving certain responsibilities as well as establishing certain rights. It was the general conviction of the chief maritime nations of those days that the Lord of the Sea would provide for policing the waters over which he exercised dominion. At a time when piracy was rampant this was recognized as being of very real importance to trade. In 1299 not only English merchants but also "the maritime people of Genoa, Catalonia, Spain, Germany, Zeeland, Holland, Fresia, Denmark, Norway and several other places of the Empire" declared that Kings of England had from time immemorial been in "peaceable possession of the sovereign lordship of the seas of England," and had done "what was needful for the maintenance of peace, right and equity for the people of all sorts, whether subjects of another kingdom or not, who passed through those seas." (S. K. Laughton, "Sovereignty of the Seas," Fortnightly Review, August 1866.)

"The English Sovereignty of the Seas" was not taken as authority to exact toll but a salute was expected as a form of acknowledgment of the more or less effective policing of the waters. But in the 17th century the Dutch objected to the demand for this salute and insistence upon it was one of the causes of the war which ensued. In the end that nation acknowledged by solemn treaty its obligation to render the salute, but the fact of the matter was that conditions had so changed that the whole system of "sovereignty of the seas" was out of date. There was not much piracy in the waters surrounding the British Isles and merchant vessels were generally able to look after themselves, while in the case of those belonging to other nations, their Governments always possessed means of affording the necessary protection. In 1805 Great Britain wisely gave up her claim to exact the salute, but the custom of dipping the ensign when passing still survives. British merchant shipping is in the habit of saluting British men of war in this fashion, doubtless in token of the protection which the latter afford them and as a mark of loyalty to the King's ships, and such salutes are promptly and punctiliously returned. Similarly warships of different nations passing each other are wont to salute mutually in like manner. Thus the old demand for recognition as the "sovereign of the seas" has now become a form of politeness which may be regarded as a "courtesy of the seas." (E. A.)

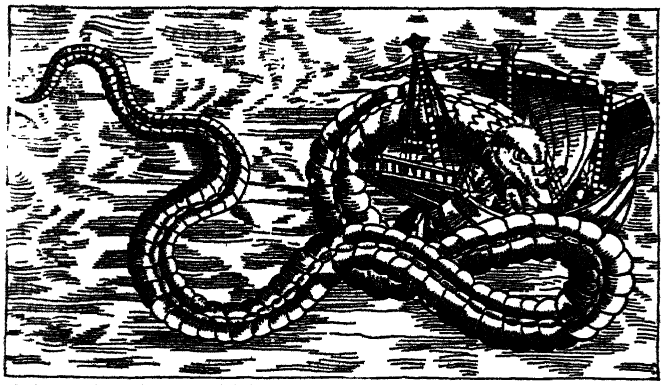
SEARS, ROEBUCK AND COMPANY, a large mail order house with executive offices in Chicago (Ill.), was founded by Richard W. Sears, who, about 1886, while a railroad agent in a small Minnesota town, began selling watches by mail, securing his customers through personal correspondence. His early venture proving very successful, Sears soon moved to Chicago to secure a more central situation for a business rapidly growing nation wide. There he joined forces with A. C. Roebuck and organized the Richard W. Sears Watch Company, which later was sold. Not long after they branched out in a more general line, constantly adding merchandise of varied character and steadily increasing sales. A corporation was formed under the name Sears, Roebuck and Company in 1893.

The first Sears's catalogue of general merchandise contained less than 300 small pages. In 1928 the current Sears's catalogue had more than 1,000 pages, $8\frac{1}{2} \times 11$in. and showed more than 35,000 items. These included an enormous variety of merchandise, comprising practically everything needed in the home or on the farm, including complete homes and complete farm buildings, with their entire equipment. In 1928, Sears, Roebuck and Company had ten complete mail order plants in various metropolitan centres of the United States. These were: Chicago (Ill.), Philadelphia (Pa.), Kansas City (Mo.), Boston (Mass.), Memphis (Tenn.), Atlanta (Ga.), Dallas (Tex.), Minneapolis (Minn.), Seattle (Wash.) and Los Angeles (Calif.). With each of these is incorporated a complete retail department store. In 1928 the company had 16 additional retail stores not connected with the mail order division, each carrying a full line of general merchandise. In 1928 the company had well over 11,000,000 customers on its books, filled more than 37,000,000 orders and was showing steady increase in both customers and sales. The gross sales for 1925 were more than $258,000,000; for 1926, above $272,000,000; for 1927 they were in excess of $290,000,000, and in 1928 they passed $319,000,000. (E. H. P.)

SEA-SERPENT. Enormous serpents, both terrestrial and marine, are subjects around which have arisen such an array of legends and stories that it is almost impossible to disentangle fiction from fact. So far as terrestrial snakes are concerned it seems fairly safe to assume that there are none in the few remaining unexplored parts of the world which greatly exceed in size those that are already known; in the depths of the sea, however, there may still be gigantic creatures of which we have no knowledge; and with this possibility, remote though it may be, in the background it is unwise to deny the existence of the sea-serpent. Up to the present no animal has been captured which has not on examination by competent persons proved to belong to a previously well-known group, and a large number of the well-authenticated stories of monstrous marine creatures seem to be explicable as incorrect observations, due to abnormal visual conditions or to ignorance, of animals already quite well-known. Some of the possible explanations which have been put forward may be mentioned:—(1) A number of porpoises swimming one behind the other and rising regularly to take breath might produce the appearance of a very large serpentiform creature progressing by a series of vertical undulations. (2) A flight of sea-fowl and a brood of ducks have been mistaken for a large snake swimming at the surface of the water. (3) Large masses of sea-weed half awash

have, on more than one occasion, been believed to be some gigantic animal. (4) Basking Sharks (*Cetorhinus maximus*) which have a habit of swimming in pairs one behind the other with the dorsal fin and the upper lobe of the tail just above the surface produce the effect of a body 60 or more feet long, and a partially decomposed specimen which was cast ashore was reported in all good faith as a sea-serpent. In the same category as Basking Sharks



FROM CHARLES GOULD, "MYTHICAL MONSTERS"

SEA SERPENT ATTACKING A VESSEL (AFTER A 16TH CENTURY WOODCUT)
This type of sea serpent, according to Olaus Magnus in "Histor. Septentrion." inhabited Norwegian coast waters where it occasionally would snap men from the deck of a vessel. It was 200 feet in length and 20 feet around

may be mentioned Tunnies (*Thynnus thynnus*), Porbeagles (*Lamna cornubica*) and Chimaeras (*Chimaera monstrosa*) which at various times have been incorrectly recorded by observers unfamiliar with them. (5) Ribbon or Oar Fishes (*Regalecus*) which attain a length of 20–30 feet and are snake-like in shape have been suggested as the possible explanation of some so-called sea-serpents, particularly of those reported from the Mediterranean where these animals are most common. (6) Nemertines, which may reach a length of 30–45 feet, have also been suggested as a possible explanation of some records. (7) Sea-Lions when breaking surface for breath might, if seen from an unfamiliar viewpoint or in a fading light be mistaken for much larger, snake-like animals. (8) Gigantic Squids (*Architeuthis*) are undoubtedly the foundation on which many accounts are based; these animals, which attain a total length of 50 feet, are sufficiently uncommon to be unfamiliar to the majority of people but do occasionally frequent those regions from which many accounts of sea-serpents have come, viz., Scandinavia, Denmark, the British Isles and the eastern coasts of N. America. One of these animals swimming at the surface with the two enormously elongate arms trailing along through the water would produce almost exactly the picture which many of the strangely consistent independent accounts require; a general cylindrical shape with a flattened head (=posterior end of the squid's body), appendages on the head and neck (=lateral fins and edge of mantle), colour dark, lighter beneath, progression steady and uniform, body straight but capable of being bent and spouting water (=water ejected from siphon). Further, Sperm Whales are known to kill and devour *Architeuthis* and similar cephalopods, and one of the most graphic accounts of the sea-serpent speaks of it as in conflict with a whale around which it had thrown two coils and which it ultimately dragged below the surface; actually it seems very probable that the whale was eating a giant squid whose tentacles, thrown round the whale in the struggle, were mistaken for the coils of a snake, and that the whale, so far from being dragged under, merely "sounded" with its prey in its mouth.

When, however, all these and similar possibilities have been explored, there still remain a number of independent and apparently credible stories which are not satisfactorily explained. To account for these, the continued existence of plesiosaurs or some other huge marine reptiles, usually believed to be extinct, has been advocated in the past. More recently Oudemans[1], who gives a very full account of the whole subject, has pointed out that the known characters of plesiosaurus do not in the least agree with the features described in the unexplained accounts of sea-serpents and has boldly suggested the existence of an undiscovered, long-tailed mammal allied to the seals and walruses. (H. W. P.)

[1]Oudemans, *The Great Sea Serpent* (1892).

SEA-SICKNESS, the symptoms experienced by many persons when subjected to the pitching and rolling motion of a vessel at sea. Identical symptoms are liable to occur in flying, and in some persons even in railway travelling. They generally show themselves, soon after the vessel has begun to roll, by giddiness, nausea and sinking at the stomach, which soon culminate in vomiting. With the sickness there are great physical prostration, pallor, cold sweats and feeble pulse, accompanied with mental depression and wretchedness. The condition depends upon disturbance of the balancing system contained in the semicircular canals (*see* EAR, ANATOMY OF) but visual, mental and olfactory impressions contribute.

No means has yet been discovered which can altogether prevent sea-sickness. Swinging couches or chambers have not proved of practical utility, nevertheless there is less risk of sickness in a large and well-ballasted vessel than in a small one. None of the medicinal agents proposed is infallible even in the same person on different occasions. Nerve sedatives, *e.g.*, bromide of potassium, acetanilide, bromural or chloral, appear to act usefully in many persons. On the other hand, some authorities have recommended nerve stimulants, such as a small cupful of very strong coffee, to be taken about two hours before sailing. The recumbent position and warmth, especially to the feet, often help; so soon as they can be taken small amounts of dry biscuit or toast and weak brandy and soda aid recovery. As a rule the individual is well again in 24 hours or less but in lengthened voyages sea-sickness may be so severe that the help of the ship's doctor is necessary. Even the ship's doctor is sometimes subject to sea-sickness.

See R. A. Bennett, "Sea-sickness and Its Treatment," *Brit. Med. Jour.*, 1928, 1,751.

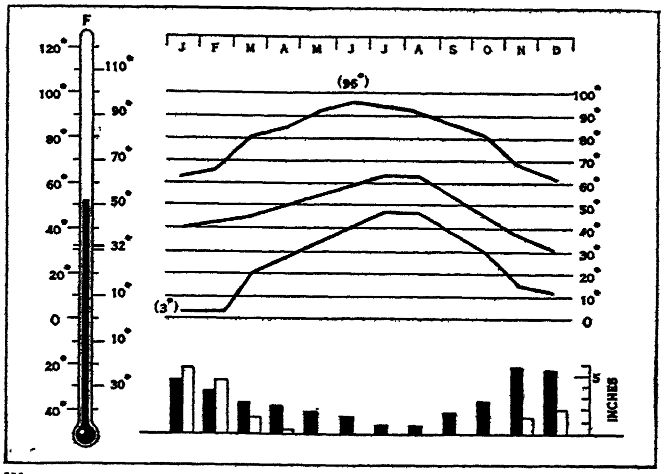
SEA-SQUIRT, the common name for the Tunicata (*q.v.*), animals representing a degenerate off-shoot of the vertebrate stem. The sac-like adults live fixed to rocks or other substrata, but, in the more typical cases, have a free-swimming larva which reveals their affinities by its possession of a dorsal, hollow central nervous system, gill-slits and notochord; the first and last of these are lost on metamorphosis.

SEATTLE (sē-ăt'ĕl), the chief city of Washington, U.S.A., situated on a neck of land between Elliott bay (Puget sound) and the freshwater Lake Washington; 125 nautical miles from the Pacific ocean, 140 m. S. of the Canadian border, 965 m. by water N. of San Francisco, and 2,200 m. by rail from Chicago; a port of entry, headquarters of the Washington customs district, the county seat of King county, the largest city of the Pacific Northwest, and the largest city of its age in the world. It is on Federal highways 10 and 97 and the Pacific Coast air-mail route; is served by the Chicago, Milwaukee, St. Paul and Pacific, the Great Northern, the Northern Pacific and the Union Pacific railways, has through train service over the Burlington Route and the Southern Pacific Lines, and has connection through both boat and train service at Vancouver, B.C., with the Canadian Pacific railway; and is the terminus or a port of call for numerous lines of steamers with sailings across the Pacific ocean, to Alaska and California, and through the Panama Canal to eastern American and European ports. It is the centre of interurban trolley and motor-coach lines, and of the "mosquito fleet" of steamers serving the 2,000 m. of Puget Sound shores. The population (1920) was 315,312 (113·5 males to 100 females), of whom 80,976 were foreign born, including 6,016 Japanese; and was 365,583 by the Federal census in 1930.

Seattle is situated on a series of hills above its fine harbour (reaching a maximum of 500 ft. above sea-level), in surroundings of great natural beauty. To the west, across Puget Sound, rises the jagged sierra of the Olympics. The eastern boundary of the city is Lake Washington (27 m. long), backed by the Cascade range. To the south rises snow-capped Mount Rainier. Within the city are Union and Green lakes, the latter bordered by a public park. The area of the city includes 68·5 sq.m. of land and 36 sq.m. of water.

The outer (salt water) harbour measures 5 m. across from

West Point on the north to Alki Point on the south, and includes the East, West and Duwamish Waterways, extending inland on the south side of the bay; Smith Cove, on the north side; and Shilshole bay, the western outlet of the Lake Washington Ship Canal, north of West Point. The ship canal (8 m. long, with a minimum depth of 26 ft.) connects Puget Sound with the fresh-water harbour, Lake Washington, passing through Lake Union.



WEATHER GRAPH OF SEATTLE. THE MERCURY INDICATES THE NORMAL ANNUAL MEAN TEMPERATURE, THE CENTRE CURVE SHOWS THE NORMAL MONTHLY MEAN TEMPERATURE AND THE CURVES ON EITHER SIDE THE LOWEST AND HIGHEST RECORDED EACH MONTH. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION, THE SHADED PART SIGNIFYING TOTAL PRECIPITATION, THE WHITE PART, SNOWFALL

The locks near the west end of the canal, which overcome the difference of 16 ft. between sea and lake levels, accommodate ships 780 ft. long. Elliott Bay proper, where the greater part of the shipping is concentrated, lying between Magnolia Bluff on the north and Duwamish Head on the south, has an entrance width of 2·5 m., a shore line of 9·7 m., and a surface area of 3,800 ac., and is very deep and free from natural obstructions or dangers throughout its entire extent. Harbour development and administration of public terminal facilities are in the hands of a public corporation called "the Port of Seattle," created in 1911 by the people of Seattle and King county, and administered by a board of elected commissioners. Under its jurisdiction harbour facilities were developed by 1928 to a value of $15,000,000, and included terminal wharves, transit sheds, waterside warehouses, cold-storage plants, grain elevators and tanks for vegetable and fuel oils.

Along the water front the hills have been graded down to give a comparatively level area for the business district. This is built up with many large and substantial hotels, public buildings (some of them grouped around a civic centre), the fine public library (1905), and high business buildings (one of them 42 stories high), most of which have been erected since the World War. Beyond this narrow strip rises a succession of heights, crowned with residential districts commanding fine views, and reached by cable railways or by electric lines ascending by winding routes. There are 35 m. of boulevard (skirting the sound and the three lakes and following the high ridges), 44 parks and 24 playgrounds, with an aggregate area of 1900 acres. The 582 ac. campus of the University of Washington, lying between Lakes Union and Washington, with a shore line on both, and the fine grounds of Ft. Lawton (605 ac., given to the Federal Government by the city) are practically additions to the city's park system. The climate is moderate, favourable to industry and to health, and encouraging outdoor recreation the year round. The extremes of temperature on record are 3° and 96° F. The average annual precipitation is 34 in., distributed through all 12 months, but two-thirds falling in the winter months October to March. The average wind velocity is 7·4 m per hour (compared with 17 m. in New York city). The death rate is low.

The city is governed under a charter of 1896, with various amendments, one of which (1908) provides for initiative and referendum petitions. The mayor is elected every two years. The city council is composed of nine members, elected at large for a one-year or a two-year term. The city owns its street railway, water-supply and hydro-electric generating and distributing systems. The water supply is obtained from the Cedar river, and is stored in reservoirs with a capacity of 300,000,000 gal., in the Cascade mountains, 26 m. S.E. In 1911 the city took its first step towards acquiring the street railways, and by 1928 it owned 235 m. of track out of the total of 265 miles. The municipal light and power plant built up its patronage, against determined opposition from the private companies in the city, until by 1928 it was serving 80% of all the customers. A zoning ordinance was adopted in 1923. The assessed valuation of property for 1928 was $288,882,721. Building permits in the nine years following the World War represented values averaging $23,000,000 per year. The percentage of home ownership is high. The public school system includes 82 grade and special schools and 9 high schools. Attendance in the higher grades is unusually large, and the percentage of illiteracy in the general population is very low. The public library maintains ten stations, and has a total circulation of over 2,000,000 volumes per year. The city has a cosmopolitan press, including two Japanese dailies and a Swedish weekly.

Seattle is the leading commercial, industrial and financial centre of the Pacific North-west. Its geographical position (the nearest United States port to the Orient, and the nearest large city of the United States to Alaska) makes it a natural receiving and distributing point for trans-Pacific and Alaska traffic, and the Panama Canal gives easy access to Atlantic and Gulf markets; while the products of its tributary territory and its own manufactures supply staple articles for outgoing freight. About 80% of the mail moving across the Pacific is handled in Seattle. The traffic of the port in 1927 amounted to 8,544,910 tons, valued at $705,255,761, of which $251,203,678 represented imports from foreign countries, $398,283,008 exports, and $55,769,075 domestic coastwise receipts and shipments. The Washington customs district, of which Seattle is the headquarters, ranked first in 1927 among the Pacific Coast districts in value of imports, and third (after New York and Boston) among all the customs districts of the country. Raw silk (valued at $223,789,870 in 1925) constitutes nearly 80% (according to value) of all the imports entering through the port of Seattle, and this is about 80% of the total amount of raw silk imported into the country. Other imports of consequence are coffee and tea, rice, vegetable oils, porcelain and silk goods. Exports consist largely of tobacco and cigarettes, raw cotton, lumber products, canned salmon, flour and machinery. Every State in the Union and almost every Canadian province contributes to the foreign commerce of Seattle, but the great bulk of the exports come from the north-western States and the south-western cotton-producing States (Oklahoma, Texas, Arkansas and Louisiana). Seattle is the principal outfitting point for the whaling industry and the fisheries of the North Pacific, the principal trading centre for Alaska, and the principal supply point and wholesale market for the 300 logging camps of Washington and the agricultural North-west in general. Cheap electric power, combined with abundant raw materials of certain kinds and distance from the older industrial centres, has stimulated manufactures, and in 1927 the city had 1,154 plants, representing an investment of more than $120,000,000 and producing goods valued at $168,032,381. Seattle is the seat of a branch of the Federal Reserve Bank of the 12th district. Debits in the local banking institutions amounted in 1927 to $2,615,826,000.

Seattle was founded in 1852 by 21 white settlers who had arrived at Alki Point the preceding year, and was named after a friendly Indian chief (d. 1866). In 1853 a town plat was filed, King county was created, and Seattle became the county seat. By 1855 it had a population of 300. In Jan. 1856, it was attacked by neighbouring Indians and successfully defended by the U.S. sloop-of-war "Decatur." Growth was slow at first. The city was incorporated in 1869, with an area of 10·86 sq. miles. In 1870 the population was 1,107, and in 1880 only 3,533. The first railroad (the Northern Pacific) reached the city in 1884, and by 1890 the population had increased to 42,837, though a destructive

fire had in 1889 burned down most of the buildings. Seattle was still a little-known lumbering town when in 1897 the discovery of gold in Alaska and the Yukon Territory changed it almost overnight into an important commercial centre, the outfitting point for prospectors, and the port to which they shipped their gold; and by 1900 the population was 80,671. The arrival of the first steamer from the Orient in 1896, marked the beginning of considerable foreign trade, and in 1910 the Union Pacific and the Milwaukee railroads were connected with Seattle. In 1909–10 the Alaska-Yukon-Pacific Exposition was held, on grounds which are now part of the university campus. Between 1905 and the close of 1910 ten adjacent cities and towns were brought within the city limits, and in 1910 the population was 237,194. The opening of the Panama Canal in 1914 gave a new stimulus to the city's commerce, and the years of the World War, when Seattle built more ships than any other port of the United States, were a period of rapid and hectic growth. The average number of wage-earners in the city's manufacturing establishments rose in five years (1914 to 1919) from 11,523 to 40,843; the value of the output, from $64,475,000 to $274,431,000. Since the first incorporation of the city in 1869 successive annexations of territory have increased its area about sevenfold.

SEA-URCHIN, any animal belonging to the Echinoidea, a class of Echinoderma (*q.v.*). The simplest living forms are the Cidaridae (*Cidaris*, "jewelled tiara"). In them the test when denuded of prickles, which thickly cover its surface, is of flattened turban shape, beautifully ornamented with tubercles. The test is built of thin but solid plates closely united. It is divided into five parts by five double columns of smaller plates, and to each of these plates is attached an extensile tube (podium, or "little foot") connected through two holes in the plate with the hydraulic system inside the test. These double columns are called ambulacra ("garden walks"). The five portions of the test between them are the interambulacra, and each is composed of larger plates, also arranged in double alternating columns. The terminal plate at the upper end of each ambulacrum is pierced with a pore for a sensitive papilla, and is termed an "ocular," because in sea-stars the corresponding plate bears an eye. Between the oculars and at the top of the interambulacra are five larger plates, each pierced with a pore for the extrusion of the generative products; they are therefore termed "genitals." One of the genital plates has also many small pores leading to the hydraulic system, and is termed the "madreporite." Within the circlet formed by these ten plates is a finely-plated membrane through which opens the vent. On the under side of the test is a larger circular space covered with membrane, in the centre of which is the mouth. The pore-plates of the ambulacra pass over the membrane to the edge of the mouth.

Each interambulacral plate bears a large tubercle, set in a circlet of smaller tubercles. Each main tubercle bears a long prickle or "radiole," attached to it by a socket and a covering of muscles, which can move the radiole in any direction. The joint is protected by flattened prickles or radioles attached to the smaller tubercles. Prickles also protect the various pores and the delicate organs issuing from them. This species is dredged at depths of 50 to 1,800 metres along the east coast of the Atlantic, and Scottish fishermen call it the piper, from the resemblance of its long radioles to the drones of a bagpipe.

Projecting from the mouth of a *Cidaris* are five pointed teeth; these are long, curved and chisel-ended, and are supported by a frame-work of 30 bones, with the necessary muscles, forming a five-sided structure which Aristotle compared to a ship's lantern. From the top of the lantern rises the gut, which passes in a looped curve round the inside of the test till it reaches the vent. Inside the test are also the five double rows of hollow balls connected with the podia (*see* ECHINODERMA, fig. 7), and in the interspaces the five genital glands. The suckers of the podia are poorly developed, and are chiefly used as feelers when the animal walks about in search of food; because they have no gripping power, *Cidaris* is not found in waters disturbed by waves and currents. *Cidaris* usually moves by using the large radioles as stilts. It can climb over obstacles, and has even been seen to swarm up a glass rod by grasping it with the curved and serrate radioles round the mouth; it uses these also to seize its prey. Though the small prickles protect the openings in the test, the true defensive organs are its pedicellariae, scattered over the test between the prickles. These are like little pincers, each having three teeth at the end of a flexible stalk, and each tooth with a poison-gland. Pedicellariae are found in all sea-urchins, but differ in size and shape according to the genus. Besides gripping and poisoning enemies and prey, pedicellariae clean the test from particles of dirt, and in some shallow-water urchins they hold bits of sea-weed on the upper surface of the test to hide it.

The most familiar British echinoid is the egg-urchin, *Echinus esculentus* (ECHINODERMA, fig. 3), which owes its name to the fact that the ripe ovaries are eaten, both raw and cooked. Essentially a shore-dweller, it grips the sea-weed with its podia, which have well-developed suckers and are far more numerous than in *Cidaris;* E. Forbes estimated their number as 1,860. To accommodate them, the number of plates in the test is increased, and the ambulacral plates are crowded, so that the pore-pairs are arranged in oblique groups of three on each side of the avenue, instead of in single rows as in *Cidaris*. The prickles are all short, and locomotion is effected mainly by the podia; the animal can also drag itself along by its teeth.

The purple egg-urchin (*Paracentrotus lividus*), which ranges from the south of the British Isles to the Azores and into the Mediterranean, lives among *Zostera* leaves and on rocky shores in holes which it bores in the rocks. Some of the turban-urchins (*Diadema*), which live on rocky bottoms in smoother water, have very long thin prickles, which can pierce the stoutest boot; some of these urchins have organs sensitive to light and shade, so that they quickly direct their prickles to the point of danger. Reef-dwelling urchins exposed to the surf have their prickles thickened and crowded, and sometimes the ends are expanded like parasols to form a complete outer covering.

In some deep sea-urchins, as in most of those that lived in early ages, the test is flexible, and in one of them the podia are protected by sharp prickles each bearing a poison-gland. These and all previously mentioned are of regular five-rayed symmetry. Many urchins that have taken to live in sand or mud are irregular. In them the mouth tends to move forward, and to become wide, with projecting under-lip; the vent moves from the top to the hinder end of the test; the prickles are fine and directed backwards; the podia of the upper surface subserve respiration and are concentrated in five petal-shaped areas. Among such forms are the shield-stars or cake-urchins (*Clypeaster*), which live just below the surface of the sand, and use their reduced teeth for shovelling sand, with its small animals, into the mouth. The sand-dollars (*Scutella*) are thin and flat, and in some the test grows out like the spokes of a wheel (*Rotula*). More familiar are the heart-urchins, such as the common *Echinocardium cordatum* (ECHINODERMA, fig. 19), which lives at the bottom of a burrow and has the podia of its front ambulacrum modified so that they can be stretched right up the tube of the burrow to collect food.

The position of sea-urchins in the Economy of Nature has been mentioned in ECHINODERMA (*q.v.*).

BIBLIOGRAPHY.—Besides works mentioned under ECHINODERMA, a specialist work is H. L. Clark, *Catalogue of the Recent Sea-urchins in the British Museum* (1925); an illustrated popular account is in *Animals of all Countries* (1924). (F. A. B.)

SEA-WOLF, SEA-CAT or **WOLF-FISH** (*Anarrhichas*), a marine fish, the largest of the blenny group (*see* BLENNY). The body is long, subcylindrical in front, compressed in the tail region, smooth and slippery, with rudimentary scales embedded in the skin. An even dorsal fin extends the whole length of the back, and a similar fin from the vent to the caudal fin, as in blennies. The pectorals are large and rounded, the pelvic fins entirely absent. Both jaws are armed in front with strong conical teeth, and on the sides with two series of large tubercular molars, a double band of similar molars occupying the middle of the palate. By these teeth the sea-wolf is able to crush the hard carapaces or shells of the crustaceans and molluscs on which it feeds. It is doubtful if it deserves the character of ferocity often attributed

to it. Sea-wolves inhabit the northern seas of both hemispheres, one (*A. lupus*) being common on the coasts of Scandinavia and North Britain, and two in the seas round Iceland and Greenland. Two others occur in corresponding latitudes in the North Pacific. They attain a length of over 6ft., and in the north are esteemed as food, both fresh and preserved. The oil extracted from the liver is said to be in quality equal to the best cod-liver oil.

SEAWRACK, the detached seaweeds thrown up, often in great quantities, by the sea and used for manure, also formerly for making kelp. It consists largely of species of *Fucus*—brown seaweeds with flat branched ribbon-like fronds, characterized in *F. serratus* by a saw-toothed margin and in *F. vesiculosus,* another common species, by bearing air-bladders. Also of *Zostera marina,* so-called sea-grass, a marine flowering plant with bright green long narrow grass-like leaves. (*See* EEL-GRASS.)

SEBASTIAN, ST., a Christian martyr whose festival is celebrated on Jan. 20. According to St. Ambrose (in Psalm 118, oct. 20) Sebastian was a native of Milan, went to Rome at the height of Diocletian's persecution, and there suffered martyrdom. The *Acta* of St. Sebastian, falsely attributed to the same St. Ambrose, are far less sparing of details. They make him a citizen of Narbonne and captain of the first cohort under the emperors Diocletian and Maximian. He made many converts, several of whom suffered martyrdom. Diocletian remonstrated with him, but, finding him inflexible, ordered him to be bound to a stake and shot to death. After the archers had left him for dead, a devout woman, Irene, came by night to take his body away for burial, but, finding him still alive, carried him to her house, where his wounds were dressed. No sooner had he wholly recovered than he hastened to confront the emperor, who ordered him to be instantly carried off and beaten to death with rods. The sentence was forthwith executed, his body being thrown into the *cloaca,* where, however, it was found by another pious matron, Lucina, whom Sebastian visited in a dream, directing her to bury him *ad Catacombas juxta vestigia apostolorum.* It was on this spot, on the Appian way, that was built the basilica of St. Sebastian, which was a popular place of pilgrimage in the middle ages. The translation of his relics to Soissons in 826 made that town a new centre of his cult. St. Sebastian is specially invoked against the plague. As a young and beautiful soldier, he is a favourite subject of sacred art, being most generally represented undraped, and severely though not mortally wounded with arrows.

See *Acta Sanctorum,* January, ii. 257–296; *Bibliotheca hagiographica Latina* (Brussels, 1899), n. 7,543–7,549; A. Bell, *Lives and Legends of the Evangelists, Apostles and other early Saints* (London, 1901).

SEBASTIAN, king of Portugal (Port, *Sebastião*) (1554–1578), the posthumous son of Prince John of Portugal and of his wife, Joanna, daughter of the emperor Charles, was born in 1554, and became king in 1557, on the death of his grandfather John III. of Portugal. During his minority (1557–68), his grandmother Queen Catherine and his great uncle the Cardinal Prince Henry acted jointly as regents. Sebastian was a mystic and a fanatic, whose sole ambition was to lead a crusade against the Mohammedans in north-west Africa. He entrusted the government to the Jesuits; refused either to summon the Cortes or to marry, although the Portuguese crown would otherwise pass to a foreigner, and devoted himself wholly to hunting, martial exercises and the severest forms of asceticism. His first expedition to Morocco, in 1574, was little more than a reconnaissance; in a second expedition Sebastian was killed and his army annihilated at Al Kasr al Kebir (Aug. 4, 1578). Although his body was identified before burial at Al Kasr, reinterred at Ceuta, and thence (1582) removed by Philip II. of Spain to the Convento dos Jeronymos in Lisbon, many Portuguese refused to credit his death. "Sebastianism" became a religion. Its votaries believed that the *rei encuberto,* or "hidden king," was either absent on a pilgrimage, or, like King Arthur in Avalon, was awaiting the hour of his second advent in some enchanted island.

Four pretenders to the throne successively impersonated Sebastian; the first two, known from their places of birth as the "King of Penamacor" and the "King of Ericeira," were of peasant origin; they were captured in 1584 and 1585 respectively. The third, Gabriel Espinosa, was a man of some education, whose adherents included members of the Austrian and Spanish courts and of the Society of Jesus in Portugal. He was executed in 1594. The fourth was a Calabrian named Marco Tullio, who knew no Portuguese; he impersonated the "hidden king" at Venice in 1603 and gained many supporters, but was ultimately captured and executed. The Sebastianists had an important share in the Portuguese insurrection of 1640, and were again prominent during the Miguelite wars (1828–34). At an even later period Sir R. F. Burton stated that he had met with Sebastianists in remote parts of Brazil (Burton, *Camoens,* vol. i. p. 363, London, 1881), and the cult appears to have survived until the beginning of the 20th century, although it ceased to be a political force after 1834.

See PORTUGAL, *History;* J. Barbosa Machado, *Memorias para . . . . . o governo del rey D. Sebastião* (4 vols., Lisbon, 1736–41); Miguel d'Antas, *Les Faux Don Sébastien* (1866); São Mamede, *Don Sébastien et Philippe II* (1884).

SÉBASTIANI, HORACE FRANÇOIS BASTIEN, COUNT (1772–1851) French marshal and diplomatist. Of Corsican birth, he was in his early years banished from his native island during the civil disturbances, and in 1789 he entered the French army. In 1793, as a French lieutenant, he took part in the war in Corsica, serving later in the Army of the Alps. He became *chef de brigade* in 1799. Attached to the future Emperor Napoleon, he took part in the *coup d'état* of 18th Brumaire (Nov. 9, 1799). He was present at Marengo in 1800. Sébastiani next appears in his first diplomatic post, in Turkey and Egypt (1802). Promoted general of brigade in 1803, he served in 1805 in the first of the great campaigns of the Empire. At Austerlitz he was promoted (Dec. 2) general of division. As French ambassador at Constantinople he induced the Porte to declare war on Russia; as a soldier he directed the defence of Constantinople against the British squadron. But the deposition of the Sultan Selim III. put an end to French diplomatic success. Sébastiani was recalled in April 1807, and made count of the empire. He commanded a corps in the Peninsular War, but his cavalry genius did not shine in the laborious and painful operations against the careful English and the ubiquitous *guerrilleros.* In the *grande guerre* of Russia and Germany he did brilliant service. He accepted the Restoration government in 1814, but rejoined Napoleon on his return from Elba. After Waterloo he retired into England for a time. From 1819 he was a prominent member of the Chamber of Deputies. He held the posts of minister of marine, and later of foreign affairs and was the author of the historic saying "Order reigns at Warsaw." He became consecutively minister of state without portfolio (1832), ambassador at Naples (1833), and ambassador to Great Britain (1835–40). On his retirement he was made marshal of France. He died in Paris on July 21, 1851.

See E. Driault, *La Politique orientale de Napoléon: Sébastiani et Gardane* (1905).

SEBASTIANO DEL PIOMBO (1485–1547), Italian painter of the Venetian school, was born at Venice in 1485. His family name was Luciani. At first a musician, chiefly a soloplayer on the lute, he soon showed a turn for painting, and became a pupil of Giovanni Bellini and afterwards of Giorgione. His first painting of note was done for the church of San Giovanni Crisóstomo in Venice. It represents Chrysostom reading aloud at a desk, a grand Magdalene in front, and two other female and three male saints. Towards 1511 Sebastiano was invited to Rome by the wealthy Sienese merchant Agostino Chigi, and came under the powerful influence of Michelangelo.

Four leading pictures which Sebastiano painted in pursuance of his admiration for Buonarroti are the "Pietà" (earliest of the four), in the church of the Conventuali, Viterbo; the "Transfiguration" and the "Flagellation," in the church of S. Pietro in Montorio, Rome; and, most celebrated of all, the "Raising of Lazarus," now in the National Gallery, London. This grand work is more than 12 by 9 ft. in dimensions, with the principal figures of the natural size; it is inscribed "Sebastianus Venetus faciebat," and was transferred from wood to canvas in 1771.

It was painted in 1517–1519 for Giulio de' Medici, then bishop of Narbonne, afterwards Pope Clement VII.; and it remained in Narbonne cathedral until purchased by the duke of Orleans early in the 18th century—coming to England with the Orleans gallery in 1792. How much of the design is directly due to Michelangelo is a matter of speculation. Among other important works are "The Holy Family" in the National Gallery and in the Naples Museum; "the Visitation" in the Louvre (1521); the "Martyrdom of St. Agatha" (1520) in the Pitti, Florence; and the "Birth of the Virgin" a late work, in S.M. del Popolo, Rome.

After the elevation of Giulio de' Medici to the pontificate, the office of the "piombo"—that is, the office of sealer of briefs of the apostolic chamber—became vacant; two painters competed for it, Sebastiano Luciani and Giovanni da Udine. Sebastiano, assuming the habit of a friar, secured the very lucrative appointment—with the proviso that he should pay out of his emoluments 300 scudi per annum to Giovanni. If he had heretofore been slow in painting, he now became supine in a marked degree. One of the few subject-pictures which he executed after taking office was "Christ carrying the Cross" for the patriarch of Aquileia, also a "Madonna with the body of Christ." The former painting is done on stone, a method invented by Sebastiano himself. He likewise painted at times on slate—as in the instance of "Christ on the Cross," now in the Berlin gallery, where the slate constitutes the background. In the same method, and also in the same gallery, is the "Dead Christ supported by Joseph of Arimathea, with a weeping Magdalene"—colossal half-length figures. Late in life Sebastiano had a serious disagreement with Michelangelo with reference to the Florentine's great picture of the "Last Judgment." Sebastiano encouraged the pope to insist that this picture should be executed in oil. Michelangelo, determined upon nothing but fresco, replied to his holiness that oil was only fit for women and for sluggards like Friar Sebastian; and the coolness between the two painters lasted almost up to the friar's death, which took place in Rome in 1547.

Numerous pupils sought training from Sebastiano del Piombo; but, owing to his dilatory and self-indulgent habits, they learned little from him, with the exception of Tommaso Laureti. Sebastiano was celebrated as a portrait painter: the likeness of Andrea Doria, in the Doria Palace, Rome, is one of the most renowned. In the National Gallery, London, are also two fine specimens.

See F. Propping, *Die künstlerische Laufbahn des Sebastiano del Piombo* (Leipzig, 1892); E. Bonhard, *Die Venezianische Frühzeit des Sebastiano del Piombo* (Heidelberg, 1907); G. Bernardini, *Sebastiano del Piombo* (Bergamo, 1908); B. Berenson, *Drawings of Florentine Painters* (1904).

SEBORRHOEA, a medical term applied to accumulation on the skin of the normal sebaceous secretion with formation of scales or a distinct incrustation. Often the condition is associated with eczema. On the head, where it is commonly seen, it may interfere with the nutrition of the hair and cause partial baldness. A form of this disease occurs in young infants. The main treatment consists in thoroughly cleansing the parts. In uncomplicated Seborrhoea the crusts may be softened with oil and the affected skin regularly washed with soft soap and rectified spirit. Sebum frequently accumulates in the sebaceous ducts, giving rise to the minute black points often noticed on the face, back and chest in young adults, to which the term *comedones* is applied.

SECAUCUS, a town of Hudson county, New Jersey, U.S.A., 3 m. N. of Jersey City; served by the Erie and the Lackawanna railways. Pop. (1920) 5,423 (36% foreign-born white); 1930 Federal census 8,950. It has embroidery and button factories, nurseries, and market gardens. The borough of Secaucus was formed in 1900 from part of North Bergen and in 1917 it was incorporated as a town.

SECESSION, a term used in political science to signify the withdrawal of a State from a confederacy or composite State, of which it had previously been a part; and the resumption of all powers formerly delegated by it to the Federal Government, and of its status as an independent State. To secede is a sovereign right; secession, therefore, is based on the theory that the sovereignty of the individual States forming a confederacy or Federal union has not been absorbed into a single new sovereignty. Secession is a right claimed or exercised by weaker States of a union whose rights are threatened by the stronger States, which seldom acknowledge such a principle. War generally follows the secession of a member of a union, and the seceding State, being weaker, is usually conquered and the union more firmly consolidated.

Secession in theory and practice is best exhibited in the history of the United States. Most of the original States, and many of the later ones, at some period when rights were in jeopardy proclaimed that their sovereignty might be exercised in secession. The right to secede was based, the secessionists claimed, upon the fact that each State was sovereign, becoming so by successful revolution against England; there had been no political connection between the Colonies; the treaty of 1783 recognized them "as free, sovereign and independent States"; this sovereignty was recognized in the Articles of Confederation, and not surrendered, they asserted, under the Constitution; the Union of 1787 was really formed by a secession from the Union of 1776–87. New States claimed all the rights of the old ones, having been admitted to equal standing. Assertions of the right and necessity of secession were frequent from the beginning; separatist conspiracies were rife in the West until 1812; various leaders in New England made threats of secession in 1790–96 and 1800–15—especially in 1803 on account of the purchase of Louisiana, in 1811 on account of the proposed admission of Louisiana as a State, and during the troubles ending in the War of 1812. Voluntary separation was frequently talked of before 1815. In 1832–33 the "Union" Party of South Carolina was composed of those who rejected nullification, holding to secession as the only remedy; and from 1830 to 1860 certain radical abolitionists advocated a division of the Union. But as the North grew stronger and the South in comparison grew weaker, as slavery came to be more and more the dominant political issue, and as the South made demands concerning that "peculiar institution" to which the North was unwilling to accede, less was heard of secession in the North and more in the South. Between 1845 and 1860 secession came to be generally accepted by the South as the only means of preserving her institutions from the interference of the North. The first general movement toward secession was in 1850. In 1860–61, when the Federal Government passed into the control of the stronger section, the Southern States, individually, seceded and then formed the Confederate States, but in the war that followed they were conquered and forced back into the Union.

See Jefferson Davis, *Rise and Fall of the Confederate Government* (1881); A. H. Stephens, *Constitutional View of the War between the States* (Philadelphia, 1868–70); J. Hodgson, *Cradle of the Confederacy* (Mobile, 1876); B. Samuel, *Secession and Constitutional Liberty* (1920); B. J. Burgess, *Political Science and Comparative Constitutional Law* (1895), and C. E. Merriam, *American Political Theories* (1902). *See* also STATE RIGHTS; NULLIFICATION; and CONFEDERATE STATES. (W. L. F.)

SECONDARY EDUCATION. The word secondary is used in contradistinction to primary or elementary both in England and America to describe a system above that of elementary standard.

ENGLAND AND WALES

The term secondary was first used by Matthew Arnold, who adopted it from French education, to indicate that grade of general education which lies between the elementary or preparatory school and the university. His famous cry, "organize your secondary education," marks the beginning of a movement which led to the appointment of the Bryce Commission on secondary education and eventually to the acts of 1902 and 1918. Before 1902 this kind of education had been carried on by the public schools (*q.v.*), by little local grammar schools or schools of nonconformist foundation, together with a certain number of recently founded schools, due to private initiative or public spirited societies like the Girls' Public Day School Company, supplemented to some extent by more or less efficient private ventures. The most that local authorities could do was to make grants to existing schools. It was not till after 1902 that they were able to build schools of their own. Henceforth the move has been one of steady progress, aided by the liberal scholarship schemes estab-

lished by local authorities, and further stimulated from 1907 onwards by the provision, as a condition of receiving grants from the Board of Education, of free places for pupils from elementary schools (normally 25% of the entrants, but since 1926 often higher). In the ten years ending 1914–15 the number of schools on the grant list in England and Wales rose from 575 to 1,047, and the number of pupils per 1,000 of the population from 2·9 to 5·5; moreover the average size of the schools has shown a remarkable increase. In 1908–09, 64 out of 912 schools had less than 50 pupils; at the present time not more than 7% of the total have less than 100. The free place system greatly helped the efficiency of the schools; it was largely responsible, especially through the establishment of intermediate scholarships at 15–16, for raising the standard of work up to and beyond the matriculation stage, and through the fixing of age limits for scholarships and free places it helped to bring about a general standardization of the age of entry; and this affected both the leaving age and the length of school life.

The number of schools in which a considerable amount of sixth form work is done has increased steadily, and though the economic conditions which tend to the premature withdrawal of boys and girls from school are slow to change, there has been a steady improvement in this respect; the average school life of boys rose from two years and seven months in 1908–09 to three years and nine months in 1926–27, and that of girls in the same period from two years and seven months to three years and ten months, while the average leaving age rose in the case of boys from 15·5 to 16·3, and in the case of girls from 15·11 to 16·4.

Most of this development, however, belongs to the period beginning in 1914. Within a few months after the beginning of the World War, it became evident that there was an astonishing increase in the demand for secondary education. This demand persisted all through the war and shows no sign of general diminution; it has shown itself not merely in the increase in the numbers applying for admission to secondary schools but even more in the support given to important educational measures.

As to the schools, the numbers on the grant list for England and Wales in 1926–27 were 1,319 (487 boys', 467 girls' and 365 mixed schools), containing 196,289 boys and 175,204 girls; the number of pupils per 1,000 of population, which in 1904–05 had been no more than 2·9 (1·9 boys, 1·0 girls), was now 9·5 (5·0 boys, 4·5 girls); between 1908 and 1926 the number of boys proceeding to universities increased from 695 to 2,057, and the number of girls from 361 to 1,312. Besides the schools on the grant list, the Board of Education has now recognized as efficient after inspection 326 public and private secondary schools and 108 private preparatory schools. The number of free place pupils rose from 57,933 (32·1 of the total numbers) in 1914–15 to 131,309 (37·6 of the total numbers) in 1927–28.

Financial Aspects.—This expansion entailed a great increase in expenditure from both rates and taxes; since, though fees have been generally raised by about 50%, there are few schools on the grant list in which any pupil's fees cover as much as half the cost of his education. The Board's grant was increased from £5 per pupil over 12 to £7 in 1917, and special grants were made for advanced courses; finally the Act of 1918 repealed the twopenny limit on rate aid to higher education, and also provided that the State contribution should be not less than one-half of the local education authority's approved expenditure.

Status of Teachers.—A great improvement in the salaries of teachers was secured in 1920 by the standing joint committee of representatives of local educational authorities and teachers, constituted under the chairmanship of Lord Burnham, at the suggestion of Mr. Fisher. The Teachers' Superannuation Act of 1918 had established a liberal pension system, and though before long contributions were required from the teachers to the cost of pensions, and in 1925 a modification of the salary agreement became necessary, the position of the teachers is much better than before 1920 in schools of all kinds.

Examination Reforms.—(*See* also EXAMINATIONS.)—A valuable reform in the examinations affecting secondary schools was initiated by the Board of Education in 1917. The secondary schools had suffered from the number and variety of external examinations, many of which had served a useful purpose in stimulating work, but had become oppressive and confusing. The consultative committee of the Board had issued a report on the subject in 1911; in 1914 the Board issued proposals for the recognition of two grades of examinations—one for pupils of 16–17 and another for pupils of 18–19—to be conducted by university examining bodies. In 1917 the Secondary Schools Examinations Council, representative of the examining bodies, the local education authorities and the teaching profession was established, and since then the first and second school examination of one or other of eight university examining bodies have gradually become a useful element in the organisation, not only of schools under the Board's control but of secondary schools of every kind. In grant-aided schools the Board pays the examination charges for each pupil up to a maximum of £2. In 1926–27, 43,752 pupils in grant-aided schools took a first examination and 6,681 a second.

Advanced Courses.—A second reform was the provision of grants for recognized advanced courses in certain groups of subjects; the grouping at first conceived on a rather rigid formula, has been greatly modified, and almost any kind of advanced work likely to be done in a secondary school, *e.g.*, in music and art, may now be recognized; but the grant, except for schools taking no aid from local education authorities, has now been merged in the general provision made by the act of 1918. In 1926–27, 479 advanced courses were recognised (232 in science and mathematics, 38 in classics, 189 in modern studies, seven in classical with modern studies, four in geography, nine in other combinations of subjects).

Connection with Universities.—The relation of the schools to the universities and other places of university rank has become increasingly important. The first and second school examinations are gradually simplifying the conditions of entrance to the universities and the professions, and even also to commerce and industry. Most local education authorities interest themselves in finding openings for the pupils leaving their schools. In London, two joint committees of heads of schools and employers find employment for a very large number of boys and girls. (*See* EDUCATION AND INDUSTRY.) In 1920 the Board instituted a scheme for the award of 200 State scholarships to universities for pupils in grant-aided secondary schools; the scheme was dropped in 1922 and 1923, but revived in 1924. The award is based on the second school examination; the amount varies with circumstances, but is calculated to finance the whole of the scholar's university course. (R. F. CH.; C. BR.)

IN THE UNITED STATES

The chief stages in the development of secondary education in the United States may be best visualized by reference to the main types of secondary schools. (1) The type operative in colonial America was the Latin grammar school, an institution borrowed from contemporary England and continental Europe. Its curriculum was restricted to the classical languages and literatures, and its chief purpose was to prepare boys for college. There were in this period no secondary schools for girls. (2) At a period near that of the American Revolution there arose a new type of institution, the academy. Its curriculum was much broader than that of the Latin grammar school, comprehending both college-preparatory and non-college-preparatory subjects. In many instances, in some areas predominantly, it opened its doors to both sexes. (3) Before the middle of the 19th century there arose another type of institution, the public high school, whose chief distinguishing characteristic was that it afforded free secondary education at public expense. Its curriculum aimed to serve both the college-going and the non-college-going groups. In this respect and in the fact that it was open to students of both sexes it was similar to the academy. Since the opening of the 20th century there has been developing a fourth type of secondary school which may be best described as the extended secondary school. The extension has been in two directions—both horizontal (by including an increasing proportion of the population and a wider variety of curriculum content) and vertical. Attention is here directed

chiefly to the latter type of extension. School systems are increasingly extending the secondary-school period downward by adding the last two elementary-school grades through junior high-school organization and upward by adding the junior-college years (*see* UNIVERSITIES and COLLEGES), that is, the work of the first two college years, often considered to be essentially secondary in character. Many school systems have provided for extension in one or both directions and the number is rapidly increasing.

JUNIOR HIGH SCHOOLS

The junior high school, or, as it is sometimes called, the "intermediate school," is one manifestation of a fundamental realignment which has been affecting educational organization in the United States. This particular phase of the realignment has been concerned primarily with the later years of the seven-year and eight-year elementary schools and typically, although not universally, the first year of the four-year high school, the usual junior high school being a two-grade or three-grade division of the school system.

The results of the influences of reorganization at work began to make themselves most apparent five to ten years after the opening of the 20th century, but there were evidences of reorganization having something in common with this movement before that time. The earliest were in Berkeley and Los Angeles in California. The movement made rapid gains from 1912 until 1916, and excepting for the period of the World War, has continued its growth at an accelerated rate since that time. Studies of the extent of the movement have shown that by 1923 fully three-fourths of school systems in cities with populations exceeding 100,000 either had junior high schools in operation or had been committed to junior high school reorganization. Smaller cities have also been effecting this reorganization. Data made available by the U.S. bureau of education show that in 1925 there was a total of 2,548 "non-four-year" high schools, these including as predominant types 879 "segregated" junior high schools, that is, junior high school units not housed with other units in the system, and 1,389 "junior-senior" high schools, that is, high schools comprising both junior and senior units. The movement would have made even greater gains were it not necessary in many communities to wait for new buildings. Even with this obstacle the junior high school reorganization will be before long a common feature of school systems in the United States and will in all probability develop still farther.

The features more commonly incorporated in the junior high school plan may be considered under the following sections:

(1) Although the junior high school often includes only two grades (that is, the seventh and eighth in systems formerly having eight grades in the elementary school and four in the high school), the trend of preference has been toward the three-grade unit, including the seventh, eighth and ninth grades. This is because a two-grade unit is too short to provide much leeway for fundamental change and because it often leaves the four-year high school without modification.

(2) The curriculum or programme of studies is frequently acknowledged to be the most important feature of the junior high school. Typically, besides requiring certain subjects of all pupils, it allows some choice, sometimes in seventh grade, but more often in eighth and ninth grades, to make up the remainder of the pupils' work. The work required of all is often referred to as the "core," the elective portions being drawn from the industrial arts, the home arts, elementary commercial subjects and foreign languages. In the better schools the curriculum in both required and elective work represents a vigorous effort to enrich the training programme in these grades of the junior high school as contrasted with that in the corresponding grades of the conventional organization. (3) Grouping by ability, which aims to place pupils of more nearly equal ability in the same class groups, is advocated. (4) The most common feature of junior high schools is departmentalization, that is, the assignment of subjects to teachers so as to permit at least some measure of specialization, in contrast with the unspecialized teaching formerly universal in upper grammar grades.

(5) The junior high school has also been a vehicle for innovations in teaching methods, such as directed or supervised study (in which the pupil prepares his assignments in whole or in part under supervision of the teacher of the subject), the project and problem methods and individualized instruction.

One of the most remarkable developments in American education has been the rapid expansion, since 1890, of public secondary schools. The increase has affected both the numbers of schools and the numbers of pupils enrolled. Of the latter there were in 1926 about three and three quarter millions, excluding pupils in junior high schools. The proportionate increase has been far in excess of the gain in the population. Between 1890 and 1920 the percentage of those enrolled in public high schools of all the population of normal ages for the four-year high school (14 to 17 years, inclusive) increased from 3·8 to 24·0. Influxes of pupils since 1920 have resulted in a percentage much larger than this. The proportion is far in excess of that for any other large nation.

No account of the status of secondary education in the United States is complete without reference to schools on private foundations. During the 30 year period from 1890 to 1920, the public schools increased from 60·8% to 87·3% of all schools reporting to the U.S. Bureau of Education, while the pupils enrolled increased from 68·1% to 91·0%. This means primarily that public schools were growing so rapidly as to become increasingly dominant numerically. What was taking place in private secondary education may best be shown by reference to data reported to the bureau in 1895 and 1922. The number of schools on Roman Catholic foundations increased more than three-fold, while the number of pupils in these schools increased even more rapidly; the number of schools of all other denominations combined decreased somewhat, although they experienced some gains in total enrolment; non-sectarian schools decreased both in numbers of institutions operating and in the total number of pupils enrolled. It appears that sectarianism is the dominant factor in the persistence of private secondary education, and that it is most effectively operative with Roman Catholics. *See* PAROCHIAL SCHOOLS.

Reference has already been made to the expanding concepts of purpose of American secondary education from service to college-going pupils only, toward service to both college-going and non-college-going pupils. This expansion is made much more apparent in a comparison of literature on the subject from an earlier day with that issued recently. Three types of purpose appear in the older literature, namely, college preparation, selection for higher levels of training, and what was referred to as "mental discipline." More recent statements of leaders in secondary education emphasize training for civic, social and moral relationships; training for the proper use of leisure; training for health; and training for occupation. There is also emphasis on such matters as even greater popularization of educational opportunities on the secondary-school level, recognition of individual differences, and guidance. A significant conclusion to be drawn from such a comparison of older and modern concepts is that the latter are stressing values having obvious relationships to every day needs, whereas the former are cast in terms of remoter and deferred values. Such a shift of concepts was certain to manifest itself as soon as this period of education came more frequently to be looked upon as terminal or culminal rather than preparatory. At the same time the leaders whose writings were consulted recommend the continuance of the function of preparation for college for such of the graduates of the high school who continue to higher levels of training.

It is to be expected that these shifting concepts would be reflected in the make-up of the curriculum of secondary schools. This is shown in the marked shift of registrations from certain subject-groups to others, for example from foreign language and mathematics to the social studies and the practical arts. It is shown also in the rapid multiplication of new courses formerly unrepresented or much less frequently represented in the high-school offering. One large field of expansion has been the vocational, but there are others also, like the fine arts and physical training. It is shown again in the much greater flexibility of programmes of studies than was characteristic before the opening of the 20th century, including the opportunity to select one from a

number of "courses" or curricula, and even within a curriculum to elect from a variety of different subjects. These expansions have been accompanied by the advocacy of the "comprehensive" high school, an institution which aims to care for all the needs of general and occupational training of all pupils who may care to enter. There are, nevertheless, those who advocate the restriction of the high schools to general education, the occupational training to be provided in separate vocational schools.

An interesting development contemporary with popularization and expansion of the offering has been the increase of extra-curricular activities, that is, that great body of activities in which young people engage spontaneously, for example, athletics, debate, journalism, dramatics, music and subject clubs. Those in charge of these activities are coming to regard them as possessing large values in training and are making efforts to integrate them with the curriculum proper. On this basis these activities may in an important sense be looked upon as an extension of the curriculum.

The expanded secondary school, inclusive of popularization and the enriched and flexible offering, has brought with it the problem of the proper distribution of the secondary-school population to the training opportunities, that is, the problem of guidance. The necessity for guidance in the modern school is made more apparent if one keeps in mind not only these factors of popularization and enlarged offerings, but also the complexity of occupational life outside the school with its increasing tendency to specialization, the shift of the rural population to urban centres, and the changing status of women. All these factors have stimulated the development of guidance programmes, which are becoming characteristic of the better schools. The proportion of secondary schools without some development along this line is not large. Among the means of guidance used are exploratory, or "try-out," courses (particularly in the junior high school); a course affording a survey of occupations; intelligence, aptitude and achievement tests; adequate records; summer and other part-time employment; placement and employment supervision; and the provision of special personnel officers, referred to as "advisers" or "counsellors."

In comparison with teachers in European secondary schools, instructors in high schools in the United States are criticized for their lack of professionalization. It is pointed out that both the extent of training and the period of service are shorter. Both these conditions are often explained by the large proportion of women teachers. Whatever the cause, the extent of preparation and the period of service *are* shorter. Better systems have been able for some time to insist, for teachers in four-year high schools, on the minimum represented in the bachelor's degree from a standard college, and in some quarters, notably California, there is insistence on a year of graduate work. It is likely that in time the schools will more generally move to this as the next stage of professionalization. This should assist somewhat in extending the average period of experience. Whether or not it is the determining factor of duration of training or experience, women teachers over a long period have outnumbered the men. It is not generally known, however, that with a single exception the proportion of men has ranged between 40 and 50 per cent. The exception was the period immediately following the Great War. The question of standards of preparation is being reopened owing to the appearance of junior high schools and junior colleges, for both the extent and nature of training for these teachers will need to differ.

Mention is often made in discussions of the expanding programme of secondary education in the United States of the mounting cost of these schools, a cost that is increasing not only because more pupils are in attendance, but also because the cost per pupil has increased. The question is sometimes raised as to whether the nation will continue to go forward with the programme of providing secondary education for all. Although no final pronouncement may be made on this score, the evidences point toward assumption of this larger burden. Usually, when issues involving greater outlays for schools are placed before the voters in a local situation, they respond in unmistakable terms in favour of expansion. Moreover, the aspirations to a democratic society are based on a popularization of intelligence which is not to be achieved through a system of free schools limited to what we think of as elementary education: it requires the training of almost the whole population above the traditional common-school level. For the nation to admit unwillingness or inability to afford this higher training would be tantamount to abandonment of democratic convictions.

SECOND LIEUTENANT. The lowest grade of officer rank in the British and U.S. armies. In the former the corresponding rank was Ensign until its abolition in 1871 and the rank "Sub-Lieutenant" substituted, which in turn was abolished in 1876 and "Second Lieutenant" introduced. The corresponding rank in some other armies is—French and Belgian, *Sous Lieutenant;* German, *Leutnant;* Swiss and Japanese, *Second Lieutenant;* Netherlands, *Tweede-Luitenant;* Italian, *sub-lieutenant.*

SECOND SIGHT, a term denoting the opposite of its apparent significance, meaning in reality the seeing, in vision, of events *before* they occur.

Though we hear most of the "second sight" among the Celts of the Scottish Highlands (it is much less familiar to the Celts of Ireland), this species of involuntary prophetic vision, whether direct or symbolical, is peculiar to no people. Perhaps our earliest notice of symbolical second sight is found in the *Odyssey*, where Theoclymenus sees a shroud of mist about the bodies of the doomed Wooers, and drops of blood distilling from the walls of the hall of Odysseus. The Pythia at Delphi saw the blood on the walls during the Persian War; and, in the *Argonautica* of Apollonius Rhodius, blood and fire appear to Circe in her chamber on the night before the arrival of the fratricidal Jason and Medea. Similar examples of symbolical visions occur in the Icelandic sagas, especially in *Njala*, before the burning of Njal and his family. In the Highlands, and in Wales, the chief symbols beheld are the shroud and the corpse candle or other spectral illumination. The Rev. Dr. Stewart, of Nether Lochaber, informed the present writer that one of his parishioners, a woman, called him to his door, and pointed out to him a rock by the sea, which shone in a kind of phosphorescent brilliance. The doctor attributed the phenomenon to decaying sea-weed, but the woman said, "No, a corpse will be laid there to-morrow." This, in fact, occurred; a dead body was brought in a boat for burial, and was laid at the foot of the rock, where, as Dr. Stewart found, there was no decaying vegetable matter.

Second sight flourished among the Lapps and the Red Indians, the Zulus and Maoris, to the surprise of travellers, who have recorded the puzzling facts. But in these cases the visions were usually "induced," not "spontaneous." Ranulf Higdon's *Polychronicon* (14th century) describes Scottish second sight, adding that strangers "setten their feet upon the feet of the men of that londe for to see such syghtes as the men of that londe doon." This method of communicating the vision is still practised. (For the method *see* Kirk's *Secret Commonwealth of Elves, Fauns and Fairies*, 1691, 1815, 1893.) It is, by some, believed that if a person tells what he has seen before the event occurs he will lose the faculty—a belief which renders the proof of the vision impossible. There are many seers, as Lord Tarbat wrote to Robert Boyle, to whom the faculty is a trouble, "and they would be rid of it at any rate, if they could."

Perhaps the visions most frequently reported are those of funerals, which later occur in accordance with "the sight," of corpses, and of "arrivals" of persons, remote at the moment, who later do arrive, with some distinctive mark of dress or equipment which the seer could not normally expect, but observed in the vision. A fair example of second sight is the following from Balachulish. An aged man of the last generation was troubled by visions of armed men in uniform, drilling in a particular

field near the sea. The uniform was not "England's cruel red," and he foresaw an invasion. "It must be of Americans," he decided, "for the soldiers do not look like foreigners." The Volunteer movement later came into being, and the men drilled on the ground where the seer had seen them. Another case was that of a man who happened to be sitting with a boy on the edge of a path in the quarry. Suddenly he caught the boy and leaped aside with him. He had seen a runaway trolly, with men in it, dash down the path; but there were no traces of them below. "The spirits of the living are powerful to-day," said the percipient in Gaelic, and next day the fatal accident occurred at the spot. These are examples of what is, at present, alleged in the matter of second sight.

"The sight" may, or may not, be preceded or accompanied by epileptic symptoms, but this appears now to be unusual. A learned minister lately made a few inquiries on this point in his parish, at the request of the present writer. His beadle had "the sight" in rich measure: "it was always preceded by a sense of discomfort and anxiety," but was not attended by convulsions. Out of seven or eight seers in the parish, only one was not perfectly healthy and temperate.

The phenomena, as described, may be classed under "clairvoyance," "premonition," and "telepathy" (*q.v.*), with a residuum of symbolical visions.

Bibliography.—The literature of second sight is not insignificant. *The Secret Commonwealth* of the Rev. Mr. Kirk (1691), edited by Sir Walter Scott in 1815 (a hundred copies), and by Andrew Lang in 1893, is in line with cases given in Trials for Witchcraft (*cf.* Dalyell's *Darker Superstitions of Scotland,* and Wodrow's *Analecta*). Aubrey has several cases in his *Miscellanies,* and the correspondence of Robert Boyle, Henry More, Glanvil and Pepys, shows an early attempt at scientific examination of the alleged faculty. The great treatise on Second Sight by Theophilus Insulanus (a Macleod) may be recommended, with Martin's *Description of the Western Isles* (1703–16) and the work of the Rev. Mr. Fraser, Dean of the Isles (1707, 1820). Fraser was familiar with the contemporary scientific theories of hallucination, and justly remarked that "the sight" was not peculiar to the Highlanders; but that, in the south, people dared not confess their experiences, for fear of ridicule. (A. L.)

SECOND (SOCIALIST) INTERNATIONAL: *see* International, The.

SECRET, that which is concealed from general knowledge. In special senses the word is applied to (*a*) a prayer in the Roman and other liturgies, said during mass by the priest in so low a voice that it does not reach the congregation, and (*b*) a covering or skull-cap made of steel fitting close to the head.

SECRETARY-BIRD (*Serpentarius secretarius*), an African bird with long legs, standing nearly 4 ft. high. From the back of the head and nape hangs an erectile tuft of long black feathers. Round the eyes is orange skin; the head, neck, and back are bluish-grey, the lower surface black; the tail quills are banded with black and tipped with white. The beak is hooked. There is a second species, also African. The secretary-bird feeds on insects and reptiles and can kill the most venomous snakes, striking them repeatedly with its taloned feet. The long legs together with the bird's habit of leaping back after each stroke, preserve it from being bitten. The huge nest is placed in a bush or tree and in it are laid two white eggs, spotted with rust-colour. The bird is found locally over most of Africa, south of the Sahara. It is one of the most powerful of the birds of prey (Falconiformes).

BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

SECRETARY BIRD (SERPENTARIUS SECRETARIUS), A LARGE BIRD OF PREY, FOUND WIDELY IN AFRICA

SECRETARY OF STATE, in Great Britain, the designation of certain important members of the administration (*see* Ministry); in the U.S. the ranking member of the President's cabinet. The ancient English monarchs were always attended by a learned ecclesiastic, known at first as their clerk, and afterwards as secretary, who conducted the royal correspondence; but it was not until the end of the reign of Queen Elizabeth that these functionaries were called secretaries of State.

Until the reign of Henry VIII. there was generally only one secretary of State, but at the end of his reign a second principal secretary was appointed. Owing to the increase of business consequent upon the union of Scotland, in 1708 a third secretary for Scotland was created, but a vacancy occurring in this office in 1746 the style lapsed and the third secretaryship was dispensed with. In 1768 a third secretaryship was again instituted to take charge of the increasing colonial business. In the 17th century the duties of the first two principal secretaryships had come to be divided between the Northern and the Southern departments, dealing respectively with the business of the Protestant and Catholic States. But in 1782 this style was changed to the Home and Foreign, and the office of the third secretary was again abolished, and the charge of the Colonies transferred to the home secretary. But owing to the war with France in 1794 a third secretary was once more appointed to superintend the business of the War Department, and seven years later the colonial business was transferred to his department as secretary for war and for the Colonies from 1801 to 1854. In that year a fourth secretary of State for the exclusive charge of the War Department and in 1858 a fifth secretaryship for India were created.

In 1917 the secretaryship for air was created, and in 1926 the office of the secretary for Scotland, which had been revived in 1885, was raised to that of a principal secretary of State. In 1925 the prime minister announced that the Government contemplated the creation of a new secretaryship of State for dominion affairs, which "for reasons of practical convenience" would continue to be vested in the secretaryship for the Colonies, although accompanied by the creation of a new under-secretaryship and the organization of a separate office for dominion affairs. There are therefore now seven principal secretaries of State, namely, for foreign affairs, home affairs, dominion affairs and the Colonies, war, India, air and for Scotland. One of these secretaries of State is always a member of the House of Lords. The secretaries of State are the only authorized channels through which the royal pleasure is signified to any part of the body politic, and the counter-signature of one of them is necessary to give validity to the sign manual. The secretaries of State constitute but one office, and are co-ordinate in rank and equal in authority. Each is competent in general to execute any part of the duties of the secretary of State, the division of duties being a mere matter of arrangement. For the existing division of duties, *see* under separate headings, Government Departments, Foreign Office, etc.

In the United States the "secretary of State" is that member of the President's cabinet who deals with foreign affairs, and who, in the event of a vacancy in the office of president, is next in succession after the vice-president. The title of "secretary"—"of the Treasury," "of war," etc.—is used for some other members of the cabinet. In the various States there is an executive officer called "secretary of State," whose duties are those belonging properly to a secretary for the State.

SECRET COMMISSIONS. The giving of a commission, in the sense of a bribe or unlawful payment to an agent or employé in order to influence him in relation to his principal's or employer's affairs, has grown to considerable proportions in modern times; it has been rightly regarded as a gross breach of trust on the part of employés and agents, inasmuch as it leads them to look to their own interests rather than to those of their employers. In order to suppress this bribing of employés the English legislature in 1906 passed the Prevention of Corruption Act, which enacts that if an agent corruptly accepts or obtains for himself or for any other person any gift or consideration as an inducement or reward for doing or forbearing to do any act, or for showing or forbearing to show favour or disfavour to any person, in relation to his principal's affairs, he shall be guilty of a misdemeanour and shall be liable on indictment and conviction to imprisonment with or without hard labour for a term not exceeding two years, or to a fine not exceeding £500, or to both, or on summary conviction to imprisonment

not exceeding four months with or without hard labour or to a fine not exceeding £50, or both. The act also applies the same punishment to any person who corruptly gives or offers any gift or consideration to an agent. Also if a person knowingly gives an agent, or if an agent knowingly uses, any receipt, account or document with intent to deceive the principal, he is guilty of a misdemeanour and liable to the punishment already mentioned. For the purposes of the act "consideration" includes valuable consideration of any kind, and "agent" includes any person employed by or acting for another. No prosecution can be instituted without the consent of the attorney-general, and every information must be upon oath.

Legislation to the same effect has been adopted in Australia. A federal act was passed in 1905 dealing with secret commissions, and in the same year both Victoria and Western Australia passed drastic measures to prevent the giving or receiving corruptly of commissions. The Victorian act applies to trustees, executors, administrators and liquidators as well as to agents. Both the Victorian and the Western Australian acts enact that gifts to the parent, wife, child, partner or employer of an agent are to be deemed gifts to the agent unless the contrary is proved; also that the custom of any trade or calling is not in itself a defence to a prosecution. When a bribe has been given to an agent, his principal is not bound by the resulting contract, and the agent is accountable to him for the amount of the bribe, and also forfeits any remuneration to which he would otherwise be entitled. (*See* BRIBERY.)

SECRET LANGUAGES. Many societies, ancient and modern, comprise special groups—distinct by racial, political, functional differences from the main community—and these special groups often preserve their identity and guard their independence by the use of a secret language. In secret societies, passwords are used and where hieratic functions are discharged by a special permanent class, the members of that group converse by means of secret languages. In cases like the Todas the use of a secret language is due to the desire to keep private affairs hidden from the preying curiosity of their neighbours—Kotas and Badagas (W. H. R. Rivers, *The Todas*). The use of slang as a secret language is recorded of the Sema Nagas (J. H. Hutton, *Sema Nagas*, 1921, p. 296), where the advantage of being able to irritate one's neighbours is associated with its value in trade, and in personal intrigue. Similarly of the Langos (J. H. Driberg, *The Lango*) the secret language "consists entirely of different words for substantives but apparently the rest of the grammar and syntax remains unchanged. The language is much used by lovers and is normally employed if it is desired to keep the conversation secret from others. It is widely distributed but whether or not it is confined to a group of initiates is unknown."

Political conditions have often occasioned the use of secret languages (*see* BILINGUALISM) and in thieves' patter we have a rudimentary form.

See Hutton Webster, *Primitive Secret Societies* (1908); L. Lévy-Bruhl, *Les fonctions mentales dans les sociétés inférieures* (1910), trans. L. A. Clare, *How Natives Think* (1926); O. Jesperson, *Language* (1922).

SECRET SOCIETIES. This term has been loosely used for a medley of associations which have little in common beyond an element of secrecy, which may vary from a mere password to an elaborate ritual of initiation with a private language, peculiar ceremonials and symbols and every circumstance calculated to lend an air of mystery. It may be applied to the Masonic Order or the Ku Klux Klan as well as to similar phenomena in primitive cultures.

From this angle Maciver's definition of an Association as "an organization of social beings . . . for the pursuit of some common interest or interests" applies equally to secret societies with the proviso that it must be re-enforced by secrecy either for the maintenance of the internal solidarity of the society or for its more effectual domination over non-members. Secrecy alone however does not necessarily imply a secret society, and other criteria have to be taken into consideration. Thus many systems of age-grades (*q.v.*) contain rites or doctrines, knowledge of which is prohibited to such members of the tribe as have not yet been affiliated; but age-grades cannot properly be termed secret societies. What differentiates age-grades from secret societies is the fact that initiation into the former is compulsory to every member of the tribe, but entrance into a secret society is optional. Moreover in all secret societies entrance or promotion from rank to rank is purchasable, whereas in age-grades promotion is inevitable and automatic. The Crow Indians combine the two systems by compulsory purchase, the compulsory element of age-grades having been added to the idea of purchase inherent in secret societies.

Theories.—The wide correlation of masks with secret societies (and it would appear that even stilts are possibly also involved) suggested to Frobenius that primarily these societies by feigning the death and resurrection of the candidate were the means of bringing the members into closer contact with the spirits of their dead and deified ancestors. To Van Gennep they symbolize a process of rebirth or separation from the world outside and a passage from immaturity to full tribal membership. Webster traces secret societies to initiation ceremonies, and it seems probable that ultimately all such societies are the outgrowths of puberty rites, and what again differentiates secret societies from age-grades is the fact that the former have developed away from these rites while the latter retain them as an essential element in the system. For secret societies are always changing, however imperceptibly, as in the change which has transformed the Human Leopard Society from a Mendi war medicine to a definitely cannibalistic institution. Thus, societies which are secret in one area are elsewhere public associations though their functions appear to be identical.

Secret societies, like all other associations, cut across the social units of the family and the clan, though instances do occur which suggest a connection with a totemic clan system. Among the Pueblo Indians the totemic clans on uniting into the tribe still continued to exist as esoteric fraternities, and in certain parts of Melanesia where totemism flourishes fraternities are unknown, but are found where totemism does not exist. This may be due however to other factors. In Africa there is evidently a correlation between secret societies and the political structure of the tribe, and with the evolution of authority from local councils to a tribal autocracy there is a parallel development of secret societies, which though often extra-legal serve to uphold the law and at the same time to act as checks on what would otherwise be complete despotism. The secret societies, or at any rate the higher degrees of the societies, become the ruling aristocracy, and in certain cases, such as the Tenda in French Guinea, it is the secret societies which are the sole means of government.

From the point of view of function secret societies among primitive peoples may be roughly classified as magical, religious and social, and the last must again be subdivided into mutual help societies, like the Nkimba of the lower Congo, certain occupational groups, such as doctors and blacksmiths, feasting clubs, sexual societies, like the Kore of the Mandingo, and governmental or police organizations, the last of which not infrequently degenerate into a system of extortion and tyranny. The Ogboni society of the Yoruba is probably the most conspicuous of these political societies, with the Oro society as their subordinate police. However for all these social functions a religious sanction must be predicated.

Despite contrary examples, such as the Imandwa, a secret society of the Banyaruanda, which is religious rather than social, the secret societies of the North American Indians have in the main religious functions, as contrasted with those of Melanesia and Africa which are primarily social and governmental.

The term secret society obviously implies that there are members of a community outside the society. In the majority of societies membership is generally limited on sex lines, but sometimes as among the Tenda along lines of social status. Some societies like the Poro admit women in exceptional circumstances, others like the Yewe admit them only to certain degrees, and others again like the Ndembo of the Lower Congo are completely bisexual. But the great majority refuse admission to women, with the result that parallel women's societies are instituted, the functions of which are mainly magico-religious and are concerned with fertility and cultivation.

CHINESE

Most of the Chinese secret societies are merely trade guilds or friendly societies, but the Hung or Triad Society comes in an entirely different category. It has the largest membership of any secret society in the world, and has existed since A.D. 386, in close association with the White Lotus. Contemporary with the ancient mysteries, it is itself a great mystery rite over 1,500 years old.

In A.D. 386 it was founded, or perhaps re-organized, by the Buddhist patriarch Eon or Hwui-Yin at Rozan, to spread the cult of Amitabha Buddha. In A.D. 630 Zendo joined it to gain instruction, and in 1344 it rebelled against the Mongolian or Yüen dynasty. In 1662 it fell under the ban of Khang Hsi, who in his *Sacred Edict* instituted a persecution of the Buddhists and Taoists, and ordered the suppression of five religious societies, among which the White Lotus and the Hung were specifically named. The exact relation between these societies is still obscure, but, if they were not alternative titles for the same organization, they were probably the names of different degrees of one common rite. It is just possible, however, that they were similar, but separate, mystical societies.

Partly as a result of this persecution, the Hung Society became political and anti-dynastic, and has raised numerous insurrections against the Manchus, one of the most famous being the Taiping revolt in 1851. The rituals were peculiarly suitable for conversion from religious to political aims, since the slogan of the brotherhood is "Overthrow Ching and restore Ming."

Ming means light, and especially the perfected spirit in man; while Ching means the vital force, or, as we should say, the soul immersed in matter. By slightly changing the way in which the character for Ching is written, it becomes the name of the Manchu dynasty, while the last Chinese dynasty was the Ming. Hence it will be seen that the change from a Buddhist-Taoist mystical initiatory rite to a dangerous political society was easy.

The rituals show a blending of Taoist-Buddhist ideas having curious analogies with the Egyptian *Book of the Dead,* and with certain "Higher Degrees" in western speculative Freemasonry. The ceremony symbolizes the journey of the soul through the Underworld and Paradise to the Holy City of the Gods, here called the City of Willows, and interwoven with this is an allegory of the experiences of the mystic in his quest for union with the Supreme Being. As regards its analogies with Masonry, practically every important incident is found in certain "Higher Degrees" in England and America, while most of the hand signs are known to many Freemasons.

The ceremony falls into four sections. First comes the traditional history, which is given to the candidates in the anteroom before they enter the lodge. It is a moving story, wherein a body of monks who had helped the emperor are requited by him with the foulest treachery, all being murdered, save five who became the founders of the order. There are three villains, and for political purposes one is a Manchu emperor, either Khang Hsi, or, in some versions, his son, but originally the story was allegorical.

After this the candidates are "prepared" in the anteroom. The most notable incidents are (*a*) ceremonial washing and changing into white robes to symbolize not only mourning but that they themselves are dead; (*b*) the right arm, shoulder and breast, and also the left knee, are made bare; (*c*) the substitution of grass slippers for ordinary boots. Meanwhile the master opens and consecrates the lodge and invests his officers.

The third section deals with the actual admission of the candidates, who have to pass through three gates inside the lodge, and take the oath of blood brotherhood by mingling their blood with that of all members present in a cup of wine, from which each person present drinks. (Women as well as men are eligible.)

The last section consists of a catechism; the master asks a series of questions, which the conductor answers for the candidates. From these we learn that they have been on a long and mysterious journey, first by land and then by boat, till they reached the City of Willows. Throughout the whole of this part of the ceremony great stress is laid on numbers, which have a definite mystical significance. The triangle also plays an important part in the ritual, hence the name "Triad" Society. The brotherhood has many aliases, the most famous being "The Society of Heaven and Earth." The significance of the ceremony is revealed by the opening questions:

Master: Whence come you?
Vanguard: From the East.
Master: At what time?
Vanguard: At sunrise, when the East was light.

Bibliography.—There are only three really important books on the subject, and the two earlier have not the complete ritual. G. Schlegel, *Thian Ti Hwui; the Hung-League* (Batavia, 1866), out of print; W. Stanton, *The Triad Society; or, Heaven and Earth Association of Hong-Kong* (1900); J. S. M. Ward and W. G. Stirling, *The Hung Society* (1925–26). (J. S. M. W.)

SECULAR, a word with two main branches of meaning: (1) lasting or occurring for a long indefinite period of time (Lat. *saecularis,* of or belonging to an age or generation, *saeculum*), and (2) non-spiritual, having no concern with religious or spiritual matters. The first sense, which is directly taken from the classical Latin, is chiefly found in scientific applications, of processes or phenomena which are continued through the ages and are not regularly recurrent or periodical, *e.g.,* the secular cooling of the earth, secular change of the mean annual change of the temperature. The word is thus used widely of that which is lasting or permanent. In mediaeval and late Latin, *saecularis* was particularly used of that which belongs to this world, hence non-spiritual, lay, e.g., *vitam venturi saeculi* as contrasted with this present life; and the Church as opposed to the world. It is thus used, first to distinguish the "regular" or monastic clergy from those who were not bound by the rule (*regula*) of a religious order, the parish priests, the "seculars," who were living in the world, and secondly in the wide sense of anything which is distinct, opposed to, or not connected with religion or ecclesiastical things, temporal as opposed to spiritual or ecclesiastical. Thus property transferred or alienated from spiritual to temporal hands is said to be "secularized"; "secularism" (*q.v.*) is the term applied in general to the separation of state politics or administration from religious or church matters; "secular education" is a system of training from which definite religious teaching is excluded.

SECULAR GAMES were celebrated at Rome for three days and nights to mark the commencement of a new *saeculum* or generation. It is important to note that there was a *saeculum civile,* the length of which was definitely fixed at 100 years, and a *saeculum naturale,* which, under Greek and Etruscan influence, came to be accepted by the quindecimviri as 110 years. According to tradition, the secular games (*Ludi Saeculares,* originally *Terentini*) had their origin in certain sacrificial rites of the gens Valeria, which were performed at the Terentum, a volcanic cleft in the Campus Martius. According to the Roman antiquarians themselves, they were derived from the Etruscans, who, at the end of a mean period of 100 years (as representing the longest human life in a generation), presented to the chthonian deities an expiatory offering on behalf of the coming generation. The first definitely attested celebration of the games took place in 249 B.C., on which occasion a vow was made that they should be repeated every 100th year (their name being also changed to *Saeculares*), a regulation which seems to have been immediately disregarded, for they were next held in 146 (not 149, although the authorities are not unanimous); in 49 the civil wars prevented any celebration. They would probably have fallen entirely into oblivion, had not Augustus revived them in 17 B.C., for which occasion the *Carmen Saeculare* was composed by Horace. In explanation of the selection of this year, it is supposed that the quindecimviri invented celebrations for the years 456, 346, 236, 126, the *saeculum* being taken as lasting 110 years.

In later times various modes of reckoning were adopted. The dates were: A.D. 47 (under Claudius), celebrating the 800th year of the foundation of the city; 88 (under Domitian), an interval of only 105 instead of 110 years; 147 (under Antoninus Pius), the 900th year of the city; 204 (under Septimius Severus), exactly two *saecula* (220 years) after the Augustan celebration; 248 (under Philip the Arabian), the 1000th year of the city; 262 (under Gallienus), probably a special ceremony in time of calamity; in 304 (which should have been 314) Maximian intended to hold a celebration, but does not appear to have done so. From this time nothing more is heard of the secular games, until they were revived in the year 1300 as the papal jubilees instituted by Boniface VIII.

At the beginning of the harvest, heralds went round and summoned the people to the festival. The quindecimviri distributed to all free citizens on the Capitol and in the temple of Apollo on the Palatine various means of expiation—torches, sulphur and bitumen. Here and in the temple of Diana on the Aventine, wheat, barley, and beans were distributed, to serve as an offering of first-fruits. The festival then began, at which offerings were made to various deities. On the first night the emperor sacrificed three rams to the Parcae at an underground altar on the banks of the Tiber, while the people lighted torches and sang a special hymn. On the same or following nights, a black hog and a black pig were sacrificed to Tellus, and dark victims to Dis (Pluto) and Proserpine. On the first day white bulls and a white cow were offered to Jupiter and Juno on the Capitol, after which scenic games were held in honour of Apollo. On the second day noble matrons sang supplicatory hymns to Juno on the Capitol; on the third, white oxen were sacrificed to Apollo and 27 boys and maidens sang the "secular hymn" in Greek and Latin.

BIBLIOGRAPHY.—The above particulars are from Zosimus (ii. 5, and 6, which contain the Sibylline oracle), who, with Censorinus (*De Die Natali*, 17), Valerius Maximus ii. 4, and Horace (*Carmen Saeculare*) is the chief ancient authority on the subject; *see* also Mommsen, *Römische Chronologie* (1858); C. L. Roth, "Über die römischen Säcularspiele" in the *Rheinisches Museum*, viii. (1853); and Marquardt, *Römische Staatsverwaltung*, iii. (1885), p. 386. The inscription commemorating the *ludi* of 17 B.C. was discovered in 1890 and is printed in the *Ephemeris epigraphica*, vol. viii. The best account of the whole subject is in H. Diels, *Sibyllinische Blätter* (1890), p. 109 et seq.

SECULARISM, a term applied specially (*see* SECULAR) to the system of social ethics associated with the name of G. J. Holyoake (*q.v.*). As the word implies, secularism is based solely on considerations of practical morality with a view to the physical, social and moral improvement of society. It neither affirms nor denies the theistic premises of religion, and is thus a particular variety of utilitarianism. Holyoake founded a society in London which subsequently under the leadership of Charles Bradlaugh advocated the disestablishment of the Church, the abolition of the Second Chamber and other political and economic reforms.

See Holyoake's *Principles of Secularism* (1885).

SECUNDERABAD, one of the chief British military stations in India, situated in the state of Hyderabad, 1,830 ft. above sea-level, 6 m. N.E. of Hyderabad city and a junction on the Nizam's state railway. Pop. (1921) 9,515 (with Bolarum). It is the headquarters of an infantry brigade. Secunderabad includes Bolarum, the headquarters of a cavalry brigade, covering an area of 17 sq.m.

SECURITY. (The following article is an authoritative statement of M. Jules Cambon of the French point of view, which is the chief practical factor in the European controversy on this subject.) The question of security dominates contemporary politics. After a war which set the whole universe aflame, the nations have only one preoccupation, and that is to avoid its return. The history of the ten years after the war is only the history of efforts—more or less fortunate—to prevent this danger. Surprising it may well be that it should be so difficult for Governments to achieve the purpose though at one in their aim; and that they have been unable to reach an understanding as to methods. The truth is that though the nations desire to ensure their security, each one of them has its own particular view; and the word security does not represent to them all exactly the same thing. A Lorraine peasant, an English working man, the grandson of an emigrant in the far west of America, may be equally desirous of peace, but in their minds they do not conceive it in the same way; and the conditions for its realization are different in their eyes.

Different Aspects.—In continental Europe, where the nations have so often seen their fields ravaged by the enemy, and where the frontiers have been incessantly changed according to the fortunes of war, to ensure security means guaranteeing a country against invasion. But England, on the contrary, has suffered no invasion for centuries, and its territorial integrity cannot be brought into question. Security, therefore, in the eyes of the English people, is the certainty of a naval supremacy which alone can assure the feeding of the country and efficaciously protect its ties with the other parts of the Empire. As for the United States, two oceans protect them from any serious encroachment. Moreover, the vastness of the American continent, and the variety of its agricultural and mineral products, relieve them from every apprehension as to the subsistence of the population. They will never lack the primary resources and one imagines that the word "security" signifies to the citizen of the United States the protection of freedom of commerce, of industrial output, and of the country's economic power.

Thus, every nation has a different conception of security; and since nations, as a rule, live in a state of mutual misunderstanding of their essential needs, they readily accuse each other of imperialism, or of blind egoism. Their interests, however, are interwoven, and their community of interest grows with the progress of civilization. The result is that there is no such thing as separate security for any one State, and that no State is assured of living in peace, unless the general security is assured. Formerly it used to be said of the liberty of the individual, that its limit was the liberty of others. So, now, it may be said the safety of each nation is measured by the safety of the others.

The defensive necessities of each nation must, therefore, be compared in order to adjust them, in a general organization for peace, taking into consideration the geographical, the economic, and even the historical conditions of their national life. Some compromises are necessary, and those will entail certain sacrifices, but no agreement is possible amongst mankind without sacrifices. The courage of the statesman consists, precisely, in consenting to those compromises upon which, as Burke says, is founded the government of nations.

Some sophists, however, have tried to separate the question of disarmament from that of security; and this idea has been supported in the League of Nations. To adopt it would mean a deadlock. One cannot imagine England giving up the fleet which she considers necessary for maintaining her overseas communications; nor France—or any other Continental nation—ceasing to guard its territory against the danger of invasion. Doubtless, the possible help which other nations can bring to a country unjustly attacked, is a certain guarantee for that country; but human nature is weak and it may be feared that, at times, the promises undertaken in virtue of the Covenant of the League of Nations may be paralysed by the sudden success of an invader, confronting neutrals at once with an accomplished fact.

Moreover, Article 8 of the Covenant, in fixing the reduction of armaments at the minimum compatible with national safety, has coupled the two questions. Limitation of armaments and security are the two sides of one and the same problem. In reality, by limiting armaments, the wish is simply to spend less than has been spent upon intimidating the enemy. Everything can be bought in this world; the difficulty is to fix the price.

However that may be, and in spite of the deceptions sometimes suffered by statesmen who have sought to solve these problems, it must be recognized that, little by little, the question has ripened. At Geneva, the persevering efforts of the representatives of nearly all the nations have ended in certain results, which are the precursors of others. Despite national rivalries, the desire for peace is gaining strength. Any man, who, to-day, would dare to proclaim the idea of solving European difficulties by war, would be an anachronism, and a scandal.

ATTEMPTS TO SOLVE THE PROBLEM

In reality, that patriotic anxiety which gave birth to this problem of security goes back to 1919. The United States and England had rejected the suggestion of Clemenceau, who proposed to constitute an independent State, between Germany and France, on the left bank of the Rhine. Instead, these two Powers proposed to him a real alliance treaty. This treaty was signed, but the Washington Senate refused to ratify it, and with that, the undertakings which the British Government had made conjointly with the United States fell to the ground. President Wilson must have neglected to submit this treaty to the Senate at Washington. Only about a fortnight after that Assembly had been informed of the Treaty of Versailles, did Wilson communicate to them the Treaty of Alliance. It is possible that this negligence, at which the Senate took offence, may have been the cause of the trouble from which we are still suffering.

Mr. H. Cabot Lodge, chairman of the commission for foreign affairs in the Senate, wrote to Jules Cambon on the subject, on July 6, 1919:

"If there had been no League of Nations presented to the Senate, I think it might have been possible to ratify the triple agreement between France, England and the United States, but the League of Nations and the opposition to it in the Senate pushed everything else aside and in the contest which ensued and which resulted in the defeat of the treaty of Versailles, the traditional feeling, which is very strong in this country, against any treaties of alliance became constantly more intense. By overwhelming majorities such as had never been seen before in any election, the people of the United States declared not merely for the Republican candidate for President, but against the League of Nations, which was the leading issue in the campaign and discussed on every platform."

Negotiations between Great Britain and France.—The British Government, none the less, felt that France might justly be disturbed by the refusal of the American Senate and by its consequences. It seemed desirable to endeavour to attain by other means the object which was the aim of this treaty. It was thus that in 1921 negotiations were opened between Lloyd George, Lord Curzon and Briand, with a view to concluding a security pact which would reinforce the guarantees already offered by the League of Nations. Lloyd George suggested to France a close political and economic union, but he asked her to renounce the building of submarines and all tendency towards maritime rivalry. Briand, on his side, wanted the undertakings of the two Governments to be bilateral, and insisted on a military convention being concluded between the general staffs of the two countries. He consented to the meeting of a conference at Genoa where all the nations, even Soviet Russia, were represented; but disagreeing on some points with his own Government, he had to retire.

Poincaré, who succeeded him, revived the proposal for a military agreement between France and England, but it was soon apparent that the two Governments did not look at it from the same point of view. At the same time, Great Britain refused to conclude a defensive agreement with Belgium. Thus, the private "pourparlers" between the cabinets came to nothing. From that time on, it seemed as if the League of Nations alone was in a position to contrive a solution for the problem of security. We shall see that the League, too, came up against considerable difficulties.

The Temporary Mixed Commission.—Article 8 of the Covenant, to which we have referred, expressly charged the Council of the League of Nations with preparing plans for the reduction of armaments, which were to be submitted to the decision of the Governments; and Article 9 instituted a permanent technical Commission which was to give its advice upon military, naval and aerial questions. In 1921, the League of Nations, whose tendency is to multiply Commissions, asked its Council to constitute a new consulting body which would study, in their entirety, the political and economic questions raised by the study of the reduction of armaments. This new organization was presided over by M. Viviani. It was called the Temporary Mixed Commission, and existed up to the 1924 session of the League of Nations Assembly.

When this commission assembled, one of its members, Lord Esher, suggested fixing a unity of comparison for land forces, such as the Washington Conference had done for naval armaments. The committee considered that armies are not the same thing as fleets, nor are military effectives like warships: that the number of soldiers is not the only factor to consider in the military strength of nations. This latter could not be expressed by a mathematical formula which took no account of either economic power, or of industrial resources. The commission pointed out that by reason of the character of war between armed nations, each nation possessed, behind the visible front of its peace time armaments, potential war-waging capacity. These conclusions were submitted to the League of Nations Assembly which, in its 1921 session, proposed that its Council should proceed to an enquiry into the armaments of the different countries since 1913; it demanded precise details about the different war budgets, about the requirements of national security in every country, about its international obligations. Thus, by degrees, the complexity of the disarmament problem appeared. Lord Robert Cecil therefore, in the Temporary Commission itself, proposed to solve the problem in a very general way, by offering to all the Governments guarantees for the security of their countries, in return for their firm undertaking to reduce armaments. On the other hand, the Permanent Advisory Commission declared that all the guarantees would be inefficacious, unless a plan of defence were previously drawn up; and from that very point arose the question how can it be determined from which side comes the aggression. The mechanism of the mutual guarantee was in itself a subject of discussion. While Lord Robert Cecil contented himself with a general undertaking, the French delegate, M. de Jouvenel, showed more confidence in private treaties. It is a long time ago since Lord Chancellor Bacon said "a mean must be observed in every doctrine, and science, and in the rules and axioms thereof, between the rocks of distinctions and the whirlpools of universalities."

The third Assembly of the League of Nations (1922) adopted a celebrated resolution which is known by the name of "resolution XIV." and which, although trying to conciliate the themes under discussion, adopted, for the most part, the proposals of Lord Robert Cecil. It acknowledged that in the actual state of the world it was impossible for a great number of Governments to proceed to a serious reduction of armaments, if they had not sufficient guarantees for the security of their countries. These guarantees could be furnished by a defensive agreement open to all countries and resting upon a plan for defence previously drawn up. The Council of the League was to establish and submit to the different Governments the plan of political and military mechanism calculated to realize and assure this resolution.

Draft Treaty for Mutual Assistance.—In conformity with resolution XIV., a draft of a treaty for mutual assistance was submitted to the League of Nations Assembly in its fourth session (1923) by the Temporary Mixed Commission. M. Beneš, the Czechoslovakian delegate, was the "rapporteur." According to him, the proposed treaty constituted a solemn pact of non-aggression. It upheld the general assistance indicated by Lord Robert Cecil, but at the same time it contemplated particular defensive agreements, by which the signatory nations undertook to put into execution immediately, in case of aggression against one of them, the plan of assistance previously determined. As for the Council, it could immediately apply against the aggressor the sanctions provided by Article 16 of the Covenant; it could nominate the Powers whose assistance it would claim; determine the forces which each of them was to put at its disposal; appoint the commander-in-chief, and prepare a plan of financial co-operation between the States. Lastly, Beneš suggested that the Council should at once propose an armistice to the belligerents, specifying that the State which refused to accept it should be considered as the aggressor, and adding that the mutual assistance would only come into force after the States signatory to the treaty had reduced their armaments.

This draft of the treaty was communicated to the Powers, who made known their answer in 1924. Eighteen among them gave it their adhesion in principle, but on the whole, it was plain that it

would not be favourably received. The British Government especially, through Ramsay MacDonald, raised numerous objections. The guarantees suggested did not seem to him to imply strictly the reduction of armaments: the judicial guarantees, such as the acceptance of arbitration or the jurisdiction of the international court of justice, appeared to be left on one side; the particular agreements recalled the system of alliances; lastly, the rule of unanimity in the decisions of the Council would paralyse its action in determining the aggressor, and indefinitely delay its intervention. These criticisms carried great weight, and the projected treaty of mutual assistance was abandoned.

The Geneva Protocol.—When, in Sept. 1924, the League of Nations Assembly met, for the fifth time, it found itself therefore once more faced with a check. Nevertheless, some light resulted from the very objections which had been made to its previous decisions; it did not abandon the great object which it had in view—security and the limitation of armaments.

Ramsay MacDonald supported the cause of arbitration; he refused to consider anything beyond it. "Our interests," he said, "our interests for peace are far greater than our interests in creating a machinery of defence. A machinery of defence is easy to create but beware lest in creating it you destroy the chances of peace. The League of Nations has to advance the interests of peace. The world has to be habituated to our existence; the world has to be habituated to our influence; we have to embody into the world confidence in the order and rectitude of law, and then nations—with the League of Nations enjoying the authority, with the League of Nations looked up to, not because its arm is great but because its mind is calm and its nature just—can pursue their destinies with a feeling of perfect security, none daring to make them afraid." Ramsay MacDonald placed confidence in human nature. He forgot Pascal's words, that justice without force is powerless, that one must bring justice and force together, and so act that what is just may also be strong.

M. Herriot answered that arbitration was necessary, but that it was not sufficient; that it was a means and not an end. He added that the three terms—arbitration, security, disarmament—went together, but that they would be vain abstractions if they did not rest upon living realities.

Agreement was reached in the course of the session. On Oct. 2, the Assembly voted the Protocol of Geneva. While M. Politis, the Greek delegate presented to the Assembly the report upon arbitration, M. Beneš submitted to it his report on security and the reduction of armaments. In the event of aggression, all the signatories of the Protocol were loyally to apply the sanctions provided against the aggressor. As to the particular agreements, they could only come into play when the Council had addressed its behests to the signatory States. Lastly, as in the eyes of M. Beneš, there could be no arbitration and security without disarmament, nor disarmament without arbitration and security, the signatories of the Protocol were to take part in an international conference for the reduction of armaments, which was to meet June 25, 1925. On Oct. 3, the Assembly elected a committee charged with preparing the work of this conference.

In the midst of this, the British parliament was dissolved and another Government took the direction of affairs. The new secretary of State for foreign affairs, Austen (afterwards Sir Austen) Chamberlain, asked for the adjournment of the Disarmament Conference and on March 12, 1925, on the re-assembly of the Council of the League of Nations, he made it known that his Government rejected the Geneva Protocol, and gave the reasons for this.

While acknowledging the aspirations of the authors of this Protocol, it seemed to him that the responsibilities already assumed by the members of the League of Nations were gravely increased by it; the absence from the League of Nations of powerful economic Powers, such as the United States, was calculated to modify the point of view from which the authors of the Covenant had considered economic sanctions. Chamberlain added that it might be imprudent to forbid a State threatened by one of its neighbours from proceeding with defensive preparations. Especially from a naval point of view, it was impossible to force a Government to leave its ships dispersed in every ocean, as they may find themselves in time of peace. Lastly, the arrangements of the Protocol appeared to him too absolute; and he ended by suggesting the idea that the nations whose differences might cause the renewal of conflicts, should bind themselves by special agreements, conceived in the spirit of the Covenant and carried out in close harmony with the League of Nations.

This important communication was the subject of a general discussion; but this latest attempt of the League of Nations to assure the security of nations failed like its predecessors. M. Beneš was not discouraged: "There is no reason," he said from the tribune, "to be pessimistic; time is necessary to enterprises like these."

An examination of the successive proposals which the League of Nations had unavailingly adopted, shows that it was dominated by the memory of those days of 1914, which had preceded the war. It wanted to spare Europe fruitless efforts at negotiations such as those which at that time had broken against the uncompromising refusal of the Vienna cabinet to prolong the time allowed for Serbia's reply to the ultimatum; which also were unable to overcome the inertia of the Berlin chancellery obstinately declining the reiterated proposals of Sir Edward Grey. Moreover, it is plain that the absence of Germany from the League of Nations weighed in some measure on the assembly at Geneva, and that her attitude in the future was the principal concern of many.

It was noticed that Chamberlain, at the end of his communication to the Council, had suggested that special, purely defensive, agreements might be concluded by the interested Powers, whose differences were of such a nature as to give rise to fresh conflicts.

Negotiations Leading to Locarno.—Now, a new situation was created by a memorandum which Herr von Hoesch, the German ambassador in Paris, had remitted on Feb. 9, 1925 to M. Herriot, then minister for foreign affairs. The German Government proposed the conclusion of an agreement by which England, France, Italy and Germany herself, undertook—for a period of time to be determined—not to make war upon each other. Germany declared herself ready to conclude arbitration treaties with all the other Powers, and agreed to guarantee absolutely the *status quo* on the Rhine, as well as the demilitarization of the Rhine territories. The conclusion of such an agreement seemed to be the first step towards a world convention embracing all nations.

Herriot welcomed these suggestions, but he replied that it was necessary for him to inform his allies of them, and on May 12, following, Briand, who had succeeded Herriot at the Quai d'Orsay, communicated to Chamberlain his draft reply to Germany. Among other things, he expressed the opinion that the renouncing of war should not be limited to a period and that Belgium as a Power directly interested ought to be associated with this new pact. After a voluminous correspondence, Briand, in complete accord with Chamberlain, was able to reply on June 16 to Stresemann. In this reply, he emphasized the fact that the settlement of the question of security did not imply a modification of the Peace Treaties, and that the Allies, being members of the League of Nations, were bound by the Covenant which comprehended for them both rights and obligations. He concluded that an agreement with Germany could not be conceived unless Germany, enjoying the same rights, but assuming the same obligations, herself entered into this League.

It was agreed, after an exchange of notes, that the judicial experts appointed by the interested Powers, should examine the technical sides of the problem thus raised, and finally that the ministers for foreign affairs should meet on Oct. 5 in Switzerland, for the German ambassador had declared that in the interest of a good understanding, it was necessary to settle the points of difference that separated the Powers, before his country became a member of the League of Nations.

The Treaties of Locarno.—It was thus, that on Oct. 16, 1925, after a laborious conference lasting ten days, the celebrated Locarno agreements were initialled, whose text was definitely signed in London on Dec. 1 following. These agreements comprise a Treaty of Security between Germany, Belgium, France, Great Britain and Italy, and four Arbitrations Conventions

between Germany on the one hand, and Belgium, Poland and Czechoslovakia on the other.

By the Treaty of Security, the signatory Powers individually guarantee the maintenance of the territorial *status quo* between Germany, Belgium and France, as well as the observance of the Peace Treaty as far as the demilitarization of the Rhine is concerned. These three countries undertook never to have recourse to war, except in three cases: legitimate defence, the application of Article 16 of the Covenant, the appeal of the League of Nations in view of common action. In no circumstances whatever can this treaty be considered as a restriction of the mission of the League, the signatories having undertaken by a final Protocol to give their help to its work for disarmament.

It is, moreover, stipulated that in case of a conflict arising between Germany, Belgium and France and diplomacy failing to put an end to it, the question, if bearing on a disputed question of right, should be judicially determined; while questions of another kind should be dealt with by a Commission of Conciliation. Finally, if this latter course failed, the affair was to be settled by the Council of the League of Nations in conformity with Article 15 of the Covenant.

The four Arbitration Conventions between Germany, Belgium, France, Poland and Czechoslovakia stipulate that all points of dispute between them, before being submitted to arbitrators or to the Permanent Court of International Justice at The Hague, may be taken before a permanent Commission to be constituted in the three months following the coming into force of the treaty.

It is, moreover, specified that these treaties make no attack on the rights and obligations resulting from the Treaty of Versailles, and do not impose any obligation whatsoever, either on British India, or on the dominions of the British empire.

On Dec. 14, 1925, Sir Austen Chamberlain and M. Paul-Boncour laid on the table of the Council of the League of Nations, the Treaties of Locarno. The secretary of State for foreign affairs recalled the fact that the League of Nations had often remarked with what favour it would see the achievement of the efforts of certain nations to conclude Arbitration and Security Conventions, and that the Locarno Agreements were but the realization of this wish. Paul-Boncour read a telegram from Briand which stated that these conventions established new relations between their signatories, founded upon the respect of treaties and upon the rights of each.

Thus Germany re-entered the European Concert, as a party to a pacific agreement. Was a new order of things arising in Europe? If so, in order to make it lasting all the signatories to this agreement must show persevering good-will and fidelity to what has since been called "the Locarno spirit."

Preparatory Commission for Disarmament Conference.—The League of Nations, however, had been informed since Sept. 1925 of the negotiations which were to end at Locarno in the month of October following. Acting on the suggestion of the Spanish Delegate, Señor Quiñones de Léon, it had associated itself with them in anticipation, expressing the wish that these agreements might apply to the whole world. The Council carried out the resolution of the Assembly by constituting in Dec. 1925, a preparatory commission for a Disarmament Conference. At the same time, it drew up a list of the questions submitted to this commission, and instituted the preparation of a draft international agreement for the control of private manufacture of arms and munitions of war.

This preparatory commission has become an essential organ of the activity of the Council since it foreshadows the assembling of a Disarmament Conference in the relatively near future. It includes even representatives of States which are not members of the League of Nations, such as the United States and the Union of Soviet Republics. It has created two sub-committees, the one military, the other economic, and it assembled for the first time under the presidency of M. Loudon, the Netherlands delegate.

From the very beginning it encountered serious difficulties: sufficient to detail a few of the questions it had to solve in order to realize where it was. To begin with, it put the question, what is meant by the expression "armaments"? How is a limit to be fixed, and how may they be compared as between one country and another? Are some armaments offensive, others defensive? Can civil aviation be distinguished from military aviation? How are we to calculate the degree of security of a country in case of attack, so as to apply Article 16 of the Covenant, which calls upon the members of the League of Nations to give it their material support? This last question led the United States delegate to retire. He did not wish to take part in a debate of interest only to the members of the League of Nations.

On the other hand, the British delegates raised some objections, for they feared that Article 16 of the Covenant might lead back to solutions similar to those of the Protocol which Sir Austen Chamberlain had rejected in 1925. Finally, the German delegates also made certain reservations which they supported by diplomatic overtures in London and Paris; they wished to be heard by the Council, of which Germany was not yet a member. It must be allowed that the Convention which Germany had recently concluded with Soviet Russia, in virtue of which these two Powers had promised each other reciprocal neutrality, placed her in a peculiar situation from the point of view of the obligation of mutual assistance which the Covenant of the League of Nations imposes upon all its members.

However, such is the power of words that in the eyes of a certain number of delegates, a great many difficulties raised by the study of Article 16 of the Covenant regarding the measures to be taken in the event of aggression were removed by the initiative of the Belgian delegate M. de Brouckère, who proposed to substitute in its place the study of the application of Article 11 regarding the measures to be taken in the event of the threat of war.

The economic sanctions were also the cause of serious deliberations. The abstention of the United States, the greatest economic Power in the world, weighed heavily upon these negotiations; especially the proposal for a peaceful blockade of the aggressor State of a nature to awaken the susceptibilities of the American Government, always alert in matters of this kind.

As to the military measures, Briand and Chamberlain, faced with the difficulties of applying these, caused their examination to be deferred until the next Assembly of the League of Nations which was to meet in Sept. 1927.

When, at that date, at Geneva, the Assembly had to make decisions, it defined its ideas and took practical measures with a view to facilitating arbitration and the reduction of armaments. The *rapporteur*, M. de Brouckère—struck once more with the close tie existing between security and the limitation of armaments—declared plainly that it was useless to bring together the Disarmament Conference so long as the preparatory technical work was not finished. He proposed that the preparatory commission of this conference should name a committee of Arbitration and Security which should pursue its study parallel with the other preparatory body, and in close co-operation with it.

In the course of the discussions of the preparatory commission, the distinctive attitude of some of its members was noticed. The German delegates, through Count Bernstorff, insisted on the meeting of the Disarmament Conference to discuss only present conditions of security. That would have been to separate completely the two questions, contrary to the text of the Covenant, and to the obvious wish of the League of Nations. On the other hand, M. Litvinof and M. Lunacharski, of the Soviet Delegation, lodged a proposal aiming at the general and complete disarmament of all nations. They demanded the complete and immediate abolition of all military, naval and aerial forces, the destruction of fortresses and naval bases, the suppression of all military legislation, of all service—compulsory or voluntary—and the prohibition of all military education of the young.

The Arbitration and Security Committee.—The Arbitration and Security Committee, of which we spoke just now, met on Nov. 3, 1927. Beneš was made president, and Politis was charged with preparing a memorandum on security. The report was presented and discussed at the second meeting of the committee which took place at Geneva from Feb. 20 to March 7,

1928. Politis dismissed as at present unrealizable the idea of a general agreement, adding to the obligations of the Covenant, and recommended the conclusion of regional agreements (particular or collective) of non-aggression, of arbitration or of mutual assistance, or of non-aggression only. These regional pacts were always to include the renunciation of recourse to force, the organization of pacific procedure for the settlement of all differences, and the establishment of a system of mutual assistance consistent with the principles of the League of Nations. These pacts, in case of war, would enable the Council to name the aggressor, and to exercise the right of prescribing armistice. The connection between security and disarmament could be stipulated, and the Council of the League of Nations could co-ordinate the different regional pacts as between each other and in relation to the Covenant of the League.

After this report, a drafting committee was charged by the Arbitration and Security Committee with preparing a certain number of model treaties of conciliation, arbitration, non-aggression, and mutual assistance. M. Rolin-Jaequemyns, the Belgian delegate, was charged with reporting upon them to the third meeting of the committee which took place from June 27 to July 4, 1928. Certain delegates were led to make some reservations upon the conclusions submitted to them. It was thus that the Yugoslav delegate asked for the insertion of a clause directed against flagrant aggression, and the question of the territorial *status quo* was raised by the representative of Poland; but the most remarkable suggestions came from the German delegates. They demanded that in the event of international conflicts the measures to be taken by the Council of the League of Nations should be determined by a majority vote, and not by a unanimous vote. If there were danger of war, the German delegates proposed that the normal peace time military establishment should be re-established, and that if hostilities had broken out there should be an armistice and a withdrawal of the troops that had penetrated into foreign territory. These proposals were worthy of attention, but they could only be efficacious, if they were subject to rapid control and organized beforehand. That is what the French delegate, Paul-Boncour, demanded, and in so doing came into opposition with the Italian and Japanese delegates. Lord Cushendun, for his part, rejected in the name of the British Government the greater part of the German suggestions.

Nevertheless, Beneš succeeded in introducing enough harmony into the committee to allow Rolin-Jaequemyns to present his report. It was under these conditions that the work of the Arbitration and Security Committee was presented to the 9th Assembly of the League of Nations, which met at Geneva in the month of Sept. 1928.

The Kellogg Pact.—But before this meeting, a considerable event had taken place, which essentially concerns the problem of security—the signature of the general pact renouncing war, known by the name of the Kellogg Pact.

Is its origin understood? In April 1927, Briand, in a message addressed to the American people on the occasion of the tenth anniversary of the entry of the United States into the World War, had proposed to the Washington Government to subscribe publicly with the United States, to a mutual undertaking whose aim was to "outlaw war"—according to the American expression—between the two countries. Mr. Kellogg, secretary of State, welcomed this suggestion favourably, but it seemed to him that the pact would have more authority if, instead of being concluded only between the United States and France, it bore the signatures of all the Great Powers. There was an exchange of correspondence on the subject between Kellogg and Briand and especially about the fact that the French minister employed the term "war of aggression," and by that desired to reserve the right of legitimate defence, whilst the American secretary of State preferred to speak of war, simply and generally. On April 13, 1928, the Government of the United States communicated its scheme to Great Britain, Germany, Italy and Japan, and on the 30th of the same month the French Government transmitted its own. It was agreed that the projected pact, if it were realized, should not in any way restrict the right of legitimate defence, that if one of the signatories were to violate the undertakings, all the others should be released from theirs with regard to that signatory, and that the respect of obligations under the Covenant of the League and the Treaty of Locarno should remain the fundamental law of the States which had signed these diplomatic documents. Finally, Sir Austen Chamberlain, on May 19, was careful to make a reservation—which the Government that makes the Monroe Doctrine a cardinal point of its foreign policy could not reject. He drew attention to the fact that there exist certain parts of the world whose welfare and safety present a special and vital interest for the British empire, and that no outside intervention whatsoever could be tolerated.

On Aug. 27, 1928, the general Pact renouncing war was signed in Paris. As Briand, who presided at the signing, pointed out, this pact was lacking in sanctions. In that, it complied with the wish of the American Government to reserve in every case the liberty of its decisions, but it was none the less the recognition of the interdependence of nations upon each other, and at a time when public opinion rules the world, it constituted a moral and preventive sanction against Governments who might tend towards a wish to resort to force.

9th Session of the Assembly of the League.—It was under these conditions that the ninth session of the Assembly of the League of Nations opened in Sept. 1928.

The discussions which took place showed how fortunate it was that the Powers had reached agreement some days previously when signing the Pact renouncing war. The questions of disarmament and security occupied an important place in the deliberations and one felt this time that the hour of idealism had passed. No longer was that sort of sentimentality displayed which in the early sessions of the Assembly coloured the language of the delegates in an attempt at union more apparent than real. Perhaps one must attribute this to the presence of the German delegates. The Chancellor, Herr Muller, who replaced Herr Stresemann, requested that everyone should make a great effort for sincerity. Briand did not fail to reply to this suggestion, and drew attention pointedly to the disturbing possibilities concealed by German military organization.

Beneš presented to the Assembly the conclusions of the aforementioned Arbitration and Security Committee. They encountered on the part of the German, Hungarian and Austrian delegates an opposition which showed the persistence of the unity between these erstwhile allies. The projected treaties of non-aggression and mutual assistance were voted with insignificant amendments, in spite of the criticism which they raised, notably on the part of Poland, who on account of the insufficiency of the guarantees which she discovered in them would only consider the insufficiency of her actual armaments. At last, Paul-Boncour, with the support of Politis, pointed out that the Committee of Security had only accomplished one part of its task. It was therefore decided that this committee as well as the Preparatory Commission should proceed with their work in such a way as to allow a progressive reduction of armaments in proportion to the development of the conditions of security. This is a decision not to be overlooked, at a time when the Council of the League of Nations tends more and more to bring into political disputes the intervention of the technical organizations of the League.

Such is the actual state of the question of security. It is plain that whatever efforts the League of Nations may make for ensuring the benefits of peace to the world, nations can only enjoy it if they bring equal goodwill into their relations with each other. We must condemn the passion with which certain people in all countries try to excite distrust in public opinion and suspicion of the purest intentions. (J. Cn.)

SEDAINE, MICHEL JEAN (1719–1797), French dramatist, was born at Paris on July 4, 1719. His father, who was an architect, died when Sedaine was quite young, leaving no fortune, and the boy began life as a mason's labourer. He was later taken as pupil by an architect whose kindness he eventually repaid by the help he was able to give to his benefactor's grandson, the painter David. Meanwhile he had done his best to repair his deficiencies of education, and in 1750 he published a *Recueil de pièces fugitives,* which included fables, songs and pastorals. His especial talent was, however, for light opera. He produced *Le Diable à quatre* (1756), the music being by several composers; *Blaise le Savetier* (1759), for the music of Danican Philidor; *On ne s'avise jamais de tout* (1761) and others with Pierre de Monsigny; *Aucassin et Nicollet* (1780), *Richard Coeur de Lion* (1784), and *Amphitryon* (1788) with André Grétry.

Sedaine's vaudevilles and operettas attracted the attention of Diderot, and two plays of his were accepted and performed at the *Théâtre Français.* The first and longest, the *Philosophe sans le savoir,* was acted in 1765; the second, a lively one-act piece, *La Gageure imprévue* in 1768. These two at once took their place as stock pieces. Except these two pieces little or nothing of his has kept the stage or the shelves, but Sedaine may be regarded as the literary ancestor of Scribe and Dumas. He had the practical knowledge of the theatre, which enabled him to carry out the ideas of Diderot and gave him claims to be regarded as the real founder of the domestic drama in France. Sedaine, who became a member of the Academy (1786), died at Paris on May 17, 1797. He wrote two historical dramas, *Raymond V. comte de Toulouse,* and *Maillard, ou Paris sauvé.*

His *Oeuvres* (1826) contain a notice of his life by Ducis.

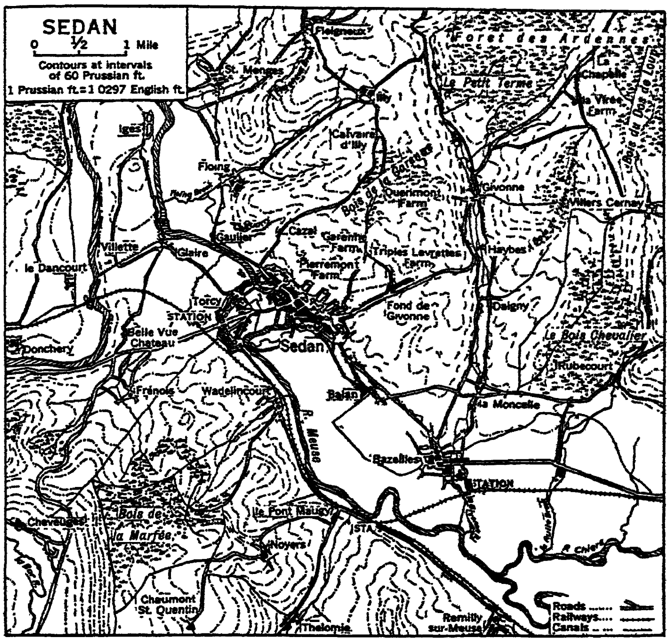
SEDALIA, a city of Missouri, U.S.A., 85 m. S.E. of Kansas City, on Federal highways 50 and 65, and served by the Missouri-Kansas-Texas and the Missouri Pacific railways. Pop. (1920) 21,144 (87% native white and 10% negroes); and 20,806 in 1930 by the Federal census. The city has a pleasant site of 1,440 ac. on a rolling prairie, 910 ft. above sea-level, and is laid out in an exact square. Industries include railroad shops, flour-mills, ice and poultry-packing plants and factories making mattresses, fixtures and clothing. Sedalia was founded in 1858, and in 1864 was chosen as the county seat in place of Georgetown. Throughout the Civil War it was a Union post, except for one day (Oct. 15, 1864) when it was occupied by a detachment from Sterling Price's raiding column. The city was chartered in 1889.

SEDAN, a town of northern France, in the department of Ardennes, on the right bank of the Meuse, 12 m. E.S.E. of Mézières by rail. Pop. (1926) 16,300. Sedan was in the 14th century a dependency of the abbey of Mouzon, the possession of which was disputed by the bishops of Liége and Reims. United to the crown of France by Charles V., it was ceded by Charles VI. to Guillaume de Braquemont, whose son sold it to his brother-in-law Evrard de la Marck, whose family for two centuries continued masters of the place, and Henri Robert adopted the title "prince of Sedan." In the 16th century Protestant refugees laid the basis of its industrial prosperity, and it became the seat of a Protestant seminary. Robert I. de la Marck (d. 1489) was lord of Sedan when he acquired Bouillon. His grandson, Robert III., seigneur of Fleurange and Sedan (d. 1537), was marshal of France. Robert IV. de la Marck (d. 1556), also marshal of France, erected Sedan on his own authority into an independent principality. By the marriage of his granddaughter Charlotte with Henry I. de la Tour d'Auvergne, the duchy of Bouillon and the principality of Sedan passed to the house of Turenne. When the new duke attempted to maintain his independence, Henry IV. captured Sedan in three days; and the second duke Frédéric Maurice de la Tour d'Auvergne, was obliged to surrender his principality. Sedan thus became part of the royal domain in 1642. On Sept. 1, 1870 the fortress was the centre of the most disastrous conflict of the Franco-German War (*see* below). On the left bank stands the suburb of Torcy. There are remains of a castle of the 15th century. Sedan has a municipal school of weaving. The chief industries are the manufacture of woollen goods and of machinery. (X.)

Battle of Sedan (Sept. 1, 1870).—During the course of Aug. 31 (*see* FRANCO-GERMAN WAR) the retreating French army (I., V., VII., and XII. corps) under Marshal MacMahon assembled in and around Sedan, watched throughout the day by the German cavalry but not severely pushed by them. Sedan is a small old-fashioned fortress, lying in a depression between two ridges which converge in the plateau of Illy about 2½ m. N.E. of the town. The only part which its defences played, or might have played, in the ensuing battle lay in the strategic possibilities contained in the fine and roomy bridge-head of Torcy, covering an elbow bend of the Meuse whence the whole French army might have been hurled into the gap between the German III. and Meuse armies, had there been a Napoleon to conceive and to execute this plan. But MacMahon seems to have been too despondent to contemplate anything further than a battle for the honour of the army, and though communications with Mézières, where Vinoy's corps (XIII.) was gathering, lay open throughout the day, he neither sent orders nor made arrangements for the disposition of his forces to meet the coming danger.

The troops received food and ammunition, the disorders consequent on the successive days' fighting in retreat were remedied,

and the men themselves got what they needed most of all, an almost unbroken day's rest. Locally their position was strong, particularly to the east, where the stream flowing through the Fond du Givonne, though fordable, presented a serious tactical obstacle. But as a whole it was far too cramped for the numbers crowded into it; it could be completely overlooked from the heights of Frénois, where the king of Prussia's headquarters took



their stand, and whence in the afternoon the German artillery fire began to cross over the town itself. At nightfall on the 31st the leading German infantry were approaching. The Army of the Meuse was on the right bank of the river, with the II. Bavarians moving towards Bazeilles to reinforce it, while the III. Army was heading for Donchéry to cut off the French from Mézières, and only a weak cavalry screen closed the gap between them.

During the night of August 31 the Bavarians threw a pontoon bridge across the Meuse below Rémilly, and soon after daybreak, in a fog which lay thickly over the whole country, they began their advance towards Bazeilles, held by Vassoigne's division. The firing called all troops within reach of the sound to arms, and before 5 A.M. the Meuse Army was marching to the battle-field, the Guards on the northern road via Villers-Arnay, the Saxons and IVth corps to the south along the river.

Vassoigne's division contained a number of Marine battalions, and their stubborn resistance completely disconcerted the Bavarians. Deprived of all artillery co-operation owing to the fog, the latter spent themselves in fruitless and disconnected efforts in the gardens and streets of the village. About 6 A.M. the fog lifted, and the German batteries at once intervened. One of the first shells wounded Marshal MacMahon. The next senior officer, General Ducrot, at once assumed command (7 A.M.). But it happened that General Wimpffen, who had only joined the army from Algiers on the night of the 30th, brought with him a secret commission to assume command in the event of the death or disablement of MacMahon. Of this power he did not at first avail himself, since he was a stranger both to the army and the country, whilst Ducrot possessed the confidence of the one and a knowledge of the other. But when about 9 A.M. he learnt that Ducrot proposed to move the whole army under cover of rearguards to the west towards Mézières, he produced his commission and countermanded the movement, being himself convinced that eastward towards Bazaine at Metz lay the road to salvation. Orders once issued on a battle-field are not easily recalled, and the result of this change of command was dire confusion. The French troops northward of Bazeilles, along the Fond du Givonne, were already commencing their withdrawal, when the leading troops of the Saxon XII. corps began to arrive about Daigny, and being only opposed by a weak rearguard, easily carried the ridge south of the Givonne-Sedan road, thus threatening the retreat of Vassoigne's division in and about Bazeilles, which then fell into the hands of the Bavarians between 10 and 11 A.M. At the same moment the Guard corps had begun to form up between Daigny and Givonne, and there being no serious force of the enemy in front of them, the artillery was deploying along the western heights above the valley of Givonne, covered only by weak advanced guards of infantry, when suddenly a great column of French infantry, some 6,000 strong, moving west in pursuance of Wimpffen's orders, came over the eastern border of the valley and charged down at full speed towards the guns. Then followed one of the most dramatic spectacles of the entire war. The whole of the corps artillery of the Guard turned upon these devoted men, and tore the column in half, shrouding it in dense clouds of dust and smoke from the bursting shells, above which could be seen the trunks and limbs of men flung upwards by their explosion. The head of the column nevertheless kept on its way, but under the combined fire of the Guard rifle battalion and the flanking fire from other guns its impetus died out and its débris disappeared by degrees under convenient cover. The German Guards were now free to stretch out their right towards the Belgian frontier (where the scouts of the III. Army were already moving) and prepare with all deliberation for the attack on the Bois de la Garenne.

The III. Army had moved off as early as 2.30 A.M., and by 4 A.M. was already crossing the Meuse at Donchéry, aided by several pontoon and trestle bridges thrown over during the night. Their right was covered from sight by the peninsula formed by a bend of the river, and the march of the several columns was unopposed till, clearing its northern extremity, they began to deploy to their right between St. Menges and Floing. Here they encountered French outposts, which fell back on their main position on the ridge, to the south of the Floing-Illy road. Against this position the German artillery now pressed forward, and seeing their exposed position, General Gallifet brought forward his brigade of Chasseurs d'Afrique and delivered a most dashing charge. But being unsupported he was compelled to withdraw again behind the cover of the Cazal-Illy ridge.

It was now about 11 A.M., and, whether moved by the belated impulse of Ducrot's orders or attracted by the apparent weakness of the Prussians within sight, the French infantry now made a brilliant counter-attack out of their position in their usual manner. But German reinforcements coming suddenly into view, and their *élan* having spent itself, they fell back again to their former position.

About noon Wimpffen rode up to General Douay and asked him whether he could hold on to his position. The latter, possibly elated by the success of his recent attack, replied in the affirmative, pointing out only the importance of maintaining the Calvaire d'Illy to the north. Wimpffen promised him support from the I. corps on the right rear, part of which, hidden in the Bois de la Garenne, had as yet been little engaged, and then rode south to Balan, where he found the XII. corps fighting desperately. He then sent back to Douay for reinforcements, and the latter despatched all he could spare. These, marching south, crossed the troops of the I. corps sent to Douay's assistance. The Prussian shells were already crashing into the woods from all sides, and countless stragglers and riderless horses caused most serious delay. To gain time, Margueritte's division was ordered to charge. Margueritte was killed as he rode forward to reconnoitre, and Gallifet took command. "For the next half-hour," says the Prussian official account, "the scene defies description. Gallifet and his squadrons covered themselves with glory, but he had not 2,000 sabres at his disposal. Under the storm of shell and over the broken ground manoeuvring was impossible." It was not until about an hour after this series of cavalry charges that, between 3 and 4 P.M., the Germans at length gathered weight enough to attempt the assault of the French main position, and moved by a common instinct, lines of men almost 2 m. in extent, pressed on, gaining cover from the convex slope of the hill, till at length they

ration of ice or a melting out in sea-water, for it usually consists of a non-bedded heterogeneous mixture of coarse boulders, pebbles, sand and fine clay.

Under the action of the wind, sand grains become well rounded and "frosted," because the lubricating action of water is absent. Sorting is usually well-marked, and silt and dust are carried far beyond the area of sand-deposition (of which the dune is a characteristic form). By this means fine terrigenous material becomes incorporated with sediments of even deep-water type. Where, in late glacial times, the wind has played upon areas of boulder clay, it has brought about the deposit of an extra-glacial belt of a sandy clay called loess which almost encircles the earth, in about latitude 40–45° N. Indurated boulder-clays or tillites occur in deposits of Cretaceous, late Carboniferous, Cambrian and Pre-Cambrian age (although some are disputed) in various parts of the world. They are often associated with kame-like gravels and varved shales.

The term "facies" has been used to connote the sum-total of the features which characterize any particular sedimentary rock. Thus we may have a sandy facies or a coaly facies, depending on the constitution; a lagoon facies or a reef-facies, from a geographical or community standpoint; or a graptolite-facies or brachiopod facies according to the dominant life.

Apart from physical changes such as consolidation under renewed deposition, and drying, sedimentary rocks may undergo chemical and other changes during their formation on the sea-floor, or but slightly subsequent to it (penecontemporaneous changes). Coral reefs or other limestones may be dolomitized by partial replacement by magnesia from warm sea-water. (*See* DOLOMITE.) While flint and chert may be in part deposited directly by chemical or organic action, they doubtless also represent in part a penecontemporaneous or subsequent segregation of silica in limestones and replacement of calcareous material. Before consolidation, clays and coals enclose large quantities of water, often saturated with carbonate of lime, iron, etc. By rapid segregation and crystallization of the latter substances, masses of septaria or cement-stone are formed in the clay, but where the action is slower and proceeds from many centres, beds may be formed consisting almost wholly of "spherulites" of spheroidal form and radiating structure. Where anaerobic bacteria are present, large quantities of iron (ferrous) sulphide may be formed throughout the clay, giving it a black colour, but not necessarily inhibiting other life. Subsequent segregation of this material yields nodules of pyrite or marcasite.

For additional information *see* ALLUVIUM, BRECCIA, CLAY, COAL, CONGLOMERATE, FLINT, LIMESTONE, MARL, OCEANOGRAPHY, SAND, SANDSTONE, etc. (P. G. H. B.)

SEDITION, in law, an attempt to disturb the tranquillity of the State. In English law it is a very elastic term, including offences ranging from libel to treason (*q.v.*). It is rarely used except in its adjectival form, *e.g.*, seditious libel, seditious meeting or seditious conspiracy. Sedition is a common law indictable misdemeanour, and embraces everything whether by word, deed or writing which is calculated to disturb the tranquillity of the State, and lead ignorant persons to endeavour to subvert the Government and laws of the empire.

The principal enactments now in force dealing with seditious offences were all passed during the last 25 years of the reign of George III. They are the Unlawful Oaths Act 1797, prohibiting the administering or taking of unlawful oaths (*see* OATH) or the belonging to an unlawful confederacy; the Unlawful Drilling Act 1819, which prohibited unlawful drilling and military exercises; and the Acts for the suppression of corresponding societies, the Unlawful Societies Act 1799 and the Seditious Meetings Act 1817. No proceedings can be instituted under these last two Acts without the authority of the law officers of the Crown. By the Prison Act 1877, any prisoner under sentence for sedition or seditious libel is to be treated as a misdemeanant of the first division.

In the United States, Congress has passed sedition acts for the supposed protection of the Government. The Alien and Sedition laws passed during the administration of President Adams were partly responsible for the defeat of the Federalist party. During the World War, Congress passed with the approval of President Wilson sedition measures for the purposes of minimizing domestic opposition to the war.

SEDLEY, SIR CHARLES (*c.* 1639–1701), English wit and dramatist, was born about 1639, and was the son of Sir John Sedley of Aylesford in Kent. He was educated at Wadham College, Oxford. The college was then under the direction of John Wilkins, whose other pupils included Rochester and Car Scroop. Sedley is famous as a patron of literature in the Restoration period, and was the "Lisideius" of Dryden's *Essay of Dramatic Poesy.* His most famous song is "Phyllis is my only joy." His first comedy, *The Mulberry Garden* (1668), hardly sustains Sedley's contemporary reputation for wit in conversation. The best of his comedies is *Bellamira; or The Mistress* (1687), an imitation of the *Eunuchus* of Terence, in which the heroine is supposed to represent the duchess of Cleveland, the mistress of Charles II. His two tragedies, *Antony and Cleopatra* (1667) and *The Tyrant King of Crete* (1702), an adaptation of Henry Killigrew's *Pallantus and Eudora,* have little merit. He also produced *The Grumbler* (1702), an adaptation of *Le Grondeur* of Brueys and Palaprat.

An indecent frolic in Bow Street, for which he was heavily fined, made Sedley notorious. He was member of parliament for New Romney in Kent. His *bon mot* at the expense of James II. is well known. The king had seduced his daughter, Catherine (*c.* 1657–1717), and created her countess of Dorchester, whereupon Sedley remarked that he hated ingratitude, and, as the king had made his daughter a countess, he would endeavour to make the king's daughter a queen. He died on Aug. 20, 1701.

See *The Works of Sir Charles Sedley in Prose and Verse* (1778), with a slight notice of the author; and V. de Sola Pinto, *Sir Charles Sedley 1639–1701: A Study in the Life and Literature of the Restoration* (1927).

SEDUCTION, a term generally used in the special sense of wrongfully inducing a woman to consent to sexual intercourse. The action for seduction of an unmarried woman in England stands in a somewhat anomalous position. The woman seduced has herself no right of action, for she must have given her consent to the connection, and *volenti non fit injuria.* The foundation of the action is the relationship of master and servant, and the plaintiff in order to succeed must prove that the woman seduced was at the time of the seduction in his service, actual or constructive, and that he has lost her services by reason of her confinement and illness (*Peters* v. *Jones,* 1914, 2 K.B. 781). A father may maintain the action in respect of a daughter who is under 21 years of age and living with him, without proof of any actual services rendered, for he has a right to the services of his daughter, so that she is constructively in his service (*Terry* v. *Hutchinson,* 1868, L.R. 3 Q.B. 599). But if the daughter is over 21 years of age, the father must give evidence of actual services rendered by the daughter, although such slight services as making tea, or looking after children are sufficient evidence of service to support the action (*Bennett* v. *Allen,* 1787, 2 T.R. 166). On the other hand, if the girl is not living at home but was in the service of a third person, only that third person can sue, since the loss of service falls on him (*Carr* v. *Clarke,* 1818, 2 Chitty 260). In such a case the mere fact that the girl comes home at intervals and on such occasions does some of the household work does not create the relationship of master and servant between her father and herself so as to enable the father to maintain an action (*Williams* v. *Whitbourne,* 1901, 2 K.B. 722). Where the girl was at the time of the seduction in the service of the seducer himself no action is maintainable, unless the hiring was merely a pretence and contrivance for the purpose of seduction (*Speight* v. *Oliveira,* 1819, 2 Stark, 493).

The relationship of master and servant must have existed at the time of seduction and also at the time of the illness consequent upon it that deprives the plaintiff of the girl's services. Thus where a girl was in service as a governess and was seduced by the defendant whilst on a four days' visit, with her employer's permission, to her widowed mother, but at the time of her confinement was in the service of another employer, it was held that no action lay

(*Hedges* v. *Tagg*, 1872, L.J. Ex. 169). Similarly where a girl was seduced whilst living at home with her father and mother, but the father died before her confinement, it was held that the widowed mother, to whom she rendered ordinary household duties after her father's death, could not maintain an action, as the girl was not in her service at the time of the seduction but in that of the father (*Hamilton* v. *Long*, 1903, 2 Ir.R. 407; affirmed, 1905, 2 Ir.R. 252).

Although the action is nominally for loss of service, the plaintiff can, if a parent, recover in addition to the actual loss sustained damages for distress and anxiety of mind (*Andrews* v. *Askey*, 1837, 8 C. and P. 7), for the loss of the society of the daughter seduced, and for the dishonour which he receives (*Bedford* v. *McKowl*, 1800, 3 Esp. 119). But where the action is not brought by a parent, the plaintiff can only recover the actual pecuniary loss which he has sustained (*McKenzie* v. *Hardinge*, 1906, 23 T.L.R. 15).

The defendant can, in mitigation of damages, give evidence as to the general loose character of the girl (*Carpenter* v. *Wall*, 1840, 11 A. and E. 803), and also call witnesses to prove that they have had sexual intercourse with the girl previously to the seduction (*Verry* v. *Watkins*, 1836, 7 C. and P. 308).

As to seduction of a married woman, the old action for criminal conversation was abolished in England, but in Ireland, by the Divorce Act 1857 which substituted for it a claim for damages against the co-respondent in a divorce suit; but if a married woman were living apart from her husband in her father's house, and giving her services to her father in the slightest degree, an action for seduction would lie. Seduction in England is not as a rule a criminal offence. But a conspiracy to seduce a woman is indictable at common law. And the Criminal Law Amendment Act 1885 (which extends to the United Kingdom) makes it a felony to seduce a girl under the age of 13, and a misdemeanour to seduce a girl between 13 and 16 (ss. 4, 5). The same act also deals severely with the cognate offences of procuration, abduction and unlawful detention of a girl or woman with intent that she should be carnally known by any man (ss. 2, 7, 8). The Children Act 1908 gives a further protection to young people, enacting that if any person having the custody, charge or care of a girl under the age of 16 causes or encourages the seduction of that girl, he shall be guilty of a misdemeanour, and be liable to imprisonment, with or without hard labour, for a term not exceeding two years (s. 17).

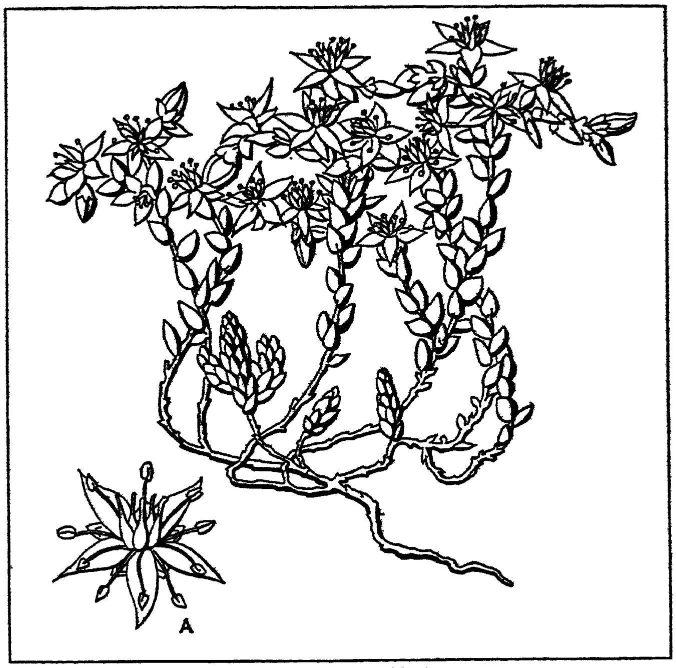
Scotland.—In Scotland the seduced woman may herself maintain an action, but only if some species of fraud or deceit was practised on her, *e.g.*, if her consent to the connection was induced by a promise of marriage, or by a profession of honourable love leading her to expect marriage. Indeed, if a man, by an abuse of the confidence resulting from his position as master, and by the exercise of dominating influence, has induced a girl in his service to allow him to have connection with her, or by gradually debauching the mind of the girl and by continued solicitations, has overcome her resistance to the act of intercourse, an action of seduction will lie at her suit, though marriage was not thought of.

United States.—In the United States the common law tort of seduction exists, but by statute the woman, if previously of chaste character, is usually given a right of action in her own name. The element of the offence is the accomplishment of the seduction by deceit or false promises, illicit intercourse by itself being insufficient. Most States also make seduction a criminal offence, some, however, limiting the crime to cases where the seduction is accomplished by false promises of marriage. Previous chaste character is an essential element of the crime. Subsequent marriage of the parties is generally a defence to both civil and criminal actions. The seduction of married women is covered by the maintenance of an action for criminal conversation or, where abolished, for the alienation of affections. Illicit intercourse unaccompanied by false artifices may constitute the statutory crimes of fornication or adultery.

SEDULIUS, Coelius or Caelius (a praenomen of doubtful authenticity), a Christian poet of the first half of the 5th century, is termed a presbyter by Isidore of Seville and in the Gelasian decree. He must not be confused with Sedulius the Irish-Scot grammarian of the 9th century. His fame rests mainly upon a long poem, *Carmen paschale*, based on the four gospels.

Sedulius's works were edited by F. Arevalo (Rome, 1794), reprinted in J. P. Migne's *Patrol. Lat.* vol. xix.; and finally by J. Huemer (Vienna, 1885). *See* J. Huemer, *De Sedulii poëtae vita et scriptis commentatio* (Vienna, 1878); M. Manitius, *Geschichte der christlich-lateinischen Poesie* (Stuttgart, 1891); Teuffel-Schwabe, *Hist. of Roman Lit.* (Eng. trans.), 473.

SEDUM, in botany, a genus of the family Crassulaceae, containing about 150 species, natives chiefly of the north temperate



BY COURTESY OF THE BRITISH MUSEUM (NATURAL HISTORY)
BITING STONECROP (SEDUM ACRE) SHOWING THE CREEPING STEMS WHICH BECOME PARTLY ERECT, (A) SINGLE FLOWER ENLARGED

and frigid regions, and mostly perennial herbs with succulent leaves of varied form, but never compound. The white or yellow, rarely pink or blue, flowers are usually small and grouped in cymes. They have a calyx of five sepals, as many petals, usually ten stamens and five distinct carpels, which have as many glands at their base and ripen into as many dry seed-pods. Several species are British, including some with tuberous roots and large leaves (*S. Telephium*), and others of smaller size, chiefly found on rocks, walls and dry banks; *S. acre* is stonecrop, well known also in gardens, a variety of which, *aureum*, is in cultivation with golden-yellow tips to the leaves and shoots. Upwards of 30 species are native to North America, widely distributed across the continent. In addition, the Old World *S. Telephium* and *S. acre* have become widely naturalized in the eastern States and Canada. Many species are cultivated for the beauty of their foliage or flowers, and many are remarkable for their vitality under adverse circumstances. They succeed on rockwork, old walls or as border plants; some, e.g., *S. Lydium*, a native of Asia Minor, are excellent for carpet bedding. *S. spectabile*, 1 to 1½ ft., with pink flowers in great cymose heads, is a fine plant for the borders.

SEE, a seat or throne, particularly the throne of a bishop, the *cathedra*, the symbol of his office and dignity, the placing of which in a church makes it a cathedral (*q.v.*). The term is thus applied to the place where the bishop's cathedral is situated and from which he properly takes his title, and so is to be distinguished from diocese (*q.v.*), the territorial province over which his jurisdiction extends (*see* Bishop).

SEEBOHM, FREDERICK (1833–1912), English historian, born at Bradford on Nov. 23, 1833, the son of a Quaker wool-merchant, was educated at the Bootham school, York, and read law in London. In 1856 he began to practise as a barrister, finally moving to Hitchin, where he became a partner in the bank of Sharples and company (amalgamated with Barclay and company in 1896). He played an active part in municipal affairs, was a

Poor Law guardian, justice of the peace, and member of the Hertfordshire County Council education committee. His interest in the social and religious problems of modern life led him to study the conditions of English rural life in the past, and the religious movements of the Reformation. In 1867 he published *The Oxford Reformers,* and in 1874 *The Era of the Protestant Revolution.* But Seebohm's best known and most valuable contributions to history were made in connection with the history of the village community, in his *The English Village Community* (1883); *The Tribal System in Wales* (1895); and *Tribal Custom in Anglo-Saxon Law* (1902). He argued that the open-field manorial system of villages had its basis in the Roman villa, in opposition to those who held that Roman civilization was practically wiped out from Roman Britain by the Teutonic invasions. Seebohm was working on another volume, *Customary Acres,* which was published posthumously in 1914, when he died at Hitchin on Feb. 6, 1912.

See the obituary of Seebohm in *The Collected Papers of Paul Vinogradoff* (1928).

SEECKT, HANS VON (1866–), German soldier, was born in Schleswig April 22, 1866. He entered the Kaiser Alexander Grenadier Regiment as ensign (fahnenjunker). In 1897 he was appointed to the general staff, becoming chief of staff of the III. Army Corps (Berlin) in 1913, in which capacity he went on active service in Aug. 1914, with the rank of lieutenant-colonel. On Jan. 27, 1915, he was promoted colonel, and soon after became chief of staff to Mackensen's army group. He had a large share in conducting the break-through of the Central Powers at Gorlice-Tárnow, May 1915, and the subsequent invasion of Serbia. After the collapse of the Monarchy he became adjutant-general (*Chef des Truppenamtes*) in the *Reichswehrministerium* (Nov. 1919). After the Kapp "putsch" of March 1920 he was appointed chief of the German Army Command. In Jan. 1926 he was again promoted to the rank of general by President von Hindenburg.

SEED. The seed is formed from the ovule as the result of fertilization (*q.v.*). It is contained in a seed vessel (*see* FRUIT)

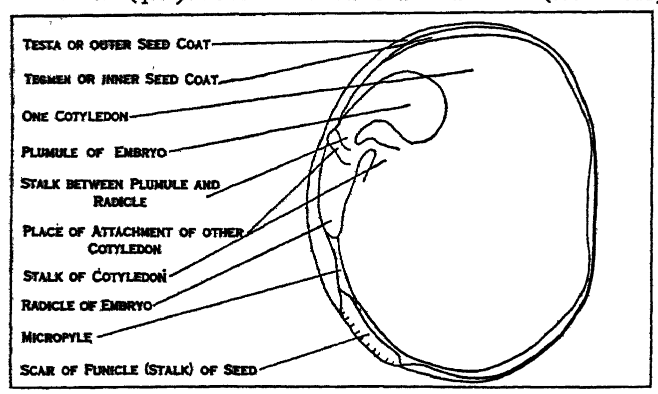


FIG. 1.—SEED OF PEA (PISUM SATIVUM) WITH ONE COTYLEDON REMOVED

formed from the ovaries in the plants called *angiospermous;* while in *gymnospermous* plants, such as Coniferae and Cycadaceae, it is naked, or, in other words, has no true pericarp. It sometimes happens in angiosperms, that the seed-vessel is ruptured at an early period of growth, so that the seeds become more or less exposed during their development; this occurs in mignonette, where the capsule opens at the apex, and in *Cuphea,* where the placenta bursts through the ovary and floral envelopes, and appears as an erect process bearing the young seeds. After fertilization the ovule is greatly changed as a result of the formation of the embryo. In the embryo-sac of most angiosperms (*q.v.*) there is a development of cellular tissue, the endosperm, more or less filling the embryo-sac. In gymnosperms (*q.v.*) the endosperm or embryo sac tissue is formed preparatory to fertilization. The fertilized egg enlarges and forms the embryo. The embryo-

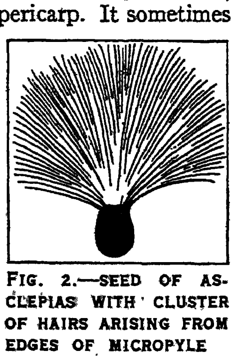

FIG. 2.—SEED OF ASCLEPIAS WITH CLUSTER OF HAIRS ARISING FROM EDGES OF MICROPYLE

sac enlarges greatly, displacing gradually the surrounding nucellus, which eventually forms merely a thin layer around the sac, or completely disappears. The remainder of the nucellus and the integuments of the ovules form the seed-coats. In some cases a delicate inner coat or *tegmen* can be distinguished from a tougher outer coat or *testa;* often, however, the layers are not thus separable. The consistency of the seed-coat, its thickness, the character of its surface, etc., vary widely, the variations being often closely associated with the means of seed-dispersal. An account of the development of the seed from the ovule will be found in the article ANGIOSPERMS. When the pericarp is dehiscent the seed-covering is of a strong and often rough character; but when the pericarp is indehiscent and encloses the seed for a long period, the outer seed-coat is thin and soft. The cells of the testa are often coloured, and have projections and appendages of various kinds. Thus in *Abrus precatorius,* it is a bright red; in French beans it is beautifully mottled; in *Asclepias* it has hairs attached to it; and in *Bignonia* and the pines and firs it is expanded in the form of wing-like appendages. In *Collomia* and other seeds, it contains spiral cells, from which, when moistened with water, the fibres uncoil in a beautiful manner; and in flax (*Linum*) and others the cells swell up and become mucilaginous. These structural peculiarities of the testa in different plants have relation to the scattering of the seed. But in some plants the pericarps subserve the same purpose; this especially occurs in small pericarps enclosing single seeds, as achenes, caryopsides, etc. Thus in Compositae, the pappose limb of the calyx forms a parachute to the pericarp; and the epicarp is prolonged as a wing in *Fraxinus* and *Acer.*

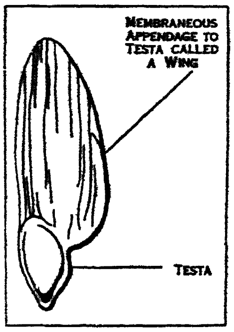

FIG. 3.—SEED OF PINE (PINUS)

Sometimes there is an additional covering to the seed, formed after fertilization, to which the name *arillus* has been given. This is seen in the passion-flower. In the nutmeg this additional coat constitutes a laciniated scarlet covering called *mace.* The fleshy

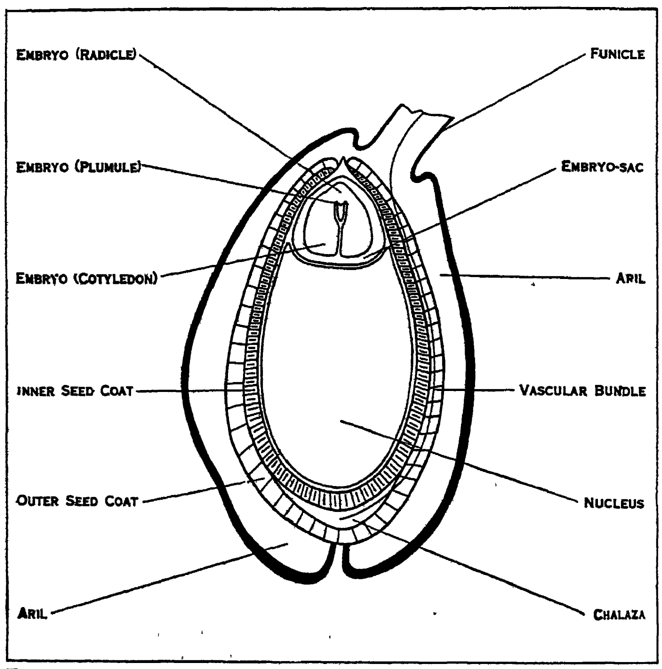

FIG. 4.—YOUNG ANATROPAL SEED OF THE WHITE WATER LILY (NYMPHAEA ALBA), CUT VERTICALLY

scarlet covering formed around the naked seed in the yew is by some considered of the nature of an aril. On the testa, at various points, there are produced at times other small outgrowths to which the name *caruncles* has been given. The funicles of the ovules frequently attain a great length in the seed, and in some magnolias, when the fruit dehisces, they appear as long scarlet

cords suspending the seeds. The hilum or umbilicus of the seed is usually well marked, as a scar of varying size; in the calabar bean it extends along a large portion of the edge of the seed; it frequently exhibits marked colours, being black in the bean, white in many species of *Phaseolus*, etc. The *micropyle* of the seed may be recognizable by the naked eye, as in the pea and bean tribe, etc., or it may be minute or microscopic. It indicates the true apex of the seed, and is important as marking the point to which the root of the embryo is directed. At the micropyle in the bean is observed a small process of integument, which, when the young plant sprouts, is pushed up like a lid. The chalaza is often of a different colour from the rest of the seed. In the orange it is reddish-brown, and is easily recognized at one end of the seed when the integuments are carefully removed.

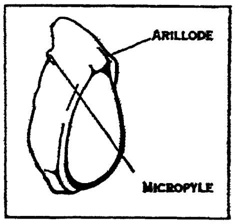

FIG. 5.—ARILLODE, OR FALSE ARIL, OF THE SPINDLE-TREE (EUONYMUS) ARISING FROM THE MICROPYLE

The position of the seed as regards the pericarp resembles that of the ovule in the ovary, and the same terms are applied—erect, ascending, pendulous, suspended, curved, etc. These terms have no reference to the mode in which the fruit is attached to the axis. Seeds exhibit great varieties of form. They may be flattened laterally (*compressed*), or from above downwards (*depressed*). They may be round, oval, triangular, polygonal, rolled up like a snail, as in *Physostemon*, or coiled up like a snake, as in *Ophiocaryon paradoxum*.

The endosperm formed in the embryo-sac of angiosperms after fertilization, and found previous to it in gymnosperms, consists of cells containing nitrogenous and starchy or oily material, destined for the nutriment of the embryo. It occupies the whole cavity of the embryo-sac, or is formed only at certain portions of it, at the apex, as in *Rhinanthus*, at the base, as in *Vaccinium*, or in the middle, as in *Veronica*. As the endosperm increases in size along with the embryo-sac and the embryo, the substance of the original nucellus of the ovule is gradually absorbed. Sometimes, however, as in Zingiberaceae, no endosperm is formed; the cells of the original nucellus, becoming filled with food-materials for the embryo, are not absorbed, but remain surrounding the embryo-sac with the embryo, and constitute the *perisperm*. Again, in other plants, as Nymphaeaceae, both endosperm and perisperm are present. There is a large class of plants in which although at first after fertilization a mass of endosperm is formed, yet, as the embryo increases in size, the nutrient matter from the endospermic cells passes out from them, and is absorbed by the cells of the embryo plant. In the mature seed, in such cases, there is no separate mass of tissue containing nutrient food-material apart from the embryo itself. Such a seed is said to be *exalbuminous*, as in most Leguminosae. When either endosperm or perisperm or both are present the seed is said to be *albuminous*.

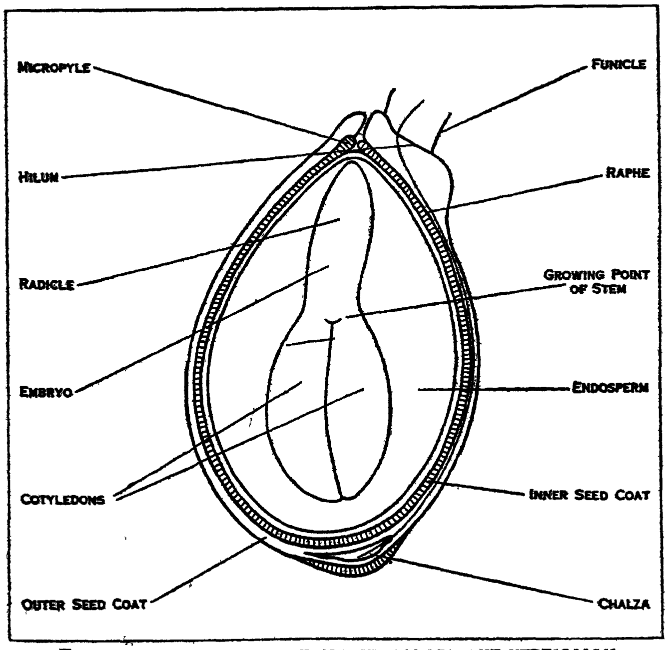

FIG. 6.—SEED OF PANSY (VIOLA TRICOLOR) CUT VERTICALLY

The albumen varies much in its nature and consistence, and furnishes important characters. It may be farinaceous or mealy, consisting chiefly of cells filled with starch, as in cereal grains, where it is abundant; fleshy or cartilaginous, consisting of thicker cells which are still soft, as in the coco-nut, and which sometimes contain oil, as in the oily albumen of *Ricinus* and poppy; horny, when the cell-walls are slightly thickened and capable of swelling, as in date and coffee; the cell-walls sometimes become greatly thickened, filling up the testa as a hard mass, as in vegetable ivory (*Phytelephas*). A cavity is sometimes left in the centre which is usually filled with fluid, as in the coco-nut. The relative size of the embryo and of the endosperm varies much.

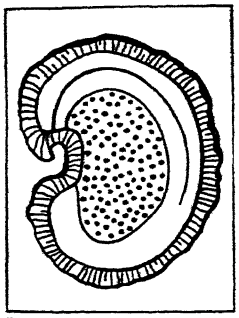

FIG. 7.—SEED OF RED CAMPION (LYCHNIS), CUT VERTICALLY

In monocotyledons the embryo is usually small, and the endosperm large, and the same is true in the case of coffee and many other dicotyledons. The opposite is the case in other plants, as in the Labiatae.

The embryo consists of an axis bearing the *cotyledons* or the first leaves of the plant. To that part of this axis immediately beneath the cotyledons the term *hypocotyl* has been applied, and continuous backwards with it is the young root or *radicle*, the descending axis, their point of union being the collar or neck. The terminal growing bud of the axis is called the *plumule*, and represents the ascending axis. The radicular extremity points towards the micropyle, while the cotyledonary extremity is pointed towards the base of the ovule or the chalaza. Hence, by ascertaining the position of the micropyle and chalaza, the two extremities of the embryo can in general be discovered. It is in many cases difficult to recognize the parts in an embryo; thus in *Cuscuta*, the embryo appears as an elongated axis without divisions; and in *Caryocar* the mass of the embryo is made up by the radicular extremity and hypocotyl, in a groove of which the cotyledonary extremity lies embedded. In some monocotyledonous embryos, as in Orchidaceae, the embryo is undifferentiated, being a mere cellular mass showing no parts. When the embryo follows the direction of the axis of the seed, it is axile or axial; when it is not in the direction of the axis, it becomes abaxile or abaxial. In campylotropous seeds the embryo is curved, and in place of being embedded in endosperm, is frequently external to it.

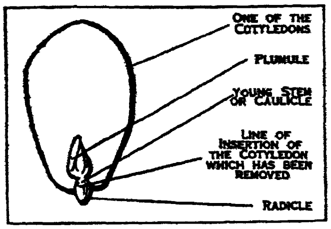

FIG. 8.—MATURE DICOTYLEDONOUS EMBRYO OF THE ALMOND WITH ONE OF THE COTYLEDONS REMOVED

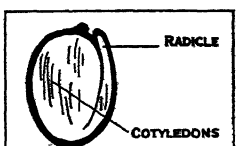

FIG. 9.—EXALBUMINOUS SEED OF WALLFLOWER (CHEIRANTHUS), CUT VERTICALLY

It has been already stated that the radicle of the embryo is directed to the micropyle, and the cotyledons to the chalaza. In some cases, by the growth of the integuments, the former is turned round so as not to correspond with the apex of the nucellus, and then the embryo has the radicle directed to one side, and is called excentric, as is seen in Primulaceae and many palms, especially the date. The position of the embryo in different kinds of seeds varies. In an orthotropal seed the embryo is inverted or *antitropal*, the radicle pointing to the apex of the seed, or to the part opposite the hilum. Again, in an anatropal seed the embryo is erect or *homotropal*, the radicle being directed to the base of the seed. In curved or campylotropal seeds the embryo is folded so that its radicular and cotyledonary extremities

are approximated, and it becomes *amphitropal*. In this instance the seed may be exalbuminous, and the embryo may be folded on itself; or albuminous, the embryo surrounding more or less completely the endosperm and being peripherical. According to the mode in which the seed is attached to the pericarp, the radicle may be directed upwards or downwards, or laterally, as regards the ovary. In an orthotropal seed attached to the base of the pericarp it is superior as also in a suspended anatropal seed. In other anatropal seeds the radicle is inferior. When the seed is horizontal as regards the pericarp, the radicle is either centrifugal, when it points to the outer wall of the ovary; or centripetal, when it points to the axis or inner wall of the ovary. These characters are of value for classification, as they are often constant in large groups of genera.

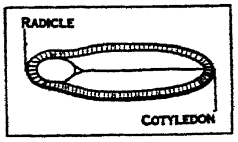

FIG. 10.—TRANSVERSE SECTION OF SEED OF WALLFLOWER, WITH RADICLE FOLDED ON EDGES OF ACCUMBENT COTYLEDONS

Plants in which there are two cotyledons formed in the embryo are *dicotyledonous*. The two cotyledons thus formed are opposite to each other, but are not always of the same size. Thus, in the Nyctaginaceae, one of them is smaller than the other (often very small), and in *Carapa guianensis* there appears to be only one, in consequence of the intimate union which takes place between the two. The union between the cotyledonary leaves may continue after the young plant begins to germinate. The texture of the cotyledons varies. They may be thick, as in the pea, exhibiting no traces of venation, with their flat internal surfaces in contact, and their backs more or less convex; or they may be in the form of thin and delicate laminae, flattened on both sides, and having distinct venation, as in *Euonymus*, etc. The cotyledons usually form the greater part of the mature embryo, and this is remarkably well seen in such exalbuminous seeds as the bean and pea.

Cotyledons are usually entire and sessile. But they occasionally become lobed, as in the walnut; or petiolate, as in *Geranium molle;* or auriculate, as in the ash. Like leaves in the bud, cotyledons may be either applied directly to each other, or may be folded in various ways, the same terms being applied as to the foliage leaves. The radicle and cotyledons are either straight or variously curved. Thus, in some cruciferous plants, as the wallflower, the cotyledons are applied by their faces, and the radicle is folded on their edges, so as to be lateral; the cotyledons are here *accumbent*. In others, as *Hesperis*, the cotyledons are applied to each other by their faces, and the radicle is folded on their back, so as to be dorsal, and the cotyledons are *incumbent*. Again, the cotyledons are *conduplicate* when the radicle is dorsal, and enclosed between their folds. In other divisions the radicle is folded in a spiral manner, and the cotyledons follow the same course.

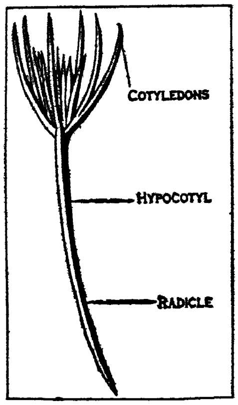

FIG. 11.—POLYCOTYLEDONOUS EMBRYO OF THE PINE (PINUS), BEGINNING TO SPROUT

In many gymnosperms more than two cotyledons are present, and they are arranged in a whorl. This occurs in Coniferae, especially in the pine, fir, spruce and larch, in which six, nine, twelve and even fifteen have been observed; they resemble in their form and mode of development the clustered or fasciculated leaves of the larch. In species of *Streptocarpus* the cotyledons are permanent, and act the part of leaves. One of them is frequently largely developed, while the other is small or abortive.

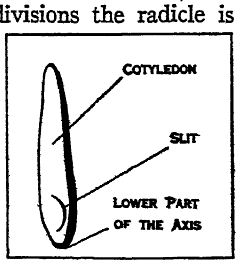

FIG. 12.—EMBRYO OF A SPECIES OF ARROW-GRASS

In those plants in which there is only a single cotyledon in the embryo, hence called *monocotyledonous*, the embryo usually has a cylindrical form more or less rounded at the extremities, or elongated and fusiform, often oblique. The axis is usually very short compared with the cotyledon, which in general encloses the plumule by its lower portion, and exhibits on one side a small slit which indicates the union of the edges of the vaginal or sheathing portion of the leaf. In grasses, by the enlargement of the embryo in a particular direction, the endosperm is pushed on one side, and thus the embryo comes to lie outside at the base of the endosperm. The lamina of the cotyledon is not developed. Upon the side of the embryo next the endosperm and enveloping it is a large shield-shaped body, termed the *scutellum*. This is an outgrowth from the base of the cotyledon, enveloping more or less the cotyledon and plumule, in some cases, as in maize, completely investing it; in other cases, as in rice, merely sending small prolongations over its anterior face at the apex. (*See* GRASSES.) In many aquatic monocotyledons (e.g., *Potamogeton*) there is a much-developed hypocotyl, which forms the greater part of the embryo and acts as a store of nutriment in germination. In some grasses, as oats, a projection of cellular tissue is seen upon the side of the embryo opposite to the scutellum, that is, on the anterior side. This has been termed the *epiblast*. This by some was considered the rudimentary second cotyledon; but is now generally regarded as an outgrowth of the sheath of the true cotyledon.

SEED TESTING. Sixty years ago the seed trade of Great Britain was in a most unsatisfactory state, and the dishonourable manner in which seeds were treated and sold was widely known. It had, of course, long been recognized by progressive men that a good seed supply was as essential a part of farming as sound cultivation, proper manuring, and safe harvesting. Nevertheless, large quantities of very low grade seeds were sown. Whereas it would seem that as long ago as 1816 steps had been taken in Switzerland to prevent fraud in the seed trade, the first official steps taken in England were in 1869 and 1878 when the Adulteration of Seeds Acts were passed. These Acts made it a criminal offence to sell or cause to be sold seed that had been killed or dyed, or to kill or dye seeds.

The first official seed testing stations or seed control stations were started in 1869 at Tharandt in Saxony by Nobbe and in 1871 at Copenhagen by Möller Holst. In 1875 Nobbe published his *Handbuch der Samenkunde*, and this gave a new impetus to seed testing work throughout Europe. Later a Swiss station was started under Stebler at Zürich, and for many years thereafter a considerable number of British seedsmen had their seeds scientifically examined at that station. An official seed testing station was started at Dublin in 1900 and in Edinburgh in 1914, but it was not until 1917 that an official seed testing station was organised for England. Seed testing is conducted under official auspices in practically all civilised countries, the seed "control" stations, as they are termed, being of inestimable value to agriculture. The Seeds Act was passed in England in 1920, and the administration of this act has undoubtedly been highly beneficial, this being recognised by farmers and the seed trade alike.

Seeds for sowing need to be true to name; to have a high degree of purity, or freedom from weed seeds, rubbish, or seeds of a species not required; to have a high germinating capacity, or be capable of growing and producing strong plants under suitable conditions; they should be of the origin and strain required, home-grown or foreign seed or seeds of a certain strain being the better as the case may be; and they should be free from injurious insects and fungi. Considered generally, good seed will be plump, bright, have an "alive" appearance, and an average colour which varies according to the species.

The number and kind of weed seeds contained in a sample of

seeds for sowing has an important bearing upon the value of the sample. Below a certain point of purity and germinating capacity, or if it contains more than a given quantity of certain species of injurious weed seeds, the sample should in no circumstances be accepted from the seed merchant. Under the British Seeds Act, 1921, and the Seeds Regulations, 1922, the seeds merchant is bound to declare certain facts relating to the seeds he offers for sale, and it is to the farmer's interest to ensure that he knows all about the seeds which he purchases, and he should only purchase under guarantee. On receipt of his seed, samples may be submitted to the official seed testing station (Huntingdon Road, Cambridge) for examination and report, for which only a small fee is charged (to farmers, 6d. per sample). Full particulars may be obtained from the Station.

What is commonly called the true value of a seed sample (which is represented by the combined purity and germinating capacities, per cent) is not in itself a complete guide to the value of the sample for sowing, as it is necessary to take into consideration the kind of impurity or "other seeds" present; while it is commonly impossible to determine by analysis whether the species is of the variety or strain desired. Knowledge of seed samples is now, however, so excellent that it is commonly possible to determine at any rate the country of origin, a decision being based not only upon the appearance of the seed sample itself but upon the species of weed seeds included in it—since the species are liable to vary widely with the country from which the seed sample is derived. The possibilities were abundantly shown in a case early in 1928 in which the British Ministry of Agriculture and Fisheries prosecuted a seeds merchant for falsely selling imported seed as Kentish wild white clover. The botanical analyses clearly demonstrated that the seeds sold were of New Zealand and central European origin. (*See* also SEED TRADE.) (H. C. L.)

In the United States, seed testing followed the work done in Europe by about 25 years. Quite rapid strides have been made since 1876 toward placing the testing of seeds for both purity and viability on a comprehensive basis. Connecticut, North Carolina and Michigan have long urged the importance of seed testing and the University of Nebraska has taught seed testing as a part of the botanical training of students for many years. In 1897, Maine enacted a State law governing the sale of agricultural seeds. Other States followed until in 1928, 45 of the States have laws regulating the quality of agricultural seeds which may be sold within these States, and maintain seed-testing laboratories as an aid and protection to agriculture. The individual States may regulate trade within each State, while the Federal Government controls trade between individual States and with foreign countries.

As a result of the work carried on by the States in the improvement of agricultural seeds, many of the larger seed firms throughout the United States have well-equipped laboratories in which analysts test their seeds, thus enabling them to offer high grade seeds to the public. Seed testing as a definite line of investigation was organized in the U.S. Department of Agriculture in 1896, where seeds from farmers, seedsmen and other sources are tested free of charge. In 1912, Congress passed the Seed Importation Act, restricting the quality of specified seeds imported into the United States. This act established standards of live pure seed, and of freedom from adulterants and weed seeds which must be conformed to by all seeds before they are allowed into the United States. In 1926, the Seed Importation Act was amended and the name changed to the Federal Seed Act, the amended act requiring the colouring of imported seed of red clover and alfalfa to indicate the origin.

In addition to the enforcement of the Federal Seed Act and the testing of samples from all sources for purity and viability, samples of seed are bought in the open market, tested for adulteration, and when found to contain more than 5% of adulterants, these amounts, together with the name of the seedsmen handling such seeds, are published. The Federal seed laboratory and many of the State seed laboratories carry on various phases of research work, prominent among these being the physiology of germination, including such problems as hard seeds, retarded germination and after-ripening of seeds; the identification of seeds by comparison with material in an authentic herbarium and by growing tests in greenhouses and field plots; methods of determining the origin of seeds and their adaptation for different localities. (E. F. SI.)

SEED TRADE. Seeds are the keystone to the agricultural and horticultural industry, an industry which is vital to the life and prosperity of every country. The responsibility resting on the shoulders of those who grow and distribute these essential articles is therefore a heavy one. Factors operating in the production of satisfactory food crops include seed, soil fertilisers, cultural methods, weather and control of insects and disease. By far the most important of these is the supply of seeds. Moreover seeds must be of suitable stocks or strains, have a high vitality and be free from disease and weed seeds. To ensure that the demand for high quality seeds is met is the constant study and duty of the seed trade.

The Seed Grower.—To give an adequate representation of the activities of the trade, it is necessary to refer, in the first place, to the seed grower on whom the trade relies, to a large extent, for the production of its supplies, although many seedsmen grow large quantities of seed on their own ground. Seed growing is a highly specialised branch of agriculture which requires the best intelligence and the exercise of considerable skill. A suitable soil and climate is a primary consideration. The "stock," "foundation" or "mother" seed, used must be of the highest quality and, in particular, it must be absolutely pure as regards variety. In growing the seed crop, the best cultural practices must be employed and care must be taken to ensure adequate isolation from growing crops of a similar kind in order to prevent cross-pollenation with inferior or allied plants. Control of insects and other pests is effected by the use of sprays and other methods. During the growing season, especially when the seed crop is approaching maturity, all plants which show characteristics dissimilar to those of the particular variety under cultivation are carefully removed—a process known as "roguing." Plants of the same species found growing along the margin of the field are also cut down before they develop a flowering head and thus endanger the purity of the seed crop by cross-fertilisation. Harvesting the crop when it has reached the proper stage of maturity calls for great care and experience. Unripe seeds give unsatisfactory results and an over-ripe crop will lead to serious loss by shedding. Methods of curing and threshing vary according to the kind of seed produced, each calling for special knowledge and many for particular treatment.

Seed-growers fall roughly into two classes, the one furnishes his own "stock" seed and sells his produce to the seed merchant, the other is supplied by the seed merchant with "stock" seed which is grown under a form of contract. The latter class ranges from the large established grower down to the small tenant farmer who has built up a reputation which enables the seed merchant to enter with confidence into a contract for the growing of his "stock" seed.

The Plant Breeder.—Before passing from the subject of the production of seed, mention should be made of the plant breeder whose business it is to create new and improved strains and varieties. This work is largely in the hands of official or semi-official establishments, experiment stations, crop improvement associations and the like, although much is also done by the seedsmen themselves. These have been responsible in recent years for marked improvements in the yield, early maturity, disease resistance, adaptability, ability to withstand frost and drought and other important characteristics of many kinds of plants.

The Wholesale Seed Merchant.—The wholesale seed merchant, as has been seen, obtains his supplies of seeds largely by growing "stock" seed on contract, or from the commercial grower. In the former case the merchant usually undertakes the roguing of the growing crops by his own experts. On delivery of bulks of seed from the grower, there are many important operations to be undertaken before the seed can be stored in readiness for disposal. Newly harvested seed is sometimes delivered in a damp condition which renders it liable to the attacks of fungi and bac-

teria. If stored in bulk in this condition it would "heat" and spoil owing to fermentation due to micro-organisms or its own physiological activities. Excessive moisture must therefore be removed, and this is sometimes effected by circulating or passing hot air through the seed placed in sacks or spread out on a specially constructed floor. The cleaning operations, if any, performed by the grower, are generally limited to the removal, by winnowing and sieving, of such dirt, chaff and weed and other foreign seed as are much heavier or lighter, or much larger or smaller than the seed that is being dealt with. Further and more drastic cleaning must be carried out by the seedsman, his object being to bring the bulk as near a hundred per cent purity as is possible without loss of too much of the seed of which the bulk consists. This entails the use of a battery of machines and apparatus, including air fans, screens, agitators, electro-magnets and other processes.

The possibilities of mechanical mixture or accidental substitution of one variety for another during handling, cleaning and storage of seed must be most carefully guarded against. The similarity in appearance of many kinds of seed would, with careless handling, lead to hopeless confusion and to the probability of heavy claims for damages from the purchaser who planted mixed seed. Various methods are therefore employed with the object of checking the identification of the bulks of stored seed. In addition to a careful and rapid double check system of keeping stock most of the large seed merchants maintain trial grounds in which a small quantity of every lot of seed handled is grown. In this way they are in a position to satisfy themselves as to the genuineness of the varieties and the general quality of the seed supplied by their growers. In these trial grounds too, the old varieties are constantly under test and new varieties are the object of close observation in order to determine their merits. Finally, it is necessary, by a laboratory test, to ascertain the vitality and analytical purity of the seed. Many seed merchants maintain their own laboratories and employ expert analysts for this purpose, others make use of the facilities offered by the State seed testing stations. The facts established by these tests enable the purchaser to gauge with some degree of accuracy the quality of the seed he is buying. The percentage of purity will show him what proportion of the bulk is the seed he requires and how much other seed, weed seed and foreign matter is present. The percentage of germination, ascertained as it is by a test carried out under the most favourable conditions in the laboratory, does not necessarily show the number of plants that will be obtained from the seed when it is planted in the field or garden, but it does give a fair indication of the vitality of the seed and is absolutely reliable when comparing the quality of various lots of seed. Other facts which can be elicited as a result of a laboratory inspection include the freedom or otherwise of the seed from seed borne diseases, insect and fungus attacks and, with certain definite limitations, proofs as to accuracy of variety and country of origin.

The Retail Seedsman.—The retail seedsman is responsible for the final distribution of the seed to the farmer and gardener. He purchases from the wholesale seed merchant those varieties and kinds of seed which best suit his class of trade and, in most cases, places particulars of his stocks before his clientèle in the shape of an attractively prepared catalogue. Some retailers rely largely on the sales effected to customers who visit their shops, others on the orders received through the post. Whether the retailer comes into personal contact with his customers or whether he approaches them by means of a catalogue, he is in a position to give considerable assistance in the way of cultural information, advice as to choice of varieties, the best time to sow, depth of sowing, and treatment during the growing period.

A transaction in seeds is not completed with the sale of the seed. The seller cannot assume responsibility for the methods adopted by his farmer or gardener customers, nor for the weather and soil conditions; nevertheless a satisfied customer is not secured until the harvest is reaped. Therefore it is one of the duties of the retailer to educate his customer to purchase the kind of seed which will bring the most satisfactory results.

It is not even sufficient for the seedsman to sell seeds of good appearance and with a high percentage of germination, freedom from weeds and so on: knowledge as to the adaptability of particular stocks and strains is advancing rapidly, and it is the business of the seedsman to supply his customers with those stocks or strains which are best adapted to the soil and climate in which they are to be grown.

See also SEED TESTING. (H. CH.)

SEED TRADE IN UNITED STATES

The trade in seeds is carried on along two main lines; farm seeds and vegetable and flower seeds. Each line is represented by a trade association and in the main dealers in vegetable and flower seeds belong to the American Seed Trade Association, and dealers in grass, clover and other farm seeds belong to the Farm Seed Association of America. Some of the larger firms deal in both lines of seeds; in fact, a few firms doing a large volume of business not only handle farm and vegetable seeds both at wholesale and retail, but engage as well in the contract growing of vegetable seed. With a few exceptions, however, the largest dealers in farm seeds handle no vegetable or flower seeds and most of the larger vegetable and flower seed dealers carry grass, clover and other farm seeds in a small way only, to provide for retail trade.

Farm Seeds.—The trade in farm seeds flows in general in two directions. The farmer producing clover or grass seed commonly sells to a local jobber or elevator man who is either an agent of some wholesaler or is in touch with the general market. Such lots are shipped to a large dealer having facilities for recleaning, by whom the seed is cleaned, graded, bulked and bagged in accordance with quality and designated by the various grade names used by the dealer. Sales are then made to country merchants who, in turn, sell to the farmer. In some seed producing sections, especially those far removed from terminal markets, large dealers have established cleaning plants where country run seed is cleaned. The cleaned seed is then shipped to the central warehouses for assembling, bulking and distributing. While the bulk of the farm seeds passing from the wholesaler to the consumer goes through the hands of the country or city merchant, some firms do what is known as a "mail order business" in farm seeds. Such dealers advertise in farm papers and sell direct to consumers in any quantity desired. In some cases such business is known to reach a volume of one to three million dollars per year.

Cleaning, Grading and Bulking.—Preparing field seeds for marketing is the most important function of the wholesale dealer in farm seeds. Alfalfa, clover and grass seed, especially as it comes from the producer, contains a certain proportion of dirt and weed seeds, all of which must be removed. The size and colour of the "berry" also vary in different lots and these must be mixed and blended to produce a uniform sample. The large dealer is, therefore, equipped with cleaning mills of various kinds, some designed for special purposes as the removal of dodder or buckhorn seed. In the process of cleaning, a given lot of seed may be handled five or six times before it is considered fit for market. Country run seed is bought either on the basis of a certain price for the clean seed, the screenings being returned to the producer, or on sample, the buyer estimating the loss and paying for what clean seed he believes will be secured.

Production of Farm Seeds.—Seed of some hardy varieties of alfalfa is produced by special growers but in general there are no special growers of grass and clover seed. There are, however, regions where the production of certain farm seeds is so common that such production is a regular part of the cropping system practiced. This is the case with alfalfa seed in the Southwest, in Utah, Idaho and portions of Kansas; with red clover seed in Idaho and the Arkansas Valley in Colorado; with white clover seed in Wisconsin and Louisiana; with meadow fescue seed in Missouri and Kansas; with Kentucky Bluegrass seed in Kentucky, Missouri and Iowa; with orchard grass seed in Kentucky; with lespedeza seed in Louisiana, Mississippi and Tennessee; and with sorghum and Sudan grass seed in Kansas, Oklahoma and Texas. There are some special seed corn growers and the organization of Crop Improvement Associations in many states has stimulated some of the best farmers in the production of improved vari-

eties of small grains. Much of the seed thus produced finds its way to the consumer through the better seedsmen. Important as this movement is, it represents but a small portion of the small grain and corn seed handled by the farm seed trade; the larger part of such seed differs from market grain only in being more carefully cleaned and graded.

Trade in Farm Seeds.—The greater portion of the farm seeds, except small grains, entering consumption is handled by the seed trade. According to figures collected in 1919 by the Bureau of Economics, U.S. Department of Agriculture, the proportion of clover and alfalfa seed handled by the trade varied from 52 per cent in the central to 91 per cent in the eastern states. In the same territory the proportions of grass seed handled by the trade are 65 and 93 while comparable figures for small grains are 9 and 44.

Clover and timothy are traded in on some exchanges in the same way as wheat and corn. The trade in grass and clover seed is international in character, prices being affected by available supplies abroad as well as by those in the United States. There is consequently a more or less constant movement back and forth and a given lot of clover seed, for example, may be exported and later imported, depending on price fluctuations.

Co-operative Marketing.—The movement for the co-operative marketing of farm seeds has attained some size, but the methods of handling and distributing used by the co-operative organizations are much the same as those employed by the wholesale trade. The distinctive claim made by co-operatives is that they supply the consumer with seeds of strains and origin best suited to his needs.

Verification of Origin.—A service providing for the verification of origin of alfalfa seed has been inaugurated by the Bureau of Agricultural Economics, U.S. Department of Agriculture. In this service the dealer gives the state of production of alfalfa seed offered and keeps certain records which may serve as evidence of the correctness of the claim. Officials of the Bureau check these records from time to time. If defective records are found the dealer may be removed from the list of dealers to whom the service is extended. This service derives its importance from the fact that alfalfa seed from sections with mild winters is unsuited for seeding in sections with severe winters.

Legislation Affecting the Trade.—Most states have laws regulating the sale of seed but there is no uniform seed law. In general these laws require the giving of certain information covering percentage of purity and germination and the percentage of weed seeds present. In some states the sale by the trade of seed containing more than a specified number per unit of weight of certain noxious weed seeds as dodder, is prohibited. Owing to the fact that seed laws are not uniform in the various states, large dealers are compelled to use various tags to be attached to shipments in accordance with the laws of the state to which the seed is consigned. These laws do not apply to the sale of seed by farmers and, although they apply to the sale of vegetable as well as field seeds, their effect is felt more strongly by the field seed than by the vegetable seed dealers.

There is also national seed legislation covering the importation of seed. Under this law percentages of purity and germination are fixed for specified kinds of field seeds and any lot of such seed falling below these percentages may be refused entry. Adulteration of seed is prohibited. This law also requires the staining of red clover and alfalfa seed to indicate, so far as practicable, the country of origin of such seed and prohibits misbranding of seed in interstate commerce. Similar legislation is in force in Canada.

Seed Testing Laboratories.—In order to comply with the various seed laws the larger dealers have established seed testing laboratories and employ competent seed analysts. All lots of seed entering the warehouses of such a firm are tested for purity and germination.

Vegetable and Flower Seeds.—While the wholesale dealers in field seeds issue periodic or regular price lists, these are simple and contain little descriptive matter. The vegetable and flower seed trade, however, is built up largely on the catalogue, which in some cases is elaborate and richly illustrated. In it are given descriptions of the varieties offered and a special feature of the catalogue is commonly the "novelty" section, in which new or especially recommended varieties are described.

Those engaged in the vegetable and flower seed trade may be roughly grouped into professional seed growers, growers and dealers, dealers, wholesale or retail or both, and the small local retailer. In many cases the functions performed overstep these designations, some of the largest dealers being at the same time growers, wholesalers and retailers.

A special feature of the vegetable and flower seed business is the box trade. In this the dealer prepares boxes designed for holding and displaying assorted varieties of vegetable seeds or of flower seeds. These boxes are placed with local merchants, usually in drug stores or hardware stores, in every city and village. The packets are sold at a fixed price and the local dealer receives a commission on the total sales. This trade is very extensive and is in the hands of a relatively small number of dealers. Boxes offering seeds from more than one dealer are commonly found in the same store even in small cities.

Production of Vegetable and Flower Seeds.—In contradistinction to farm seeds, vegetable and flower seeds are produced almost wholly by special growers or by farmers under contract with dealers or larger growers. The nature of such a seed-growing establishment may vary from that of the large general grower producing a variety of seeds limited only by the climatic conditions to that of the highly specialized grower producing but one article, as cabbage seed.

In general, such seeds as peas, beans, sweet corn and vine seeds are grown under a contract system. In this the large wholesale grower makes contracts with farmers in suitable territory for the planting of a definite acreage with stock seed furnished by the wholesale grower. The grower retains the right to send his representatives into the field at the proper time in order to "rogue" the field. This work is necessary to maintain a high standard of purity in the stock. The farmer delivers the crop at a fixed price.

Such seeds as onion, radish, lettuce, carrot, cabbage and sweet peas are generally produced by the professional seed grower on his own farms or on nearby farms under his direct supervision. Flower seeds other than sweet peas are produced by special growers; in many cases these growers specialize on one crop, as double petunias or pansies, and devote great care to the production of the best quality seed.

While there is scarcely a section of the United States in which some kind of vegetable or flower seed is not produced, the main producing region is California. All the lettuce, sweet pea seed, and most of the onion seed is produced in this state, as well as flower seeds in great variety. Pole and lima beans are also exclusively produced in California as well as carrot and much of the radish seed. Considerable quantities of radish, dwarf beans and vine seeds are produced in Michigan.

Garden peas are produced in the Northwest, while dwarf beans, sweet corn and vine seeds are grown in various parts from New England to the Rocky Mountains. The production of cabbage seed is confined to Long Island and the Puget Sound region in Washington State.

Seed for the Canning Trade.—This is an important branch of business for a number of the large growers, the most important single item in this trade being peas. Here the purity of stocks is a first consideration, since faulty stocks may cause enormous damage. The volume of business is large, as one acre of seed peas will supply seed for only three acres of canning peas. For some other crops as tomatoes, small quantities of seed are needed and the canner either produces his own or has seed grown by specialists in this work.

Trial Grounds and Stocks.—An important feature of the business of every prominent vegetable and flower seed grower and dealer is the stock record and trial ground. The reputation of a grower and dealer is built on the purity of his stocks. Most dealers depend on the grower to attend to this feature and seeds of the standard varieties offered by a hundred or more dealers may all have been produced by one grower. In a few cases, how-

ever, dealers maintain extensive stock seed farms and all good dealers and growers maintain careful records of the history and quality of their stocks.

Trial grounds in which samples of a grower's or dealer's stocks are planted for observation and selection are maintained by some of the larger firms, and on a smaller scale by many growers of special lines. These trials are of value not only in checking the quality of the dealer's stocks but in determining the value of varieties offered by competitors. Since there is no final authority in the matter of names some varieties may be offered under more than one name and an alleged new variety may be only an old acquaintance under a new label. (A. J. Pi.)

SEELEY, SIR JOHN ROBERT (1834–1895), English essayist and historian, was born in London on Sept. 10, 1834. His father, R. B. Seeley, was a publisher, and author of several religious books and of *The Life and Times of Edward I.* Seeley was educated at the City of London School and at Christ's College, Cambridge, where he was head of the classical tripos and senior chancellor's medallist, was elected fellow and became classical tutor of his college. For a time he was a master at his old school, and in 1863 was appointed professor of Latin at University College, London. His essay *Ecce Homo,* published anonymously in 1866, and afterwards owned by him, caused much controversy at the time. His later essay on *Natural Religion,* which, premising that supernaturalism is not essential to religion, maintains that the negations of science tend to purify rather than destroy Christianity, satisfied neither the Christian nor the scientist. In 1869 he was appointed professor of modern history at Cambridge.

His *Life and Times of Stein* (1879) is a valuable narrative of the anti-Napoleonic revolt, led by Prussia mainly at Stein's instigation. The famous essay, the *Expansion of England* (1883), shows how and why Great Britain gained her colonies and India, the character of her empire, and the light in which it should be regarded: it secured him the K.C.M.G. His last book, *The Growth of British Policy,* written as an essay and intended to be an introduction to a full account of the expansion of Great Britain, was published posthumously. Seeley died on Jan. 13, 1895.

See G. W. Prothero, *Memoir* prefixed to *Growth of British Policy* (1895).

SEELY, JOHN EDWARD BERNARD (1868–), British politician, was born on May 31, 1868, the third son of Sir Charles Seely, Bart. Educated at Harrow and at Trinity college, Cambridge, he became a barrister. In 1900–01 he served with the Imperial Yeomanry in South Africa, winning the D.S.O. and during his absence was returned to parliament as Conservative M.P. for the Isle of Wight. His later career as a politician was somewhat varied. Forsaking the Conservative party when Chamberlain introduced his tariff reform proposals, Seely was returned to Parliament after the general election of 1906 as Liberal M.P. for a Liverpool division, and in 1908 he took office as under-secretary for the Colonies. In 1911 he was appointed to a similar position at the War Office and in 1912 he succeeded Lord Haldane as secretary of State for War. He held this position until the Curragh incident in 1914, when, having initialled a demand by certain officers that they should not be asked to serve against Ulster, he was compelled to resign. During the World War he served on the staff and later commanded a brigade of Canadian cavalry. In 1918–19, having been M.P. for the Ilkeston division of Derbyshire since 1910, he was under-secretary at the Ministry of Munitions, and then under-secretary of State for Air in the Coalition Ministry. In 1923 he again became M.P. for the Isle of Wight, but he lost his seat in 1924.

SÉES, a town of north-western France, in the department of Orne, on the river Orne 3 m. from its source and 13 m. N.N.E. of Alençon by rail. Pop. (1926) 2,710. The first bishop of Sées (*Saium, Sagium*) was St. Lain, who lived about the 4th century. In the 9th century Sées was a fortified town and fell a prey to the Normans. At that period Sées consisted of two distinct parts, separated by the Orne—the bishop's burgh, and to the south, the new or count's burgh (*Bourg le Comte*). From 1356 the counts of Alençon were its possessors. In the Hundred Years' War it fell into the hands of the English (1418). Pillaged by the Protestants during the Wars of Religion, Sées attached itself to the League in 1589, but voluntarily surrendered to Henry IV. in 1590. The town is a bishop's see and has a Gothic cathedral which dates from the 13th and 14th centuries and occupies the site of three earlier churches. The west front, which is disfigured by the buttresses projecting beyond it, has two stately open work spires 230 ft. high. The nave and the choir are 13th century.

SEGANTINI, GIOVANNI (1858–1899), Italian painter, was born at Arco in the Trentino on June 15, 1858. His mother, who belonged to an old family of the mountain country, died in 1863. His father then went to Milan, and there left Giovanni in the care of a step-sister. At the age of seven the child ran away; he was found perishing of cold and hunger, and was employed by peasants as a herdsman. He spent his long hours of solitude in drawing. Owing to his fame having reached the ears of a syndic, he was sent back to Milan; he led a wandering life, and finally remained at Milan to attend classes at the Brera, earning a living meanwhile. In 1882 he settled in Brianza, near Como and four years later sought the Swiss Alps, finally settling in the Engadine. There he gave himself up to the study of mountain life, and became in truth the painter of the Alps. The "Ave Maria" took a gold medal at the Amsterdam Exhibition (1883). Like Millet he depicted the hard life of the peasant. The atmosphere of his picture is clear and crystalline and his figures stand out in clear relief. "The Drinking-place" received a gold medal in Paris (1889), "Ploughing in the Engadine" (Munich Pinakotek) gained a gold medal at Turin (1892). Besides those works in which he studied simple effects of light and Alpine scenery, such as "Midday on the Alps" and "Winter at Savognino," he also painted symbolical subjects: "The Punishment of Luxury" and the "Unnatural Mothers" (in the Walker Art Gallery, Liverpool). Segantini died on Sept. 28, 1899, at Maloja, where a museum contains many of his works, including the great unfinished triptych of "The Alpine World."

See L. Villari, *G. Segantini* (London, 1901); F. Servaes, *G. Segantini* (Leipzig, 1907); G. Segantini, *G. Segantini* (Munich, 1918); G. Segantini, *Scritti e Lettere* (Turin 1910).

SEGESTA (Gr. Ἔγεστα), an ancient city of Sicily, 8 m. W.S.W. of the modern Alcamo and about 15 m. E.S.E. of Eryx. It was a city of the Elymi, but, though the Elymi were regarded as *barbari,* Segesta, in its relations with its neighbours, was almost like a Greek city. Disputes with Selinus over questions of boundary were frequent from 580 B.C. onwards. One of the ostensible objects of the Athenian expedition to Sicily in 415 was to aid Segesta against Selinus in a dispute, not only as to questions of boundary, but as to rights of marriage. After the Athenian *débâcle,* the Segestans turned to Carthage; but when Hannibal in 409 B.C. established the Carthaginian power in western Sicily, Segesta became a dependent ally, and was besieged by Dionysius in 397, being at last relieved by Himilco. In 307 Agathocles marched on the city, massacred 10,000 men, sold the rest of the inhabitants into slavery and changed its name to Dicaeopolis; but it soon recovered its old name and returned to the Carthaginians. Early in the First Punic War, however, the inhabitants, having massacred the Carthaginian garrison and allied themselves with Rome, had to stand a severe siege from the Carthaginians. Segesta was treated with favour by the Romans; perhaps the territory of Eryx was assigned to it.

The town lay upon the Monte Barbaro (1,345 ft.); scanty remains of its external walls, of houses and of a temple are to be seen. The theatre is well preserved. The *Thermae Segestanae* were situated about 5 m. to the north on the road to Castellammare: the hot sulphur springs are still in use. (T. A.)

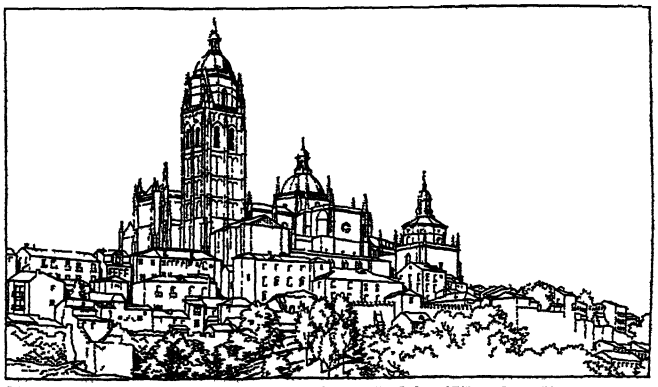
SEGO LILY (*Calochortus Nuttallii*), a North American plant of the lily family (Liliaceae), native to dry soil from South Dakota to Washington and south to California and Oregon. Its slender stem rises from a coated corm and bears narrow leaves and large, beautiful, somewhat tulip-like, white flowers, variously marked with yellow, purple and lilac. Like manna in the wilderness, the edible roots are said to have been used for food by the early Mormon settlers in the Salt Lake valley. The plant has

since been identified with the symbolism of the Mormon Church in Utah, of which State it has been formally adopted as the floral emblem or State flower. (*See* MARIPOSA LILY.)

SEGOVIA, a province of Spain, formerly part of Old Castile, bounded on the north and north-east by the provinces of Burgos and Soria, south-east by Guadalajara and Madrid, south-west by Avila, and north-west by Valladolid. Pop. (1920) 167,081; area, 2,635 sq. miles. The greater part consists of an arable tableland (2,500 ft.) producing some of the finest corn in the Peninsula. Along the whole south-eastern boundary the Sierra de Guadarrama rises up suddenly, like a huge barrier, separating Old from New Castile and the basin of the Duero from that of the Tagus. Except the capital, Segovia (*q.v.*), there is no town of more than 5,000 inhabitants. At the foot of the Navacerrada pass lies the royal demesne and summer residence of La Granja (*q.v.*). There are small manufactures of coarse pottery, dyes, paper and alcohol. Segovia is dependent upon its agricultural produce—wheat, rye, barley, peas, hemp, flax, etc.—together with the rearing of sheep, cattle, mules and pigs. There are extensive forests in the sierras, which yield excellent granite, marble and limestone; but the difficulty of transport has prevented any systematic development of these resources.

SEGOVIA, the capital of the Spanish province of Segovia; on the railway from Madrid to Valladolid and Zamora. Pop. (1920) 16,013. Segovia is built upon a narrow ridge of rock which rises in the valley of the Eresma, where this river is joined by the Clamores. It is an episcopal see in the archbishopric of Valladolid. The place has many records and monuments of the vicissitudes of fortune through which it has passed, foremost among the latter being the ancient alcázar or citadel, the cathedral and the aqueduct of Trajan.

The alcázar is perched upon the western tip of the long tongue of rock upon which the city is built. Of the original mediaeval fortress but little remains save the noble façade. The 16th-century cathedral (1521–1577), the work of Juan Gil de Ontañon and his son Rodrigo, is a well-proportioned and delicate piece of Late Gothic—the latest of its kind in Spain—and contains some very fine stained glass. The most remarkable of the many other churches are those of La Vera Cruz (Knights Templar, Romanesque of the early 13th century), San Millan and San Juan (both Romanesque of the second half of the 13th), El Parral (Gothic of early 16th century), and Corpus Christi, an ancient Jewish sanctuary and an interesting specimen of Moorish work. The



THE SEGOVIA CATHEDRAL, COMPLETED IN A.D. 1577, AN EXAMPLE OF LATE GOTHIC ARCHITECTURE IN SPAIN

towers and external cloistering, or *corredores*, of several of the later churches—especially those of San Esteban and San Martin—are fine. The great aqueduct, however, called El Puente del Diablo, usually ranks as the glory of Segovia. It dates probably from the time of Trajan (*c.* A.D. 53–117), and is now in working order, bringing the waters of the Rio Frio down from the Sierra Fuenfria, 10 m. S. The bridge portion striding across the valley into the city is 847 yd. long, and consists of a double tier of superimposed arches, built of rough-hewn granite blocks, laid without lime or cement. (For illustration, *see* AQUEDUCT.) The royal artillery school of Spain is established here.

SÉGUIER, PIERRE (1588–1672), chancellor of France, was born in Paris on May 28, 1588, of a famous Quercy legal family. Pierre was brought up by his uncle, Antoine Séguier, *président à mortier* in the parlement, and became master of requests in 1620. From 1621 to 1624 he was intendant of Guienne, where he became closely allied with the duc d'Épernon. In 1624 he succeeded to his uncle's charge in the parlement, which he filled for nine years. In this capacity he showed great independence with regard to the royal authority; but when in 1633 he became keeper of the seals under Richelieu, he proceeded to bully and humiliate the parlement in his turn.

Séguier became allied with the cardinal's family by the marriage of his daughter Marie with Richelieu's nephew, César du Cambout, marquis de Coislin, and in December 1635 he became chancellor of France. In 1637 Séguier was sent to examine the papers of the queen, Anne of Austria, at Val de Grâce. According to Anquetil, the chancellor saved her by warning her of the projected inquisition. In 1639 Séguier was sent to punish the Normans for the insurrection of the Nu-Pieds, the military chief of the expedition, Gassion, being placed under his orders. He put down pillage with a strong hand, and was sufficiently disinterested to refuse a gift of confiscated Norman lands. He was the submissive tool of Richelieu in the prosecutions of Cinq-Mars and François Auguste de Thou in 1642.

His authority survived the changes following on the successive deaths of Richelieu and Louis XIII., and he was the faithful servant of Anne of Austria and of Mazarin. His resolute attitude towards the parlement of Paris made the chancellor one of the chief objects of the hatred of the Frondeurs. On Aug. 25, 1648, Séguier was sent to the parlement to regulate its proceedings. On the way he was assailed by rioters on the Pont-Neuf, and sought refuge in the house of Louis Charles d'Albert, duc de Luynes. In the course of the concessions made to the Fronde in 1650, Séguier was dismissed from his office of keeper of the seals. He spent part of his retirement at Rosny, with his second daughter Charlotte and her husband, the duke of Sully. He was recalled in April 1651, but six months later, on the king's attaining his majority, Séguier was again disgraced, and the seals were given to President Mathieu Molé, who held them with a short interval till his death in 1656, when they were returned to Séguier. Séguier lived for some time in extreme retirement in Paris, devoting himself to the affairs of the academy. When Paris was occupied by the princes in 1652, he was for a short time a member of their council, but he joined the king at Pontoise in August, and became president of the royal council.

After Mazarin's death in 1661 Séguier retained but a shadow of his former authority. He showed a great violence in his conduct of the case against Fouquet (*q.v.*), voting for the death of the prisoner. In 1666 he was placed at the head of a commission called to simplify the police organization, especially that of Paris; and the consequent ordinances of 1667 and 1670 for the better administration of justice were drawn up by him. He died at St. Germain on Jan. 28, 1672.

Séguier succeeded Richelieu as official "protector" of the Academy, which from that time (1642) until his death held its sessions in his house.

See F. Duchesne, *Hist. des chanceliers de France* (fol. 1680); for the affair of Val de Grâce, *Catalogue de documents historiques . . . relatifs au règne de Louis XIII.* (Paris, 1847); also R. Kerviler, *Le Chancelier P. Séguier* (Paris, 1874). Great part of his correspondence is preserved in the Bibliothèque Nationale, Paris.

SÉGUR, the name of a French family, the first member of which to attain distinction was FRANÇOIS DE SÉGUR, better known as the seigneur de Sainte-Aulaye (d. *c.* 1605), who professed the reformed religion, and was closely associated with Henry IV., becoming in 1576 president of his council. Jean-Isaac, marquis de Ségur (d. 1707), fought in most of the campaigns of the France of his time, and remained loyal throughout the troubles of the Fronde. His son, HENRI JOSEPH, marquis de Ségur (1661–1737), was lieutenant-general of Champagne and Brie, governor of Foix. In his youth he was the hero of an episode of gallantry with Anne of Beauvilliers, abbess of La Joye, which led to the suggestion that she was none other than the Portuguese nun of

the famous Letters. (But *see* ALCOFORADO, MARIANNA.) His son, HENRI FRANÇOIS, comte de Ségur (1689–1751), was colonel at seventeen, when he succeeded to the command of the Ségur regiment, which his father had raised. In 1718 he began a thirty years' tenure of the lieutenant-generalship of Champagne and Brie. He had married in that year Angélique de Froissy, a natural daughter of the regent, Philip of Orleans, but the death of his father-in-law a few years later prevented his reaping special advancement from his marriage, though Mme. de Ségur belonged to the inner circle of Louis XV.'s intimates.

Ségur served in Italy during the war of the Polish Succession under Marshal Villars, and became, in 1736, inspector-general of cavalry. In 1738 he was sent to Nancy as lieutenant-general under Marshal Belle-Isle, and to Bohemia in 1741 with the French troops allied with the Bavarians. But in September 1741 he was compelled by the imperial troops to surrender at Linz. In 1744 he was again sent to Bavaria, and defeated the Austrians at Lichtenau on Jan. 28, 1745. He served throughout the Flemish campaigns of 1746 and 1747, and was commandant of Metz at the time of his death (June 18, 1751).

OCTAVE-HENRI GABRIEL DE SÉGUR (1778–1818), elder son of Louis Philippe de Ségur (*q.v.*), served in the later Napoleonic campaigns, and remained in the army under the Restoration. He threw himself into the Seine on Aug. 15, 1818. The domestic unhappiness that led to his suicide is retailed by the comtesse de Boigne in her *Mémoires* (vol. i., 1907). His eldest son, EUGÈNE, comte de Ségur, succeeded his grandfather in the peerage in 1830. He married Sophie Rostopchine (1799–1894), daughter of Count Feodor Rostopchine, governor of Moscow. The countess of Ségur wrote some famous books for children, the most familiar of which are perhaps the *Malheurs de Sophie* and the *Mémoires d'un âne*, and many tales in the *Bibliothèque rose*. Her letters to her daughter and son-in-law, the count and countess de Simard de Petray, were published in 1891, and those to her grandson in 1898.

RAYMOND JOSEPH PAUL, comte de Ségur d'Aguesseau (1803–1889), third son of Octave de Ségur, took his mother's family name in addition to his own. He studied law at Aix and Paris. As *procureur général* of Amiens he gave in March 1830 a decision on the question of the electoral lists which pleased the liberal party, but late in the year, as substitute in the royal court of Paris, he ordered the suppression of certain liberal journals, and in other civil appointments was accused of reactionary administration. He gave his adhesion to Prince Louis Napoleon, and became a member of the consultative commission in 1851, and of the senate in 1852. After the fall of the empire he retired into private life.

PIERRE MARIE MAURICE HENRI, marquis de Ségur (1853–1916), wrote a life in 1895 of the marshal de Ségur, which was crowned by the French Academy. His book on Madame Geoffrin, *Le Royaume de la rue Saint-Honoré* (1897), also received a prize. His principal work is the three volumes devoted to Marshàl Luxembourg—*La Jeunesse du maréchal de Luxembourg, 1628–1668* (1900); *Le Maréchal de Luxembourg et le prince d'Orange, 1668–1678* (1902); *Le Tapissier de Notre-Dame. Dernières années du maréchal de Luxembourg, 1678–1695* (1904); *Julie de Lespinasse* (1905), English Transl., 1907; and *Au couchant de la monarchie Louis XVI. et Turgot, 1774–1776* (Paris, 1910). He was elected to the French Academy in 1907.

There is much general information on the family of Ségur in A. de Ségur's *Le Maréchal de Ségur, 1724–1801* (Paris, 1895), and in L. P. de Ségur's *Recueil de famille* (1826).

SÉGUR, PHILIPPE HENRI, MARQUIS DE (1724–1801), marshal of France, son of Henri François, comte de Ségur, served under his father in command of an infantry regiment in Italy and Bohemia. He lost an arm at Lauffeld in 1747. In 1748 he succeeded his father as lieutenant-general of Champagne and Brie; he also received in 1753 the governorship of the county of Foix. He fought in the Seven Years' War and in 1760 he was taken prisoner at Kloster-campen. As minister of war (1780–87) under Necker he created in 1783 the permanent general staff, and made admirable regulations with regard to barracks and military hospitals. In 1783 he became a marshal of France. During the Terror he was imprisoned in La Force, and after his release was reduced to considerable straits until in 1800 he received a pension from Napoleon. He died in Paris on Oct. 3, 1801.

See A. de Ségur, *Le Maréchal de Ségur, 1724–1801* (1895).

SÉGUR, PHILIPPE PAUL, COMTE DE (1780–1873), French general and historian, son of Louis Philippe, comte de Ségur, was born in Paris on Nov. 4, 1780. He served with General Macdonald in the Grisons in 1800–1801, and published an account of the campaign in 1802. By the influence of Colonel Duroc (afterwards duc de Frioul) he was attached to the personal staff of Napoleon. He served through most of the important campaigns of the first empire, and was frequently employed on diplomatic missions. He remained in the army at the Restoration, but, having accepted a command from Napoleon during the Hundred Days, he was retired until 1818, and took no further active part in affairs until the revolution of 1830.

During his retirement Ségur wrote his *Histoire de Napoléon et de la grande armée pendant l'année 1812* (Paris, 2 vols., 1824), which ran through numerous editions, and was translated into several languages. The unfavourable portrait of Napoleon given in this book provoked representations from General Gourgaud, and eventually a duel, in which Ségur was wounded. On the establishment of the July monarchy he received, in 1831, the grade of lieutenant-general and a peerage. In 1830 he was admitted to the French Academy, receiving the grand cross of the Legion of Honour in 1847. After the revolution of 1848 he lived in retirement. He died in Paris on Feb. 25, 1873. His works include: *Histoire de Russie et de Pierre le Grand* (1829); *Histoire de Charles VIII.* (2 vols., 1834–1842), in continuation of the history of France begun by his father; and the posthumous *Histoire et mémoires* (8 vols., 1873).

See *Un Aide-de-camp de Napoléon (1800–1812), mémoires du général comte de Ségur*, new edition by his grandson Louis de Ségur (3 vols., 1894–1895), of which an abridged English version was published in 1895.

SEGUSIO (mod. *Susa, q.v.*), an ancient town in north Liguria, the capital of the Cottii (*see* COTTII REGNUM). Here the son of King Donnus, Cottius—who held the rank of imperial praefect over the 14 tribes over which his father had ruled as king—erected a triumphal arch in honour of Augustus in 9–8 B.C., which is still standing. Claudius restored the royal titles to the family; but, after the death of its last member, Nero made the district into a province. It was strongly fortified and garrisoned, and remains of its walls, including those of a double-arched gate, exist. Constantine captured the town, which offered some resistance to him, on his march against Maxentius.

SEHESTED, HANNIBAL (1609–1666), Danish statesman, born at Arensborg Castle on Ösel, was educated abroad, returned to Denmark in 1632 and was attached to the court of Christian IV. Two or three years later he was sent to Wismar to negotiate a treaty with the Swedish chancellor, Axel Oxenstjerna, and, if possible, bring about a match between Christian's son Frederick and Gustavus Adolphus's daughter Christina. Though failing in both particulars, he retained the favour of the king, who betrothed him to his daughter Christine, then in her tenth year, whom he married in 1642. In May 1640 Sehested became a member of the *Rigsraad*. In 1642 he was appointed viceroy of Norway (April 1642). He sought to develop Norway's material resources, and reorganize her armaments and fiscal system; and he aimed at giving her a more independent position as regards Denmark. During Christian IV.'s second war with Sweden (1643–1645), Sehested, as viceroy of Norway, assisted his father-in-law materially. He invaded Sweden four times; successfully defended Norway from attack; and he won an engagement at Nysaker in 1644. After the war he renewed his reforming efforts, and during the years 1646–1647 he succeeded with the help of Christian IV. in creating a separate defensive fleet for Norway and giving her partial control of her own finances. Sehested's success, and still more his accumulation of money and honours aroused the distrust of the *Rigsraad* and the envy of his rivals.

Charges of embezzlement and peculation were brought against him, and he surrendered his private property in Norway to the

Crown. From 1651 to 1660 he lived abroad. In the summer of 1657 he returned to Denmark, but Frederick III. refused to receive him, and he hastily quitted Copenhagen. During the crisis of the war of 1658 he was at the headquarters of Charles X. of Sweden. In seeking the help and protection of the worst enemy of his country, Sehested approached the very verge of treason, but, as soon as he was assured that the case of Denmark was not hopeless, he began to work in her interests in Sweden. In 1660 Frederick III. allowed him to return to Copenhagen, and finally made him plenipotentiary to negotiate with the Swedes. The treaty of Copenhagen, which saved the honour of Denmark, was very largely Sehested's work. He was one of the willing abettors of Frederick III. at the revolution of 1660, when he re-entered the Danish service as lord treasurer and councillor of state. As a diplomatist he, in some respects, anticipated the views of Griffenfeldt, supporting the policy of friendship with Sweden and a French alliance. He died suddenly on Sept. 23, 1666 at Paris, where he was conducting important negotiations. His "political testament" is perhaps the best testimony to his liberal and statesmanlike views.

See Thyra Sehested, *Hannibal Sehested* (Copenhagen, 1886); Julius Albert Fridericia, *Aldelsvaeldens sidste Dage* (Copenhagen, 1894).

SEHORE, a British station in Central India, within the state of Bhopal, 24 m. E. from Bhopal. Pop. (1921) 10,183. It is the headquarters of the political agent for Bhopal, and a British military cantonment. For many years it was also the headquarters of the Bhopal contingent, which was in 1903 incorporated in the Indian army.

SEICHE, an irregular fluctuation of the water level of lakes, first observed in Switzerland. *See* Lake and Geneva, Lake of.

SEIGNIORAGE. The due levied by the authority that possesses the right of coining on the metal that it manufactures into coin. The term "brassage" has been used to describe this due, when confined to the mere cost of the process, the wider term "seigniorage" being employed when the charge is so raised as to become a profit to the imposer. The exercise of the right of seigniorage has been the instrument by which most of the debasements of currency have been carried out. Under feudalism, especially in France, the chief nobles had this prerogative. In the modern state it is reserved for the sovereign authority. Most countries adopt a moderate seigniorage charge. Thus the fundamental currency law of France (1803) provides that "only the expense of coining" shall be charged. The limitation on the coinage of silver in practically all countries has made the seigniorage on that metal very heavy. The policy of England in respect to gold has been peculiar. Since 1664 it has been freed from any charge though the delay in returning the coined gold causes a small loss of interest.

The theory of the effects that a seigniorage produces have been discussed at length. The definitive results obtained may be briefly stated as follows:—(1) A seigniorage charge is the same as a debasement, but its evil effect may be avoided by limiting the amount of coin issued. (2) Seigniorage operates as a tax on the metal subject to it, and this tax tends ultimately to fall on the producers, or rather on the rent obtained through the production. (*See* Money.)

SEIGNOBOS, CHARLES (1854–), French historian, was born Sept. 10, 1854, at Lamastre (Ardèche). Educated at the Lycée de Tournon, he passed to the École Normale Supérieure. Entrusted with an independent course of historical instruction in 1879 at Dijon, he was appointed to the Sorbonne, first as unattached professor in 1883 and later as special lecturer in 1890. In 1897 appeared his *Histoire politique de l'Europe contemporaine*, which was crowned by the Académie française. His work is distinguished by a broad-minded and often democratic tone, and a grasp of social science which place him in the forefront of modern historical writers.

His other published works include: *Histoire de la civilisation* (1886); *Histoire des anciens peuples de l'Orient* (1890); *La méthode historique appliquée aux sciences sociales* (1901); and in *L'Histoire de France Contemporaine* of E. Lavisse, *La Révolution de 1848* (1921); *Le Second Empire* (1921); *Le Déclin de l'Empire et l'Établissement de la IIIe République* (1921).

SEIGNORY or SEIGNIORY, in English law, the lordship remaining to a grantor after the grant of an estate in fee-simple. There is no land in England without its lord: "Nulle terre sans seigneur" is the old feudal maxim (*see* Tenure, Feudal). Where no other lord can be discovered the Crown is lord as lord paramount. The principal incidents of a seignory were an oath of fealty; a "quit" or "chief" rent; a "relief" of one year's quit rent, and the right of escheat. In return for these privileges the lord was liable to forfeit his rights if he neglected to protect and defend the tenant or did anything injurious to the feudal relation. Every seignory now existing must have been created before the Statute of *Quia Emptores* (1290), which forbade the future creation of estates in fee-simple by subinfeudation. The only seignories of any importance at present are the lordships of manors (*see* Copyholds). They are regarded as incorporeal hereditaments, and are either appendant or in gross. A seignory appendant passes with the grant of the manor; a seignory in gross—*i.e.*, a seignory which has been severed from the demesne lands of the manor to which it was originally appendant—must be specially conveyed by deed of grant.

As to seignorial tenures in the Channel Islands *see* W. Burge, *Commentaries on Colonial and Foreign Laws*, vol. iv. pt. 1, p. 1,018; and as to Quebec, see *ib.* p. 1,028.

SEINE, the department of northern France which has Paris as its chief town, formed in 1790 of part of the province of Ile-de-France. It is entirely surrounded by the department of Seine-et-Oise, from which it is separated at certain parts by the Seine, the Marne and the Bièvre. The area of the department is only 185 sq.m., and of this surface about a sixth is occupied by Paris; the suburban towns also are close together and very populous. The population in 1926 was 4,628,637, of which number 2,871,429 were in the city of Paris. Flowing from south-east to north-west through the department, the Seine forms three loops; on the right it receives above Paris the Marne, below Paris the Rouillon, and on the left the Bièvre within the city. The left bank, higher than the right, consists of the Villejuif and Châtillon plateaux separated by the Bièvre; the highest point (560 ft.) is above Châtillon and the lowest (105) at the exit of the Seine.

Market gardening is the chief agricultural industry, and by means of irrigation and manuring the soil is made to yield from ten to eleven crops per annum. Below Paris the plain of Gennevilliers, fertilized by sewage water, yields large quantities of vegetables. Milch cows are reared in large numbers. The principal woods (Boulogne and Vincennes) belong to Paris. It is partly owing to the number of quarries in the district that Paris owes its origin: Châtillon and Montrouge in the south yield freestone, and Bagneux and Clamart in the south and Montreuil and Romainville in the east possess the richest plaster quarries in France. Within the circuit of Paris are certain old quarries now forming the catacombs. Most of the industrial establishments in the department are situated in Paris or at St. Denis (*qq.v.*). The department is traversed by all the railway lines which converge in Paris, and also contains the inner circuit railway (Chemin de Fer de Ceinture) and part of the outer circuit. There are many canals. The department forms the archiepiscopal diocese of Paris, falls within the jurisdiction of the Paris court of appeal and the académie (educational division) of Paris, and is divided between the II., III., IV., V. and VI. *corps d'armée*. Apart from Paris (*q.v.*) the department includes the arrondissements of St. Denis and Sceaux with 22 cantons between them. The 20 arrondissements of Paris are ranked as cantons for certain purposes. The chief places besides Paris are St. Denis, Asnières, Aubervilliers, Boulogne-sur-Seine, Clichy-sur-Seine, Courbevoie, Levallois-Perret, Neuilly-sur-Seine, Pantin, St. Ouen, Colombes, Charenton, Ivry-sur-Seine, Montreuil-sous-Bois, Nanterre, Nogent-sur-Marne, Vincennes and Arcueil.

SEINE, one of the chief rivers of France, rising on the eastern slope of the plateau of Langres, 18 m. N.W. of Dijon. It flows north-westward throughout its entire course, but has numerous windings: between its source and its mouth in the English Channel the direct distance is only 250 m., but that actually traversed by the river is 482 m.

Rising at 1,545 ft. above sea-level, the Seine is at first such an insignificant streamlet that it is often dry in summer as far as Châtillon (705 ft.) some 31 m. from its source. It next passes Méry, and at Marcilly receives the Aube (right), at which point the Haute-Seine Canal from Troyes and Bar terminates and the river itself is canalized. Here it is deflected south-west by the heights of the Brie, the base of which it skirts past Nogent and Montereau. At the latter point it receives the Yonne (left), and is deepened from 5 ft. 3 in. to 6 ft. 6 in. It resumes its north-west direction, receives the Loing (left) at Moret, passes Melun, is joined at Corbeil by the Essonne (left), and just above Paris by the Marne (right). From this point to the sea its channel has been deepened so that vessels of 9 to 10 ft. draught can reach the capital. The river then meanders through a pleasant champaign country past St. Cloud, St. Denis, Argenteuil, St. Germain, Conflans where it is joined by the Oise (right) and then passes Poissy, Mantes and Les Andelys. From the Oise to the sea the river flows over Cretaceous strata. At Poses the river becomes tidal. It next receives the Eure (left), and passes Pont de l'Arche, Elbeuf and Rouen, where sea navigation commences.

The river is dyked below Rouen so as to admit vessels of 20 ft. draught, and large areas have thus been reclaimed for cultivation. At every tide there is a "bore" ranging usually from 8 to 9 ft. Below Quilleboeuf, where it receives the Risle (left) the estuary begins, set with extensive sandbanks, between which flows a narrow navigable channel. Tancarville (right) is the starting-point of a canal to enable river boats for Havre to avoid the sea passage. The river enters the English Channel between Honfleur (left) and Havre (right). The low elevation of the surrounding hills has rendered it comparatively easy to connect the Seine and its affluents with adjoining river basins by means of canals; and it is so connected with the Somme, the Scheldt, the Sambre, the Meuse, the Rhine, the Saône and the Loire.

SEINE-ET-MARNE, a department of northern France, formed in 1790 of almost the entire district of Brie (half of which belonged to Champagne and half to Ile-de-France) and a portion of Gâtinais (from Ile-de-France and Orléanais). Pop. (1926) 380,017. Area, 2,275 sq.m. The department belongs to the Seine basin, and is drained partly by that river and partly by its tributaries the Yonne and the Loing from the left, and from the right the Voulzie, the Yères and the Marne, with its affluents the Ourcq, the Petit Morin and the Grand Morin, at the last-named of which the German advance in Sept. 1914 was stayed.

The oats and wheat of Brie are very good; potatoes, sugar beet, mangel-wurzel and green forage are important crops, and market gardening flourishes. Provins and other places are well-known for their roses. The cider and honey of the department are of good quality. Brie cheeses are well known, and large numbers of calves, sheep and poultry are reared. There are large forests covering a fifth of the surface. Most important is the forest of Fontainebleau. Large areas are devoted to game-preserves. Excellent freestone is quarried in the department, notably at Château-Landon and Nemours, mill-stones at La Ferté-sous-Jouarre; the Fontainebleau sandstone is used for pavements, and the white sand which is found along with it is in great request for the manufacture of glass. Along the Marne are numerous gypsum quarries; lime-kilns occur throughout the department; and peat is found in the valleys of the Ourcq and the Voulzie. Beds of common clay and porcelain clay supply the potteries of Fontainebleau and Montereau. Paris is the chief outlet for the industrial and agricultural products of the department.

The Seine, the Yonne, the Marne, and the Grand Morin are navigable, and, with the canals of the Loing and the Ourcq and those of Chalifert, Cornillon and Chelles, which cut off the windings of the Marne, form a total waterway of over 200 m. Seine-et-Marne has 3 arrondissements (Melun, Meaux and Provins), 29 cantons and 534 communes. It forms the diocese of Meaux (archiepiscopal province of Paris), and part of the region of the V. army corps and of the *académie* (educational division) of Paris, where is its court of appeal. Melun, the capital, Meaux, Fontainebleau, Coulommiers, Provins, Nemours and Montereau (*qq.v.*), are the chief towns. Lagny (pop. 6,398), has an abbey-church of the 13th century; Brie-Comte Robert has a church of the early 13th century; Ferrières, a 13th century church; Moret-sur-Loing preserves 15th century fortifications including two remarkable gateways; St. Loup-de-Naud a church of the early 12th century; Jouarre a church of the 15th century, built over a 10th century crypt; and Vaux-le-Vicomte has the famous *château* built by Fouquet, minister of Louis XIV.

SEINE-ET-OISE, a department of France, formed in 1790 of part of the old province of Ile-de-France, and traversed from south-east to north-west by the Seine, which is joined by the Oise. Pop. (1926) 1,137,524. Area, 2,184 sq. miles. It is bounded by the departments of Seine-et-Marne on the east, Loiret on the south, Eure-et-Loir on the west, Eure on the north-west and Oise on the north. It encloses the department of Seine, and with it forms the centre of the Paris basin. The Epte on the north-west is almost the only natural boundary of the department. The streams (all belonging to the basin of the Seine) are: (right) Yères, Marne, Oise and Epte; (left) Essonne (joined by the Juine, which passes Étampes), Orge, Bièvre and Mauldre. Seine-et-Oise belongs in part to the Pliocene tableland of Beauce in the south and to that of Brie in the east. In the centre are the wooded hills of the Hurepoix which make the charm of Versailles, Marly and St. Germain. In the north-west, in the Vexin, the culminating point (690 ft.) is reached, while the lowest point, where the Seine leaves the department, is little more than 40 ft. above the sea.

Seine-et-Oise is a flourishing agricultural and horticultural department. Wheat, oats, potatoes and sugar-beet are important crops. Versailles, Rambouillet, Argenteuil are among the many market-gardening and horticultural centres, and wine is grown at Argenteuil and elsewhere. Forests occupy about 190,000 ac., the largest being that of Rambouillet (about 32,000 acres). There are mineral springs at Enghien and Forges-les-Bains. Important industrial establishments are the national porcelain factory at Sèvres; and the government powder-mills of Sevran and Bouchet.

The railways of all the great companies of France (except the Midi) traverse the department. The Seine and the Oise, and the canals of Ourcq and Chelles provide about 120 m. of waterway. Seine-et-Oise is divided into four arrondissements (Versailles, Corbeil, Pontoise, Rambouillet) with 40 cantons and 692 communes. It forms the diocese of Versailles under the archbishop of Paris, and part of the educational division (académie) of Paris and is under the command of the military government of Paris, where is its court of appeal.

The chief towns are Versailles, the capital, Corbeil, Sèvres, Étampes, Mantes, Pontoise, Rambouillet, Argenteuil, Poissy, St. Cloud, St. Cyr, St. Germain-en-Laye, Meudon, Montmorency, Rueil and Marly-le-Roi (*qq.v.*). Montfort-l'Amaury has a Renaissance church, a 16th century gateway and a ruined château once the seat of the family of Montfort; Montlhéry preserves the keep (13th century) and other ruins of a fortress which commanded the road from Paris to Orléans; Roche-Guyon, seat of the family of that name, has two châteaux, one a feudal stronghold, the other also mediaeval but altered in the 18th century; Vigny has a Gothic 15th century château; Ecouen, a château of the 16th century once the property of the Condé family; Dampierre has a 17th century château once the property of Charles, cardinal of Lorraine; Maisons-Laffitte, a château of the same period once belonging to the family of Longueil. The château of Malmaison (18th century) is famous as the residence of the Empress Joséphine.

Of the many churches the most interesting are those of Jouy-le Moutier (11th and 12th centuries); Beaumont-sur-Oise (13th century); Taverny (12th and 13th centuries); Longpont (remains of an abbey-church dating from the 11th to the 13th centuries). Near Cernay-la-Ville are remains of a Cistercian abbey and near Lévy-St.-Nom those of the abbey of Notre-Dame de la Roche, including a church (13th century) with stalls which are among the oldest in France and the tombs of the Lévis-Mirepoix family.

SEINE-INFÉRIEURE, a department of the north of France, formed in 1790 of four districts (Vexin normand, Bray,

Caux and Roumois) belonging to the province of Normandy. Pop. (1926), 885,299. Area, 2,448 sq.m. Seine-Inférieure is bounded north-west and north by the English channel for a distance of 80 m., north-east by Somme, from which it is separated by the Bresle, east by Oise, south by Eure and the estuary of the Seine, which separates it from Calvados. The department consists of a portion (Pays de Caux) of the chalk plateau of western France, through which the Seine has sawn its way near the southern boundary. From the slopes of the plateau many small streams drain seawards, the most important being the Arques, emerging at Dieppe, and the Bresle at Le Tréport on the north-eastern boundary. In the comparatively regular outline of the coast there are a few breaks, as at Le Tréport, Dieppe, St. Valery-en-Caux, Fécamp and Havre, the Cap de la Hève, which commands this last port, and Cape Antifer, 12 or 13 m. farther north. Le Tréport, Dieppe, Veules, St. Valery, Veulettes, Fécamp, Yport, Étretat and Ste. Adresse (to mention only the more important) are fashionable watering-places. Forges-les-Eaux (in the east of the department) has cold chalybeate springs.

In general the department is fertile and well cultivated. Along the Seine fine meadow-land has been reclaimed by dyking; and sandy and barren districts have been planted with trees, mostly oaks and beeches, at their finest in the forest of Arques and along the railway from Rouen to Dieppe. The forest of Eu covers 36 sq.m. in the north-east. Wheat and oats are the principal arable crops, rye, flax, colza, sugar beet and potatoes being also important. Milch cows are kept in great numbers especially in the Bray district, and Gournay butter and Gournay and Neufchâtel cheese are in repute. The farms of the Caux plateau are each surrounded by an earthen dyke, on which are planted forest trees, generally beech and oak. Apples and pears are grown, and much cider is produced. A little peat is cut, and there is a number of quarries. Rouen is the chief centre of the cotton trade, which comprises spinning and the weaving of *rouenneries, indiennes* (cotton prints), cretonnes and other cotton goods. Elbeuf is the centre of woollen manufacture. The dyeing and printing of fabrics and other accessory industries also employ many hands. Engineering works, foundries and iron ship-building yards are found at Havre and Rouen. Wooden ships are also built at Havre, Rouen, Dieppe and Fécamp. Other establishments of importance are the national tobacco-factory at Dieppe, sugar-refineries, distilleries, glass-works, potteries, paper-works, soap-works, chemical-works, flour-mills, oil-factories, leather-works, etc. Fisheries are important. Fécamp, which plays a very important part at the Newfoundland fisheries, sends large quantities of cod, herring, mackerel, etc., into the market; Dieppe supplies Paris with fresh fish; St. Valery sends boats as far as Iceland. The principal ports for foreign trade are Havre, Rouen and Dieppe.

Seine-Inférieure is served by the Ouest-État railway, but the Northern railway also has several lines there. The Seine and other rivers provide 85 m. of navigable waterway. The canal of Tancarville from Quilleboeuf to Havre is about 15 m. long, that from Eu to Tréport about 2 m. The department is divided into three arrondissements (Rouen, Dieppe and Havre), 55 cantons and 759 communes. It forms the diocese of the archbishopric of Rouen and part of the region of the III. army corps and of the *académie* (educational division) of Caen. Its court of appeal is at Rouen, the capital.

Rouen, Havre and Dieppe and in a lesser degree, Elbeuf, Fécamp, Harfleur, Lillebonne, Yvetot, Eu, Le Tréport, Aumale, Étretat, Bolbec, Barentin (*qq.v.*) and Caudebec-en-Caux are the chief towns. St. Martin-de-Boscherville has remains of an important abbey, with a fine church in the 12th century Romanesque style, and a Gothic chapter-house of the latter half of the 12th century; Valmont has fine ruins (16th century) of the choir of a Cistercian abbey-church; Varengeville is well known for the manor (16th century) of Jacques Ango (*see* DIEPPE); Graville-Ste. Honorine has a Romanesque church and other remains of an ancient abbey; Montivilliers has a fine abbey-church of the 11th, 12th and 16th centuries; and Arques, Boos, Martainville, Mesnières and Tancarville have old châteaux of various periods.

SEINING, NETTING AND TRAWLING. From remote antiquity fish have been taken by spear, line, trap and net. At the present day nets are by far the most important fishing implements employed, although certain deep water fish (for instance halibut) are still taken mainly by long lines. Fishing nets, although of innumerable kinds, fall naturally into two main groups, namely, stationary nets and nets used in motion. The former group contains the most primitive nets, though nets of great complexity are now included in it; and the simplest fixed nets, themselves derived probably from dams of rushes or stones so placed as to lead fish in to a "pound" or enclosure, may with some confidence be considered as the ancestors of the great otter trawls now shot and towed daily from powerful steamers on fishing grounds more than a thousand miles from the market they work to supply. The more primitive fixed nets are of far less importance than movable nets (except in the capture of certain particular species), owing to the fact that they are necessarily confined to very shallow water. The main types of movable nets may therefore be treated first.

All nets are constructed in accordance with what is known of the habits of the fish they are designed to capture; and as fishes may be roughly divided into those spending at least the greater part of their lives on or near the sea-bottom and those spending a great portion of their lives near the surface, two lines have been followed in the development of nets, some being designed to work on the bottom, others to work near the surface. The most important nets used in the capture of "demersal" or bottom-living fishes are trawls; the most important pelagic nets are drift-nets. The word trawling was at one time applied to more than one method of fishing, but has, at all events in Europe, now become restricted to the operation of a flattened conical net or trawl, dragged along the sea-bottom. There are two trawls in common use, the beam-trawl and the otter-trawl. They differ in the method adopted for extending the mouth of the net. The original form is the beam-trawl.

The beam-trawl may be described as a flattened conical net whose mouth is kept open when in use by a long beam preferably of elm supported at the ends by iron runners, the trawl-heads. Trawl-heads are of various shapes, but usually take the form of a loop, the curve being in front and ending in straight bars which meet at a point behind. One of these bars, the "shoe" lies along the sea-bed when the trawl is in use, and is usually of double thickness, in order to withstand wear. A square socket is bolted to the top of the head, to receive the beam, and ring-bolts are fitted at the front of the curve and in the angle of the "heel" for attaching the towing ropes and the "ground rope" to which the lower lip of the net is lashed.

The Net.—The top lip of the net is lashed along the beam, but the ground rope, being much longer than the beam, when the trawl is towed forms a deep curve between the trawl-heads, the centre or "bosom" thus being considerably behind the beam. Accordingly, when the fish on the sea-bed are disturbed by the travelling ground rope, the roof of the trawl is above them, and the way of escape has already passed and is moving steadily on: a great number of them therefore ultimately pass over the ground rope into the net. The net narrows gradually until the last few feet are reached: this terminal portion is cylindrical and is called the "cod-end." It is closed by a line rove through the terminal meshes, the "cod-line." The fish taken mostly collect in the cod-end, and as their weight increases friction with the bottom, it is protected by pieces of old netting laced across its under side. The fish not taken from the cod-end are found in the "pockets" the pockets are made by lacing together the upper and under sides of the net. They are wedge shaped, the points lying at the sides of the net, at about the level of the bosom, the broad ends at that of the entrance to the cod-end. At this level the lumen of the net thus is divided into three: a fish enters by the central passage, which is furnished with a valve-like curtain, the "flapper," and then either stays in the cod-end or works back along the sides into the pockets. Some species, particularly soles, are frequently found in the pockets.

Dimensions.—A full-sized beam trawl has a beam from 45 to

50 ft. long, and its own length is nearly twice as great: the heads hold the beam from $3\frac{1}{2}$ to $4\frac{1}{2}$ ft. from the bottom. There are, however, wide local differences in size and pattern: and the proportions of the various parts of the net and the sizes of the mesh depend also on the species sought. A North Sea trawl has a cod-end of about 12 ft., out of a total length of 75 ft.: its meshes are 3 in. in size in the front part of the net, lessening to $1\frac{1}{2}$ in. in the cod-end. Small pocketless trawls of 15 ft. beam are used for shrimping from open boats. Shank-nets, whose mouths are kept open by wooden rectangles, with the lower lip a few inches from the ground are also used in shrimping.

Working the Net.—The large beam-trawl is towed a little faster than the tide, and in the same direction. It is drawn along by two ropes ("bridles") of 15 fathoms, one attached to each trawl-head and which are shackled to a 6 in. manila rope or warp. The length of warp run out is rather over 3 times the depth of the ground. Successful shooting of the trawl is an art which has to meet and overcome innumerable difficulties caused by the various combinations of wind, tide, ground and weather, and space does not permit of its discussion here. Essentially, it proceeds in the following stages. The beam and heads are put over the side and the net paid out after them: the fore bridle is run out until the beam is at right angles to the ship's side: both bridles and the warp are then run out: a rope ("guy") is however attached to the warp when nearly out and made fast in the bow, in such a manner that if the net "comes fast" on an obstruction the guy takes the strain and brings the ship head to wind, where she can lie until a change of tide enables her to free her gear. The towing generally lasts one tide (6 hours) and the hauling of the nets is now usually effected by a small steam capstan ("steam man"), whose compact engine is housed under a cover on the capstan top. When the trawl-heads are made fast the net is hauled in by hand until the cod-end is reached, when a bight of rope is put round it, passed over a "tackle" (pulley block) and the cod-end heaved in by the capstan, when the cod-line is loosed and the fish fall on deck.

Replacement of Beam- by Otter-trawl.—Although a very old net, the beam-trawl reached its highest importance in the nineteenth century. In that century the sailing trawlers which employed it increased greatly in numbers and tonnage and improved in equipment and efficiency: and they brought the whole North Sea under the trawl. Its closing decades however witnessed the beginning of the rise of the otter-trawl and of the use of steam in fishing vessels: and saw also the decay of beam-trawling and the decline of sailing trawlers. Thus in England and Wales there were over 2,000 first class sailing trawlers in 1893, over 900 in 1900, 817 in 1913 and 272 in 1928: in the same period the average tonnage fell from 57 to 33. In the first stages of the change the fact that the otter could not be worked with confidence from a sailing vessel no doubt accelerated the adoption of steam power, since the efficiency of the otter rendered its use inevitable; while on the other hand the power of steam favoured the development of larger nets and enabled more distant grounds to be explored and worked, and the otter, having no rigid beam, was capable of manufacture in a large size and of yielding, on an abundantly stocked ground, the large catches necessary to pay the expenses of long voyages. It is probable that the low working expenses of sailing beam trawlers may ensure their continuance on grounds near ports in close touch with good markets, especially when the fish on the ground are of the more valuable kinds ("prime"), although even on these grounds the motor otter trawler is increasing in importance; but in the present phase of fisheries it is clearly the great steam trawler that bears the main burden of the supply of demersal fish. In 1928 steam trawlers landed in England and Wales 415,000 tons of these fish; sailing (beam) trawlers less than 7,000 tons.

The Otter-trawl.—The essential feature of the otter-trawl is that its mouth is kept open not by a rigid structure but by two large boards, the otter-boards or "doors" acting like kites working horizontally instead of vertically. The device was employed by yachts since its invention by Hearder in 1860, and later by Danish plaice seiners, but the boards now used were first patented in 1894 and 1895 by Scott of Granton and Nielsen, a Dane, respectively.

The otter-boards resemble massive wooden doors, liberally strengthened by iron bands: they are about 8 ft. high, 9 ft. long and 3 in. thick. The net is fastened to shackles placed at the top and bottom of the after-end of the board. Like the beam-trawl, the otter has many types, the proportions of the parts varying with the species sought. Headlines may be as much as 120 ft. in length: the fore and aft length of the actual net is rather less than that of the head rope, and as has been said that of the ground rope greater: the cod-end is usually about 14–18 ft. Much research has been devoted to determining the actual spread of the net when towed: and it appears probable that a 90 ft. headline gives a spread of rather over 50 ft.

Working the Net.—The operation of shooting is carried out fundamentally as in the beam-trawl—*i.e.*, the trawl is brought at right angles to the ship by running out the fore warp sufficiently, before both warps are lowered. The fore warp is then drawn to the quarter of the vessel, where it is shackled with the after warp during towing. Towing takes place at varying speeds, round about $2\frac{1}{2}$ knots, or in herring trawling $3\frac{1}{2}$ knots. Hauls vary in duration with the abundance of the fish: a common duration, seldom exceeded, is 3 hours. When about to haul the fore warp is released from the aft and the ship steered in a curve to bring them both at right angles to the side and so clear of the propellers. The warps are then rapidly wound in, and the net and cod-end brought on board as in the beam-trawl. The trawler carries her fish iced to port.

Seines.—The movable nets most resembling trawls are seines. This net consists essentially of a long strip of netting with a buoyed headline and a weighted ground rope. It is taken out in a boat to some distance from shore, paid out in a curve concave to the beach, and the lines attached to the net being brought ashore, the net is hauled to land. This simple seine is used for the capture of smelts and other small fish, but most seines have developed into more complex forms, usually by changes involving the formation of a bunt, or a true cod-end in the middle of the net: and several forms are worked completely away from shore.

Thus the *Danish plaice-seine* is now worked by a small steamer or motor vessel. It is a net some 180 ft. long, with a 50 ft. cod-end, and to each wing over a mile of warp is attached. One end of a warp is buoyed, and the ship moves in a great oval, paying out warp, net and second warp, and then returning to the buoy, when both warps and the net are hauled by special winding engines. The net gives excellent results with plaice or, properly modified, with haddock on clean level sand at moderate depths, but has hardly fulfilled expectations for general fishing far from land.

This net is the last development of the Danish seines. A simpler form is the *eel drag-seine,* which is worked from a boat in shallow water. It is somewhat smaller (140 ft. long) tapering at the wings and with a bag of 30 ft., the wings are attached to spars and drawn on board by warps. The *drift eel-seine* is an interesting development. It is similar but smaller, and drifts with the boat, the ends of the net being kept apart by a floating spar or, latterly, by small trawl boards. The bag is valved by a funnel of netting.

The Mediterranean *filet de boeuf* may be here included, as a net having affinities with both trawl and seine. It is worked between two boats, and has a very long cod-end.

Pilchard-seines are shot about a shoal of these fish by boats guided by the signals of watchers ("huers") on shore. They are shot in a nearly complete circle, which is then closed by a short "stop" net, when lines from the ends of the main net are taken ashore and the whole hauled to the shallows. The fish are then removed by a "tuck net," a small seine through whose lowest meshes a line is rove, so that by hauling this line the net changes from a wall of netting to a shallow basin. The main seine is about 200 fathoms long: as in the trawl, the meshes decrease in size towards the cod-end or purse.

The Purse-seine, much used in the United States and in Japan, is in principle a tuck-net. The mackerel or other shoal is

surrounded by a long wall of netting whose ground-rope bears rings through which is rove the line which on hauling converts the circle into a saucer. The slack of the net is then taken up gradually until the area is small and the fish are reached. In Japan the fish are guided into the purse by a long line of net which acts as a leader.

Drift-nets.—The nets of most importance after the otter-trawl are the drift-nets employed for the capture of herring, mackerel and other fish which pass much of their life near the surface of the sea. Although both herring and, in less degree mackerel are now trawled, the main fishery for these important fish is carried out by the drifters.

Drift-nets as employed in Great Britain are of fine cotton, the rougher nets being used now only by continental nations. The size of net varies with the locality and the fish to be taken, as does the mesh; but a common length is 30 yds. The mesh measures in rows of knots to the yard vary from over 60 for sprat, 29 to 36 for herring, and from 25 to 36 for mackerel. The nets are shot end to end on the same long warp, which may extend for as much as 3 miles, all headlines are buoyed by cork, the ground-ropes weighted, and in addition the warp is buoyed at intervals by buoys called bowls, the net being attached to the buoy ropes also. Some small nets are used with their headline at the surface, but usually they are sunk, except for mackerel. The warp is sometimes worked above the net, sometimes a fathom or more below it, the former are known as "sunk" nets, and French and Dutch drifters follow this plan; the others are called "swum" nets. When riding at nets the strain of the warp is taken by a chain or rope called the "tissot" which joins the warp near the net. The warp is of 3½ in. manila. The evolutions of shooting and hauling cannot be here described. The former is done so as to ensure the nets drifting free of the ship, the latter with the vessels head up wind.

Steam has replaced sail in drift vessels, and even more completely, such sailing drifters as remain being aided by auxiliary motor engines. An interesting development is the success of small vessels capable both of working drift-nets and at other seasons a small otter-trawl.

Stationary Nets.—Stationary nets, except for a few fish are relatively unimportant and can receive little more than a mention. They are of four main kinds. *Stake-nets* are gill nets usually set up between tide marks and supported by stakes. Occasionally the net between pairs of stakes is occupied by a simple bag, as in Germany. If the stake-net acts as a "leader" into a circular enclosure of netting the net is a pound- or kettle-net. The bag-net and fly-net for the capture of the salmon are merely elaborated forms of this type. The pound is roofed by netting, in the fly-net, and in the bag-net, which is floated—not staked—floored also. It is wedge shaped, narrowing gradually from the entrance end and divided incompletely by oblique internal walls or valves of netting into side compartments.

The stow-net is used in the Wash, Thames and Solent for the capture of sprats. It is a pyramidal net, about 200 ft. long, whose nearly square mouth is kept open by 20 ft. "balks" of timber, the bottom one weighted. Four bridles lead from the ends of the balks to the chain by which the vessel employing the net is anchored, always in a tideway. The sprats are carried by the tide into the net, which on the slackening of the tide is hauled after it has been closed by raising the bottom balk up to lie against the top one. A small stow-net is used also for taking "whitebait."

BIBLIOGRAPHY.—F. M. Davis, *An account of the Fishing Gear of England and Wales*, Ministry of Agriculture and Fisheries, Fishery Investigations, ser. ii. vol. ix. No. 6 (1927), has a good bibliography, to which may be added Fulton, *19th Reports of Scottish Fishery Board* (1900); Cunningham, *Journal of the Marine Biological Association of the United Kingdom*, vol. iv.; Petersen, *Report of the Danish Biological Association*, vol. viii. (Copenhagen, 1899); Hjort, *Report on Norwegian Fishery and Marine Investigation*, vol. i. (Christiania, 1900); *Mittheilungen: Deutscher Seefischer-Verein*, various numbers; and in other numbers; *Report and Minutes of Evidence of the Committee*, "appointed to inquire into the scientific and statistical investigations now being carried on in relation to the fishing industry of the United Kingdom" (1908). (J. O. B.)

SEIPEL, IGNAZ (1876–), Austrian statesman and Roman Catholic priest, was born in Vienna July 19, 1876. As professor at Salzburg (1909–12) he saw much of Heinrich Lammasch (*q.v.*), with whom he worked until 1917 in the preparation of an edition of the writings of Hugo Grotius on international law.

Seipel was appointed to Vienna University in 1917 and his work, *Nation and State*, dealing with the supernational state, such as the Austro-Hungarian Monarchy, as a higher type of State compared with the national State, and thus viewing Austria-Hungary's future optimistically, at the same time favouring a reasonable pacificism, caused the Emperor Charles to include him in the circle of those men who were to prepare the way for peace through unofficial negotiations abroad. At the same time, the German parties in the Austrian Parliament summoned him as scientific expert to the consultations on the reform of the constitution now recognised as overdue, and in these Seipel supported moderate federalism on a national basis. But the downfall of the Austro-Hungarian Monarchy could not be prevented either by reform of the constitution or by the peace policy of the Lammasch Ministry, which took office at the eleventh hour, in Oct. 1918, and included Joseph Redlich and Seipel as peace exponents.

After the collapse, Seipel succeeded in preventing the threatened split of the strongest Conservative party in the country, the Christian Socialist, into a Monarchist and a Republican party. This and the necessity of getting new men into Parliament under the new conditions caused his election in 1919 to the National Constituent assembly by the electoral division for central Vienna, and later to the National Council. During the first coalition Government, Seipel worked against too close an alliance of the Christian Socialists with the Social Democrats; in particular he prevented the execution of far-reaching schemes for the socialisation of means of production. After the elections of 1920, which returned the Christian Socialists at the head of the poll, Seipel was undisputed leader of his party. Under his influence Austrian policy gradually veered to the right, and after the resignation of Dr. Schober (*q.v.*), Seipel created a firm Anti-Socialist majority by concluding a parliamentary pact with the Pan-Germans. He then took office as Chancellor (May 31, 1922). At that time the universal misery had reached its climax owing to the policy of inflation. Seipel, together with his Ministers of Finance, August Ségur and Victor Kienböck, put an end to inflation by the creation of a new note bank independent of the Government and prepared for his negotiations with the League of Nations in the autumn of 1922 by his political journeys to Prague, Berlin and Verona, by which he obtained the guarantee of a foreign loan by a number of States and eventually the loan itself. Seipel succeeded by hard fighting in carrying through Parliament the acceptance of the Geneva Protocol and of the foreign controller of Austrian finances appointed by the League of Nations, and led Austrian policy to the re-establishment of almost complete financial equilibrium, and his majority and position were confirmed by the elections of October 1923. In the autumn of 1924, however, when he had hardly recovered from a wound inflicted in an attempt on his life, he resigned office on account of opposition encountered from that wing of his own party which represented local interests in the provinces. Seipel took office again on Oct. 20, 1926, at the head of a Christian-Socialist–Pan-German coalition, which he managed skilfully, discouraging open *Anschluss* propaganda and insisting on the maintenance of treaties, but stressing every opportunity for co-operation with Germany. Proper control of the budget was assured as a safeguard against the repetition of scandals. The elections of April 1927 continued Dr. Seipel's mandate; but his term of office witnessed dangerous growth of hostility between the Socialist and Anti-Socialist elements. On May 4, 1929, Dr. Seipel retired, and was succeeded as chancellor by Ernst Streerowetz.

SEISIN, the possession of such an estate in land as was anciently thought worthy to be held by a free man. Seisin is of two kinds, in law and in deed. Seisin in law is where lands descend and the heir has not actually entered upon them; by entry he converts his seisin in law into seisin in deed. Seisin is now confined to possession of the freehold, though at one time it appears to have been used for simple possession without regard to

the estate of the possessor. Its importance is considerably less than it was at one time, owing to the old form of conveyance by feoffment with livery of seisin having been superseded by a deed of grant (*see* FEOFFMENT), and the old rule of descent from the person last seised having been abolished in favour of descent from the purchaser (*q.v.*). At one time the right of the wife to dower (*q.v.*) and of the husband to an estate by curtesy (*q.v.*) depended upon the doctrine of seisin.

Primer seisin was a feudal burden at one time incident to the king's tenants *in capite,* whether by knight service or in socage. It was the right of the Crown to receive of the heir, after the death of a tenant *in capite,* one year's profits of lands in possession and half a year's profits of lands in reversion. This was ended by the act abolishing feudal tenures (12 Car. II. c. 24, 1660).

See F. W. Maitland, "Seisin of Chattels," *Law Quarterly Review,* vol. i., p. 324 and "The Mystery of Seisin," *Law Q.R.* ii. 481; Pollock and Maitland, *Hist. Eng. Law,* vol. ii. 29 *seq.*

SEISMOMETER. The term *seismometer* (from σεισμός, an earthquake, and μετρόν, a measure) was invented by David Milne (afterwards Milne Home) in 1841 to denote an instrument for recording and measuring the movements of the ground during an earthquake. It is our earliest seismological term. A few years later, the name *seismograph* (γραφη, a writing) was given to an instrument erected in 1855 by L. Palmieri in the (then) new observatory on Vesuvius. A much simpler type of instrument is included under the heading of *seismoscope* and aims at little more than the announcement of the fact that a shaking has occurred, or the record of its time or direction.

Early Instruments.—The first seismometer deserving of the name was one invented in 1841 by J. D. Forbes for "measuring earthquake shocks and other concussions." The scientific principles underlying the construction of seismographs were realized in 1880 by some of the British teachers in Japan—J. A. Ewing, T. Gray and J. Milne—and the instruments erected by them in Tokyo and elsewhere, threw much light on the nature of the earthquake-motion. In 1881–82, the attempt of G. H. and H. Darwin at Cambridge to measure the lunar disturbance of gravity led to the construction, in 1893, of H. Darwin's bifilar pendulum and of Rebeur-Paschwitz's horizontal pendulum (1887).

Seismoscopes.—The earliest instrument of the kind known to us may be classed as a seismoscope. The invention of a Chinese scholar Chang Hêng, it dates as far back as the year A.D. 132. It consisted of a column so suspended that it could move in one of eight directions. A ball was held lightly along each of these lines and, when thrown down by the rod, was caught in a cup below and so revealed the direction of the motion.

Later seismoscopes were frequently designed to give the time of occurrence of a shock. They consisted as a rule of a horizontal rod lightly pivoted at one end and provided with teeth below so that, when the rod fell, the teeth caught a pin projecting from the pendulum of a clock.

Modern Types.—The essential feature of a seismometer is that some point or line within it shall remain at rest, or very nearly so, during the complicated movements of the ground in an earthquake. Various methods of obtaining such steady points have been proposed, but the instruments in general use are various forms of pendulums, either *common* pendulums, in which a heavy mass is suspended by a wire or rod from a fixed point above, or *inverted* pendulums, which consist of a vertical rod with its lower end pointed and working in a conical cavity and carrying a heavy mass at its upper end, or *horizontal* pendulums in which a horizontal rod carrying a heavy mass is suspended from two points in various ways. A few instruments are a combination of two forms of pendulum—the Ewing duplex pendulum seismometer of common and inverted pendulums, and the instrument used by the Darwins of common and horizontal pendulums. Two methods of registration are now used—the one mechanical, a fine point tracing the movement on smooth paper covered with a thin layer of smoke, the other photographic, the beam of light either passing through a hole at the end of the pendulum or, more generally, reflected from a mirror connected with it.

An important point to remember about all pendulums is that they tend to oscillate with their own proper period. If the period of vibration of an earthquake should approach that of the pendulum, such vibrations will then be unduly magnified in the record. The tendency is met, and the record corrected, by some form of damping, such as the resistance of a liquid (as in the Darwin bifilar pendulum), or a confined air-space (as in the Wiechert pendulum), or electro-magnetic reactions (as in the Galitzin and Milne-Shaw seismographs).

Common Pendulums.—Seismometers based on the common pendulum were in early use. One was erected near Comrie in Perthshire in 1840. It was 39 inches long and the bob carried at its lower end a pointer that traced the movement of the pendulum in a thin layer of sand below it. Instruments of this class have always been favoured in Italy, and many records of distant earthquakes have been obtained by them. They agree closely in their methods of recording the movements on smoked paper wrapped round a revolving drum. A thin rod, projecting downwards from the bob of the pendulum, works in slits in the short arms of two horizontal levers. The short arms are at right angles to one another, so that the pointed ends of the long arms record two perpendicular components of the motion. One of the levers is straight and the other is bent at right angles, or both are bent at an angle of 45°, and the pointed ends rest near one another on the smoked paper in motion below. The instruments differ chiefly in the length of the pendulum and the weight of the bob.

Inverted Pendulums.—The oldest form of inverted pendulum seismometer, indeed the oldest seismometer of any kind, was that designed by Prof. J. D. Forbes in 1841 and erected in the same year at several places near Comrie. Its essential features are shown in fig. 1. The heavy ball C is carried on a vertical metal rod AB, on which it can be adjusted at any height desired. The rod ends below in a cylindrical steel wire D fixed to the base of the instrument, which can be made more or less stiff by altering its free length. As this wire is cylindrical, the direction of the displacement is indicated by the plane of vibration of the pendulum. The self-registering part of the instrument consists of a spherical segment E of copper lined with paper, against which a pencil F, in the top of the pendulum rod, is pressed by a spring.

The most widely used form of inverted pendulum is that designed by Prof. E. Wiechert. In one, the heavy mass consists of iron plates, weighing a little more than a ton. This is carried on a stout iron rod, supported at the lower end on springs which enable it to turn freely in any direction and yet, after disturbance, restore it to its vertical position of equilibrium. The displacements of the pendulum are magnified by two levers ending in fine glass rods which inscribe the records of their movements on a sheet of moving smoked paper. By means of air-damping cylinders, the pendulum can be made as nearly aperiodic as is desired. The movements of the ground are magnified about 500 times. In a still more sensitive form of the instrument, the iron plates forming the heavy mass are replaced by a cylinder that can be filled with the heavy mineral barytes. The weight is thus increased to nearly 17 tons, while the movements are magnified 2,200 times.

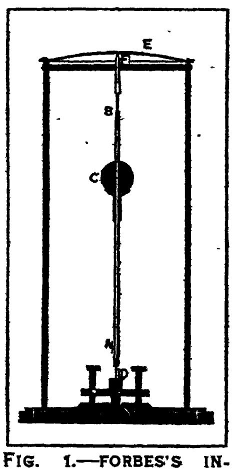


FIG. 1.—FORBES'S INVERTED PENDULUM

Horizontal Pendulums.—The horizontal pendulum in its simplest form consists of a metal rod or frame rotating about a nearly vertical axis, and carrying a heavy mass near one end or the middle. It may be (a) supported on two conical steel points, or (b) one end of the rod may be pointed and rest in a conical hole in the frame while the other is supported by a wire, or (c) the rod may be supported by two wires, the weight being either between or outside the two points of attachment of the wires. Whatever the mode of suspension, however, it is essential that the horizontal distance between the points of support shall be very small compared with the vertical distance between them, that is, that the line joining

the two points of support shall be inclined at a very small angle to the vertical. In each case, it is clear that, if the pendulum when at rest is directed east and west, it is only movements which are wholly or partly in the north-south direction that disturb the instrument. For a complete representation of the horizontal motion, it is therefore necessary to have two similar instruments placed side by side at right angles.

The Rebeur-Paschwitz horizontal pendulum is of interest as the first instrument erected by which records of distant earthquakes were regularly made. It is notable for its lightness and small size, its weight being only 1½ ounces and its length less than

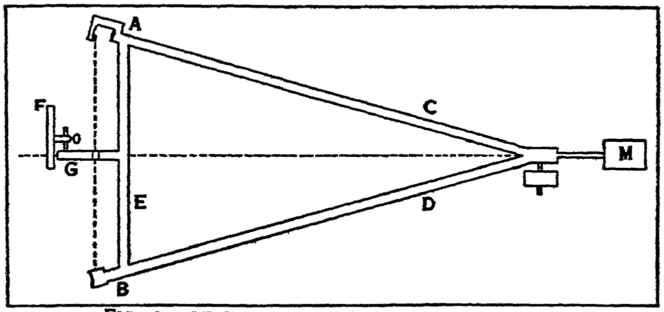

FIG. 2.—REBEUR-PASCHWITZ HORIZONTAL PENDULUM

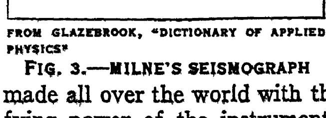
8 inches. It consists (fig. 2) of three thin brass tubes, C, D, E, in the form of an isosceles triangle, carrying a small mass M. The two equal tubes are prolonged at A and B and end in small spherical agate cups. These rest against steel points fixed to the frame of the instrument. The rod G projects at right angles to the tube E, and to it is attached the mirror F, which passes through the frame of the support. The photographic method of registration is used.

The Milne seismograph (fig. 3) was used by Prof. Milne in Japan for the registration of distant earthquakes and, with improvements in detail, became for many years the standard instrument at the observatories under the care of the British Association Seismological Committee. The boom of the pendulum BD is an aluminium rod about 39 inches long. The bob M consists of two brass balls, each about half a pound in weight and attached to the ends of a short bar crossing the boom at right angles. At the end B of the boom there is a small agate cup that rests on a steel point in the cast-iron column AB, which is about 20 inches in height. The boom is further supported by a silk thread CA, which passes over a small pulley at the top of the column. It ends at D in a small aluminium plate, in which there is a narrow slit. In the top of the case containing the recording part of the instrument a similar plate is fixed in the direction at right angles to the other. A ray of light from an adjacent lamp is reflected by a mirror so as to pass through both slits and form a small spot of light on a sheet of bromide paper wrapped round the brass cylindrical drum P. The drum is 39 inches in circumference, rotates once in four hours, and, with every revolution, advances one-quarter of an inch in the direction of its axis. Close to the end D, a small shutter attached to the long hand of a watch cuts off the light once every hour, thus providing the scale of time.

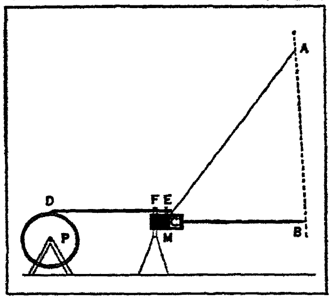


FROM GLAZEBROOK, "DICTIONARY OF APPLIED PHYSICS"

FIG. 3.—MILNE'S SEISMOGRAPH

It would be difficult to overestimate the value of the records made all over the world with the Milne seismograph. The magnifying power of the instrument is, however, low (about 7 or 8 times), and it is unprovided with any form of damping. Both of these defects have been removed by Mr. J. J. Shaw, and, since 1915, the Milne-Shaw seismograph has been gradually replacing the earlier form. In this, a boom, 16 inches long, carries a heavy mass weighing one pound, and also a damping vane which moves in a magnetic field so strong that the pendulum is brought to rest after each oscillation. The beam of light is reflected by a mirror which rotates in an agate setting and is coupled to the free end of the boom. This gives a magnifying power of 300. After passing through two cylindrical lenses at right angles to one another, the beam of light converges to so fine a point on the paper that waves with a period of two or three seconds are clearly shown on paper moving at the rate of about 20 inches an hour.

The Omori horizontal pendulum (fig. 4) belongs to the same type as the Milne seismograph, the chief difference being that the record is made on smoked paper, thus allowing a much more open diagram. The boom BC is an iron rod about 40 inches long and the bob M is a cylinder filled with lead and weighing about 30 pounds. The pointed end B rests in a conical socket fixed to the iron supporting column, the other support being a wire CA that passes over a pulley at the top of the column. The recording lever DE is a light aluminium rod which turns about an axle F connected with the ground. The short arm FE of the lever ends a horizontal fork, the branches of which pass round a vertical steel axle connected with the mass M. This axle turns with great freedom, so that there is very little friction between it and the lever. The other end D of the lever is a light aluminium pointer which rests lightly on a sheet of thinly smoked paper wrapped round the rotating drum P. The drum is about 36 inches in circumference, rotates once an hour, and advances parallel to its axle one-sixth of an inch with every revolution. Once every minute, time-marks are made on the paper by a small pointer (not shown in fig. 4) connected with a clock. The chief advantage of the Omori pendulum is the open diagram that it provides, but, being undamped, the oscillations of the pendulum lessen the value of the record. The Omori pendulum is also made in other forms. In the portable form, the mass weighs about 6¾ pounds and the length of the rod is nearly 30 inches. For recording local shocks, two other forms are used. In one, the mass weighs 110 pounds, the length of the rod is nearly 8 inches, and the movements of the ground are magnified 20 times; in the other, the corresponding figures are 33 pounds, 2½ inches and 70 times. A somewhat similar instrument is the Bosch-Omori horizontal pendulum, one form of which records mechanically and the other photographically.



FROM DAVISON, "A MANUAL OF SEISMOLOGY"

FIG. 4.—OMORI'S HORIZONTAL PENDULUM

The Darwin bifilar pendulum (fig. 5) is a modification of the instrument used by G. H. and H. Darwin in their experiments on the lunar disturbance of gravity. In this instrument, the mirror M itself is the bob of the pendulum. It is carried by a fine silver wire, passing through two hooks C, D, in the rim of the mirror and attached to two points of support at a very small distance apart horizontally. The instrument is damped by being entirely immersed in oil, and its movements are recorded by light reflected from the mirror to a sheet of bromide paper wrapped round a revolving drum. Though many earthquakes have been recorded by the bifilar pendulum, it does not, owing to its immersion in oil, respond to the preliminary tremors of short period. The instrument is, however, extremely sensitive to small tilts of the ground, and it has been found possible to measure a tilt of $\frac{1}{300}$ of a second, which is equal to the angle formed by lifting through an inch the end of a line one thousand miles in length.

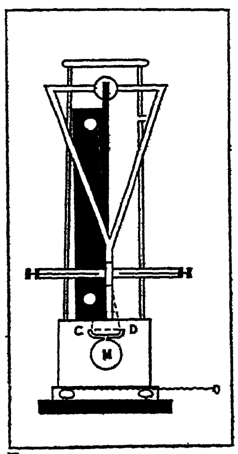


FIG. 5.—DARWIN'S BIFILAR PENDULUM

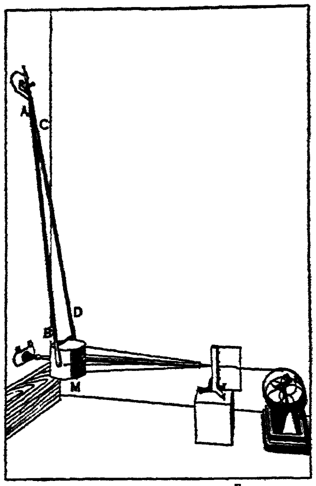
The Galitzin seismograph, like the Darwin pendulum, belongs to the third type of horizontal pendulum. The arrangement of the mass M and the supporting wires AB, CD are as shown in fig. 6. The weight of the mass is about 110 kg. At one end of the

beam, a copper plate is attached horizontally and placed between a pair of powerful horseshoe magnets. When the pendulum is displaced, currents are induced in the copper plate, and the attraction between them and the magnets damps the swing. By adjusting the distance between the magnets, the pendulum can be rendered absolutely aperiodic. Close to the copper plate, coils of fine wire are also attached to the beam and placed between another pair of horseshoe magnets. When the beam moves, an electric current is generated in the coils, and is transmitted to a sensitive d'Arsonval galvanometer, the movements of which are registered by a ray of light reflected by the galvanometer mirror on to photographic paper wrapped round a revolving drum. This current is proportional, not to the displacement of the beam, but to its velocity. Thus, the record does not correspond to the actual movements of the ground, but it gives with great accuracy the epochs of the various phases of an earthquake. Though not without disadvantages, the instrument possesses many compensations. It can be accurately damped, it can be arranged so as to magnify the movements of the ground 1,000 times or more, owing to its suspension by wires the beam moves without friction, and the recording apparatus can be placed at some distance from the pendulum, if desired.

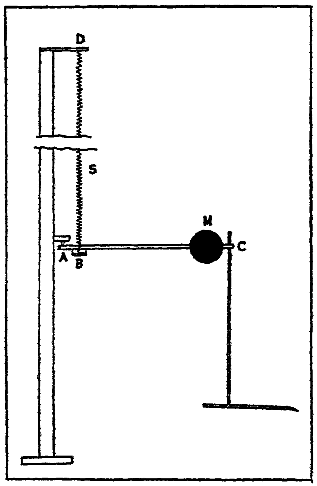


FROM GALITZIN "VORLESUNGEN ÜBER SEISMOMETRIE"

FIG. 6.—GALITZIN'S HORIZONTAL PENDULUM

A pendulum suspended in the same manner, with a small concave mirror attached to the rod at the centre of rotation, has recently (1927) been erected by Mr. M. Ishimoto at Tokyo and other places in order to measure very small tilts of the ground.

Vertical Motion Seismograph.—All the instruments described above are designed to record the horizontal component or components of the earthquake motion. Instruments intended for recording the vertical component depend as a rule on a principle first recognised by Prof. T. Gray in 1881. Gray's vertical motion seismograph, with improvements suggested by Sir J. A. Ewing, is represented in fig. 7. In this instrument, AC is a horizontal metal beam, carrying near one end the cylindrical heavy mass M. The beam turns about a fulcrum at the end A, which consists of two steel points fixed to a projection from the frame and pressing into a hole and knife-edge at the end of the beam. It is supported by two long springs S, adjustable at the upper end D, while their lower ends are attached to a hanging cross-bar B, in the middle of which a point presses against the lower side of the beam. The length of the springs S is adjusted so that the moments about the fulcrum of the weight of the pendulum and the upward pull of the springs are approximately equal. When the fulcrum A is displaced in the vertical direction, the line that remains steady lies within the mass M on the side of its centre away from the fulcrum, and the movements of the ground are magnified by a lever projecting downwards from the free end of the arm. In Galitzin's vertical motion seismograph, which is a compact form of the above, the weight of the beam and mass is about 54 pounds and the length of the beam 30 inches. At the end of the beam are attached a copper plate and coils of wire placed between magnets, the one for damping the instrument and the other for recording the velocity of the beam, as in the horizontal motion seismograph.



FROM DAVISON, "A MANUAL OF SEISMOLOGY"

FIG. 7.—GRAY'S AND EWING'S VERTICAL MOTION SEISMOGRAPH

BIBLIOGRAPHY.—The literature of seismometry is very extensive, and it is only possible here to refer to a few of the works in which the theory and construction of different instruments are described—R. Ehlert (*Beit. zur Geoph.*, vol. 3, 1896–98, pp. 350–474); J. A. Ewing, *Earthquake Measurement* (Tokyo Imp. Univ., Mem. Sci. Dept., no. 9, 1883, pp. 1–92); Prince B. Galitzin, *Vorlesungen über Seismometrie* (1914, pp. 1–538, German trans. edited by O. Hecker); C. G. Knott, *The Physics of Earthquake Phenomena* (1908, pp. 48–89); H. F. Reid, *Theory of the Seismograph* (Californian Earthquake of 1906, vol. 2, 1910, pp. 143–190) and *On the Choice of a Seismograph* (Amer. Seis. Soc. Bull., vol. 2, 1912, pp. 8–30); G. W. Walker, *Modern Seismology* (1913, pp. 1–36); and E. Wiechert, *Theorie der automatischen Seismographen* (Abhand. der kön. Gesell. Wissen. zu Göttingen, Math. Phys. Kl., vol. 2, 1903, pp. 1–128). Brief descriptions of several instruments specially adapted for recording near earthquakes, such as Ewing's three component seismograph, the Gray-Milne seismograph, and Ewing's duplex pendulum seismometer, will be found in C. Davison's *Manual of Seismology* (1921, pp. 17–22).

SEISTAN, the ancient *Sakastane* ("land of the *Sakae*"), an extensive border district between Persia and Afghanistan, situated in most part between 29° 0′ and 32° 0′ N., and 61° 0′ and 62° 30′ E. Its area, some 100 m. in extreme length and breadth, covers about 7,000 sq.m. about two-fifths of which lies in Persia and three-fifths in Afghanistan. The total population was estimated at 205,000 in 1906.

A physical feature of this region of Asia is that none of the rivers flow to the sea, but discharge into great inland depressions—the Seistan depression being one—of which the general level is about 1,400–1,700 ft. above the sea. Regarded as a whole the Seistan depression, or Hamun, into which the rivers here discharge themselves, consists of two extensive lagoons, formed respectively by the Harud Rud and the Farah Rud (both coming from the north), and by the Helmund river and Khash Rud (coming respectively from the south and east). South of these lagoons extends a tract of country covered with reeds called the Naizar. When the rivers are in flood the two lagoons become united and the inundation covers the Naizar also. A further tract then also becomes overflowed, so that a great lake is formed which, lastly, discharges its redundant waters, through a course called the Shela (or Shelag), into a depression called the Gawd i Zarih.

The population consists chiefly of Tajiks, but Baluchis and Qainis, descendants of the ancient rulers of the land, have also established themselves; and Nadir Shah forced some nomad tribes of Shiraz to emigrate to Seistan.

Politically, Seistan is divided between Persia and Afghanistan by a theoretical boundary line fixed by Commissions appointed to examine the question in 1872 and 1903–5. This line runs from the Kuh i Malik Siyah mountain, on the Perso-Afghan frontier, roughly north-east to Band i Seistan on the Helmund, thence northward to the Naizar reed beds on the Hamun shore, whence it turns westward to Siyah Kuh. The part falling to Persia west of this line is usually known as "Seistan Proper" and that on the east as "Outer Seistan."

The original chief town of Persian Seistan, Sihkuna, has been supplanted by Nasratabad (formerly Nasirabad), founded by the Amir of Qain about 1870, and locally known as Shahr-i-Seistan. Quain (*q.v.*) and Seistan together form a hereditary governorship, practically independent of the governor-general of Khurasan.

The trade outlets from Seistan proper are: (a) from Nasratabad southward to Duzdab (135 m.) and thence by rail to Nushki and Quetta; (b) from Nasratabad to Birjand, where the route joins the Meshed-Duzdab motor road. Both roads are unmetalled but are passable for light motor traffic; transport by caravan on the first takes 7–8 days to Duzdab, and on the second 14–15 days to Birjand. A project was under consideration in 1927 for a light railway from Duzdab to Seistan, for the transport of the wheat which is the special product of the district, to the Indian market.

Afghan Seistan comprises the land east of the frontier described above, and includes the Hamun i Puza (the more eastern of the two northern lagoons) up to Juwaim in the north; the tract extends southward to the frontier of Persian Baluchistan, in which country lies the Gawd i Zarih lagoon. The capital is Khakansur,

a small settlement on the Khash Rud, about 30 m. north-east of Nasratabad.

History.—The ancient *Drangiana*, or land of the *Drangai*, received the name of Sakastane after the country was conquered by the Sakae (Scythians) about 128 B.C. Certain references in the Avesta lead to the supposition that Seistan, in antiquity, was a principal seat of the Zoroastrian religion. In ancient and mediaeval times the name Sakastane denoted a larger area than the name now implies and possibly even included a great area towards the east up to Kandahar. Ardashir, the founder of the Sasanian dynasty, subjugated Sakastane, but during the Sasanian epoch the Sakae appear rather as allies than subjects.

The Arab conquest of Seistan began in 683–4, but the hold of the country by some of the caliphs was precarious and uncertain. The only time Seistan played an important part in mediaeval history was during the reign of the Safavid dynasty—founded by Yaqub b. Layth, himself a Seistani—during which period it was naturally the central land of the dynasty. After the downfall of the Safavids, Seistan belonged successively to the empire of the Samanids and Ghaznawids, but the land had its own *maliks*, or native rulers, under the suzerainty of the greater dynasties.

The early ravages of the Mongols reached the frontiers of Seistan and after their departure its history becomes confused and several persons strove for the supremacy. In 1300–1 Seistan suffered from an invasion of the Chagatai and then, again, sustained fearful damages from the Mongols at the hands of Timur, who destroyed Zaranj, the capital situated near the Sanarud canal, took prisoner the *malik*, Qutb ud Din Kayam (1383) and destroyed the canal system of the land.

Thenceforward Seistan had its own rulers until Shah Ismail conquered the country in 1508–9. The native princes of Seistan remained vassals of the Persian empire till the Afghan invasion of Mir Mohammed (1722), when the *malik*, Kayani Mohammed, by means of a disloyal treaty with the Afghans, secured for himself the possession of Seistan and Khurasan. He was slain by Nadir Quli Khan, the general of Shah Tahmasp who, afterwards, as Nadir Shah, retained Seistan as part of his Persian dominions. After Nadir's death (1736) Seistan came under the suzerainty of Ahmad Shah, the Durrani ruler of Afghanistan but, on his death (1773), the land became a bone of contention not so much between Persians and Afghans as between Herat and Kandahar.

Eventually the internal dissensions of Afghanistan gave Persia her opportunity—the Sarbandi chief, Ali Khan, allied himself with the Persian government, hoisted the Persian flag on the fortress of Sihkuha, the capital town, and sent his sons as hostages to the Shah at Meshed (1853). The Shah's army finally took possession of Seistan in 1865, and two years later it was placed under a Persian governor with the title of *Hashmat ul Mulk*. Complications between Persia and Afghanistan during this period led to British arbitration and the delimitation of the border by the Seistan Commission of 1872, under the leadership of Sir F. J. Goldsmid. In accordance with the award, the Persian forces evacuated that part of Seistan lying on the right bank of the Helmund. The work of delimitation was finally completed by the MacMahon Mission in 1903–5.

(P. Z. C.)

SEITZ, KARL (1869–), Austrian politician, was born at Vienna on Sept. 4, 1869, the son of a wood merchant. Originally inclined to the German National party, he joined in 1888 the Social Democratic party. He organized the Social Democratic teachers of Vienna, and in the diet of Lower Austria waged a fierce fight against Burgomaster Lueger and the dominant Christian Socialist party. Elected to the Austrian *Reichsrat* in 1901 he became after the death of Pernerstorfer, its vice-president down to its dissolution. After the revolution of 1918 he was president of the German-Austrian National Assembly, and subsequently of the national parliament (*Nationalrat*) until the new elections in Oct. 1920, and acting federal president until Nov. 1920. He was in 1921 chairman of the committee of the Social Democratic party and of the parliamentary party, and vice-president of the *Nationalrat*. In 1924 he was elected burgomaster of Vienna.

SEJANUS, LUCIUS AELIUS, favourite and minister of the emperor Tiberius. He was the son of Seïus Strabo, prefect of the praetorians, and was adopted into the Aelian gens. When his father became governor of Egypt, Sejanus was made prefect in his stead, with the support of the praetorians, whom he concentrated in a camp on the Viminal hill. He became virtually ruler of Rome. In pursuit of a still higher ambition, he poisoned Drusus, whose death was followed by those of Agrippina and her sons, Drusus and Nero, all under suspicious circumstances. He then induced Tiberius to return to Capreae. Tiberius caused Sejanus to be put to death (A.D. 31).

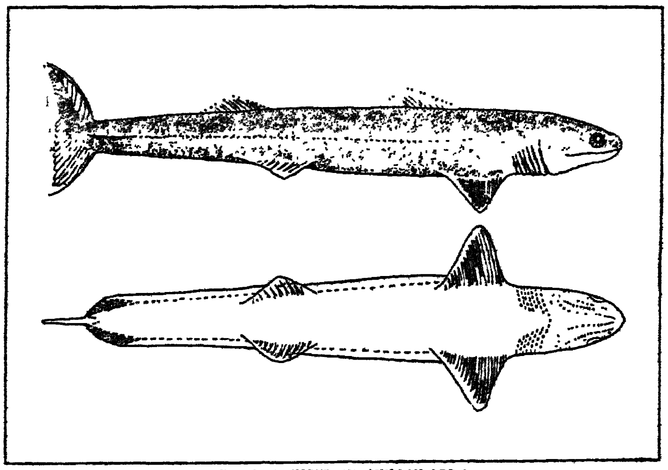
See Tacitus, *Annals*, iv. 1, 2, 3, 8, 39–59, 74, v. 6–9; Suetonius, *Tiberius*, 62; Dio Cassius, lvii., lviii.; Juvenal, x. 65–86; J. Jülg, *Vita Aelii Sejani* (1882), with notes giving full references to authorities; J. C. Tarver, *Tiberius the Tyrant*, chap. xvii. (London, 1902).

SEKONDI, a town on the Gold Coast, British West Africa, in 4° 57′ N., 1° 42′ W., and 167 m. by rail S. by W. of Kumasi. Pop. (1921) 9,500 natives and about 300 Europeans. Sekondi is one of the old trading stations on the Guinea coast, and Fort Orange was built here by the Dutch about 1640, the English later on building another fort near by. In 1694 the Dutch fort was plundered by the Ahanta, who in 1698 burnt the English fort. It was not rebuilt, and it was not until 1872 that the place became definitely British. The town was of little account until it was chosen as the sea terminus of the railway serving the gold-mining districts and Ashanti. The railway reached the Tarkwa goldfields in 1901 and the Obuassi mines in 1902. Although it had no sheltered harbour (ships had to anchor in the roadstead half a mile from the shore). Sekondi then became the chief port of the Gold Coast colony. But after the opening in 1928 of the deep water harbour a few miles west at Takoradi (*q.v.*) Sekondi declined as a port. It continued, however, to be a business centre, with excellent rail and road connections with Takoradi.

SELACHIANS, a group of fish-like vertebrates that includes the sharks and rays. They are often ranked as a sub-class of the Pisces, but differ so fundamentally from the bony fishes that it is best to recognize them as a distinct class, Selachii, which may be thus defined:—Craniate vertebrates with jaws, and with branchial arches supporting the gills. Nasal organs, paired blind sacs, with incompletely divided external apertures. Skin with denticles structurally similar to teeth; no dermal ossifications. Internal skeleton cartilaginous. Median and paired fins with horny rays, and with skeleton typically of a series of cartilaginous rods. Vertebral column of the notochord and its sheath, neural and haemal arches, and intermuscular ribs; no supra-neural arches or pleural ribs. No air-bladder.

Most living sharks are more or less spindle-shaped, with transverse or crescentic mouth, generally on the under side of the head, and with a series of five to seven gill-openings on each side in front of or partly above the pectoral fins. The end of the tail is provided with a fin above and below the upper and lower lobes of the caudal fin. Generally the end of the tail is upturned and the lower caudal lobe is more developed than the upper (heterocercal tail); in swift pelagic sharks with pointed fins the end of the tail

is strongly upturned, the upper lobe is greatly reduced and the lower is correspondingly developed, but in the slower bottom-living forms with rounded fins the end of the tail is but little upturned and the caudal lobes are more nearly equal. The rays are bottom-living forms with flattened head and body, ventral gill-openings and large pectoral fins. The Chimaeroids live on the bottom, and have a long tapering tail and large paddle-like pectoral fins. From the correspondence between habits and form of the fins in living selachians, it is certain that the Palaeozoic *Cladoselachus* and *Acanthodes,* with broad-based, pointed fins and strongly heterocercal tail, were pelagic, but that *Pleuracanthus,* with long tapering tail and paddle-like paired fins, lived at the bottom. (For a general account of the principal living forms, and their habits, *see* SHARK, RAY.)



FROM MIVART, "CAMBRIDGE NATURAL HISTORY" (MACMILLAN LTD.)

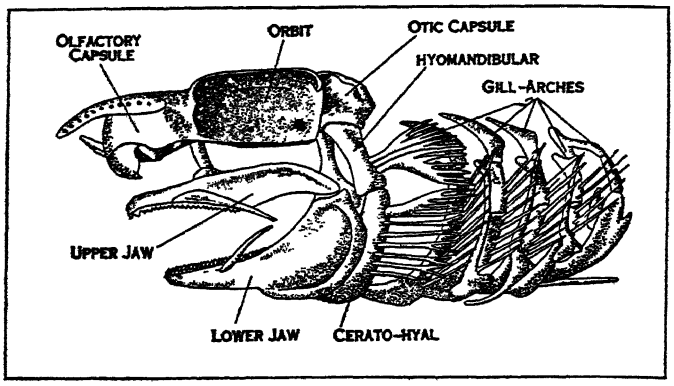
FIG. 1.—CLADOSELACHUS, A PRIMITIVE PALAEOZOIC SHARK

ANATOMY

Gill-arches and Jaws.—Selachians are of special interest in that they are in many respects the most primitive of the vertebrates, and a study of their structure and development throws light on the origin of jaws, teeth and limbs. They differ from the Cyclostomata in their method of breathing, water being taken into the pharynx and expelled through the gill-clefts by the expansion and contraction of the pharynx. The gills are series of parallel strap-like projections from the anterior and posterior walls of the gill-clefts, which are separated by thin septa; the inner ends of the septa are supported by cartilaginous arches that nearly encircle the pharynx, and are divided on each side into four segments; the principal elements of these arches, epi-branchials above and cerato-branchials below, are directed backwards and meet at an angle when the pharynx is contracted; above the epi-branchials are the pharyngo-branchials, and below the cerato-branchials the hypo-branchials join a median series of basi-branchials. The jaws of Selachians clearly represent the epi- and cerato-elements of an anterior gill-arch, enlarged and covered with teeth. In modern sharks and rays the jaws are supported by the enlarged epi-element, or hyomandibular, of the arch behind it, or hyoid arch, which articulates with the otic region of the skull, but in the Chimaeroids the upper jaw, or pterygo-quadrate, is fused with the skull, and the hyoid arch is not modified for suspension.

Teeth.—In having the body covered with denticles formed of dentine the Selachians resemble the most primitive Agnatha, the Silurian and Devonian Coelolepidae (*see* CYCLOSTOMATA). Similar, but smaller denticles, may occur in the mouth and pharynx, and the true teeth are to be regarded as homologous structures. The teeth are attached to the membrane covering the jaws, which is continually moving outwards, so that the worn teeth drop off and are replaced; behind the series in use can be seen a number of series in reserve.

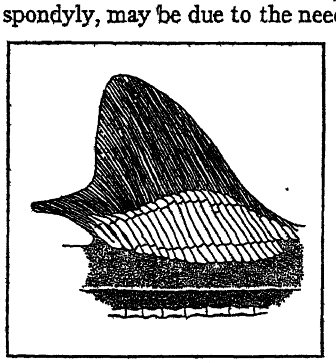
Fins.—In the Selachians both median and paired fins are keel-like outgrowths of the body strengthened by horny fin-rays; their skeleton primarily consists of a series of cartilaginous rods segmented into two principal pieces, basals within the body and radials in the fin; each of the rods has a muscle on each side. A study of the development shows that all the fins begin as longitudinal folds of the epidermis, at the base of which a mesenchyme plate develops; next a double series of buds from the body muscles migrate into the fins, and later the cartilaginous skeleton differentiates out of the mesenchyme plate. From their similar structure and development the conclusion is drawn that the median and paired fins have a similar origin, and that they originated as outgrowths of the body. The limb-girdles, pectoral arch and pelvis are formed by fusion of the anterior basals, and sharks in which there is no pelvis (*Cladoselachus*) are the most primitive.



BY COURTESY OF THE ZOOLOGICAL SOCIETY OF LONDON

FIG. 2.—SCYLIORHINUS SKULL SHOWING JAWS AND GILL ARCHES

Vertebral Column.—In Selachians the vertebral column consists of the notochord and its cartilaginous sheath, and of dorsal and ventral series of paired cartilaginous plates; the dorsal plates may meet above the spinal cord, or the arch may be completed by a median series of cartilages, but the whole is below the longitudinal elastic ligament; there are no paired elements meeting above the ligament and carrying a series of spines, as in the Pisces, and their ventral counterparts, the pleural ribs and haemal spines, are also absent. The cartilaginous sheath of the notochord may be calcified, and segmented into centra. Each vertebra has a neural plate, or basi-dorsal cartilage, perforated or notched behind for the exit of the ventral root of a spinal nerve, and another, inter-dorsal, perforated or notched for a dorsal root. In the caudal region of the Euselachii the vertebrae are twice as numerous as the muscle segments, so that every other pair of basidorsals and interdorsals has no nerve exits; this condition, known as diplospondyly, may be due to the need for greater flexibility of the tail. The tail of the Chimaeroids is polyspondylic; *i.e.,* the vertebrae are more than twice as numerous as the myotomes. In musculature, visceral anatomy, etc., the Selachians have a general resemblance to the more primitive bony fishes; thus the intestine has a spiral valve and the heart has a conus with several series of valves; the brain is characterized by the large divergent olfactory lobes.



FROM MIVART, "CAMBRIDGE NATURAL HISTORY" (MACMILLAN LTD.)

FIG. 3.—SKELETON OF THE FIRST DORSAL FIN OF MUSTELUS ANTARCTICUS

Development.—In all living Selachians fertilization is internal, the males being provided with paired intromittent organs, mixopterygia, which are appendages of the pelvic fins, with a cartilaginous internal skeleton and with a groove or canal along the whole length of each, which is the duct of a glandular sac at its base. The eggs are large, heavily yolked, and enclosed in horny cases; in many sharks and rays the eggs are not laid, the cases are absorbed, and development proceeds within the body of the mother; some of these viviparous forms (e.g., *Mustelus*) have a yolk-sac placenta, and in certain rays (e.g., *Pteroplatea*) long

uterine villi pass into the spiracles of the young and furnish a nutritive secretion.

CLASSIFICATION

The following classification is modified from that of Regan (1906).

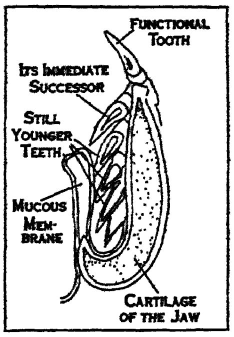
Class *Selachii*

Sub-class 1. *Pleuropterygii.* Palaeozoic sharks with broad-based, paired fins, the pelvics without any fusion of the basalia, the pectorals scarcely more advanced in structure. *Cladoselachus, Cladodus, Symmorium, Cratoselache.*

Sub-class 2. *Acanthodii.* Palaeozoic sharks with a strong spine at the anterior edge of each fin. As in the Pleuropterygii, the paired fins were broad-based, and mixopterygia appear not to have been developed. *Acanthodes,* etc.

Sub-class 3. *Ichthyotomi.* Palaeozoic sharks in which the pectoral basalia form the segmented axis of a biserial fin like that of *Ceratodus* (lung fish); males with mixopterygia. *Pleuracanthus.*

Sub-class 4. *Euselachii* (modern sharks and rays). Pectoral fin with metapterygium (fused basalia), and with propterygium and mesopterygium, formed by union of proximal segments of anterior radials; pelvic fins with pelvis and basipterygium; males with mixopterygia. Pterygoquadrate free from skull. Hyomandibular articulating with skull and supporting jaws. Gill-clefts with separate external openings.



FROM RIDWOOD, "CAMBRIDGE NATURAL HISTORY" (MACMILLAN LTD.)
FIG. 4.—TRANSVERSE SECTION THROUGH THE JAW OF A SHARK

Order 1. *Pleurotremi* (sharks)

Pectoral fins free from head; gill-openings lateral. Hyomandibular with cartilaginous rays supporting the first half-gill. Two halves of pectoral arch well separated above.

Sub-order 1. *Notidanoidea.* Six or seven gill-openings. A single dorsal fin above the anal. Rostrum simple.

Family 1. Chlamydoselachidae (*Chlamydoselachus*).

Family 2. Hexanchidae (*Hexanchus, Heptanchus*).

Sub-order 2. *Galeoidea.* Five gill-openings. Two dorsal fins and an anal; no fin-spines. Rostrum triradiate.

Family 1. Odontaspididae (*Odontaspis, Scapanorhynchus*).

Family 2. Lamnidae (*Lamna, Carcharodon, Alopias, Cetorhinus*).

Family 3. Orectolobidae (*Orectolobus, Chiloscyllium, Stegostonea, Ginglymostoma, Rhinodon*).

Family 4. Scyliorhinidae (*Scyliorhinus, Pseudotriacis*).

Family 5. Carchariidae (*Carcharias, Sphyrna, Galeus, Mustelus*).

Sub-order 3. *Squaloidea.* Five or six gill-openings. Two dorsal fins, each typically preceded by a spine, but if these are wanting the anal fin is also absent. Rostrum simple.

Family 1. Hybodontidae (Mesozoic).

Family 2. Heterodontidae (*Heterodontus, Gyropleurodus*).

Family 3. Protospinacidae (Jurassic).

Family 4. Pristiophoridae (*Pristiophorus, Pliotrema*).

Family 5. Squalidae (*Squalus, Spinax, Centrophorus, Somniosus*).

Family 6. Squatinidae (*Squatina*).

Order 2. *Hypotremi* (rays)

Pectoral fins produced forwards and joined to head; gill-openings ventral. Hyomandibular purely suspensory.

Sub-order 1. *Narcobatoidea.* Large electric organs between pectoral fins and head. Suprascapulae united above vertebral column.

Family 1. Torpedinidae (*Torpedo, Narcine,* etc.).

Sub-order 2. *Batoidae.* No large electric organs. Suprascapulae united to vertebral column.

Family 1. Rhinobatidae (*Rhinobatus, Discobatus*).

Family 2. Pristidae (*Sclerorhynchus, Pristis*).

Family 3. Raiidae (*Raia, Psammobatis,* etc.).

Family 4. Trygonidae (*Trygon, Myliobatis, Rhinoptera, Mobula,* etc.).

Sub-class 5. *Holocephali.* Males with mixopterygia. Pterygoquadrate fused with skull. Lower jaw with one pair of tooth-plates, upper with two pairs. Hyoid arch complete, with pharyngohyal. Gill-clefts opening into a chamber with one external opening.

Family 1. Squaloraiidae (Mesozoic).

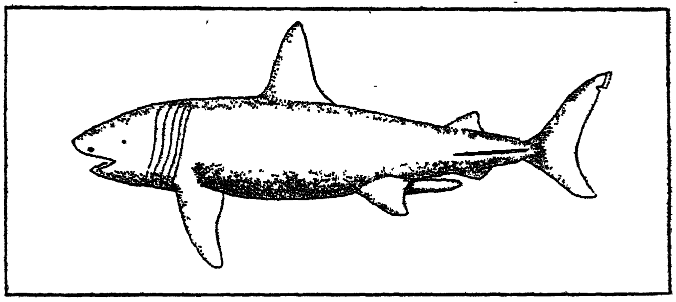
Family 2. Myriacanthidae (Mesozoic).

Family 3. Chimaeridae (*Chimaera, Callorhynchus, Harriotia, Rhinochimaera*).

The three sub-classes distinguished by the presence of mixopterygia are evidently derived from a common ancestor, which was not hyostylic, for the presence of a complete hyoid arch in the Holocephali, with a pharyngo-hyal above the epi-hyal or hyomandibular, shows that they are not derived from a form in which the hyomandibular articulated with the skull and supported the jaws. In the Palaeozoic sub-classes the pterygo-quadrate appears to have articulated with the otic region of the skull; such an articulation occurs in the Hexanchidae and Hybodontidae of the Euselachii, but whether it is primitive or secondary in these is uncertain. Some authors consider the Holocephali to be related to the Squaloid sharks, but their tooth-plates appear to be formed by fusion, not enlargement, and are therefore not comparable with the enlarged lateral teeth of *Heterodontus,* and the dorsal fin spine is not an enlarged denticle as in the Squaloids, but is formed by concrescence of horny rays; moreover, the structure of the hyoid arch, and the separate pelves, preclude the derivation of the Holocephali from the Euselachii. For further details of the anatomical characters of the orders and families of the Euselachii Regan (1906) may be consulted.

Geographical Distribution.—Many families of Euselachii are restricted to tropical and subtropical seas, the principal exceptions being the Scyliorhinidae, Squalidae, Squatinidae and Raiidae, nearly all of which are bottom-living forms; to these four families belong the species that can be reckoned as British, except summer migrants and occasional visitors. *Squatina* is found mainly north and south of the Tropics, as is *Squalus,* but *Scyliorhinus* and *Raia* are large, nearly cosmopolitan genera. A few sharks enter rivers, and two species of *Carcharias* are believed to live only in fresh water, one in Lake Nicaragua, the other in the Zambezi. Of the rays, *Pristis* and *Trygon* may ascend rivers, and there are a few fresh water Trygonidae in South America.

Palaeontology.—Many living genera of Euselachii are of considerable antiquity; all the recent families except the Carchariidae and Trygonidae have genera living to-day that are found fossil in Cretaceous strata, and such specialized forms as *Squatina* and *Rhinobatus* occur in the Jurassic, together with



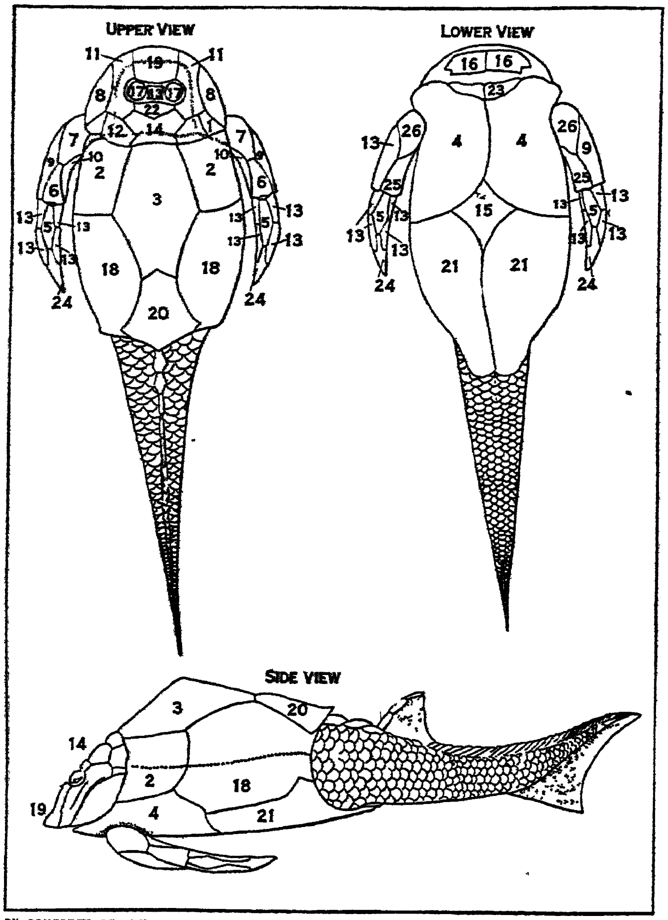
FROM GOOD AND BEAN, "CAMBRIDGE NATURAL HISTORY" (MACMILLAN LTD.)
FIG. 5.—THE BASKING SHARK (CETORHINUS MAXIMUS)

Heterodontus, Pristiurus and *Hexanchus.* The curious *Scapanorhynchus,* with long shovel-like snout, was discovered in 1898 living in deep water off Japan, but had long been known from Cretaceous rocks. *Protospinax,* a recently described Jurassic shark, appears to stand in the same relationship to *Pristiophorus* that *Rhinobatus* does to *Pristis.* The saw-shark (*Pristiophorus*) has the snout produced into a long blade with a series of teeth on each side, and in this resembles the saw-ray (*Pristis*); but *Pristis* is evidently a modified *Rhinobatus,* and the discovery of *Protospinax* (Woodward, 1918), a shark with the snout produced and

flattened as in *Rhinobatus,* but except for the more primitive median fins otherwise similar to *Pristiophorus,* is of some interest.

The Euselachii are not certainly known before the Trias, for the Carboniferous and Permian Orodontidae, Cochiliodontidae, Petalodontidae and Psammodontidae, generally assigned to this sub-class, are mainly known from teeth. The Holocephali also date back to the Trias. Of the Palaeozoic sub-classes only the Pleuropterygii can be regarded as ancestral, the Devonian *Cladoselachus* being the most primitive shark known.

The Placodermi.—The researches of Stensio (1925) have revealed the relationship to the Selachii of the Arthrodira, a group



BY COURTESY OF THE PALAEONTOGRAPHICAL SOCIETY

FIG. 6.—PTERICHTHYS, AN ANCIENT TYPE WITHOUT LIVING RELATIVES

of Palaeozoic fish-like vertebrates in which the head is covered by a shield of bony plates, movably articulated with a bony carapace that protects the anterior part of the body. Below the head-shield Stensio has found a cartilaginous cranium wholly or partly invested inside and out by a thin layer of bone; this cranium is of typical Selachian form, with prominent olfactory capsules; there are no dermal bones (parasphenoid, vomers) below it. It is clear that the Arthrodira are not Pisces, but are an independent offshoot of the Selachii. It is, perhaps, best to place them in a separate class, Placodermi, which will include also the similarly armoured Palaeozoic Asterolepida (*Pterichthys,* etc.).

Anat.* 7 (1907).

(C. T. R.)

SELAGINELLA, a genus of plants of the club-mosses or Lycopodiales (see *Pteridophyta*), allied to the ferns. There are about 700 species, chiefly tropical in distribution, with a much-branched, usually creeping stem, bearing roots on the lower, and leaves on the upper side, with terminal sporangia. The leaves are arranged spirally or in four rows, the latter the more common method. *S. selaginoides* occurs on boggy hill-sides in Great Britain and also in North America from New Hampshire to Colorado and northward to Greenland. Some 35 other species occur in the United States, chiefly in the southern and western States.

SELBORNE, ROUNDELL PALMER, 1ST EARL OF (1812–1895), English lawyer and statesman, was born at Mixbury, in the county of Oxford, on Nov. 27, 1812; his father was rector of the parish. He was educated at Rugby and Winchester, and at Trinity College, Oxford. He was called to the bar on June 7, 1837, and soon had a good chancery practice. In addition he wrote for *The Times* and the *British Critic,* and took an active interest in Church affairs.

In 1847, and again in 1853, Palmer was returned as M.P. for Plymouth, as a Peelite, and in the House of Commons he took an active and independent part. He advocated the admission of Jews to parliament; he opposed Lord John Russell's measure to repel the so-called papal aggression; he opposed the admission of Dissenters into the university of Oxford; and he was hostile to the action of the government in the Crimean War, and the second opium war with China. This attitude was disapproved of by his constituency, and he gave up his seat at the election of 1857. In 1848 he married Lady Laura Waldegrave, and in 1849 he became a Q.C. In July 1861 he accepted from Lord Palmerston the office of solicitor-general, a knighthood, and a safe seat for the borough of Richmond in Yorkshire; in Sept. 1863 he became attorney-general, and, as such, was adviser of the ministry, in the courts, and in the House, in the questions which arose in respect of the "Trent" and the "Peterhoff," the cruisers "Alabama" and "Florida" and the "Alexandra," during the American Civil War. In 1866 he advocated making household suffrage the basis of representation, an expression of opinion which probably influenced the Reform Bill of the following year—in the discussions on which Palmer took a prominent part, and especially in opposition to the so-called "fancy franchises" originally proposed by its authors. In April 1868 he refused to support Gladstone's measures for the disestablishment of the Irish Church, and after the election of that year he declined Gladstone's offer of the office of lord chancellor.

The treaty of Washington cast a great duty upon Palmer. After the conclusion of the Civil War in America very large claims were preferred against Great Britain for alleged breaches of her duty as a neutral power; and after long negotiations, England and the United States agreed to arbitration.

In Sept. 1872 Gladstone again offered him the great seal, and he accepted it, with the title of Lord Selborne. In the following year Lord Selborne carried through Parliament the Judicature Act. The result of this act was to effect a fundamental change in the judicature system. By the operation of the Judicature Act one supreme court with several divisions was constituted; each division could administer the whole law; the conflict of divergent systems of law was largely overcome by declaring that when they were at variance, the principles of equity should prevail over the doctrines of the common law. The details of this great change were embodied in a code of general rules prepared by a committee of judges, over which Lord Selborne for two years presided week by week. "If," wrote Lord Selborne in his memoirs, speaking of the Judicature Act of 1873, "I leave any monument behind me which will bear the test of time, it may be this." This unification of the courts was more or less contemporary with the construction of a single building to house them; in 1882 Queen Victoria personally presided in the new Law Courts, and handed them over formally to Lord Selborne. On this occasion he received an earldom. In 1885 he definitely broke with Gladstone over Home Rule and disestablishment. But though he never held office again, he continued to sit in the House of Lords both to hear appeals and in the ordinary business.

In 1886, in answer to a pronouncement of Gladstone's, Lord Selborne published *A Defence of the Church of England,* on a historical basis, with an introductory letter addressed to Gladstone. In 1888 he published a second work on the Church question, entitled *Ancient Facts and Fallacies concerning Churches and Tithes,* in which he examined more critically than in his earlier book the developments of early ecclesiastical institutions, both on the continent of Europe and in Anglo-Saxon England, which resulted in the formation of the modern parochial system and its general endowment with tithes. He died on May 4, 1895, at his seat in Hampshire after an attack of influenza.

Among Lord Selborne's other interests were university and legal education: he made an attempt, before the time was ripe, to establish a school of law in London in 1867.

See his *Memorials* (ed. by Lady Sophia Palmer, 4 vols. 1896–98).

SELBORNE, WILLIAM WALDEGRAVE PALMER, 2ND EARL OF (1859–), son of the preceding, was educated at Winchester and University College, Oxford, where he took a first class in history. In 1883, being then Viscount Wolmer, he married Lady Beatrix Cecil, 3rd daughter of the 3rd marquess of Salisbury. From 1895 to 1900 he was under-secretary for the colonies, under Chamberlain as his chief. He sat in the House of Commons for East Hants (1885–92), and for West Edinburgh (1892–95). In 1900 he entered the cabinet as first lord of the admiralty, and in 1905 he succeeded Lord Milner as high commissioner for South Africa and governor of the Transvaal and Orange River colonies. He assumed office at Pretoria in May of that year. He had gone out with the intention of guiding the destinies of South Africa during a period when the ex-Boer republics would be in a transitional state between crown colony government and self-government, and letters patent were issued granting the Transvaal representative institutions. But the Liberal party came into office in England in the December following, before the new constitution had been actually established, and the decision was now taken to give both the Transvaal and Orange River colonies self-government without delay. Lord Selborne loyally accepted the changed situation, and his moderation and good sense helped to make the new régime a success. He left South Africa in May 1910, on the eve of the establishment of the Union of South Africa which he had done so much to promote. On his return to England, Selborne took an active share in defending the House against liberal attack, and was one of the leading "diehards" who maintained an uncompromising resistance to the Parliament bill. During the World War he joined the first Coalition ministry in May 1915, as minister of agriculture. He appointed an expert agricultural committee under the chairmanship of Lord Milner, to report on the means of maintaining and increasing food production in England and Wales; but he and the government rejected their recommendation to guarantee farmers a minimum price of 45s. a quarter for four years. In June 1916 he resigned his office because he disapproved of the Irish policy of compromise accepted by Asquith's government. He did not join Lloyd George's ministry. After the war he promoted the movement of self-government in the Church which culminated in the Church Enabling Act of 1919. He also identified himself strongly with the policy of reforming the House of Lords and reconsidering the relations between the two Houses under the Parliament Act.

SELBORNE, a village of Hampshire, England. It is celebrated as the birthplace and scene of the work of Gilbert White the naturalist; his house is in the village, and his memorial and grave are in the ancient church.

SELBY, WILLIAM COURT GULLY, 1ST VISCOUNT (1835–1909), Speaker of the British House of Commons, was born on Aug. 29, 1835, the son of Dr. James Manby Gully of Malvern. He was educated at Trinity College, Cambridge, where he was president of the Union. He was called to the bar in 1860, went the northern circuit, and took silk in 1877. In 1880 and 1885 he unsuccessfully contested Whitehaven as a Liberal, but was elected for Carlisle in 1886, and continued to represent that constituency until his elevation to the peerage. In April 1895 he was elected Speaker by a majority of eleven votes over Sir Matthew White Ridley (cr. Viscount Ridley, 1900), the Unionist nominee. In 1905 he resigned and was raised to the peerage with the title of Viscount Selby. He died on Nov. 6, 1909.

SELBY, an urban district in the West Riding of Yorkshire, England, 13½ m. S. of York on the L.M.S. and L.N.E. railways. Pop. (1931) 10,064. It is situated in the low-lying vale of York on the Yorkshire Ouse by which communication is afforded with the Humber. It is connected by canal with the Aire and Calder navigation, and has shops for building river craft.

The church of St. Mary and St. German belonged to a Benedictine abbey founded under a grant from William the Conqueror in 1069 and raised to the dignity of a mitred abbey by Pope Alexander II. The monastic buildings have almost disappeared. The nave of the church passes from Norman to Early English in the course of its eight bays from east to west and also in the arcade through the triforium to the clerestory. The choir and Lady chapel belong to the Decorated period. In 1906 a fire broke out in the Latham chapel adjoining the north choir aisle and soon involved the whole building. The oak-grained roof and rich fittings of the choir were wholly destroyed, but the finely-moulded arches and the magnificent tracery of the east window survived in great part. Much damage was done to the tower and the roof of the nave perished, though the stonework of the nave suffered comparatively little. Tradition indicates Selby as the birthplace of Henry I., and this accounts for the high privileges conferred upon the abbey. The town played a considerable part in the operations of the Civil Wars, being held at the outset by the Parliamentarians, captured by the Royalists in 1644, but soon retaken by Sir Thomas Fairfax.

SELDEN, JOHN (1584–1654), English jurist, legal antiquary and oriental scholar, was born on Dec. 16, 1584, at Salvington, in the parish of West Tarring, Sussex. His father, also John Selden, held a small farm. Selden was educated at Chichester grammar school and Hart hall, Oxford. In 1603 he entered Clifford's Inn, London, and in 1604 migrated to the Inner Temple, and in 1612 he was called to the bar. His practice was mostly conveyancing, and he rarely went into court.

Selden's early works were: *Analecton Anglo-Britannicon* (1615); *England's Epinomis* and *Janus Anglorum; Facies Altera* (1610), which dealt with the progress of English law down to Henry II.; *Titles of Honour* (1614), which, in spite of some obvious defects and omissions, has remained to the present day the most comprehensive and trustworthy work of its kind that we possess; and *De diis Syriis* (1617), which immediately established his fame as an oriental scholar among the learned in all parts of Europe. For his *History of Tithes* (1618), Selden was summoned before the privy council and compelled to retract his opinions, or at any rate what were held to be his opinions. Moreover, his work was suppressed and himself forbidden to reply to any of the controversialists who had come or might come forward to answer it.

This seems to have introduced Selden to the practical side of political affairs. It was pretty certain that, although he was not in parliament, he was the instigator and perhaps the draftsman of the memorable protestation on the rights and privileges of the House affirmed by the Commons on Dec. 18, 1621. For this he was committed to the Tower, and he occupied himself in preparing an edition of Eadmer's *History,* which he published two years afterwards. In 1623 he was returned to the House of Commons for the borough of Lancaster, and sat with Coke, Noy and Pym on Sergeant Glanville's election committee. In Charles's second parliament (1626) he was elected for Great Bedwin in Wiltshire, and took a prominent part in the impeachment of George Villiers, duke of Buckingham. In the following year, in the "benevolence" case, he was counsel for Sir Edmund Hampden in the court of king's bench. In 1628 he was returned to the third parliament of Charles for Ludgershall in Wiltshire, and had a large share in drawing up and carrying the Petition of Right.

In the session of 1629 he was one of the members mainly responsible for the tumultuous passage in the House of Commons of the resolution against the illegal levy of tonnage and poundage, and, along with Eliot, Holles, Long, Valentine, Strode, and the rest, he was sent once more to the Tower. He was released by the intervention of Laud. In 1628 at the suggestion of Sir Robert

Cotton he had compiled, with the assistance of two learned coadjutors, Patrick Young and Richard James, a catalogue of the Arundel marbles. He employed his leisure at Wrest, to which he now retired, in writing. About this period he seems to have inclined towards the court rather than the popular party, and even to have secured the personal favour of the king. To him in 1635 he dedicated his *Mare clausum*, and under the royal patronage it was put forth as a kind of State paper. It had been written 16 or 17 years before; but James I. had prohibited its publication for political reasons; hence it appeared a quarter of a century after Grotius's *Mare liberum*, to which it was intended to be a rejoinder. He was returned to the Long Parliament without opposition for the University of Oxford.

Selden joined in the protestation of the Commons for the maintenance of the Protestant religion according to the doctrines of the Church of England, the authority of the Crown, and the liberty of the subject. In 1643 he participated in the discussions of the assembly of divines at Westminster, and was appointed shortly afterwards keeper of the rolls and records in the Tower. In 1646 he subscribed the Solemn League and Covenant, and in 1647 was voted £5,000 by the parliament as compensation for his sufferings under the monarchy. He published in 1642 *Privileges of the Baronage of England when they sit in Parliament* and *Discourse concerning the Rights and Privileges of the Subject*; in 1644, *Dissertatio de anno civili et calendario reipublicae Judaicae*; in 1646 his treatise on marriage and divorce among the Jews entitled *Uxor Ebraica*; and in 1647 the earliest printed edition of the old English law-book *Fleta*. In 1650 Selden passed the first part of *De synedriis et prefecturis iuridicis veterum Ebraeorum* through the press, the second and third parts being severally published in 1653 and 1655, and in 1652 he wrote a preface and collated some of the manuscripts for Sir Roger Twysden's *Historiae Anglicae scriptores decem*. His last publication was a vindication of himself from certain charges advanced against him and his *Mare clausum* in 1653 by Theodore Graswinckel, a Dutch jurist.

After the death of the earl of Kent in 1639 Selden lived permanently under the same roof with his widow. It is believed that he was married to her, although their marriage does not seem to have ever been publicly acknowledged. He died at Friary House in Whitefriars on Nov. 30, 1654, and was buried in the Temple church, London. Of all the members of the Antiquarian Society, the centre of historical research of the 17th century, Selden was the acknowledged master.

See Wood, *Athenae Oxonienses* (ed. Bliss, 1817, 4 vols.); Aikin, *Lives of John Selden and Archbishop Usher* (1812); Johnson, *Memoirs of John Selden*, etc. (1835); Singer, *Table Talk of John Selden* (1847); and Wilkins, *Johannis Seldeni opera omnia*, etc. (1725).

SELECTION, the term applied in biology to the picking out of some variants in preference to others from a population of animals or plants. Human or artificial selection has been the chief instrument in establishing the breeds of domestic animals; natural selection has been the main agency in bringing about evolution in nature; and sexual selection has helped in producing the adornments used by animals in courtship (*see* VARIATION; EVOLUTION; BREEDS AND BREEDING). (X.)

ARTIFICIAL SELECTION

Artificial selection is definable as the methodical or unconscious choice by man of certain individual animals or plants as parents of the next generation. It is made possible by the facts that related individuals maintained under the same conditions exhibit dissimilarities, and that certain of these dissimilarities are hereditary. Man cannot as yet produce new hereditary characters at will, but as and when these appear he can, by appropriate breeding practices, incorporate or eliminate them from his stock. When a conspicuous and advantageous new inherited character appears, selection is reduced to the preservation of the individual or individuals exhibiting it and to the use of these for further breeding. But in most instances a new desirable character is at first only faintly pronounced; it is a slight difference in the degree of expression of a character already existing in the stock, a slightly finer quality of wool, or a slightly increased quantity or improved quality of milk, and then patience, the finest powers of discrimination and the soundest of judgments must be exercised during many years if this improvement is to be maintained. For such selection there must always be a clearly predetermined object in view, the breeder must be able to define his aim and to discriminate between slight differences. In the absence of any precise method of assessing the kind and degree of improvement, judgment can be acquired only by long experience.

Unconscious selection is the practice of preserving the more valued and of eliminating the less valued individuals without any thought of altering the general characterization of the stock. Methodical selection is the conscious and deliberate practice of modifying the general characterization of a stock according to some predetermined standard through the careful choice of certain individuals as the parents of the next generation and through the control of the matings of these individuals. Save that in one case man acts deliberately and purposefully and in the other unintentionally, there is little difference between the two kinds of artificial selection: each blends into the other. In both cases man preserves those individuals which promise to be most useful or attractive to him, and neglects the others.

In methodical selection the choice of the individual for further breeding is determined by (1) its appearance, (2) the record of its ancestry (pedigree) and (3) the record of its progeny (the progeny test).

Remarkable results have been secured by this mass selection—the choice for breeding of all or many of those individuals exhibiting variation in the desired direction. This is the method of the grower of corn who, at harvest time, selects the best ears from the whole yield and from these rears his next year's crop. This selection, on the basis of appearance, though slow and uncertain, has produced the improved varieties of plants and animals. It is effective because most of the characters upon which it is employed are dependent on a large number of hereditary factors, which can be sorted out and accumulated by selection of this kind. The most rapid and permanent results of such selection are those which take the form of the sorting out of pure lines from a mixed population of self-fertilized plants, for in this case a single selection separates the inherited differences at once. This accomplishes immediately all that is possible, for selection within a pure line is ineffective. (*See* PURE LINE.) In animals the nearest approach to a pure line is a closely inbred strain comparatively homozygous for the characters for which selection is practised. It is abundantly demonstrated that appearance alone is not a reliable guide to breeding ability. Individuals which look alike may possess different breeding records, and the only real tests for breeding ability are the performances of their relatives (pedigree) and more especially the records of their progeny (the progeny test).

Many domestic animals and plants afford striking proofs of the power of artificial selection. Thus from a wolf-like ancestor have arisen the greyhound and the bull-dog, the Pekinese and the great dane. Similarly, artificial selection has been the means of perfecting the thoroughbred, the Shetland, and the shire horse. Amongst plants, most, if not all, cultivated species have been more or less transformed by selection, roses and hyacinths affording notable instances. (*See* ANIMAL BREEDING, MENDELISM, PURE LINE, and HEREDITY.) (F. A. E. C.)

NATURAL SELECTION (MATHEMATICAL THEORY)

Pearson developed a theory of the effects of natural selection on continuously varying characters which was based on the law of ancestral heredity, enunciated by Galton and modified by himself. He produced very strong evidence that natural selection is occurring in men. The theory is complicated, and somewhat incomplete. Intense selection for a character is effective, being nearly complete in three or four generations, but two points remain uncertain, namely (*a*) whether the population can ever be brought quite to the level selected for, and (*b*) whether it will regress indefinitely towards its original state when selection ceases. It is at least clear that such regression would be slow. The doubt depends on the uncertainty of the coefficients of correlation between

7. Bare-headed bird of paradise (*Schlegelia wilsoni*)

a character in an individual and his remote ancestors.

Haldane and Norton developed a theory of selection in populations exhibiting Mendelian inheritance. (*See* HEREDITY.) A population mating at random and only partly possessing an autosomal gene A is in equilibrium in the absence of selection when the three genotypes are in the ratio $u^2AA:2uAa:1aa$. If u_n is the value of the ratio in the nth generation, and selection occurs so that the population breeds in the ratios $(1-K)u_n^2:2u_nAa:(1-k)aa$,

$$u_{n+1}=\frac{(1-K)u_n^2+u_n}{u_n+1-k}.$$

If K and k, which are called coefficients of selection, are both positive, the population reaches an equilibrium with $u_\infty=\frac{k}{K}$. Otherwise either the gene A or a disappears. If $K=0$, *i.e.*, dominance is complete, we have, if $u_0=1$

$$\therefore n=-\int_1^{u_n}\frac{(2u+1)du}{u(u+1)\log_e\left[1-\frac{k(2u+1)}{(u+1)^2}\right]}$$

$$+\frac{k}{12}\left[\frac{2u_n+1}{(u_n+1)^2}-\frac{9}{4}\right]+\frac{k^2}{24}\left[\frac{(2u_n+1)^2}{(u_n+1)^4}-\frac{81}{16}\right]+\cdots$$

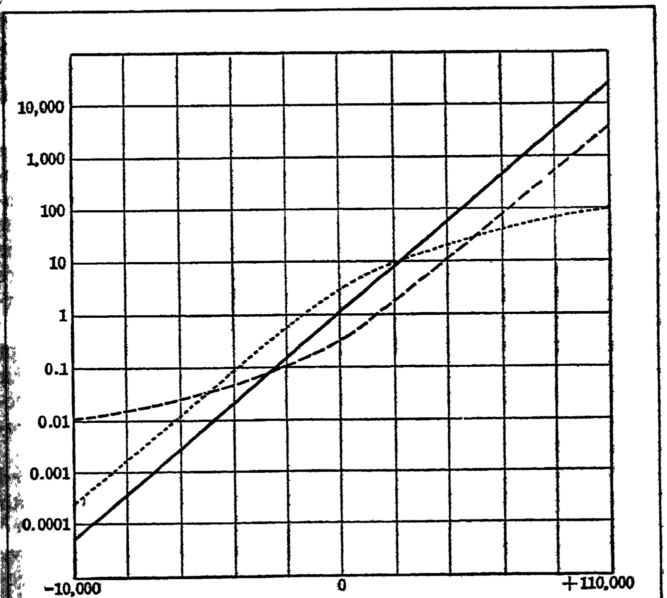
The series appears to be an asymptotic expansion.

When k is small

$$\frac{du_n}{dn}=\frac{ku^u}{1+u_n}\therefore kn=u_n+\log_e u_n-1 \text{ approximately.}$$

In the case of sex-linked inheritance, where the proportions of the male sex are $u_nA:1a$, of the female $u_n^2AA:2u_nAa:1a$, and selection occurs in both sexes with equal intensity, we have

$$kn=\log_e u_n+2\log_e\left(\frac{u_n+3}{4}\right), \text{ when selection is slow.}$$



PROCEEDINGS OF THE CAMBRIDGE PHILOSOPHICAL SOCIETY BY COURTESY OF THE CAMBRIDGE UNIVERSITY PRESS

FIG. 1

Effect of selection on an autosomal mendelian character. Abscissa=number of generations. Ordinates=percentage of population with the favoured character. ——— = Self-Fertilization. ------ = Random mating, dominants favoured. ...... = Random mating, recessives favoured

These equations can be generalized in various ways. The generations may be supposed to overlap, as in man. In this case we must know for each genotype the probability of a member of it producing an offspring between the ages x and $x+\delta x$ (dead as well as living members being included in the calculation). If this probability is $K(x)\delta x$ for a dominant, $[K(x)-k(x)]\delta x$ for a recessive, then when selection is slow the equations for selection are similar to the above, provided we put

$$k=\frac{\int_0^\infty k(x)\delta x}{\int_0^\infty xK(x)\delta x}.$$

Similarly we may obtain formulae for the effects of differential selection in the two sexes, and of competition limited to members of the same family.

When the two competing types do not mate, owing to self-fertilization or incompatibility, or when inheritance is wholly maternal, we find $kn=\log_e u_n$, where u_n is the ratio of the types. Fig. 1 shows the very different rates at which the population would change according to the type of inheritance of the character selected. In each case $k=\cdot 001$, *i.e.*, 1,000 of the favoured type survive for every 999 of the other. In all cases the reverse series of changes occurs if the sign of k be changed. It is clear that in the case of an autosomal gene selection is somewhat ineffective so long as the recessive is rare. This is due to the fact that kn is not entirely a sum of logarithmic functions of u_n. When, however, dominance is incomplete, recessives, however rare, will increase at a relatively rapid rate.

If there is a moderate degree of self-fertilization, inbreeding or assortative mating, the population assumes different equilibria in the absence of selection and the rate of change under selection may be altered. Thus if a proportion l of the population be self-fertilized or mated to sibs we have

$$kn=\log_e u_n+\frac{2}{l}\log_e\left(\frac{2-l+lu_n}{2}\right)$$

or

$$kn=\log_e u_n+\frac{4(1-l)}{l}\log_e\left(\frac{4-3l+lu_n}{4-2l}\right)$$

respectively, so that selection is not very greatly slowed down even when recessives are rare. On the other hand assortative mating does not have this effect.

Selection and Mutation.—The effect of selection may be balanced or even over-ridden by that of mutation, if the latter is sufficiently frequent. This is the case if the probability of a gene mutating to its allelomorph in the course of a generation is greater than k, the coefficient of selection. On the other hand a single mutant gene in a large population is usually extinguished by mere misfortune. If it is recessive it has a negligible chance of spreading through the population, if dominant its chance of doing so is approximately 2k, where k is the coefficient of selection in its favour.

When a character is determined by the coexistence of a number of genes, whether dominant or recessive, selection proceeds somewhat more slowly, but on the same general lines as above. Thus if a character is produced by m recessive genes, and carries a disadvantage measured by k, the proportion y_n of the population carrying it after n generations is given by eliminating s between

$$y_n=\prod_{r=1}^{m}(1-a_r s)^2 \text{ and } kn=\int\frac{ds}{sy_n}$$

where the values of a_r depend on initial conditions.

Linkage between two selected genes is irrelevant, provided that the probability of crossing over between them is greater than k. An autotetraploid population mating at random is acted on by selection more slowly than a diploid.

It will be clear that in order to obtain any idea of the effect of selection on a relatively rare character in a population in which inbreeding is not intense, it is necessary to know its mode of inheritance. If it is a recessive, or determined by a number of dominant genes, selection, whether favourable or the reverse, will only cause slow changes in the number of individuals which manifest it. On the other hand selection acts rapidly on rare dominants, and on all characters in a highly inbred population.

If a character while valuable to the community of which an individual is a member diminishes the probable number of offspring left by that individual (as is the case with some social instincts) it will not spread through the population unless this consists of small endogamous groups. If, however, as in social insects, most of the individuals are neuters, a socially valuable character,

even though tending to shorten their lives, will, in general, spread. Similarly, except in insect societies, a socially disadvantageous character increasing the probable number of offspring left by its bearers will spread through the species.

Fisher investigated the equilibrium which would be reached in a population in which very numerous Mendelian differences existed, under the influence of mutation, random survival and selection. When a gene has great selective value it will rapidly spread all through a population if ever present in appreciable numbers. Thus genetic differences (and hence variation in natural populations), must mainly be due to genes of little survival value, or to those which are most beneficial in the heterozygous condition. If u represents, as above, the ratio of dominant to recessive genes in any character, then for a large number of different characters the distribution of $z_z = \log_e u$, is given by the expression $df \propto \frac{1}{2\pi} \operatorname{sech} \tfrac{1}{2}z dz$, f being the frequency for a given value of z, no selection occurs, but mutation is balanced by random extinction. This is a symmetrical function of z, the most frequent value of u being unity. Even in the absence of mutation, the variability of a population is only diminished with extreme slowness by random extinction. In the more important case where the genes are dominants acted upon by selection, a balance is struck between the increase of variance by mutation and its diminution by selection and to a less extent by random extinction. Here $df \propto \frac{dz}{\sqrt{(e^{-2} \operatorname{sech}^2 \frac{1}{2}z + k^2 \cosh^2 \frac{1}{2}z)}}$, where k is a small quantity depending on the size of the population and the intensity of selection. This is an asymmetrical function of z and the most frequent value of u is large, *i.e.*, the variation in the population is mainly due to more recessives. The observed values of correlations between relatives for continuously varying characters can be predicted with great accuracy if these characters are due to numerous genes whose distribution in the population is determined according to this law. Thus, while Haldane's work relates to the hitherto almost unobserved process of evolution, that of Fisher explains observed facts concerning heredity.

SEXUAL SELECTION

Charles Darwin, after propounding the revolutionary and far-reaching theory of natural selection (*q.v.*) to account for the evolutionary origin of adaptive characters, set himself to see whether the conception was all-embracing. He came to the conclusion that the bulk of the large group of secondary sexual characters, such as the deer's antlers, the peacock's train, the lark's song, etc., could not be accounted for by the operation of natural selection, but that another type of selective mechanism, which he called sexual selection, here came into operation.

He argued that whenever any character possessed only by males conferred upon its possessor no direct advantages in the struggle for existence, but served merely to confer advantages upon one male in its struggle with other males to secure a mate, then we could not speak of natural selection, but of sexual selection. In some cases, as in polygamous birds, the two forms of selection might be in opposition, the gorgeous but cumbrous plumes favoured by sexual selection being definitely disadvantageous in the struggle for existence.

Although much attacked, the theory survives, if in a somewhat altered form, and the evidence now available makes it clear that sexual selection has undoubtedly played a considerable part in moulding the form and behaviour of higher animals.

The most important types of character which have presumably thus originated are as follows:—(1) for pursuit and capture of one sex by the other; (2) offensive and defensive weapons employed by members of one sex in fighting for the other; (3) means for making known the presence of one sex to the other; (4) characters employed in stimulating sexual emotion in the other sex; *i.e.*, organs employed in courtship of animals (*q.v.*).

As examples of these various types may be cited (1) the enlarged prehensile antennae of various small Crustacea (*Moina;* many Copepods) or the enlarged limbs (*gnathopods*) with which male gammarid Crustacea seize and grip the female; (2) (*a*) offensive—the antlers of stags, the enlarged canines of boars and stallions; (*b*) defensive—the mane of the lion or of certain male baboons; (3) the chirping of male crickets and the croaking of male frogs, the drumming of certain woodpeckers, the flashing of fireflies; (4) the train of the peacock, the crest (present in both sexes) of the Crested Grebe, the bower of bower-birds.

Naturally these different categories grade into each other; courtship characters grade into recognition marks; weapons may serve also as adornments, and the same character, *e.g.*, great strength, may serve both to fight enemies and to capture mates.

It has been suggested with some plausibility that prominent weapons may secure advantage by deterring other males from attempting combat; there seems no doubt that young stags with poorly-developed antlers avoid battle with large-antlered males. There are a number of prominent secondary sexual characters to which no function can yet be assigned; *e.g.*, the enormous horns of the males of the Goliath and other beetles.

The fact that organs for capturing the female may grade insensibly into copulatory organs, and organs for stimulating the emotions into those facilitating the meeting of the sexes, suggests a valid criticism of the pure neo-Darwinian doctrine which maintains that sexual selection is something altogether apart from natural selection.

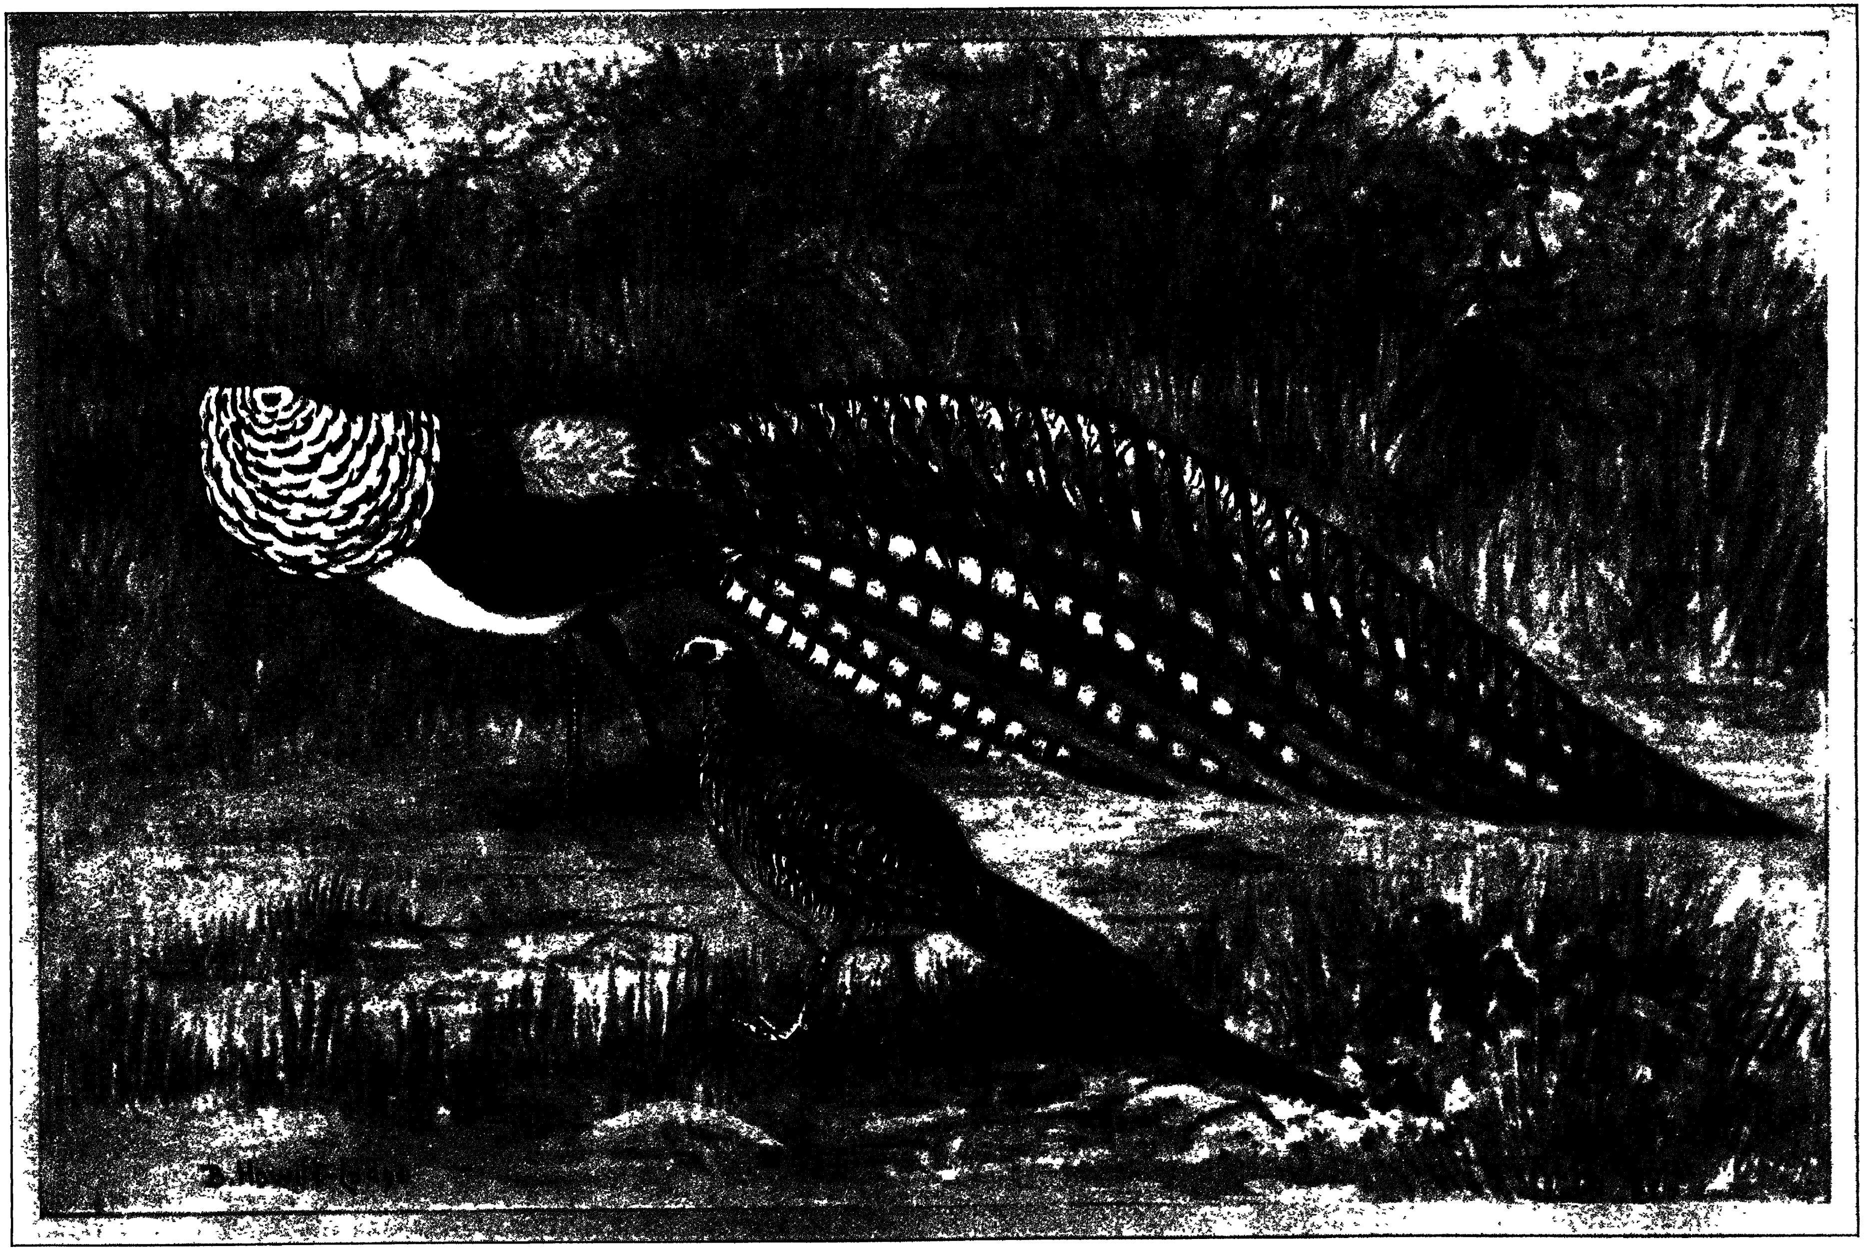
Certain organs and instincts are obviously necessary to a sexually-reproducing species if the race is to continue; and in so far as selection has contributed to their origin, it will, as Darwin himself pointed out, have been natural selection.

Devices for securing efficient mating and fertilization will eventually become more elaborate as we ascend the animal scale, as internal supplants external fertilization, as locomotion becomes more rapid, as the brain becomes more complex. The two chief ways to secure mating will be material force (pursuit and capture; or fighting for possession), or stimulation of the opposite sex (advertisement of a "sexual situation" by means of recognitional sounds, colours, actions or scents; or by emotionally stimulating display). In all these cases, while natural selection will see to it that the devices are reasonably efficient, there may and usually will also exist Darwinian sexual selection, as a result of competition between males, and this may intensify and exaggerate the characters. Since it will usually be impossible to disentangle the shares of natural and of Darwinian sexual selection, and since they both tend to produce characters of the same type, it is perhaps better to re-define sexual selection. If, instead of making competition between members of one sex the criterion, we adopt selection with reference to successful and efficient mating as our definition, the situation clears up considerably. For sexual selection in the original sense we may then substitute the term ***intra-sexual selection.***

In all recognitional and courtship characters selection is exerted *via* the brain and mind of the opposite sex, and may thus, with Lloyd Morgan, be called *psychical sexual selection* (as opposed to psychical selection of a non-sexual nature, such as must have operated in the genesis of conspicuous flowers by psychical selection *via* insects).

Sexual selection is usually unisexual, acting only upon one sex. In many cases, however (courtship decorations in herons, grebes, etc.), it is mutual and affects both sexes similarly. Rarely, as in phalaropes, the male broods and cares for the young, and the female does most of the courting. We may here speak of reversed sexual selection, falling mainly upon the females, which are accordingly the more brightly coloured.

A. R. Wallace wished to discard the whole sexual selection theory, and to ascribe the development of male weapons and display characters to the hypothetical action of "male vigour." This view as it stands is undoubtedly erroneous. However, it will often be true that greater prowess in battle and greater efficiency in song or display will be associated with high vigour; and in this way sexual selection will have, as an important by-product, the



PAINTED FOR THE ENCYCLOPÆDIA BRITANNICA BY B. HOWITT-LODGE

MALE AND FEMALE LADY AMHERST PHEASANT AT MATING TIME

The Lady Amherst Pheasant (*Chrysolophus amherstiae*) is an inhabitant of western and southern China and eastern Tibet. The male is one of the most gorgeous of all pheasants. One of his attitudes towards the female at the mating season is shown here. His body and long gaudy tail are tilted towards the hen-bird and the cape-like ruff of erectile feathers on the back of his head and neck is widely spread on the side towards her

selection, as fathers of the next generation, of males above the average in vigour.

The new definition above given obviates one great difficulty in the theory as originally stated. It was difficult to see how intra-sexual selection could be very effective without a preponderance of males, or polygamy; and in the great majority of animals there is no polygamy, and the proportion of the sexes is nearly equal. (*See*, however, Darwin, *Descent of Man*, 2nd ed., p. 329; and E. Howard, *Territory in Bird Life*, p. 35.) If, however, sexual selection is primarily designed for securing efficient and speedy mating, this difficulty is removed.

The other objection which is commonly raised, that the theory of sexual selection ascribed too much taste and conscious discrimination to the female, rests upon a pure misconception. So long as the courtship display stimulates the female, a selective result will be obtained, whether she exercise taste and judgment or be stimulated in the most automatic way.

A few examples will go to show how entangled are natural and intra-sexual selection.

In the courtship of the little fly *Drosophila*, the male approaches the female while waving his wings in a peculiar manner. Sturtevant made up three series of bottles. In each of series A was placed a normal male and female; in B a female with a male whose wings had been cut off; and in C a female with one normal and one wing-clipped male. Successful mating was accomplished by the wing-clipped males in series B, but in a much longer average time than in series A; *i.e.*, the wing-waving courtship apparently has the effect of stimulating the female to sexual response more quickly than does the mere presence of a male. In series C, the average time of mating was only a trifle longer than in series A; but the wing-clipped males were almost as successful as their normal rivals. This can only be explained as meaning that, once the courtship has excited and stimulated the female, she will be ready to accept any male. Courtship is, in this case, almost entirely an affair of natural selection; like a copulatory organ, it renders fertilization more certain, and so benefits the race, and is of little benefit to one male in competition with another.

The same appears definitely to hold good in newts, in which courtship is the preliminary to the male's depositing his sperm in a packet on the pond-bottom. Even should two or more males be courting simultaneously, and should the courtship of one be more effective than that of the rest, it would be impossible that the female should pick up his sperm packet in preference to another. In certain polygamous birds, on the other hand, although the display of the males presumably has some function in merely securing fertilization, yet intra-sexual selection of one male in preference to others is predominant. This occurs in birds where there are special assembly-places for the males' display in the breeding season: the females visit these places only for the purpose of mating, and the males take no share in caring for eggs and young. Black grouse, certain birds of paradise, and the ruff are examples from different orders. Owing to the unique variability of male ruffs in the breeding-plumage, every male on a "hill" (as the ruff's assembly places are called) can be individually recognized. Edmund Selous took advantage of this fact. He made observations on one "hill" throughout several weeks of the breeding season, and was able to establish the fact that whereas some of the cocks never succeeded in mating at all while he was watching, and others but rarely, one or two secured a large number of mates. Not only that, but the most successful cock had an exceptionally well-developed ruff, and one that to our eyes at least was very striking in its colour contrasts. In this species, then, by no means every male secures a mate, and courtship-display is concerned with the securing of mates. There is a real "struggle for reproduction" among males, with resultant intra-sexual selection.

In man it is obvious that sexual selection plays, and has played an important rôle, but in a more complex way than in most species, since not only does some degree of mutual sexual selection exist, but also some degree of intra-sexual selection in both sexes separately. Sexual selection has undoubtedly helped to diversify as well as to improve human appearance.

Sexual selection has exercised a considerable secondary effect in evolution, through characters which have arisen in one sex under the influence of sexual selection, being often partially or completely transferred to the other sex under the influence of heredity. A good example is afforded by the finch family (*Fringillidae*). In general, male finches are brighter-coloured than the females, but their characteristic patterns are usually reproduced in duller colours in the females. It is probable that the bright colours originated in the males through sexual selection; but their partial transference to the females (though of no functional significance in them) has resulted in the females of the different species being more different from each other than they otherwise would have been.

When, *e.g.*, the females nest in holes, bright colours can be transferred to them more completely without endangering their safety; this is so, for instance, in the European robin and the tits. When, however, as in most pheasants, the female nests in exposed situations, natural selection inhibits the transference.

Admittedly many of these conclusions are based solely on indirect evidence; but in view of the experimental work on Drosophila and newts, and the natural experiment annually staged with ruffs, which decisively point to a stimulating effect of display on the female, the cumulative circumstantial evidence must be presumed correct unless it is actually shown false. (*See* COURTSHIP OF ANIMALS; SELECTION: *Natural Selection; BIRD: Reproductive Habits.*)

SELENE or **MENE**, the moon-goddess, daughter of Hyperion and Theia, sister of Helios and Eos, mother of Pandia by Zeus. She was also wooed by Pan in the form of a white ram, or she had selected a white ram from his flock as the price of her favours. The most famous of her amours was with Endymion (*q.v.*). Selene was represented as driving a chariot drawn by two horses, or later by cows or oxen, herself mounted on a horse, a bull, a mule, or a ram. Later, she was identified with Artemis, and with Phoebe (*q.v.*). She was worshipped on the days of the new and the full moon. The male moon-god (Mēn) is Asiatic. The Roman goddess of the moon was Luna, who possessed sanctuaries on the Aventine and Palatine hills. She had the title Noctiluca (night-shining) and her Palatine temple was lit up at night.

See W. H. Roscher, *Über Selene und Verwandtes* (1890), with *Nachträge* (1895); Preller, *Griechische Mythologie* (4th ed., 1894), pp. 443–446; A. Legrand, s.v. "Luna" in Daremberg and Saglio, *Dictionnaire des antiquités*; G. Wissowa, *Relig. u. Kultus* (2nd ed.), p. 315 *et seq.*

SELENGA-ORKHON, a river of Central Asia, which rises in two principal headstreams, the Selenga and the Orkhon, on the plateau of north-west Mongolia in 101° E. Both flow east-north-east to their confluence near Kiakhta (*q.v.*) on the border of Mongolia and the Buriat-Mongol A.S.S.R. (*q.v.*). From Kiakhta to its delta on Lake Baikal the Selenga flows down a gently graded slope giving access from Mongolia to the plains of Asiatic Russia. Along the lower part of this trench climbs the Siberian railway which then passes to Chita. The Selenga is frozen from November 22nd to May 9th at Verkhne-Udinsk and from December 1st to May 8th at Novo-Selenginsk. It is navigable in summer from the delta to Kiakhta (210 m.); its total length is 750 m. On the left it receives the Djida and the Temnik and on the right the Tola, Khara-gol, Chikoi, Khilok and Uda. For a description of its former trading importance *see* KIAKHTA. Near the upper Orkhon was the permanent camp of Karakorum, from the 8th century down to the end of the 13th the centre of the Mongol power, especially under the sway of Jenghiz Khan and his son Ogotai or Ogdai in the 12th and 13th centuries. For an interpretation of the inscriptions discovered here in the 19th century *see* V. Thomsen, *Inscriptions de l'Orkhon* (Helsingfors, 1900).

SELENIUM, a chemical element closely allied in physical and chemical properties with sulphur (symbol Se, atomic number

34, atomic weight 79·20). It is a complex element having six isotopes (*q.v.*) with atomic weights ranging from 74 to 80. It was discovered in 1817 by J. J. Berzelius who called it selenium (Greek σελήνη, the moon) because of the close analogy between the new element and the recently discovered tellurium (Latin, *tellus*, the earth).

Distribution.—Selenium is widely distributed throughout the world, although in small quantities, being the 40th element in order of plentifulness, between bismuth and gold. It is present in meteoric iron. It rarely occurs native; occasionally it accompanies native sulphur, but is usually found in combination with the heavy metals to form selenides, such as clausthalite, PbSe (29% Se); eucairite, $(Ag,Cu)_2Se$; crookesite $(CuAgTl)_2Se$; naumannite, Ag_2Se; and zorgite (a complex selenide with 31% Se). It occurs also in various pyrites and galenas. Whenever any of the foregoing seleniferous minerals are subjected to manufacturing operations, the selenium appears as a by-product.

In the U.S.A. selenium is obtained in considerable quantities together with some tellurium from the anode slime of the copper refineries. This material is fused with sodium nitrate and sand or oxidised with nitric acid. In either case the aqueous extract is treated with hydrochloric acid and sulphur dioxide to set free the selenium.

Physical Properties.—Selenium exists in several allotropic forms (*see* ALLOTROPY), four of which are definitely crystalline.

Crystalline Red Selenium α and β are two varieties separating in monoclinic crystals obtained from solutions of amorphous or vitreous selenium in hot carbon disulphide. At 110–120° C the α-form, which is isomorphous with monoclinic sulphur, changes into grey metallic selenium, while with the β-form the transformation temperature is 125–130° C. By rapid heating the melting points of α and β forms have been found to be about 180° C. The density of crystalline red selenium is 4·45.

Crystalline Grey Selenium A is obtained by warming vitreous selenium to 175° C. It is only sparingly soluble in hot carbon disulphide, is a bad conductor of the electric current, and is metastable, changing into the following second grey variety.

Crystalline Grey Selenium B (*Metallic Selenium*), formed by warming the other modifications to 200° C, has a metallic lustre, is malleable and, unlike variety A, is in certain circumstances a good electrical conductor. This metallic selenium (m.p. 220·2° C, sp.gr. 4·8) crystallises in rhombohedral crystals of the hexagonal system and is isomorphous with tellurium. Metallic selenium is a non-conductor in the dark, but on exposure to light its electrical conductivity is proportional to the intensity of the light falling upon it. This remarkable property has led to the selenium cell, the basic principle of which depends on coating with a thin film of selenium a conducting metal such as copper, brass, platinum, silver or gold. This metal is either in the form of plates insulated from each other by mica or other insulating material, or two metallic wires wound closely on a cylinder of glass or other non-conductor and covered with selenium. As it is only metallic selenium (variety B) which is sensitive to light, the cell contents after coating with the element must be carefully annealed at 200° C to insure that the selenium has been transformed into the photo-sensitive modification.

APPLICATIONS

United States Production.—The output of selenium in the United States has increased very considerably in recent years. In 1914 22,867 lb. were produced, whereas in 1924 the production reached 130,000 lb., the average price being about $2.10 per pound. This supply goes chiefly to the glass industry, the makers having displaced manganese by selenium as a glass decolorizer, the pink tint produced by this element being complementary to the objectionable green shade arising from the presence of iron in the glass. Moreover, the addition of further quantities of selenium, either as such or as sodium selenite, Na_2SeO_3, imparts to glass a clear red colour useful in railway work. Selenium is used in the ceramic industries for the production of red enamels and red enamelled steelwares. The use of 1–3% of selenium in vulcanised india rubber articles increases their resistance to abrasion by 50%.

Uses as a Solvent, etc.—Selenium oxychloride was shown by V. Lenher to be a liquid having many valuable properties. It is a solvent for natural and synthetic resins, fish oils, etc.; it assists in distinguishing between saturated and unsaturated hydrocarbons, attacking the latter but not the former. In a mixture of benzene and heptane, it dissolves the former whereas the latter floats unchanged. That this liquid is now a commercial product is largely due to Lenher, who established a research school at Wisconsin University for the study of selenium and tellurium.

The remarkable electrical properties of metallic selenium have led to the development of the selenium cell, whereby one can over the telephone "hear a ray of light falling upon a metallic plate." The following electrical contrivances are rendered possible by this selenium cell: (i.) phototelegraph for transmitting photographs or sketches along a wire; (ii.) photographophone for making synchronous records of sounds with moving pictures; (iii.) optophone, invented by E. E. Fournier d'Albe in 1914, for enabling the blind to read ordinary type by ear; (iv.) self-lighting buoys, whereby buoys and beacons in inaccessible spots may light and extinguish themselves automatically, depending only on sunlight; (v.) photometry; (vi.) military uses in wireless telephony and in locating enemy batteries by light.

The fire-proofing of cables with selenium has proved successful. Diethyl selenide has been recommended as a warning stench for introduction into inodorous poisonous commercial gases such as carbon monoxide.

Chemical Properties.—*Hydrogen selenide* (seleniuretted hydrogen) is a colourless gas with repulsive odour, which when liquefied boils at −41° C/760 mm. and melts at −68° C (Olzewski). It burns with a blue flame giving either red selenium or white selenium dioxide depending on the amount of oxygen present. Its solubility in water is somewhat greater than that of hydrogen sulphide. It is obtained by the action of hydrochloric acid on ferrous selenide, but is better prepared by dropping water on aluminium selenide produced by the direct combination of selenium and powdered aluminium.

Metallic Selenides are produced by direct combination of the metals with selenium or, in the case of selenides insoluble in water, by precipitation of solutions of metallic salts by hydrogen selenide. The alkali selenides are colourless but become red on taking up more selenium to form polyselenides such as Na_2Se_2.

Selenium tetrafluoride, SeF_4, was obtained in a state of purity (1928) by E. B. R. Prideaux and C. B. Cox by the interaction of selenium tetrachloride and silver fluoride as a colourless liquid boiling at 93° C (m.p. −13·2° C) and having density 2·77. It attacks glass and is completely hydrolysed by water to selenious and hydrofluoric acids.

Diselenium dichloride, Se_2Cl_2, a brownish-yellow liquid with pungent odour, is decomposed by water into hydrochloric and selenious acids with elimination of red selenium. *Selenium tetrachloride*, a colourless crystalline mass, which vaporises without melting, is produced by burning selenium in chlorine. *Selenium oxychloride*, $SeOCl_2$, a pale yellow liquid boiling at 177·2° C (m.p. 8·5° C), is prepared by mixing the tetrachloride with selenious oxide under carbon tetrachloride, or by partially hydrolysing the tetrachloride.

Selenium forms two oxides: The long-known *dioxide*, SeO_2, crystallising in colourless, lustrous needles, obtained by burning selenium in oxygen, readily sublimes but under pressure it melts at 340° C; it dissolves in water to form selenious acid. *Selenium trioxide*, recently described by R. R. Worsley and H. B. Baker (1923) as a solid substance resulting from the action of ozone on selenium dissolved in dry selenium oxychloride, dissolves in water to give selenic acid. This acid, the analogue of sulphuric acid, is usually seen as a syrupy liquid, but has been obtained solid (m.p. 58° C); it has the noteworthy property of dissolving gold.

ORGANIC SELENIUM COMPOUNDS

Derivatives of Bivalent Selenium.—Ethylselenomercaptan, C_2H_5SeH, a liquid of repulsive odour (b.p. 57° C), is obtained by

distilling an alkali hydroselenide with an alkali ethylsulphate. Diethyl selenide (b.p. 108° C) and diethyl diselenide (b.p. 186° C) are prepared from potassium ethyl sulphate and potassium mono- and di-selenide respectively. These three liquids are also obtained by treating phosphorus pentaselenide with potassium ethyl sulphate and caustic potash.

Derivatives of Quadrivalent Selenium.—The dialkyl selenides are unsaturated compounds and combine further with alkyl iodides, dimethyl selenide and methyl iodide yielding trimethylselenonium iodide, $(CH_3)_3SeI$, a crystalline salt which is transformed by moist silver oxide into the basic trimethylselenonium hydroxide, $(CH_3)_3Se{\cdot}OH$. From sodium selenophenoxide, $NaSe{\cdot}C_6H_5$, and methyl iodide, phenyl methyl selenide, $C_6H_5{\cdot}Se{\cdot}CH_3$, is produced, and this substance combines with bromoacetic acid to form phenylmethylselenetine bromide (I.) a salt containing

(I.) 
 (II.)

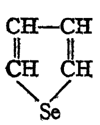
an asymmetric selenium atom; this substance has been resolved by W. J. Pope and Neville (1902) into two optically active isomerides. (*See* STEREOCHEMISTRY.) By the interaction of selenium tetrachloride and acetylacetone, G. T. Morgan and H. D. K. Drew (1920) obtained chloroacetylacetone and bimeric selenium acetylacetone (II.) in yellow plates melting at 175° C. The interaction of this organic derivative with sulphurous acid or alkali bisulphites affords an elegant method of preparing either selenodithionic acid, $Se(SO_3H)_2$, or its alkali salts:

$$(C_5H_6O_2Se)_2 + 4H_2SO_3 \text{ (or } 4KHSO_3) = 2C_5H_8O_2 + 2Se(SO_3H)_2 \text{ [or } 2Se(SO_3K)_2]$$

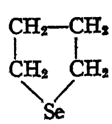
Phenol condensed with selenium oxychloride gives rise to two isomeric trihydroxytriphenylselenonium chlorides, $(HO{\cdot}C_6H_4)_3$-SeCl; with selenious acid it yields dihydroxydiphenyl selenide $(HO{\cdot}C_6H_4)_2Se$ (M. Takamatru, 1928). Ortho- and para-cresols also give rise to both types of selenium compound, whereas β-naphthol furnishes only di-β-hydroxydinaphthyl selenide (G. T. Morgan and F. Burstall, 1928).

Derivatives of Sexavalent Selenium.—The aromatic selenonic acids are obtained by (1) direct action of selenic acid on benzene and its homologues, or (2) permanganate oxidation of the aryl selenious acids or aryl diselenides. Benzeneselenonic acid, $C_6H_5{\cdot}SeO_3H$, is a hygroscopic syrup which in contact with moisture forms a crystalline hydrate. Diphenylselenone, $(C_6H_5)_2SeO_2$, a colourless crystalline substance melting at 155° C, is produced by oxidation from diphenylselenoxide, $(C_6H_5)_2SeO$, the latter being obtained from diphenylselenide dibromide.

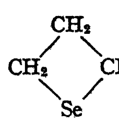
Cyclic Selenium Derivatives.—Selenium takes part in the formation of various heterocyclic compounds. Selenophen (I.), the analogue of thiophen, has been prepared by H. V. A. Briscoe and J. B. Peel (1928) from the interaction of selenium and acetylene at 400° C; it is a colourless liquid boiling at 110°/752 mm.



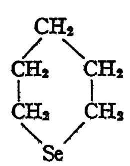
(I.)



(II.)



(III.)



(IV.)

The following saturated selenohydrocarbons have been prepared by the interaction of sodium selenide and the appropriate alkylene dibromide: (i.) *cyclo*selenopropane (III.), from trimethylene dibromide, is a colourless liquid boiling at 80–81° C/40 mm. and giving a crystalline mercurichloride; *cyclo*selenobutane (tetrahydroselenophene) (II.), from tetramethylene dibromide, is a colourless liquid boiling at 135–6°/770 mm.; (iii.) *cyclo*selenopentane (IV.), from pentamethylene dibromide, is a colourless liquid boiling at 158–161° C/760 mm. and having a disagreeable odour; it forms crystalline derivatives with the halogens and with mercuric chloride (Morgan and Burstall, 1929).

Detection and Estimation of Selenium.—Selenium is precipitated from its inorganic compounds by hydrogen sulphide, and is redissolved by ammonium sulphide. The elimination of red selenium from its soluble compounds on reduction with sulphur dioxide, hydrazine, hydroxylamine, etc., is a characteristic test. The gravimetric estimation is made by weighing this precipitate on a tarred filter after boiling until the red selenium has turned black, the latter form being more easily filtered. Selenium may be estimated iodometrically, and selenious acid may be oxidised to selenic acid by standard permanganate.

SELENIUM CELLS. The light-sensitive property of selenium was discovered in 1873 by Willoughby Smith, who, as a pioneer of submarine telegraphy, had selected that substance for some experiments requiring the use of a high electrical resistance. It is interesting to notice that 56 years had elapsed since the isolation of selenium by Berzelius, and that Riess, throughout his work upon its electrical conductivity had missed, in 1845, the important fact that light is capable of modifying the actual effect he was studying. In 1875 Siemens suggested the use of selenium in photometry and, from that time till the present day, many other proposals relating to the subject have been forthcoming. Thus in 1880 Ayrton and Perry describe what they called "electric vision" and in the following year Shelford Bidwell constructed several improved selenium cells.

Prof. Minchin, in 1891, used selenium for measuring the light from the stars and a few years later Giltay showed that Röntgen rays also changed the electrical resistance of selenium just as light does. Work on the electrical transmission of pictures was carried out during 1902 by Korn, who, five years later, succeeded in thus sending a picture from Munich to Berlin. Dr. Fournier d'Albe invented the "optophone" in 1912 and Graham Bell had made the first "photophone" some 32 years earlier. A greatly improved photophone, however, was designed by Prof. A. O. Rankine in 1916 and is referred to more in detail later.

It will be understood, from what has preceded, that these cells or bridges depend for their action on the change in electrical resistance of selenium when illuminated. A variety of forms of them have been devised but in practically all the aim is similar, namely to arrange two or more conductors so that they are separated by and in close contact with crystalline selenium. The great interest attaching to the subject arises from the fact that no completely satisfactory explanation of the action of light on selenium has been discovered.

The Construction of Selenium Cells.—The earliest systematic experiments relating to the action of light upon selenium were made by melting a platinum wire into the opposite ends of a short rod and noting the change of electrical resistance under various conditions of illumination, temperature, etc. Since the amorphous form of selenium, in which it is sold by dealers, is so poor a conductor of electricity that it may be classed as an insulator, it is necessary when preparing light-sensitive cells to convert this into one of the grey crystalline forms, which conduct comparatively well.

The simplest cells can be made by winding two thin copper wires side by side and one mm. apart upon a strip of mica, say 3″ long by 1″ wide. The strip should then be placed on a hot plate and a thin layer of selenium melted over the wires. On

removal from the plate, cooling and reheating, the black-looking lustrous selenium will rapidly become dull and finally grey. In that state it will be found to be sensitive to light and a fair conductor of electricity. With two adjacent ends of the wires separated and a potential difference of 50 volts applied to the others, a current of perhaps 50 to 100 micro-amperes may be passed through such a cell in the dark, and in the ordinary light of a room this current should immediately rise to 300 micro-amperes or even more. In a modification due to Dr. Pfund, a piece of glass 1 cm. wide and 3 cm. long is coated with selenium which is smoothed out by a hot glass rod. Four strands of bare copper wire are then wound round the whole so that the selenium surface is covered. After fixing the ends of the wires, the first and third strands are unwound and removed so as to leave a gap between the second and fourth and the bridge is reheated and annealed to grey.

Dr. Fournier d'Albe recommends preparing selenium cells by coating slate with graphite and then scratching away a zig-zag line as shown in fig. 1, so that a potential difference applied at the regions A and B would tend to cause a current to flow across the scratch. Owing to the high insulation of the slate, however, no current can pass until selenium is melted over it and allowed to turn grey. In practice it is found necessary to grind the slate surface as smooth as possible by means of pumice powder and subsequently to rub in the graphite very thoroughly to ensure a sufficiently conducting surface.

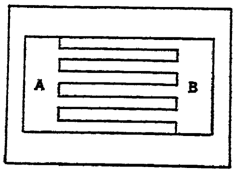

FIG. 1

One of the most successful modern cells is that devised by Prof. Thirring of Vienna. In this type the bridges are built up on what is called the "condenser" plan, and consist of a number of thin strips of brass and mica arranged alternately, and so cut that the mica is slightly narrower than the brass. If such a pack of strips be clamped together and stood on its edge upon a flat surface the brass will stand slightly higher than the mica, and selenium melted over the surface, sinks into the tiny channels between the upper part of the brass strips and thus forms a series of bridges. The selenium is then carefully annealed and finally ground off so as to expose an extremely thin layer to the action of light. The alternate brass strips are connected together in two groups after the manner of an electrical condenser.

A thin layer of selenium is now generally admitted to be essential where sensitivity and greater reliability are desired. It should also be pointed out that for many years the necessity of excluding damp air from selenium cells has been realised, and an important contribution to the subject, recently made by Prof. Rankine (*Proceedings* of the Physical Society of London, v. 39, Part 3, April 15th 1927) and Mr. Avery, shows conclusively that the variable behaviour of selenium bridges is to a large extent attributable to the presence of moisture. Polarization occurs and causes irregularities and inability to reproduce readings. It is therefore important to dry and effectively seal up all selenium bridges required for experiment. This may be partially done by coating them with paraffin wax, shellac, resin, etc., but the best plan is to seal the cells into glass tubes after thorough drying by exposure to P_2O_5. All forms of selenium appear to absorb moisture slightly.

Selenium melts at 217° C and when cooled rapidly remains amorphous. On reheating to 180° C it changes to one of the grey varieties, all of which are more or less sensitive to light. Close examination discloses a mass of minute crystals. Their shapes are largely influenced by the temperature at which they are formed. A thin layer of selenium for instance, which appears deep red by transmitted light, will gradually develop a crop of light-sensitive spherical crystals, the growth of which can be observed on the stage of a microscope if the temperature is maintained at about 100° C (fig. 2). At temperatures in the neighbourhood of 260° C a transparent highly hydroscopic type of crystal is produced which is practically insensitive to light. This and other forms of selenium crystals, excepting the spherical type, may most conveniently be obtained by condensation. A flat brass plate is placed upon a tripod and heated till selenium, rubbed over the central area of it, melts easily. This should then be smoothed off with the edge of a glass strip and a separating ring of mica laid on the molten selenium. A sheet of glass is then placed over and in contact with the mica, and the vapour rising from the selenium condenses on its under surface. At first a red deposit appears which a lens shows to consist of minute beads of transparent amorphous selenium. After a few minutes of continued heating however, the colour changes to grey and with experience, crops of very beautiful crystals can be obtained (*see* fig. 3). An exposure of twelve hours, with the plate held an inch above the molten selenium will, under suitable conditions, produce quantities of needle-like crystals 2 or 3 mm. long. If this be replaced by a slate tablet or gold coated plate on which a line, as previously described, has been cut, the selenium is soon deposited in sufficient quantity to constitute a light-sensitive layer. It is comparatively easy, in half an hour, to prepare a selenium cell in this way that will carry 5,000 micro-amperes with an illumination of 100 candle-feet and a potential difference of 50 volts.

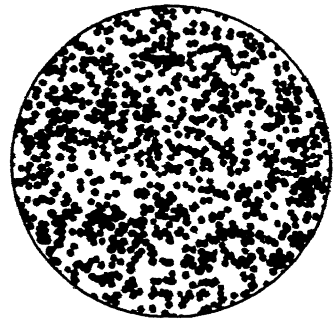

FIG. 2.—SPHERICAL CRYSTALS OF SELENIUM

The sensitivity of a selenium bridge is often expressed by stating the ratio of the "dark current" to that which passes when the cell is illuminated by a light of 100 candle-feet. In the case of a well-made cell this ratio may be 1 to 100.

The value of the current should, on shutting off the light, return to within 5% of its initial value in one second. If a longer time-lag is observed it is generally believed to be due to secondary effects. The time-lag is frequently spoken of as "inertia." Although the above conditions have been actually realised, the usual practice is to work with a 1 to 6 or 1 to 10 ratio for the dark to light current, and to be satisfied with a return to within 5% of zero within five seconds.

It will be found that selenium melted on to ordinary glass will not always adhere well on conversion to the grey or metallic variety and cooling. By using finely ground glass however, and heating the selenium till it freely fumes, it may be stroked with a mica spatula to a smooth surface as it cools, and will then adhere to the base sufficiently well for most practical purposes.

Soapstone, biscuit porcelain and a variety of insulating substances have also been tried as bases. On the other hand the process known as fuming and already described as suitable for the formation of crystals, generally gives an adherent layer even upon polished glass. The presence of oil improves the contact. In this way experiments may be made on the light sensitivity of a single crystal.

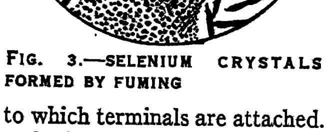

FIG. 3.—SELENIUM CRYSTALS FORMED BY FUMING

Cylindrical bridges made by placing alternate discs of brass and mica upon an insulating rod are useful for certain purposes. The discs are clamped by tightening a nut on the rod and the brass plates are alternately connected together into two groups to which terminals are attached. The whole is heated and selenium melted over the outer edges of the discs, the usual precaution being taken to convert it into the grey light-sensitive variety. Two conducting plates immersed in various liquids, so as to constitute a voltaic battery, one plate being coated with grey selenium and exposed to light, have also been found to be effective as a light-sensitive device. Bridges made with pairs of dissimilar metals separated by thin mica and coated with selenium give an electric current on illumination. Whether a cell will have a high or low electrical resistance when finished depends upon the temperature

and time taken in its preparation. It is not uncommon to find bridges designed to be operated for long periods on 200 volts.

Theoretical.—The process by which light causes the electrical resistance of selenium to vary is not known precisely.

It was formerly held that impurities were necessary but Marc has definitely proved that view to be incorrect. He showed that the presence of traces of silver, etc., affect the behaviour of the cells but proved that the fundamental action of light upon *pure* selenium is indeed a fact. He supported these ideas by various experiments, but failed to devise any really decisive proof of the correctness of his conclusions. The more modern view is, of course, based upon the existence of electrons and seems to adequately explain many of the experimental results. According to the electron theory, selenium becomes ionised by light, and the time-lag is accounted for by supposing the recombination of the ions to take place more slowly than in the case of a gas. That is of course a difficulty, but the electron theory also requires that the resistance of selenium bridges should vary as the square root of the intensity of light falling upon them, and this is found to be the case. On the other hand the sensitive crystals are surprisingly opaque to light and it appears that light waves are only able to penetrate them to a depth of ·0014 cm. In addition there is the fact that surface conditions can vary widely without affecting the sensitivity, and it therefore seems that if electrons are produced or liberated by the light, the process must be one occurring within the crystal itself. It may be generally stated that selenium does not show any selective action towards the colour of the light impinging upon it: the chief factor appears to be the energy conveyed by the beam. In most sources of light the greatest energy is carried by the longer wave lengths and it was therefore formerly thought that selenium is most sensitive to red light. As a matter of fact, for coloured lights with equal energy, selenium is usually somewhat more sensitive to blue light. It also responds to ultra violet light and X-rays as well as to the gamma rays from radium. Experiments upon the sensitivity of selenium to light of various wave lengths have shown that the temperature treatment of the bridge appreciably influences the result.

A wide range of variation is possible by different times of heating and cooling. On the whole it looks as if two chief types of crystals are generally produced viz. one more sensitive to red and one to blue light.

Prof. F. C. Brown has shown, that when using a single crystal of selenium 1 cm. long, the maximum change in resistance across its base occurred when the extreme tip only was illuminated. The crystals may be bent or flattened but still even after heavy pressure retain their sensitivity to light. A block of grey or metallic selenium is sensitive to pressure, and filing or scraping also definitely increases its resistance. If the light falls upon a block of selenium having wire gauze electrodes, the change of resistance is greater in the direction of the current than at right angles to it.

The presence of mercury may cause a selenium cell to be "light negative" *i.e.*, to show an *increased* resistance in light. There is general agreement that a selenium bridge improves up to a certain point by keeping.

Practical Applications.—The comparatively large currents carried by selenium, combined with the simplicity of accessory apparatus, render it particularly suitable for operating a relay by which other actions may be stopped or started. A beam of light can be made to undo a lock, or give an alarm, either by its sudden appearance or by its cessation.

Selenium cells are in use for talking films, where the light through the margin of the film is suitably modified by varying photographic density, so that the current carried through the bridge to a loud-speaker is correspondingly varied and speech reproduced.

To Dr. Fournier d'Albe is due the credit of applying the use of selenium cells for the assistance of blind people. By means of a clockwork device, to interrupt the current through a selenium cell sufficiently rapidly, a musical sound can be heard in a telephone and the intensity of the note made to serve as a guide to the direction and proximity of a light. Dr. Fournier d'Albe has designed a small portable apparatus by which on pointing it in various directions towards a light, the loudness of the note heard in a telephone indicates brightness. Totally blind persons can find a window in a room or learn to guide themselves about a house by this means. A more important development in this direction however, is his invention of the optophone, an instrument which enables a blind person to read ordinary print by means of sound. This apparatus depends for its action on a selenium cell. It is clear that the pitch of the note, heard in a telephone in circuit with a selenium bridge, can be altered by varying the speed at which perforations in a revolving disc allow light to reach the cell. Different notes may in fact be given out by a loud-speaker connected with a bridge, and a sort of musical instrument evolved. Similar developments have taken place in America.

Sunshine, fog or moonlight recorders have been made with selenium, and recently in America, the result of a horse race was established by the leading horse intercepting a beam of light and thereby affecting a selenium cell, which actuated a relay, and marked the exact moment of the horse's arrival at the winning post. The variations of light intensity during an eclipse of the sun have also been recorded by means of selenium.

For photometric work however, for television or all applications where great precision is required, the photo-electric cell with thermionic valve is more reliable at present.

The far greater sensitivity of selenium, and the comparatively large currents it is able to carry, at the same time offers very strong inducement to physicists to continue the study of its remarkable properties, quite apart from the intrinsic scientific interest attaching to the subject.

An ingenious device invented during the War by Prof. A. O. Rankine, and called the "photophone," enables light reflected from a mirror attached to the needle-holder of a gramophone diaphragm to affect a distant selenium cell and so transmit speech.

Some of the latest applications have been evolved in the laboratories of Messrs. The Radiovisor Parent Ltd., where a system of street lamp control has been perfected so that lamps may be automatically lighted at dusk and extinguished at dawn. This has now been in use in the urban district of Barnes, London, since March, 1928. A similar method has already been employed in Germany for lighting and extinguishing harbour buoys, etc. Amongst other applications which have been developed in this laboratory are a system of railway control and a burglar alarm.

A device whereby the smoke density in the smoke stacks of destroyers may be registered on an indicator has been experimented with both in the British and in the U.S.A. Navy. Selenium enables this to be done by recording changes of electrical resistance when light projected across the lower part of the stack is more or less obscured by the smoke. During the War it was shown to be practicable to regulate the movements of a ship, to fire guns or explode mines by means of selenium bridges controlled by a searchlight beam.

Two forms of selenium fire alarms have also been invented. Selenium bridges have also been used to increase the speed of telegraphic signalling.

SELENIUM COMPASS. The increasing use of steel in aeroplane structure and equipment has led to the need for a compass that may be fixed in a part of the ship unaffected by magnetic disturbances. The problem, simple in principle, offers difficulties in practice. The selenium compass presents an avenue of escape, though at the expense of additional weight and complication. Selenium possesses the curious property of changing its electric resistance when light strikes upon it. In the selenium compass, two diametrically opposed lamps, fitted in the bottom of the compass bowl, provide two beams of light which strike upon two selenium cells incorporated in a bridge fixed on the top of the compass bowl. The magnetic system carries a diaphragm which, in

one orientation of the bowl and bridge with respect to the magnetic system, will hide both beams of light from the selenium cells. If, however, the bowl be turned, the electric resistances of the two selenium cells become unequal, a condition which can be determined in the usual manner by means of a galvanometer fitted on the dashboard. The compass is operated in the following manner: An instrument fitted in the cockpit has a dial marked in degrees, like an ordinary compass card. By turning a handle, the pilot or navigator can move a pointer over the dial to any desired compass course, at the same time rotating through gearing the compass bowl and bridge in the tail of the aircraft. If, for example, the handle be turned until the pointer indicates a south-east direction, then the bowl will automatically be turned so that only on this course will the diaphragm on the magnetic system equally shield the selenium cells. The pilot has thus simply to turn the aircraft until the galvanometer reading is zero; any departure from the course will be indicated by a deflection of the galvanometer. The selenium compass has been successfully operated in flight, but, since it employs a null method of reading, it cannot be used to indicate bearings.

SÉLESTAT or **SCHLETTSTADT,** a town of France, capital of an arrondissement, in the department of Bas-Rhin, on the Ill, 26 m. S. of Strasbourg by the railway to Basle. It was a royal residence in Carolingian times and became a free town of the Empire in the 13th century. In the 15th century it was the seat of a celebrated academy, founded by Rodolphus Agricola, which contributed to the revival of learning in this region. Erasmus of Rotterdam was one of its students. In 1634 it passed to France and was afterwards fortified by Vauban. It offered little resistance, however, to the Germans in 1870, and the fortifications have since been razed. The Hoh-Königsburg, a great castle standing at an elevation of 2,475 ft., was presented to the emperor William II. by the town of Schlettstadt in 1899, and was completely restored in 1908. The site is first mentioned as bearing a castle in the 8th century.

SELEUCIA, the name of several Hellenistic cities named after the founder of the Seleucid dynasty, Seleucus Nicator. The most important are:

1. **Seleucia on the Tigris.**—This city lay on the right bank at the mouth of the Nahr-al-Malik (the royal canal). The city was founded by Seleucus Nicator in 312 B.C., and marks the definite shift of the centre of power in Mesopotamia from the Euphrates to the Tigris. Throughout the period of Sumerian times the principal city of the region had been on the Euphrates, first Kish (*q.v.*), and when the Euphrates shifted its course, Babylon. Alexander followed the ancient precedent. Seleucia however marks the definite end of Babylon and is closely associated with Hellenistic culture in Mesopotamia. During the Persian domination Ctesiphon on the opposite bank succeeded Seleucia.

Seleucia is said to have been founded with the definite object of destroying Babylon. It was peopled with Macedonians and Greeks, and admitted Jews and Syrians to citizenship, *i.e.*, it was definitely a cosmopolitan city, characteristic of the Hellenistic age. Pliny gives the population at 600,000. During the Parthian domination the city continued to be the foremost city of the east in position and trade. It was always in sympathy with the west rather than the east, and was definitely opposed to and at times in open rebellion against the Parthians. The Arsacids founded the rival city of Ctesiphon. Seleucia, however, continued to survive, and eventually was burnt by Avidius Cassius in A.D. 164, at which time it is said to have had 300,000 inhabitants. The destruction of the city marks the end of Hellenism in Mesopotamia.

2. **Seleucia Pieria,** in Syria, a port and frontier fortress on the Cilician border. The city lay four miles north of the mouth of the Orontes in 36° N. and 36° E. and was the port of Antioch, with which city and Apamea and Laodicea it formed the Syrian tetrapolis. The town appears to have been of considerable size and the great road to the sea, a deep cutting through the rock still survives. Walls, temples and amphitheatre can also be traced. The city was of considerable military importance during the wars between the Ptolemies and the Seleucids and was recognized as an independent city later by the Romans (in A.D. 70). It had practically disappeared by the fifth century.

3. **Seleucia Tracheotis** (modern Selefke), also called Trachea, a city in Cilicia in 36° N. 34° E. It lay on the Calycadnus (modern Gok Su), a few miles from the mouth of the river, doubtless as a protection against attacks from the sea. There are the ruins of a castle on the Acropolis and other considerable remains. The city was at one time a port with a large trade. It was built near an old site (Oldia) in 300 B.C. by Seleucus Nicator. During the third Crusade Frederick Barbarossa was drowned in crossing the river (A.D. 1190). The city was captured by the Turks in the thirteenth century. It still remains the capital of a district.

Several other towns also bore the name of Seleucia, as (4) Seleucia in Mesopotamia, modern Birijik (*q.v.*), (5) in the Persian Margiana, which received its name from Antiochus I. of Syria, having been previously called Alexandria, after its original founder; (6) in Pisidia; (7) in Pamphylia; (8) on the Belus in Syria; and (9) Tralles (*q.v.*). (L. H. D. B.)

SELEUCID DYNASTY, a line of kings who reigned in Nearer Asia from 312 to 65 B.C.

Seleucus.—The founder SELEUCUS (surnamed for later generations Nicator) was a Macedonian, the son of Antiochus, one of Philip's generals. Seleucus, as a young man of about twenty-three, accompanied Alexander into Asia in 333, and won distinction in the Indian campaign of 326. When the Macedonian empire was divided in 323 (the "Partition of Babylon") Seleucus was made *chiliarch* (practically=vizier) to the regent Perdiccas. Seleucus himself had a hand in the murder of Perdiccas in 321. At the second partition, at Triparadisus (321), Seleucus was given the government of the Babylonian satrapy. In 316, when Antigonus had made himself master of the eastern provinces, Seleucus fled to Egypt. In the war which followed between Antigonus and the other Macedonian chiefs, Seleucus actively co-operated with Ptolemy and commanded Egyptian squadrons in the Aegean. The victory won by Ptolemy at Gaza in 312 opened the way for Seleucus to return to the east.

His return to Babylon in that year was afterwards officially regarded as the beginning of the Seleucid empire. Master of Babylonia, Seleucus at once proceeded to wrest the neighbouring provinces of Persis, Susiana and Media from the nominees of Antigonus. A raid into Babylonia conducted in 311 by Demetrius, son of Antigonus, did not seriously check Seleucus's progress. Whilst Antigonus was occupied in the west, Seleucus during nine years (311–302) brought under his authority the whole eastern part of Alexander's empire as far as the Jaxartes and Indus. In 305, after the extinction of the old royal line of Macedonia, Seleucus, like the other four principal Macedonian chiefs, assumed the style of king. He attempted to recover Alexander's conquests in India, but with Antigonus threatening in the west he made peace with Chandragupta in 302, ceding him territory in Afghanistan for 500 elephants. In 301 he and Lysimachus defeated Antigonus at Ipsus in Asia Minor. A new partition of the empire followed, by which Seleucus added to his kingdom Syria, and perhaps some regions of Asia Minor. The possession of Syria gave him an opening to the Mediterranean, and he founded here his new capital, Antioch, on the Orontes. Seleucia continued to be the capital for the eastern satrapies. About 293 he installed his son Antiochus there as viceroy. Demetrius fell in 285, and an invitation by Ptolemy Ceraunus gave him a chance to remove his last rival, Lysimachus, who was defeated and killed at Corupedion in Lydia (281). Seleucus now had the whole of Alexander's empire but Egypt in his hands. He left Asia to Antiochus, and crossed over to take possession of Macedonia. He reached the Chersonese to be murdered by Ptolemy near Lysimachia (281).

Antiochus I. Soter (324 or 323–262) was half a Persian, his mother Apame being one of those eastern princesses whom Alexander had given as wives to his generals in 324. On the assassination of his father (281), the task of holding together the empire was a formidable one, and a revolt in Syria broke out almost immediately. With his father's murderer, Ptolemy, Antiochus was soon compelled to make peace, abandoning apparently Macedonia and Thrace. In Asia Minor he was unable to reduce

Bithynia or the Persian dynasties which ruled in Cappadocia. In 278 the Gauls broke into Asia Minor, and a victory which Antiochus won over them is said to have been the origin of his title of *Soter* (Gr. for "saviour"). At the end of 275 the question of Palestine, which had been open between the houses of Seleucus and Ptolemy since the partition of 301, led to hostilities (the "First Syrian War"). About 262 Antiochus tried to break the growing power of Pergamum, but suffered defeat near Sardis and died soon afterwards (262).

261–223 B.C.—He was succeeded (261) by his second son ANTIOCHUS II. THEOS (286–246), whose mother was the Macedonian princess Stratonice, daughter of Demetrius Poliorcetes. War with Egypt still went on along the coasts of Asia Minor (the "Second Syrian War"). Antiochus also made some attempt to get a footing in Thrace. About 250 peace was concluded between Antiochus and Ptolemy II., Antiochus repudiating his wife Laodice and marrying Ptolemy's daughter Berenice, but by 246 Antiochus had left Berenice and her infant son in Antioch to live again with Laodice in Asia Minor. Laodice poisoned him and proclaimed her son SELEUCUS II. CALLINICUS (reigned 246–227) king, whilst her partisans at Antioch made away with Berenice and her son. Berenice's brother, Ptolemy III., who had just succeeded to the Egyptian throne, at once invaded the Seleucid realm and annexed the eastern provinces, whilst his fleets swept the coasts of Asia Minor. In the interior of Asia Minor Seleucus maintained himself, and when Ptolemy returned to Egypt he recovered Northern Syria and the nearer provinces of Iran. At Ancyra (about 235?) Seleucus was defeated by his younger brother Antiochus Hierax, supported by Laodice, and left the country beyond the Taurus to his brother and the other powers of the peninsula. Of these Pergamum now rose to greatness under Attalus I., and Antiochus Hierax perished as a fugitive in Thrace in 228/7. A year later Seleucus was killed by a fall from his horse. His elder son, SELEUCUS III. Soter (reigned 227–223), took up the task of reconquering Asia Minor from Attalus, but fell by a conspiracy in his own camp.

Antiochus III. the Great (223–187).—Callinicus's younger son, a youth of about eighteen, now succeeded to a disorganized kingdom (223). Not only was Asia Minor detached, but the further eastern provinces had broken away, Bactria under the Greek Diodotus (*q.v.*), and Parthia under the nomad chieftain Arsaces. Soon after Antiochus's accession, Media and Persis revolted under their governors, the brothers Molon and Alexander. The young king was in the hands of the bad minister Hermeias, and was induced to make an attack on Palestine instead of going in person to face the rebels. The attack on Palestine was a fiasco, and the generals sent against Molon and Alexander met with disaster. Only in Asia Minor, where the Seleucid cause was represented by the king's cousin, the able Achaeus, was its prestige restored and the Pergamene power driven back to its earlier limits. In 221 Antiochus at last went east, and the rebellion of Molon and Alexander collapsed. The submission of Lesser Media, which had asserted its independence under Artabazanes, followed. Antiochus rid himself of Hermeias by assassination and returned to Syria (220). Meanwhile Achaeus himself had revolted and assumed the title of king in Asia Minor. Antiochus considered that he might leave Achaeus for the present and renew his attempt on Palestine. The campaigns of 219 and 218 carried the Seleucid arms almost to the confines of Egypt, but in 217 Ptolemy IV. defeated Antiochus at Raphia and compelled him to withdraw north of the Lebanon. In 216 Antiochus went north to deal with Achaeus, and had by 214 driven him into Sardis. Antiochus contrived to capture Achaeus (*see* POLYBIUS), but the citadel held out till 213.

Having thus recovered the central part of Asia Minor—for the dynasties in Pergamum, Bithynia and Cappadocia the Seleucid government was obliged to tolerate—Antiochus turned to recover the outlying provinces of the north and east. Xerxes of Armenia was brought to acknowledge his supremacy in 212. In 209 Antiochus invaded Parthia, occupied the capital Hecatompylus and pushed forward into Hyrcania. The Parthian king was apparently granted peace on his submission. In 209 Antiochus was in Bactria, where the original rebel had been supplanted by another Greek Euthydemus. (*See* further BACTRIA and articles on the separate rulers.) The issue was again favourable to Antiochus. After sustaining a famous siege in his capital Bactra (Balkh), Euthydemus obtained an honourable peace. Antiochus next, following in the steps of Alexander, crossed into the Kabul valley, received the homage of the Indian king Sophagasenus and returned west by way of Seistan and Kerman (206/5). From Seleucia on the Tigris he led a short expedition down the Persian Gulf against the Gerrhaeans of the Arabian coast (205/4). Antiochus seemed to have restored the Seleucid empire in the east, and the achievement brought him the title of "the Great King." In 205/4 the infant Ptolemy V. Epiphanes succeeded to the Egyptian throne, and Antiochus concluded a secret pact with Philip of Macedonia for the partition of the Ptolemaic possessions. Once more Antiochus attacked Palestine, and by 199 he seems to have had possession of it. Scopas recovered Palestine for Ptolemy, but was defeated at the Panium, near the sources of the Jordan, in 198. In 197 Antiochus moved to Asia Minor to secure the coast towns which had acknowledged Ptolemy and the independent Greek cities. This enterprise brought him into antagonism with Rome, since Smyrna and Lampsacus appealed to the republic of the west, and the tension became greater after Antiochus had in 196 established a footing in Thrace. The evacuation of Greece by the Romans gave Antiochus his opportunity, and he now had the fugitive Hannibal at his court to urge him on. In 192 Antiochus invaded Greece, but in 191 he was routed at Thermopylae by the Romans under M. Acilius Glabrio, and obliged to withdraw to Asia. The Romans followed up their success by attacking Antiochus in Asia Minor, and the decisive victory of L. Cornelius Scipio at Magnesia and Sipylum (190), following on the defeat of Hannibal at sea off Side, gave Asia Minor into their hands. By the peace of Apamea (188) the Seleucid king abandoned all the country north of the Taurus, which was distributed among the friends of Rome. As a consequence of this blow to the Seleucid power, the outlying provinces of the empire, recovered by Antiochus, reasserted their independence. Antiochus perished in a fresh expedition to the east in Luristan (187).

187–164 B.C.—The Seleucid kingdom as Antiochus left it to his son, SELEUCUS IV. PHILOPATOR (reigned 187–176), consisted of Syria (now including Cilicia and Palestine), Mesopotamia, Babylonia and Nearer Iran (Media and Persis). Seleucus IV. was compelled by financial necessities, created in part by the heavy war-indemnity exacted by Rome, to pursue an unambitious policy, and was assassinated by his minister Heliodorus. The true heir, Demetrius, son of Seleucus, being now retained in Rome as a hostage, the kingdom was seized by the younger brother of Seleucus, ANTIOCHUS IV. EPIPHANES, who reigned 176–164. In 170, Egypt, governed by regents for the boy Ptolemy Philometor, attempted to reconquer Palestine; Antiochus not only defeated this attempt but invaded and occupied Egypt, and left Philometor as his ally installed at Memphis. When Philometor joined Ptolemy Eurgetes, Antiochus again invaded Egypt (168), but was compelled to retire by the Roman envoy C. Popillius Laenas (consul 172), after the scene in which the Roman drew a circle in the sand about the king and demanded his answer before he stepped out of it. Antiochus had resided at Rome as a hostage, and afterwards for his pleasure at Athens, and had brought to his kingdom an admiration for republican institutions and an enthusiasm for Hellenic culture—or, at any rate, for its externals. There is evidence that the forms of Greek political life were more fully adopted under his sway by many of the Syrian cities. He spent lavishly on public buildings. It is his contact with the Jews which has chiefly interested later ages, and he is doubtless the monarch described in the pseudo-prophetic chapters of Daniel (*q.v.*). Jerusalem, near the Egyptian frontier, was an important point, and in one of its internal revolutions Antiochus saw, perhaps not without reason, a defection to the Egyptian side. His chastisement of the city, including as it did the spoliation of the temple, served the additional purpose of relieving his financial necessities. It was a measure of a very different kind when, a year or two later (after 168), Antiochus tried to suppress the

practices of Judaism by force, and it was this which provoked the Maccabaean rebellion. (*See* MACCABEES.) In 166 Antiochus left Syria to attempt the reconquest of the further provinces. He seems to have been signally successful. Armenia returned to allegiance, the capital of Media was recolonized as Epiphanea, and Antiochus was pursuing his plans in the east when he died at Tabae in Persis, after exhibiting some sort of mental derangement (winter 164/3).

164–145 B.C.—He left a son of nine years, ANTIOCHUS V. EUPATOR (reigned 164–162), in whose name the kingdom was administered by a camarilla. Their government was feeble and corrupt. The attempt to check the Jewish rebellion ended in a weak compromise. In 162 Demetrius, the son of Seleucus IV., escaped from Rome and was received in Syria as the true king. Antiochus Eupator was put to death. DEMETRIUS I. SOTER (reigned 162–150) was a strong and ambitious ruler. He crushed the rebellion of Timarchus in Media and reduced Judaea to new subjection. But he was unpopular at Antioch, and fell before a coalition of the three kings of Egypt, Pergamum and Cappadocia. An impostor, who claimed to be a son of Antiochus Epiphanes, ALEXANDER BALAS (reigned 150–145), was installed as king by Ptolemy Philometor and given Ptolemy's daughter Cleopatra to wife, but Alexander proved to be dissolute and incapable, and when Demetrius, the son of Demetrius I., was brought back to Syria by Cretan *condottieri*, Ptolemy transferred his support and Cleopatra to the rightful heir. Alexander was defeated by Ptolemy at the battle of the Oenoparas near Antioch and murdered during his flight. Ptolemy himself died of his wounds.

The Later Seleucids.—DEMETRIUS II. NICATOR (first reign 145–140) was a mere boy, and the misgovernment of his Cretan supporters led to the infant son of Alexander Balas, ANTIOCHUS VI. DIONYSUS being set up against him (145) by Tryphon, a magnate of the kingdom. Demetrius was driven from Antioch and fixed his court in the neighbouring Seleucia. In 143 Tryphon murdered the young Antiochus and assumed the diadem himself. Three years later Demetrius set off to reconquer the eastern provinces from the Parthians, leaving Queen Cleopatra to maintain his cause in Syria. When Demetrius was taken prisoner by the Parthians, his younger brother ANTIOCHUS VII. SIDETES (164–129) appeared in Syria, married Cleopatra and crushed Tryphon. Antiochus VII. was the last strong ruler of the dynasty (138–129). He took Jerusalem and once more brought the Jews, who had won their independence under the Hasmonaean family, to subjection. (*See* MACCABEES.) He led a new expedition against the Parthians in 130, but, after signal successes, fell fighting in 129. (*See* also PERSIA: *History.*) Demetrius (second reign 129–126), who had been allowed by the Parthians to escape, now returned to Syria, but was soon again driven from Antioch by a pretender, ALEXANDER ZABINAS, who had the support of the king of Egypt. Demetrius was murdered at the instigation of his wife Cleopatra in 126. The remaining history of the dynasty is a wretched story of the struggle of different claimants, while the different factors of the kingdom, the cities and barbarian races, more and more assert their independence. Both Demetrius II. and Antiochus VII. left children by Cleopatra, who form rival branches of the royal house.

To the line of Demetrius belong his son SELEUCUS V. (126), assassinated by his mother Cleopatra, ANTIOCHUS VIII. GRYPUS (141–96), who succeeded in 126 the younger brother of Seleucus V., the sons of Grypus, SELEUCUS VI. EPIPHANES NICATOR (reigned 96–95), ANTIOCHUS XI. EPIPHANES PHILADELPHUS (reigned during 95), PHILIP I. (reigned 95–83), DEMETRIUS III. EUKAIROS (reigned 95–88), and ANTIOCHUS XII. DIONYSUS EPIPHANES (reigned 86?–85?), and lastly PHILIP II., the son of Philip I., who appears momentarily on the stage in the last days of confusion. To the line of Antiochus VII. belong his son ANTIOCHUS IX. CYZICENUS (reigned 116–95), the son of Cyzicenus, ANTIOCHUS X. EUSEBES (reigned 95–83?), and the son of Eusebes, ANTIOCHUS XIII. ASIATICUS (reigned 69–65). In 83 Tigranes, the king of Armenia, invaded Syria, and by 69 his conquest had reached as far as Ptolemais, when he was obliged to evacuate Syria to defend his own kingdom from the Romans. When Pompey appeared in Syria in 64, Antiochus XIII. begged to be restored to his ancestral kingdom or what shred was left of it. Pompey refused and made Syria a Roman province. Antiochus Grypus had given his daughter in marriage to Mithradates (*q.v.*), a king of Commagene, and the subsequent kings of Commagene (*see* under ANTIOCHUS) claimed in consequence still to represent the Seleucid house after it had become extinct in the male line, and adopted Antiochus as the dynastic name. The kingdom was extinguished by Rome in 72. The son of the last king, Gaius Iulius Antiochus Epiphanes Philopappus, was Roman consul for A.D. 100.

B.; X.)

SELF-BINDER: *see* HARVESTING MACHINERY.

SELF-DETERMINATION is a term which, since the World War, has been commonly used to denote the right of every people to choose freely such form of government and of political and cultural institutions as it thinks will best correspond to its needs. As a war-time slogan it was chiefly used by Allied propagandists who represented it as part of the Allied programme to liberate certain subject nationalities of eastern, central, and south-eastern Europe and of the Middle East. President Wilson was one of its chief advocates, and included it in his famous Fourteen Points (*q.v.*) enunciated in 1918. (*See* EUROPE; PLEBISCITE; also the articles on the various European countries; *e.g*, POLAND; RUMANIA.)

SELF-HEAL (*Prunella vulgaris*), a cosmopolitan herb with a creeping rootstock and purple two-lipped flowers. The stems are short and branching, the leaves oblong or lanceolate. The plant belongs to the family Labiatae and was formerly used for cuts, wounds, etc., whence the common name.

SELF-HETERODYNE RECEPTION, a system of heterodyne reception through the use of a device which is both an oscillator and a detector. Heterodyne reception is the process of receiving radio waves by combining the received current with locally generated alternating current.

SELFRIDGE, HARRY GORDON (1864–), American business man, was born at Ripon (Wis.), U.S.A., on Jan. 11, 1864. He entered the firm of Marshall Field and Co., of Chicago, from which he retired in 1904. In 1906 he went to London and organized the firm of Selfridge and Co., Ltd., wholesale and retail merchants, which opened in 1909 with extensive premises in Oxford street. These became known throughout the country, and the firm developed into one of the most successful business enterprises of its kind in the world. Selfridge wrote a book, *The Romance of Commerce* (1918), in which he recorded the growth of commerce from earliest times until the present day.

SELIM, the name of three sultans of Turkey.

SELIM I. (1465–1521) succeeded in 1512 his father Bayezid II., whom he dethroned, and whose death, following immediately afterwards, gave rise to suspicions which Selim's character certainly justified. A bigoted Sunni, he resolved on putting down the Shi'ite heresy, which had gained many adherents in Turkey; the number of these was estimated as high as 40,000. Selim determined on war with Persia, where the heresy was the prevalent religion, and in order that the Shi'ites in Turkey should give no trouble during the war, "measures were taken," as the Turkish historian states, which proved fully efficacious. The campaign which followed was a triumph for Selim, whose firmness and courage overcame the pusillanimity and insubordination of the Janissaries. Syria and Egypt next fell before him; he became master of the holy cities of Islam; and he induced the last Caliph of the Abbasid dynasty formally to surrender the title of caliph

(*q.v.*) as well as its outward emblems, viz. the holy standard, the sword and the mantle of the prophet. After his return from his Egyptian campaign, he was preparing an expedition against Rhodes when he was overtaken by sickness and died, on Sept. 22, 1521, in the ninth year of his reign, near the very spot where he had attacked his father's troops, not far from Adrianople. He was about fifty-five years of age. He was bigoted, bloodthirsty and relentless; and at one time he was with difficulty dissuaded from ordering the complete extirpation of all the Christians in Turkey.

Selim II. (1524–1574) was a son of Suleiman I. and his favourite Roxelana, and succeeded his father in 1566. An able grand vizier, Mahommed Sokolli, succeeded in concluding at Constantinople an honourable treaty (1568) with the emperor Maximilian II., whereby the emperor agreed to pay to Turkey an annual "present" of 30,000 ducats. Against Russia he was less fortunate. A plan had been elaborated at Constantinople for uniting the Volga and Don by a canal, and in the summer of 1569 a large force of Janissaries and cavalry were sent to lay siege to Astrakhan and begin the canal works, while an Ottoman fleet besieged Azov. But a sortie of the garrison of Astrakhan drove back the besiegers; 15,000 Russians, under Knes Serebianov, attacked and scattered the workmen and the Tatar force sent for their protection; and, finally, the Ottoman fleet was destroyed by a storm. Early in 1570 the ambassadors of Ivan the Terrible concluded at Constantinople a treaty which restored friendly relations between the sultan and the tsar. Expeditions in the Hejaz and Yemen were more successful, and the conquest of Cyprus in 1571, which provided Selim with his favourite vintage, led to the calamitous naval defeat of Lepanto in the same year, which freed the Mediterranean from the corsairs by whom it was infested. Sokolli was preparing for a fresh attack on Venice, when the sultan's death on Dec. 12, 1574, cut short his plans. Selim was dissolute and idle, and took no part in the wars of his reign.

Selim III. (1762–1808) was a son of Sultan Mustafa III. and succeeded his uncle Abd-ul-Hamid I. in 1789. He was thoroughly persuaded of the necessity of reforming his state. But Austria and Russia gave him no time for anything but defence, and it was not until the peace of Jassy (1792) that a breathing space was allowed him in Europe, and Bonaparte's invasion of Egypt and Syria shattered the old-standing French alliance. Selim profited by the respite to abolish the military tenure of fiefs; he introduced salutary reforms into the administration, especially in the fiscal department, sought to extend education, and engaged foreign officers as instructors, by whom a small corps of new troops called *nizam-i-jedid* were collected and drilled. These troops were able to hold their own against rebellious Janissaries in the European provinces, where disaffected governors made no scruple of attempting to use them against the reforming sultan.

Emboldened by this success, Selim issued an order that in future picked men should be taken annually from the Janissaries to serve in their ranks. Hereupon the Janissaries and other enemies of progress rose at Adrianople, and the reforms had to be abandoned. Serbia, Egypt and the principalities were successively the scene of hostilities in which Turkey gained no successes, and in 1807 a British fleet appeared at Constantinople, to insist on Turkey's yielding to Russia's demands and on the dismissal of the ambassador of Napoleon I. Selim was, however, thoroughly under the influence of this ambassador, Sebastiani, and the fleet retired without effecting its purpose. The Janissaries rose once more in revolt, induced the Sheikh-ul-Islam to grant a fetva against the reforms, dethroned and imprisoned Selim (1807), who was strangled in the seraglio, and placed his nephew Mustafa on the throne.

For authorities *see* Turkey: *History*.

SELINUS, an ancient city on the south coast of Sicily (Σελινοῦς), 27 m. S.E. direct from Lilybaeum (the modern Marsala) and 8 m. S.E. of Castel Vetrano, which is 74 m. S.S.W. of Palermo by rail. It was founded, in 651 or in 628 B.C., by colonists from Megara Hyblaea, and from the parent city of Megara (*see* Sicily: *History*). The name, which belonged both to the city and to the river on the west of it, was derived from the wild celery which grows there abundantly, and which appears on some of its coins (*see* Numismatics, *Greek*, § "Sicily"). We hear of boundary disputes with Segesta as early as 580 B.C. Selinus soon grew in importance, and extended its borders from the Mazarus to the Halycus. Its government was at first oligarchical, but about 510 B.C. a short-lived despotism was maintained by Peithagoras and, after him, Euryleon. In 480 B.C. Selinus took the Carthaginian side. Thucydides speaks of its wealth and of the treasures in its temples, and the city had a treasury of its own at Olympia.

A dispute between Selinus and Segesta was one of the causes of the Athenian expedition of 415 B.C. At its close the former seemed to have the latter at its mercy, but an appeal to Carthage was responded to, and an overwhelming force under Hannibal took and destroyed the city in 409 B.C.; the walls were razed to the ground and only 2,600 inhabitants escaped to Agrigentum (Acragas). In 408 Hermocrates, returning from exile, occupied Selinus and rebuilt the walls; and it is to him that the fine fort on the neck of the acropolis must be attributed. He fell, however, in 407 in an attempt to enter Syracuse, and, as a result of the treaty of 405 B.C., Selinus became absolutely subject to Carthage, and remained a mere village until its inhabitants were transferred to Lilybaeum (250 B.C.). It was never afterwards rebuilt, and Strabo mentions it as one of the extinct cities of Sicily. There are traces of habitation in the early Middle Ages, and during the Islamic period there was a village there: but an earthquake in the 10th or 11th century ruined it completely, and it has been covered by shifting sand.

The ancient city occupied a sand-hill running north and south; the south portion, overlooking the sea, which was the acropolis, is surrounded by fine walls of masonry of rectangular blocks of stone, which show traces of the reconstruction of 408 B.C. It is traversed by two main streets, running north and south and east and west, from which others diverged at right angles. There are, however, some traces of earlier buildings at a different orientation. Only the south-east portion of the acropolis, which contains several temples, has been excavated: in the rest private houses seem to predominate. The deities to whom the temples were dedicated not being known, they are indicated by letters. In all the large temples the cella is divided into two parts, the smaller and inner of which (the *adytum*) was intended for the cult image. The opisthodomus is sometimes omitted. From the disposition of the drums of the columns, it is impossible to suppose that their fall was due to any other cause than an earthquake. Temple C is the earliest of those on the acropolis. It had six columns at each end (a double row in the front) and seventeen on each long side. Twelve of those on the north have been reerected. From it came the three archaic metopes now in the museum at Palermo. Portions of the coloured terra-cotta slabs which decorated the cornice and other architectural members have also been discovered, including the fragments of an enormous Gorgon mask, over 8 ft. high, from the centre of one of its pediments. In front of it stood a large altar over 60 ft. long. Next to it on the north lies temple D, both having been included in one *temenos*, with other buildings of less importance: to the east of D is a large altar. B is a small temple of comparatively late date; while A and O lie on the south side of the main street from east to west in another *peribolos*.

At the north end of the acropolis are extensive remains of the fortifications of Hermocrates across the narrow neck connecting it with the rest of the hill. In front of the wall lies a deep trench, into which several passages descend, as at the nearly contemporary fort of Euryelus above Syracuse (*q.v.*). Outside this again lies a projecting semicircular bastion, which commands the entrance from the exterior of the city on the east, a winding trench approached by a pair of double gateways, which are not vaulted but covered by the gradual projection of the upper courses. Capitals and triglyphs from earlier buildings destroyed to make room for them have been used in the construction of these fortifications: from their small size they may be mostly attributed to private houses, but a small temple was also destroyed, fragments of five metopes of which are at the museum at Palermo (*c.* 500 B.C.). A way across the curving trench leads to an open space, where the

Agora may have been situated: beyond it lay the town, the remains of which are scanty, though the line of the walls can be traced.

Outside the ancient city, on the west of the river Selinus, lie the ruins of a temple of Demeter Malophoros, with a propylon leading to the sacred enclosure: the temple itself has a cella with a narrow door and without columns; outside and in front of it was a large altar 52 ft. long. A large number of votive terra-cotta figures, vases and lamps were found in the course of the excavations. The earliest temple must have been erected soon after the foundation of the city, while the later building which superseded it dates from shortly after 600 B.C. The propylon, on the other hand, may date from after 409 B.C.

On the hill east of Selinus, separated from it by a small flat valley, lies a group of three huge temples. No other remains have been found round them, though it seems improbable that they stood alone and unprotected. It is likely that they were outside the town, but stood in a sacred enclosure. All of them have fallen, undoubtedly owing to an earthquake. The oldest of the three is F. A peculiarity of the construction of this temple is that all the intercolumniations were closed by stone screens. In it were found the lower parts of two metopes. Next in date comes the huge temple G, which, as an inscription proves, was dedicated to Apollo; though it was never entirely completed (many of the columns still remain unfluted), it was in use. The plan is a curious one: despite the comparative narrowness of the cella, it had two rows of ten columns in it, in line with the front angles of the inner shrine. The blocks of stone were quarried from the Cave di Cusa, 8 m. to the north-west, where similar blocks intended for it may still be seen in the quarry. The third temple, E, has been proved by the discovery of an inscription to have been dedicated to Hera. Its fine metopes now in the museum at Palermo belong to the beginning of the 5th century B.C. The cemeteries lay east of the acropolis, north of the city, and west of the temple of Demeter.

See W. B. Dinsmoor, *The Architecture of Greece* (London, 1927, 79 *sqq.*, 193 *sqq.*).

SELJŪKS, the name of several Turkish dynasties which reigned over large parts of Asia in the 11th, 12th and 13th centuries. The history of these rulers forms the first part of the history of the Turkish empire. Proceeding from the deserts of Turkestan, the Seljūks inherited the traditions and at the same time the power of the Arabian caliphate, of which, when they made their appearance, only the shadow remained in the person of the Abbāsid caliph of Baghdād. It is their merit from a Mohammedan point of view to have re-established the power of orthodox Islam and delivered the Muslim world from the subversive influence of the ultra-Shiite tenets, which constituted a serious danger to the duration of Islam itself.

The first Seljūk rulers were Toghrul Beg, Chakir Beg and Ibrahīm Niyāl, the son of Mikail, the son of Seljūk, the son of Tukāk, or Tuqāq (also styled Timūryālik, "iron bow"). They belonged to the Turkish tribe of the Ghuzz, which traced its lineage to Oghuz, the famous eponymic hero not only of this but of all Turkish tribes.

At the beginning of the 11th century the Ghuzz were settled in Transoxiana, and became a serious danger to the adjoining Mohammedan provinces. Under the leadership of Pīgu Arslān Israil, they crossed the Oxus and spread over the eastern provinces of Persia, everywhere plundering and destroying. After a decisive battle near Merv (1040), Persia lay open to the victors, who proclaimed themselves independent at Merv (which became from that time the official capital of the principal branch of the Seljūks), and acknowledged Toghrul Beg as chief of the whole family. After this victory the three princes Toghrul Beg, Chakir Beg and Ibrahīm Niyāl separated in different directions and conquered the Mohammedan provinces east of the Tigris; the last named, after conquering Hamadān and the province of Jebel (Irak i Ajami), penetrated as early as 1048 into Armenia and reached Manzikert, Erzerūm and Trebizond. This excited the jealousy of Toghrul Beg, who summoned him to give up Hamadān and the fortresses of Jebel; but Ibrahīm refused, and the progress of the Seljūkian arms was for some time checked by internal discord. Ibrahīm was, however, compelled to submit.

The Empire of Rūm.—At this time the power of Qaim, the Abbāsid caliph of Baghdād (*see* CALIPHATE), was reduced to a mere shadow, as the Shiite dynasty of the Būyids and afterwards his more formidable Fātimite rivals had left him almost wholly destitute of authority. The real ruler at Baghdād was a Turk named Basāsīrī, lieutenant of the last Būyid, Malik-ar-Rahīm. Nothing could, therefore, be more acceptable to the caliph than the protection of the orthodox Toghrul Beg, whose name was read in the official prayer (*khotba*) as early as 1050. At the end of the same year (1055) the Seljūks entered the city and seized the person of Malik-ar-Rahīm. Basāsīrī, after acknowledging the right of the Fātimites, gathered fresh troops, incited Ibrahīm Niyāl to rebel again, and re-entered Baghdād at the close of 1058. The next year, however, Toghrul Beg got rid of both his antagonists, and re-entered Baghdād. He re-established the caliph, and was betrothed to his daughter, but died before the consummation of the nuptials (Sept. 1063). Alp Arslān, the son of Chakir Beg, succeeded his uncle and extended the rule of his family beyond the former frontiers. He made himself master, *e.g.*, of the important city of Aleppo; and during his reign a Turkish amir, Atsiz, wrested Palestine and Syria from the hands of the Fātimites. He made successful expeditions against the Greeks, especially that of 1071, in which the Greek emperor Romanus Diogenes was taken prisoner (*see* ROMAN EMPIRE, LATER). The foundation of the Seljūk empire of Rūm (*q.v.*) was the immediate result of this great victory.

Malik Shāh, the son and successor of Alp Arslān, intervened in the affairs of Asia Minor and Syria, conceding the latter province as an hereditary fief to his brother Tutush, who established himself at Damascus. He, however, like his father Alp Arslān, was indebted for his greatest fame to the wise and salutary measures of their vizier, Nizām ul-Mulk. This extraordinary man was a renowned author and statesman, and immortalized his name by the foundation of several universities (the Nizāmiyah at Baghdād), observatories, mosques, hospitals and other public institutions. At his instigation the calendar was revised, and a new era, dating from the reign of Malik Shāh and known as the

Jelalian, was introduced. Not quite 40 days before the death of his master this great man was murdered by the Assassins. He had fallen into disfavour because of his unwillingness to join in the intrigues of the princess Turkān Khātūn, who wished to secure the succession to the throne for her infant son Maḥmūd at the expense of the elder sons of Malik Shāh.

Despite the intrigues of Turkān Khātūn, Malik Shāh was suc-

ceeded by his elder son Barkiyāroq (1092–1104), whose short reign was a series of rebellions and strange adventures such as one may imagine in the story of a youth who is by turns a powerful prince and a miserable fugitive. His brother Mohammed (1104–18) successfully rebelled against him, and his most dangerous enemies were the Isma'īlites, who had succeeded in taking the fortress of Alamut (north of Kazvīn) and become a formidable political power by the organization of bands of *fedais,* who were always ready, even at the sacrifice of their own lives, to murder any one whom they were commanded to slay.

Mohammed had been successful by the aid of his brother Sinjar, who from the year 1097 held the province of Khorāsan with the capital Merv. After the death of Mohammed, Sinjar became the real head of the family, though 'Iraq acknowledged Maḥmūd, the son of Mohammed. Thus there originated a separate dynasty of Irak with its capital at Hamadān (Ecbatana); but Sinjar during his long reign often interfered in the affairs of the new dynasty, and every occupant of the throne had to acknowledge his supremacy. In 1117 he led an expedition against Ghazni and bestowed the throne upon Bahrām Shāh, who was also obliged to mention Sinjar's name first in the official prayer at the Ghaznavid capital—a prerogative that neither Alp Arslān nor Malik Shāh had attained. In 1134 Bahrām Shāh failed in this obligation and brought on himself a fresh invasion by Sinjar in the midst of winter; a third one took place in 1152, caused by the doings of the Ghorids (Hosain Jihānsūz or "world-burner"). Other expeditions were undertaken by him against Khwārizm and Turkestan; the government of the former had been given by Barkiyāroq to Mohammed b. Anushtagīn, who was succeeded in 1128 by his son Atsiz, and against him Sinjar marched in 1138. Though victorious in this war, Sinjar could not hinder Atsiz from afterwards joining the *gurkhan* (great khān) of the then rapidly rising empire of the Karakitai, at whose hands the Seljūk suffered a terrible defeat at Samarkand in 1141. By the invasion of these hordes several Turkish tribes, the Ghuzz and others, were driven beyond the Oxus, where they killed the Seljūk governor of Balkh, though they professed to be loyal to Sinjar. Sinjar resolved to punish this crime; but his troops deserted and he himself was taken prisoner by the Ghuzz, who kept him in strict confinement for two years (1153–55), though treating him with all outward marks of respect. In the meantime they plundered and destroyed the flourishing cities of Merv and Nishāpūr; and when Sinjar, after his escape from captivity, revisited the site of his capital he fell sick of sorrow and grief and died soon afterwards (1157). His empire fell to the Karakitai and afterwards to the shāh Khwārizm.

The province of Kermān was one of the first conquests of the Seljūks, and became the hereditary fief of Kāvurd, the son of Chakir Beg. His descendants remained in possession of their ancestor's dominions; and till 1170 Kermān, to which belonged also the opposite coast of Omān, enjoyed a well-ordered government, except for a short interruption caused by the deposition of Irān Shāh, who had embraced the tenets of the Isma'īlites, and was put to death (1101). But after the death of Toghrul Shāh (1170) his three sons disputed with each other for the possession of the throne, and implored foreign assistance, till the country became utterly devastated and fell an easy prey to some bands of Ghuzz, who, under the leadership of Malik Dinār (1185), marched into Kermān after harassing Sinjar's dominions. Afterwards the shāhs of Khwārizm took this province. The Seljūkian dynasty of Syria came to an end after three generations, and its later history is interwoven with that of the crusaders (*see* CRUSADES).

Invasion of Asia Minor.—After the great victory of Alp Arslān in which the Greek emperor was taken prisoner (1071), Asia Minor lay open to the inroads of the Turks. Hence it was easy for Suleimān, the son of Kutulmish, the son of Arslān Pigu (Israil), to penetrate as far as the Hellespont. But the possession of Asia Minor was insecure to the Seljūks as long as the important city of Antioch belonged to the Greeks, so that we may date the real foundation of this Seljūk empire from the taking of that city by the treason of its commander Philaretus in 1084, who afterwards became a vassal of the Seljūks. The conquest involved Suleimān in war with the neighbouring Mohammedan princes, and he met his death soon afterwards (1086), near Shaizar, in a battle against Tutush. Owing to these family discords the decision of Malik Shāh was necessary to settle the affairs of Asia Minor and Syria; he kept the sons of Suleimān in captivity, and committed the war against the unbelieving Greeks to his generals Bursuḳ (Προσουχ) and Buzān (Πουζανος). Barkiyāroq, however, on his accession (1092), allowed Kilij Arslān, the son of Suleimān, to return to the dominions of his father. Acknowledged by the Turkish amirs of Asia Minor, he took up his residence in Nicaea, and defeated the first bands of crusaders under Walter the Penniless and others (1096); but, on the arrival of Godfrey of Bouillon and his companions, he was prudent enough to leave his capital in order to attack them as they were beseiging Nicaea. He suffered, however, two defeats in the vicinity, and Nicaea surrendered on June 23, 1097. As the crusaders marched by way of Dorylaeum and Iconium towards Antioch, the Greeks subdued the Turkish amirs residing at Smyrna, Ephesus, Sardis, Philadelphia, Laodicea, Lampes and Polybotus; and Kilij Arslān, with his Turks, retired to the north-eastern parts of Asia Minor, to act with the Turkish amirs of Sivās (Sebaste), known under the name of the Danishmand.

Afterwards there arose a natural rivalry between the Seljūks and the Danishmand, which ended with the extinction of the latter about 1175. Kilij Arslān took possession of Mosul in 1107, and declared himself independent of the Seljūks of 'Iraq; but in the same year he was drowned in the Khaboras through the treachery of his own amirs, and the dynasty seemed again destined to decay, as his sons were in the power of his enemies. The sultan Mohammed, however, set at liberty his eldest son Malik Shāh, who was succeeded by his brother Masūd, who established himself at Konia (Iconium), from that time the residence of the Seljūks of Rūm. During his reign—he died in 1155—the Greek emperors undertook various expeditions in Asia Minor and Armenia; but the Seljūk was cunning enough to profess himself their ally and to direct them against his own enemies. Nevertheless the Sel-

jūkian dominion did not rise to significance till his son and successor, Kilij Arslān II., had subdued the Danishmands and appropriated their possessions, though he thereby risked the wrath of the powerful atabeg of Syria, Nureddin, and afterwards that of Saladin. But as the sultan grew old his numerous sons, each of whom held the command of a city of the empire, embittered his old age by their mutual rivalry, and the eldest, Kutb ed-dīn, tyrannized over his father in his own capital, exactly at the time that Frederick I. (Barbarossa) entered his dominions on his way to the Holy Sepulchre (1190). Konia itself was taken and the sultan forced to provide guides and provisions for the crusaders. Kilij Arslān lived two years longer, finally under the protection of his youngest son, Kaikhosrau, who held the capital after him (till 1199) until his elder brother, Rukneddin Suleimān, having vanquished his other brothers, ascended the throne and obliged Kaikhosrau to seek refuge at the Greek emperor's court. This valiant prince who died in 1204 saved the empire from destruction and conquered Erzerūm, which had been ruled during a considerable time by a separate dynasty, and was now given in fief to his brother, Mughīt ud-dīn Toghrul Shāh. His son, Kilij Arslān III., was soon deposed with Greek assistance by Kaikhosrau. After the establishment of the Latin empire of Constantinople the Turks were the natural allies of the Greeks and the enemies of the crusaders and their allies, the Armenians. Kaikhosrau, therefore, took in 1207 from the Italian Aldobrandini the important harbour of Attalia (Adalia); but in 1211 perished in battle with Theodore Lascaris, emperor of Nicaea. His son and successor, Kaikāūs, made peace with Lascaris and extended his frontiers to the Black sea by the conquest of Sinope (1214). On this occasion he took prisoner the Comnenian prince (Alexius) who ruled the independent empire of Trebizond, and compelled him to acknowledge the supremacy of the Seljūks, to pay tribute, and to serve in the armies of the sultan. Elated by this great success and by his victories over the Armenians, Kaikāūs attempted the capture of Aleppo, at this time governed by the descendants of Saladin; but the affair miscarried.

Advance of the Mongols.—Soon afterwards the sultan died (1219) and was succeeded by his brother, Alā ud-dīn Kaikobād I., the most powerful and illustrious prince of this branch of the Seljūks, renowned not only for his successful wars but also for his magnificent structures at Konia, Alaja, Sivās and elsewhere, which belong to the best specimens of Saracenic architecture. The town of Alaja was his creation. He extended his rule as far as Seleucia, and desisted from further conquest only on condition that the Armenian princes would enter into the same kind of relation to the Seljūks as had been imposed on the Comnenians of Trebizond. But his greatest military fame was won by a war which, however glorious, was to prove fatal to the Seljūk empire in the future: in conjunction with his ally, the Ayyubite prince Ashraf, he defeated the Khwārizm shāh Jalāl ud-dīn near Erzingān (1230). This victory removed the only barrier that checked the progress of the Mongols. During this war Kaikobād put an end to the collateral dynasty of the Seljūks of Erzerūm and annexed its possessions. He also gained the city of Khelāt with dependencies that in former times had belonged to the Shāh-i-Armen, but shortly before had been taken by Jalāl ud-dīn; this aggression was the cause of the war just mentioned. The acquisition of Khelāt led, however, to a new war, as Kaikobād's ally, the Ayyubite prince, envied him this conquest. Sixteen Mohammedan princes, mostly Ayyubite, of Syria and Mesopotamia, under the leadership of Malik al-Kāmil, prince of Egypt, marched with considerable forces into Asia Minor against him. Happily for Kaikobād, the princes mistrusted the power of the Egyptian, and it proved a difficult task to penetrate through the mountainous, well-fortified accesses to the interior of Asia Minor, so that the advantage rested with Kaikobād, who took Kharput, and for some time even held Ḥarrān, Ar-Roha and Rakka (1232). The latter conquests were, however, soon lost, and Kaikobād himself died in 1234 of poison administered to him by his son and successor, Ghiyāss ed-dīn Kaikhosrau II., leaving an empire embracing almost all Asia Minor, with the exception of the countries governed by Vatatzes (Vataces) and the Christian princes of Trebizond and Lesser Armenia, who, however, were bound to pay tribute and to serve in his armies. It was an empire containing Christian as well as Mohammedan elements, for the sultan relied in war mainly upon his Christian troops, and granted extensive privileges to Christian merchants. In appearance it was so strong that the Mongols hesitated to invade it, although standing at its frontiers. Their attack was deferred until 1243, but in that year Kaikhosrau was defeated at Kuzadāg (between Erzingān and Sivās), and forced to purchase peace by the promise of a heavy tribute. The independence of the Seljūks was now for ever lost. The Mongols retired for some years; but, Kaikhosrau II. dying in 1245, the joint government of his three sons gave occasion to fresh inroads, till one of them died and Hulagu divided the empire between the other two, Izz ed-dīn (Kaikaus II.) ruling the districts west of the Halys, and Rukneddin (Kilij Arslān IV.) the eastern provinces (1259). But Izz ed-dīn, intriguing with the Mameluke sultans of Egypt to expel his brother and gain his independence, was defeated by a Mongol army and obliged to flee to the imperial court. Here he was imprisoned, but afterwards released by the Tatars of the Crimea, who took him with them to Sarai, where he died. Rukneddin was only a nominal ruler, the real power being in the hands of his minister, Muīn ed-dīn Suleimān, who in 1267 procured an order of the Mongol Khān Abaka for his execution. The minister raised his infant son, Ghīyāss ed-dīn Kaikhosrau III., to the throne, and governed the country for ten years longer, till he was entangled in a conspiracy of several amirs, who proposed to expel the Mongols with the aid of the Mameluke sultan of Egypt, Bibars (Beibars or Beybars). The latter marched into Asia Minor and defeated the Mongols in the bloody battle of Ablastān, the modern Albistan (1277); but, when he advanced farther to Caesarea, Muīn ed-dīn Suleimān retired, hesitating to join him at the very moment of action. Bibars, therefore, in his turn fell back, leaving Suleimān to the vengeance of the khān, who soon discovered his treason and ordered a barbarous execution. Kaikhosrau III. continued to reign in name till 1284, though the country was in reality governed by a Mongol viceroy. Masūd, the son of Izz ed-dīn, who on the death of his father had fled from the Crimea to the Mongol khān and had received from him the government of Sivās, Erzingān and Erzerūm during the lifetime of Kaikhosrau III., ascended the Seljūk throne on his death. But his authority was scarcely respected in his own residence, for several Turkish amirs assumed independence and could only be subdued by Mongol aid, when they retired to the mountains, to reappear as soon as the Mongols were gone. Masūd fell, probably about 1295, a victim to the vengeance of one of the amirs, whose father he had ordered to be put to death. After him Kaikobād, son of his brother Farāmarz, entered Konia as sultan in 1298, but his reign is so obscure that its very length is uncertain. With him ended the dynasty of the Seljūks; but the Turkish empire founded by them continued to exist under the rising dynasty of the Ottomans. (*See* Turkey.)

Bibliography.—The best, though insufficient, account of the Seljūks is still de Guignes, *Histoire générale des Huns*, bks. x.–xii., from whom Gibbon borrowed his dates. Among translations from original sources (of which the most trustworthy are yet unedited), *see* Mirkhond, *Geschichte der Seldschuken* (ed. Vullers, Giessen, 1838); *Tarikh-ī-Guzideh*, French translation by Defrémery in the *Journal asiatique*, 1848, i. 417 *sqq.*, ii. 259., *sqq.*, 334 *sqq.* Information respecting certain periods is given incidentally in the works of von Hammer and d'Ohsson (*see* bibliography to Turkey: *History*), and in S. Lane Poole, *Mahommedan Dynasties* (1894). (M. T. H.; F. M. S.)

SELKIRK (or SELCRAIG), ALEXANDER (1676–1721), Scottish sailor, the prototype of "Robinson Crusoe," seventh son of John Selcraig, shoemaker and tanner of Largo, Fifeshire, was born in 1676. Having been summoned on Aug. 27, 1695, before the kirk-session for indecent behaviour in church, he "did not compear, being gone away to the seas." In May 1703 he joined Dampier in a privateering expedition to the South Seas, as sailing master on the "Cinque Ports" galley. In September 1704 the "Cinque Ports" put in at Juan Fernandez Island, west of Valparaiso; here Selkirk had a dispute with his captain, Thomas Stradling, and at his own request was put ashore with a few ordinary necessaries. Before the ship left he begged to be

readmitted, but this was refused, and Selkirk remained alone in Juan Fernandez over four years, till on Jan. 31, 1709, he was found, and on Feb. 12, taken off, by Captain Woodes Rogers, commander of the "Duke" privateer (with Dampier as pilot), who made him his mate and afterwards gave him command of one of his prizes, "The Increase" (March 29th). Selkirk returned to the Thames on Oct. 14, 1711; he was back at Largo in 1712; in 1717 he was again at sea, and in 1721 he died as master's mate of H.M.S. "Weymouth" (Dec. 12th).

See Woodes Rogers, *Cruising Voyage round the World* (1712), and Edward Cooke, *Voyage in the South Sea and round the World* (1712), the earliest descriptions of Selkirk's adventures; also *Providence Displayed, or a Surprising Account of one Alexander Selkirk . . . written by his own Hand* (reprinted in *Harl. Miscell.* for 1810, v. 429); and Funnell's *Voyage round the World* (1707). Steele made Selkirk's acquaintance, and gave a sketch of the adventurer and his story in the *Englishman* (Dec. 3, 1713). In 1719, shortly after a second edition of Rogers' *Voyage* had appeared (1718), Defoe published *Robinson Crusoe*, the idea of which is plainly derived from Selkirk's story.

The best modern biography is the *Life and Adventures of Alexander Selkirk* by John Howell (1829). In 1868 a tablet was put up on Juan Fernandez at a point on the hill road called "Selkirk's Look-out."

SELKIRK, THOMAS DOUGLAS, 5TH EARL OF (1771–1820), was born at St. Mary's Isle, Kirkcudbrightshire, on June 20, 1771. He succeeded his father in 1799, his six elder brothers having predeceased him. At this time the Highlands of Scotland were being changed into grazing land and deer forests. Selkirk took deep interest in the evicted peasants, and tried to organize emigration to the British colonies. In 1803–1804 he founded a large and prosperous settlement in Prince Edward Island, and at about the same time a smaller one at Baldoon in Upper Canada. He later turned his attention to the Canadian west, and gradually acquired control of the Hudson's Bay Company. In May 1811 an immense tract was granted to him in the Red River valley, and he at once proceeded to send out settlers; but the hostility of the North-West Fur Company, with its headquarters at Montreal, eventually ruined the colony (*see* RED RIVER SETTLEMENT), and the influence of his rivals led to the defeat of Selkirk in various legal proceedings. On April 8, 1820 he died broken-hearted at Pau.

Copies of his papers, most of which are unpublished, are in the Canadian Archives Department at Ottawa.

SELKIRK, a royal and police burgh, parish and county town of Selkirkshire, Scotland. Pop. (1931) 5,667. It lies on a hill on the right bank of Ettrick Water, 6¼ m. south of Galashiels by the L.N.E. railway company's branch line, of which it is the terminus. There are statues of Sir Walter Scott in his sheriff's robes, of Mungo Park, the African explorer, who was educated at the grammar school, and a memorial of Flodden Field. Woollen manufactures and wool-spinning are the principal industry, and the town is an agricultural centre. Immediately south of the town are the beautiful grounds of the Haining.

As its early name (Scheleschyrche) indicates, Selkirk originally consisted of a number of *shiels* (huts), in the forest beside which a church had been planted by the Culdees of Old Melrose. David I., while prince of Cumbria, founded in 1113 the abbey, which was removed fifteen years afterwards to Kelso, and also erected a castle. Captured by Edward I., by whom it was enlarged and strengthened, the fortress was retaken by Wallace in 1297, and remained in the hands of the Scots till the battle of Halidon Hill (1333), when it was delivered to the English. It was probably destroyed in 1417 when Sir Robert Umfraville, governor of Berwick, set fire to the town, and nothing remains of it save some green mounds and the name Peel Hill. The charter granted by David I. was renewed by James V. in 1533.

After the battle of Philiphaugh (1645), David Leslie, the Covenanters' general, had some prisoners confined in the tolbooth of Selkirk and afterwards massacred in the market-place. From an early period the souters (shoemakers) were a flourishing craft, and in the rebellions of 1715 and 1746 were required to furnish the Jacobites with several thousand pairs of shoes. Though shoemaking is extinct, "the souters of Selkirk" is still a nickname for the inhabitants.

SELKIRK MOUNTAINS, a range in the S.E. of British Columbia, Canada, extending N. for about 200 m. from the American frontier with a breadth of about 80 m. and bounded E., W. and N. by the Columbia river. Though often spoken of as part of the Rocky Mountain system, they are really distinct, and belong to an older geological epoch, and their outline too is rounder and less serrated than that of the Rockies.

On the S.E. is the Purcell range, with the main chain of the Rockies still farther E., and on the W. the Gold range, prolonged northward as the Cariboo Mountains. They do not rise much above 10,000 ft.

The scenery is wild and magnificent; below the snow-line, especially on the western side, the slopes are densely wooded, and enormous glaciers fill the upper valleys; of these the most celebrated is that of the Illecillewaet, near Glacier House, on the Canadian Pacific railway. The Selkirks are crossed by the railway at Rogers Pass, discovered in 1883. The engineering difficulties overcome are very great and the grades in places very steep. A magnificent series of caverns, called the Nakimu Caves, occur in the Glacier Park Reserve not far from Glacier.

SELKIRKSHIRE, southern county, Scotland, bounded north by Peeblesshire and Midlothian, east and south-east by Roxburghshire, south and south-west by Dumfriesshire and west by Peeblesshire. Its area is 170,793 acres (excluding water). Almost the whole is hilly, the only low ground occurring in the larger valleys; the rocks are Silurian and Ordovician, much folded. The highest hills are in the west and south-west. On the confines of Peeblesshire the chief height is Broad Law (2,723 ft.), and on the Dumfriesshire border, Ettrick Pen (2,269). A great deal of boulder-clay covers the older rocks; the ice-borne material travelled from west to east, and many of the hills show steep and bare slopes towards the west, but have gentle slopes covered with glacial deposits on the eastern side. The principal rivers are the Ettrick (32 m.) and its left-hand affluent the Yarrow (14 m.), but for a few miles the Tweed traverses the north of the county. Gala Water (21 m.), though it joins the Tweed a little below Galashiels, belongs rather to Midlothian, since it rises in the Moorfoot Hills and for most of its course flows in that shire. St. Mary's Loch and its adjunct, the Loch of the Lornes, are the chief lakes, and there are numerous small lakes in the south-east. The vales of Tweed and Yarrow and Ettrickdale are the principal valleys.

History and Antiquities.—There are no Roman remains in Selkirkshire, the natives probably being held in check from the station at Newstead near the Eildons. The Standing Stone near Yarrow church bearing a Latin inscription is ascribed to the 5th or 6th century and is only a quasi-Roman relic. No so-called British camps have been found on the upper and middle waters of the Ettrick and Yarrow, and of the few situated in the lower valleys of these streams the most important is the large work on Rink Hill in the parish of Galashiels, the district containing various interesting prehistoric remains. At Torwoodlee, 2 m. north-west of Galashiels, are the ruins of the only example of a *broch* (round tower) in the Border counties. The barrier known as the Catrail, or Picts' Work, starts near Torwoodlee, whence it runs southwards to Rink Hill. There it sweeps round to the south-west as far as Yarrow church, from which it again takes a due south direction to the valley of the Rankle, where it passes into Roxburghshire. The history of the shire for six centuries following the retreat of the Romans is that of the whole of south-eastern Scotland. The country formed part, first, of the British kingdom of Strathclyde, then of the Saxon kingdom of Northumbria, and finally, about 1020, was annexed to Scotland. The first sheriff of whom there is record was Andrew de Synton, appointed by William the Lion (d. 1214).

To the north of Hangingshaw in the country between the Yarrow and Tweed William Wallace constructed an earthwork in 1297, still called Wallace's Trench, 1,000 ft. long, and terminating on the top of a hill in a large square enclosure. Here he lay till his plans were completed and at last departed, his forces including a body of Selkirk archers, for a raid into the north of England. During the prolonged strife that followed the death of Robert Bruce (1329) the foresters were constantly fighting, and the county suffered more heavily at Flodden (1513) than any

other district. The lawlessness of the Borderers was at length put down by James V. with a strong hand. He parcelled out the forest in districts, and to each appointed a keeper to enforce order and protect property. In 1529 the ringleaders, including William Cockburn of Henderland, Adam Scott of Tushielaw and the notorious Johnnie Armstrong. were arrested and promptly executed. This severity gradually had the desired effect, though after the union of the crowns in 1603 the freebooters and moss-troopers again threatened to be troublesome, until James VI.'s lieutenants ruthlessly stamped out disaffection. The Covenanters held many conventicles in the uplands, and their general, David Leslie, routed the marquis of Montrose at Philiphaugh in 1645.

Agriculture.—As the soil is mostly thin, over a subsoil of clayey till, agriculture is carried on at a disadvantage. About one-sixth of the surface is under cultivation; oats, turnips and a little barley are grown. Live stock is pursued more profitably, the sheep walks carrying heavy stocks; cheviots are the principal breed. Over half the holdings are over 100 acres, and the average size is 126 acres. More than one-third of the county (upwards of 60,000 acres) belongs to the duke of Buccleuch. The land between the Ettrick and the Tweed was formerly covered with forest to such an extent that the sheriffdom was described as Ettrick Forest, and became the hunting-ground of the Stuarts. James V., however, to increase his revenues, let the domain for grazing, and it was soon converted into pasture for sheep.

Woollen manufactures (tweeds, tartans, yarn and hosiery) are the predominant industry at Galashiels and Selkirk. Tanning is carried on at Galashiels.

The only railway communication is in the north, where there is a branch line from Galashiels to Selkirk, besides part of the track of the Waverley route from Edinburgh to the south and the line from Galashiels to Peebles.

Population and Administration.—In 1931 the population was 22,608; 61 persons spoke Gaelic and English and one Gaelic only. Selkirk (pop. 5,667) is the county town and only royal burgh. Galashiels (pop. 13,102) is the largest town and the only other burgh. Selkirkshire combines with Roxburgh to return a member to Parliament, and the shires of Selkirk, Roxburgh and Berwick form a sheriffdom, with a resident sheriff-substitute at Selkirk. The county is under school board jurisdiction, and there are high schools at Selkirk and Galashiels.

SELLA, QUINTINO (1827–1884), Italian statesman and financier, was born at Mosso, near Biella, on July 7, 1827. After studying engineering at Turin and Paris he became a professor at Turin. Entering the Chamber of Deputies in 1860 he became secretary-general of public instruction, and in 1862 received from Rattazzi the portfolio of finance. The Rattazzi cabinet fell before Sella could efficaciously provide for the deficit of £17,500,000 with which he was confronted; but in 1864 he returned to the ministry of finance in the La Marmora cabinet, and dealt energetically with the deficit of £8,000,000 then existing. A vote of the chamber compelled him to resign before his preparations for financial restoration were complete; but in 1869 he returned to the ministry of finance in a cabinet formed by himself, but of which he made over the premiership to Giovanni Lanza. By means of the grist tax (which he had proposed in 1865, but which the Menabrea cabinet had passed in 1868), and by other fiscal expedients, he succeeded, before his fall from power in 1873, in placing Italian finance upon a sound footing. In 1870 his influence turned the scale against interference in favour of France against Prussia, and in favour of an immediate occupation of Rome. He retired from politics in 1881, and died on March 14, 1884.

His *Discorsi parlamentari* were published (5 vols., 1887–1890) by order of the Chamber of Deputies. An account of his life and his scientific labours was given by A. Cossa in the *Proceedings of the Accademia dei Lincei* (1884–1885).

SELMA, a city of Alabama, U.S.A., the county seat of Dallas county; on the north bank of the Alabama river, 50 m. W. of Montgomery. It is on Federal highway 80, and is served by the Louisville and Nashville, the Southern and the Western of Alabama railways, and by river steamers and barges. Pop. 15,589 in 1920 (53% negroes); and 18,012 in 1930 by the Federal census, to which adjacent suburbs add more than 5,000. It is the metropolis of a large territory in the "black soil belt" of Alabama, raising especially cotton, live stock, pecans and diversified farm products; is an important dairy and lumber centre; and has extensive railroad shops, cotton mills with 25,000 spindles, a large bag factory, cottonseed-oil mills, and various other manufacturing industries. The aggregate factory output for 1927 was valued at $6,430,233. The wholesale trade is estimated at $20,000,000 annually. About 1815 a settlement was established here, called Moore's Landing or Moore's Bluff. In 1820 a town was laid out and incorporated by a company under the leadership of William Rufus King (vice president of the United States in 1853), who chose the name because of his admiration for the Ossianic legend. The city was chartered in 1852. During the Civil War it was the seat of arsenals, ship-yards and military factories, and was one of the last strongholds of the Confederacy to fall, surrendering on April 12, 1865, when Gen. Wilson entered the city and burned most of it.

SELMECZBANYA (BAŇSKA ŠTIAVNICA), old mining town on terraced slopes of a ravine in the Slovakian highlands, Czechoslovakia, and encircled by high mountains including the peak of Calvarienberg on the south-west, crowned by a castle and a church. It was colonized in the 12th century by German miners who later embraced the Reformation. The German element was driven out during the 18th century as a result of the counter-Reformation and its place taken by Slovaks. The mines were of great importance and quantities of gold and silver were raised but they have declined and now five silver mines are the chief relics of this former greatness. The activities are supplemented by the work of local potteries but the population has considerably decreased in the last twenty-five years. Pop. (1921), 13,264.

About 7 m. to the south-west and west lie Vihnye and Szkleno, two small spas with iron, lime and sulphur springs.

SELOUS, FREDERICK COURTNEY (1851–1917), British explorer and hunter, was born in London on Dec. 31, 1851, and was educated at Rugby and in Germany. He went out to South Africa when he was 19, travelled from the Cape to Matabeleland, reached early in 1872, and was granted permission by Lobengula to shoot game anywhere in his dominions. From that date until 1890, with a few brief intervals spent in England, Selous hunted and explored over the then little-known regions north of the Transvaal and south of the Congo basin, shooting elephants and collecting specimens of all kinds for museums and private collections. His travels added largely to the knowledge of Rhodesia. In 1890 he entered the service of the British South Africa company, acting as guide to the pioneer expedition to Mashonaland. Over 400 m. of road were constructed through a country of forest, mountain and swamp, and in two and a half months Selous took the column safely to its destination. He then went east to Manica, concluding arrangements there which brought the country under British control. He gave a summary of his travels in "Twenty Years in Zambesia" (*Geo. Journ.* vol. i., 1893). He returned to Africa to take part in the first Matabele War (1893), being wounded during the advance on Bulawayo. In March 1896 he settled with his wife on an estate in Matabeleland. He published an account of the Matabele campaign, entitled *Sunshine and Storm in Rhodesia* (1896). On the restoration of peace Selous settled in England. He continued, however, to make shooting and hunting expeditions—visiting Asia Minor, Newfoundland, the Canadian Rockies and other parts of the world. He wrote several books and many articles.

During the World War he served in the East African campaign in the legion of frontiersmen (25th Royal Fusiliers). He was killed in action at Beho Beho on Jan. 4, 1917. His collection of trophies was given by his widow to the Natural History Museum, London, where in June 1920 a national memorial to him was unveiled. A Selous scholarship was also founded at his old school, Rugby.

See J. G. Millais, *Life of Frederick Courtney Selous* (1918).

SELWYN, GEORGE AUGUSTUS (1719–1791), English wit, son of Colonel John Selwyn (d. 1751), of Matson, Gloucestershire, was born on Aug. 11, 1719. Educated at Eton and Oxford,

he became member of parliament for the family borough of Ludgershall in 1747, and from 1754, three years after he inherited Matson, to 1780 he represented Gloucester. He obtained two or three lucrative sinecures. In society he was very popular and won a great reputation as a wit. He is said to have been very fond of seeing corpses, criminals and executions, and Horace Walpole says he loved "nothing upon earth so well as a criminal, except the execution of him." He died in London on Jan. 25, 1791. Like the eccentric duke of Queensberry Selwyn claimed to be the father of Maria Fagniani, who became the wife of Francis Charles Seymour, 3rd marquess of Hertford.

See J. H. Jesse, *George Selwyn and his Contemporaries* (1843–44; new ed., 1882); and S. P. Kerr, *George Selwyn and the Wits* (1909).

SELWYN, GEORGE AUGUSTUS (1809–1878), English bishop, second son of William Selwyn (1775–1855), a distinguished legal writer, was born at Hampstead, London, on April 5, 1809. He was educated at Eton and at St. John's college, Cambridge, where he graduated in 1831. He returned to Eton as private tutor, was ordained deacon in 1833, and in 1841 was appointed first bishop to New Zealand, then just beginning to be colonized. He studied navigation and the Maori language on the voyage out and on his arrival gave himself up to a life of continual hardship. He spent days and sometimes nights in the saddle, swam broad rivers and provided himself with a sailing vessel. Unfortunately, just when he had gained the confidence of the natives, his ascendancy was rudely shaken by the first Maori war. Selwyn endeavoured to mediate, but incurred the hostility of both parties.

In 1854 he returned to England for a short furlough. He returned to New Zealand with a band of able associates, including J. C. Patteson, and began to divide his large diocese into sees of more manageable proportions. The colonists came to respect his uprightness, and the Maoris learned to regard him as their father. In 1868, while he was in England to attend the first pan-Anglican synod, the bishopric of Lichfield became vacant, and after some hesitation he accepted it. On his death, on April 11, 1878, his great work for the church was celebrated by a remarkable memorial, Selwyn college, Cambridge, being erected by public subscription and incorporated in 1882.

See *Lives* by H. W. Tucker (2 vols. 1879) and G. H. Curteis (1889).

His son, John Richardson Selwyn (1844–1898), bishop of Melanesia, was born in New Zealand on May 20, 1844. He was educated at Eton and at Trinity college, Cambridge, and was ordained deacon in 1869. The martyrdom of John Coleridge Patteson, bishop of Melanesia, led him to volunteer for service in the Australasian Archipelago. After three years' service, during which the bishopric remained vacant, he was nominated as Patteson's successor (1877). He returned to England in 1890 and became master of Selwyn college, where he died on Feb. 12, 1898.

SEMANG, a negrito tribe (*see* Races of Man, and Further Asia) of the Malay peninsula and of Siam. The Semang live in caves or leaf-shelters formed between branches. A waistcloth for men, made of bark hammered out with a wooden mallet from the cortex of a species of wild bread-fruit tree, and a short petticoat of the same for women, is the only dress worn; many go naked. Scarification is practised, by drawing the serrated edge of a sugar-cane leaf across the skin and rubbing in charcoal powder. They have bamboo musical instruments, the Jews' harp and a nose flute. On festive occasions they sing and dance, decorating themselves with leaves. The Semang bury their dead simply placing food and drink in the grave. The Semang of Patalung, called Ngo by the Siamese, are probably mixed with pre-Dravidian stock. They use the blow-gun (*q.v.*) as well as the bow and spears. They have a woman chief.

See Skeat and Blagden, *Pagan Tribes of the Malay Peninsula*, (1906); P. Schebesta, *Among the Forest Dwarfs of Malaya* (1929).

(J. H. H.)

SEMANTICS, the study of the changes in the meaning of words in the way of specialisation or generalisation, etc. *See* R. C. Trench, *The Study of Words* (1888, etc.).

SEMAPHORE, an apparatus for signalling by means of flags, lights or arms. Previous to the invention of the telegraph, semaphore signalling was used for transmitting messages between distant points, and is yet employed in the navies of many nations for intercourse between ships. The most familiar semaphore is that used in railway signalling for transmitting information to enginemen. (From Gr. σῆμα, sign, and φορά, carrying.)

SEMARANG, a residency of Java, Dutch East Indies, occupying a good deal of the north-eastern portion of the island; area about 11,300 sq.m. (Rembang residency was divided almost equally between Semarang and Surabaya residencies in 1928). Semarang is bounded on the west by Pekalongan, east by Surabaya, south by Kedu, Surakarta and Madiun, and on the north by the Java sea. Its western half is flat along by the coast, sloping gradually to high hills some distance inland, and culminating in mountains, especially where the residency cuts, tooth-like, into Surakarta, and the Merbabu complex of mountains. This half is abundantly watered by rivers, the most important of which are the Lusi and the Tuntang, and is a great sugar and kapok producing region (having a sugar experimental station), also a coffee-growing centre. The eastern half has a strip of flat land by the coast (Juwana and Japara plains), then limestone hills, and, in the west, the isolated mountain mass of Muria, and the fertile valley of the Lusi, running between the hills and the mountains of central Java on the southern edge of the residency. This half is noted for its teak forests and its extensive petroleum deposits, Chepu, on the eastern border, being a great refining centre; iodide of copper is also found. Population of the residency, before the Rembang addition, 2,786,921, almost entirely Javanese. The capital is Semarang (*q.v.*), in the west, and the next most important town is Rembang, in the east, on the coast, pop. 13,618. Other towns of note are Kendal, on the coast, and Ambarawa, Salatiga, Gundih, Demak, the "Mecca of Java" (*see* Java), Purwadadi and Blora. The railway from Semarang to Surakarta runs through the residency as far as Gundih, and the steam tramway from Cheribon to Surabaya traverses the coast from the western boundary very near Kendal to Semarang, thence across country to a short distance beyond Rembang, and from that place south-eastwards to the eastern boundary. Semarang was subject to Dutch rule, under a governor (the governor of the north-east coast, as he was styled), from 1748 onwards, his headquarters being at the town of Semarang. (E. E. L.)

SEMARANG, one of the chief towns and ports of Java, Dutch East Indies. It is situated, almost centrally, on the north coast 250 m. E. of Batavia, and is the capital of the residency of Semarang. It has a population of 146,509 (14,849 Europeans and Eurasians, and 19,429 foreign Asiatics, including Chinese), is on the banks of the Semarang river, and is connected by railway with Surakarta, Jokjakarta, Madiun and Surabaya, and by steam tramway with Cheribon, where connection is made with the railway to Bandung and Batavia. Semarang, like Batavia, is divided into two parts, the old native town near the coast, thickly housed, with narrow streets, but with some good shops, hotels, European business houses, and two churches (in former times it was surrounded by a moat, with forts), and a newer town, further inland, where are situated the residence of the resident, various Government and public buildings, including a military hospital, and also a club, the head offices of the Netherlands Indian railway (the workshops of this railway are also in Semarang), hotels, restaurants, and, in the large town square, *aloon*, the residence of the regent, and a mosque; the square also has recreation grounds. The two districts are connected by the fine Bojong road. South of Bojong road there is a beautiful residential hill suburb (Chandi), 500 ft. above the sea. Of interest in the vicinity of Semarang are Demak and Salatiga (*see* Java). Although Semarang is the third port in Java (exports, in 1926, 103,212,057 guilders, mainly sugar and kapok; imports 105,300,820), it is only an open roadstead, and the boisterous north-west monsoon may even cause suspension of work. Vessels anchor about 3 m. out, and, for the protection of the lighters into which they discharge their cargo, there is a harbour, the western pier-head of which extends some 1,600 metres into the sea, to prevent the mouth from silting up and to retain a sufficient depth of water. This harbour has a broad front, branching to the shore in two cus-

toms-house basins, and a fishing vessel harbour, whilst there are godowns, bonded stores and storage sheds, with two stationary steam cranes, and a small dry dock. The port is connected by rail and road with the hinterland; and by cable with Batavia, Surabaya and Balik Papan, in Borneo. The river between the town and the sea is canalized for traffic. There is a proposal (1928) to construct a deep sea harbour at a cost of, approximately, 15 million guilders. Various Dutch and other European liners and vessels of the Royal Packet Navigation company call regularly at Semarang. (E. E. L.)

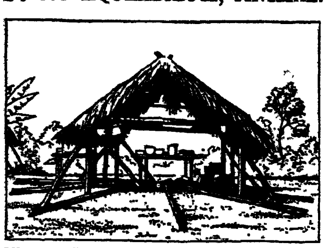
SEMBAT, MARCEL (1862–1922), French politician, was born Oct. 19, 1862, at Bonnières (Seine-et-Oise), and educated at the Collège Stanislas. In 1893 he became Socialist deputy for the 18th *arrondissement* of Paris, and attached himself to the Blanquist faction of the party headed by Edouard Vaillant. On the constitution of the United Socialist party, however, in 1905, under Jaurès, Sembat became one of a brilliant body of extremist debaters which made the Radical-Socialist party the strongest political force in France. On the outbreak of the World War, Sembat became minister of public works in the Ministry of National Defence in Aug. 1914. He died at Chamonix on Sept. 5, 1922. Among his published works are *Matisse et son oeuvre* (1920) and *La victoire en déroute* (Eng. tr. 1925).

SEMBRICH, MARCELLA (1858–), operatic singer, was born at Wiesniewczyk, near Lemberg, Austria, on Feb. 15, 1858. Discarding her own name, Praxede Marcelline Kochanska, she took her mother's maiden name for her operatic career. On June 3, 1877, she made her début at Athens as Elvira in *Puritani*. She was engaged for the Dresden opera house in 1878 appearing in the title part in *Lucia di Lammermoor*, also her first rôle at Covent Garden, June 12, 1880, and at the Metropolitan Opera House, Oct. 24, 1883. After five seasons at Covent Garden she reappeared at the Metropolitan Opera House in 1898, remaining until 1909. Since retiring from the concert stage in 1916 she has made a world-wide reputation as a teacher of singers.

SEMELE, in Greek mythology, daughter of Cadmus and Harmonia, and mother of Dionysus by Zeus. *See* DIONYSUS.

SEMICIRCULAR CANALS: *see* EQUILIBRIUM, ANIMAL.

SEMINOLE, an American Indian tribe, formed in the 18th century by splitting away from the Creek (*q.v.*). The name means "seceders." They occupied the territory of the destroyed Apalachi in northern Florida and fought the United States bitterly in 1817–18 and under Osceola in 1835–42. They number some 2,000 in Oklahoma and 300 in southern Florida, both bodies much mixed with negro blood. (*See* MacCauley, *Bur. Am. Ethn. Rep.* V., 1887.)



BY COURTESY OF THE HEYE FOUNDATION
A SEMINOLE OPEN THATCHED HOUSE IN FLORIDA

SEMIPALATINSK, (1) formerly a province of the general-governorship of the Steppes, now included in the Kazakstan A.S.S.R. (*q.v.*); (2) a town of Asiatic Russia in the Kazakstan A.S.S.R. in lat. 50° 28′ N., 80° 13′ E., on the Irtysh river, in a sandy waste at an altitude of 686 ft. Pop. (1926) 56,411. Its position on the Irtysh, with steamer routes to Omsk and Lake Zaisan made it a Kirghiz centre for trade in livestock, wool and tallow. It has a dock, wharves and repairing shops. The river is 250 yd. wide and is frozen from Nov. 26 to April 30. The opening in 1915 of the railway line from Novo-Sibirsk to Semipalatinsk greatly increased its prosperity; active work is going forward (1928) to continue the line southwards to link up with the railway systems of the Russian Central Asiatic Republics. The town has breweries, leather works, flourmills and a sheepskin factory and is the centre of a district of the same name.

SEMĪRAMIS (*c.* 800 B.C.), a famous Assyrian princess, round whose personality a mass of legend has accumulated. It was not until 1910 that the researches of Professor Lehmann-Haupt of Berlin restored her to her rightful place in Babylonian-Assyrian history. The legends derived by Diodorus Siculus, Justin and others from Ctesias of Cnidus were completely disproved, and Semīramis had come to be treated as a purely legendary figure. The legends ran as follows: Semīramis was the daughter of the fish-goddess Atargatis (*q.v.*) of Ascalon in Syria, and was miraculously preserved by doves, who fed her until she was found and brought up by Simmas, the royal shepherd. Afterwards she married Onnes, one of the generals of Ninus, who was so struck by her bravery at the capture of Bactra that he married her, after Onnes had committed suicide. Ninus died, and Semīramis, succeeding to his power, traversed all parts of the empire, erecting great cities (especially Babylon) and stupendous monuments, or opening roads through savage mountains. She was unsuccessful only in an attack on India. At length, after a reign of forty-two years, she delivered up the kingdom to her son Ninyas, and disappeared, or, according to what seems to be the original form of the story, was turned into a dove and was thenceforth worshipped as a deity.

The name of Semīramis came to be applied to various monuments in Western Asia, the origin of which was forgotten or unknown. (*See* Strabo xvi. 1. 2.) Ultimately every stupendous work of antiquity by the Euphrates or in Iran seems to have been ascribed to her—even the Behistun inscriptions of Darius (Diod. Sic. ii. 3). Semīramis appears as a goddess, the daughter of the fish-goddess Atargatis, and herself connected with the doves of Ishtar or Astartē. The same association of the fish and dove is found at Hierapolis (Bambyce, Mabbog), the great temple which, according to one legend, was founded by Semīramis (Lucian, *De dea Syria*, 14), and where her statue was shown with a golden dove on her head (33, 39). The irresistible charms of Semīramis, her sexual excesses (which, however, belong only to the legends: there is no historical groundwork), and other features of the legend, all bear out the view that she is primarily a form of Astartē, and so fittingly conceived as the great queen of Assyria.

Professor Lehmann-Haupt, by putting together the results of archaeological discoveries, has arrived at the following conclusions. Semīramis is the Greek form of Sammuramat. She was probably a Babylonian (for it was she who imposed the Babylonian cult of Nebo or Nabu upon the Assyrian religion). A column discovered in 1909 describes her as "a woman of the palace of Samsi-Adad, King of the World, King of Assyria, . . . King of the Four Quarters of the World." Ninus was her son. The dedication of this column shows that Semīramis occupied a position of unique influence, lasting probably for more than one reign. She waged war against the Indo-Germanic Medes and the Chaldaeans. The legends probably have a Median origin. A popular etymology, which connected the name with the Assyrian *summat*, "dove," seems to have first started the identification of the historical Semīramis with the goddess Ishtar and her doves.

See F. Lenormant, *La Légende de Sémiramis* (1873); A. H. Sayce, "The Legend of Semīramis," in *Hist. Rev.* (January, 1888).

SEMITIC LANGUAGES. The "Semitic" or "Shemitic" languages, so named in 1781 by Schlözer because most of those who spoke them were descended from Shem (Gen. x.–xi.), were spoken in Arabia, Mesopotamia, Syria and Palestine, whence they spread into Abyssinia, Egypt, northern Africa and elsewhere. All are closely related in structure and vocabulary (*cf.* Ass.-Bab. *bîtu*, Hebr. *bayith*, Aram. *baythâ*, Mand. *bîth*, Arab. *baitu*, and Eth. *bēt* "house"); yet cognate forms and words have not infrequently in the course of history acquired a different connotation (*e.g.*, Hebr. *'eleph*, "one thousand," but Eth. *'elf*, "ten thousand"). Each language also contains much that cannot be referred to the common stock.

Originally, the Semitic languages were less clearly defined. Early Aramaic like Assyro-Babylonian prefixed the precative *l-* to the imperfect and like Hebrew used "*wāw-* consecutive," but later dropped both constructions. Philologically they developed with varying rapidity; thus classical Arabic and Babylonian retained the case-endings of the primitive speech, while classical Hebrew and Aramaic used the accusative for all plural cases, exhibiting the same decay as modern Arabic. They can hardly be classified chronologically. Geographically, they fall into four

groups: eastern (Assyro-Babylonian or Accadian), central ("Amorite," Aramaic, Syriac), western (Canaanite, Moabite, Hebrew, Phoenician), and southern (Arabic, Ethiopic). Assyrian gave rise to "Cappadocian" in Asia Minor. Phoenician, which developed into Punic in the Mediterranean islands and northern Africa, reached Marseilles. Hebrew under Judaism passed into "Mishnaic" Hebrew and the modern vernacular and literary dialects of the East, especially Palestine, and various European countries. From Aramaic sprang Samaritan after the schism at Samaria, Palmyrene at Palmyra and Nabataean in Syria and northern Arabia, the Syriac of the Church, which missionaries carried into China and India, and the gnostic "Mandaean" of Babylonia. The modern dialects of Aramaic near Damascus and of Syriac in parts of Kurdistan have devised a definite article, enriched the tense-system, and admitted many contractions and other phonetic changes, thereby substituting an unexpected euphony for the *stridentia anhelantiaque verba* (Jerome) of the ancient speech.

In Arabia the "proto-Arabic" dialects, Sabaean ("Ḥimyaritic"), Minaean (which like Ass.-Bab. sometimes preferred *s* to *h*), and Liḥyānī (or Thamudean), preceded Arabic; this was carried far and wide by Islam and now counts some 40 dialects. Of these Socotrī (which changes *s* into *h*) and Mahrī, are spoken in Shihr and Mahra respectively. Others are the Maghribī dialects of northern Africa, which have been contaminated by Berber influence, and that (now extinct) of Sicily; they affix to the first person plural *-u*, which otherwise marks only the second and third person, and prefix to the first person singular *n-*, which otherwise marks only the first person plural. Maltese, also of the Maghribī family, but alone confined to Christians and generally written in European characters, has been for some 900 years separated from Arabic, while exposed to Italian influence. Ethiopic or *Geʿez*, originally the speech of the kingdom of Aksūm and afterwards of the Church and literature of Ethiopia, yielded to the southern and largely non-Semitic Amharic (or Abyssinian) as the language of the court; this developed into the northern Tigrē and southern Tigrai or Tigriña. Hararī at Harar, an island close to eastern, and Guraguē in southern, Shoa, are distant offshoots of Amharic.

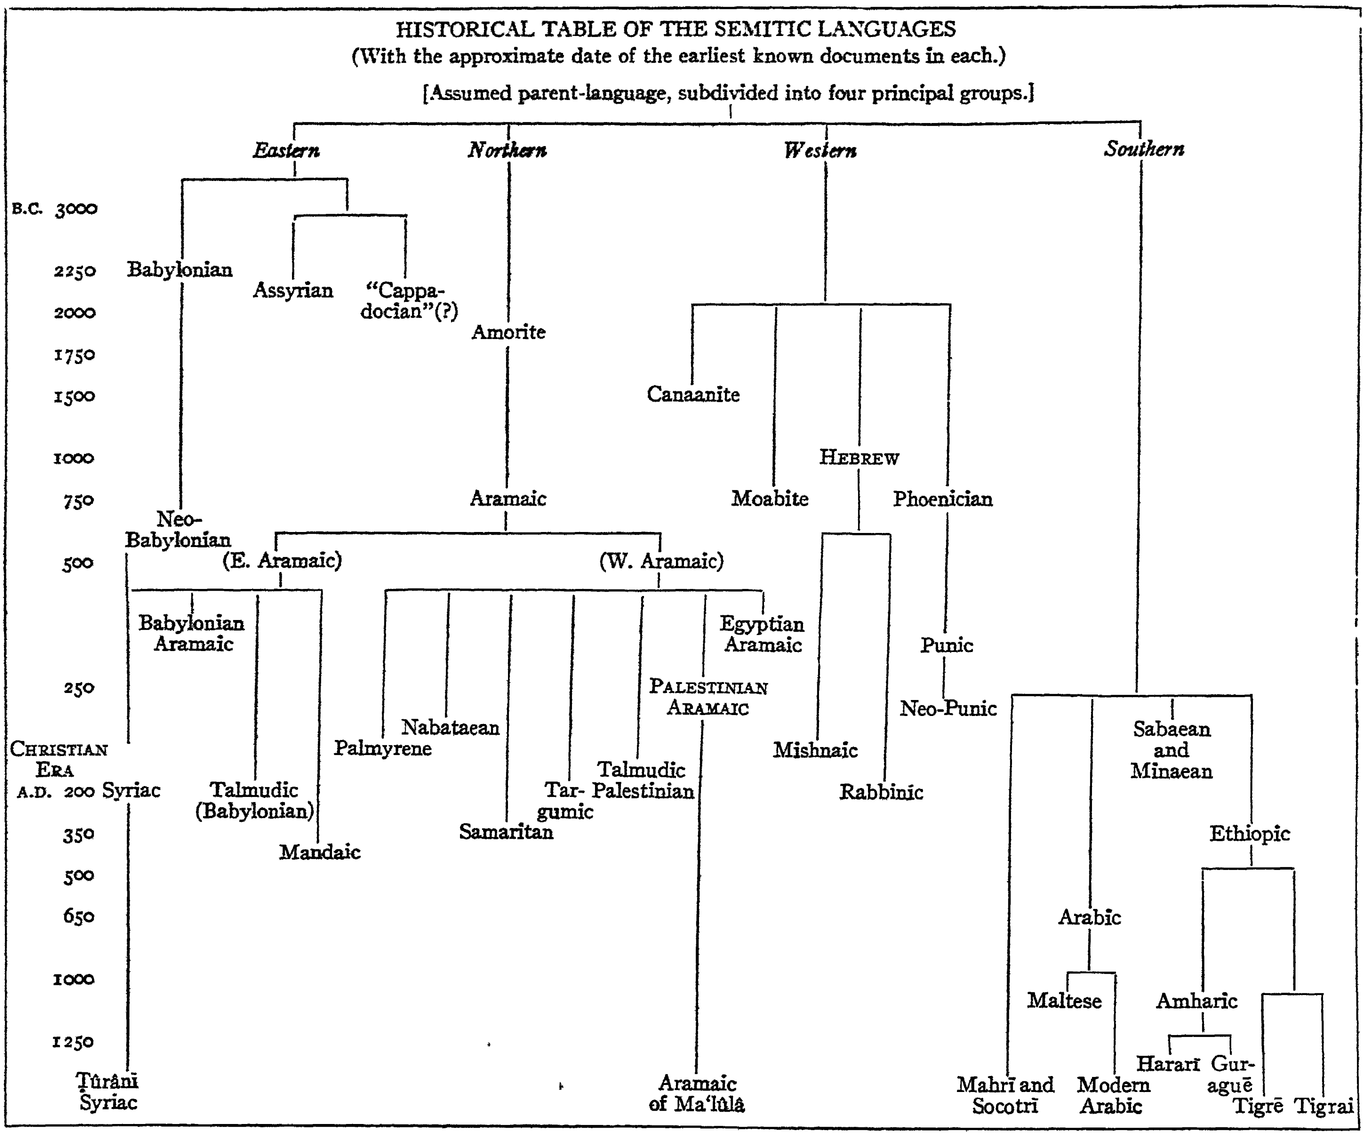
In settling the connection between the various languages it is easy to be misled by isolated peculiarities in vocabulary or grammar. Each of the older languages agreed in grammatical points with some other to which generally it bore no close resemblance, while more nearly related dialects exhibited different formations; each also possessed features peculiar to itself. For instance, on the one hand, Hebrew with Phoenician and Liḥyānī prefixed *ha-*, Nabataean and Arabic *'al-*, and Tigrē *la-*, as a definite article; yet the etymological connection between these forms is obscure. Aramaic suffixed *-â* and the other southern Arabic dialects *-n* to express determination. On the other hand, Arabic attached *-n* and the southern Arabic dialects *-m* to indicate indetermination. This *-m* was regularly used in Babylonian, where it had lost all force, even in the earliest documents, and has survived sporadically in adverbs in Hebrew and Abyssinian, a single instance of it being known in Phoenician.

Here several languages have each independently lost something which the tongues most akin to them have preserved. Similarly, the strengthening of the pronoun of the third person by *-t* or *-tū* was customary only in Ethiopic, Sabaean and Phoenician, though perhaps found also in certain Arabic particles. Aramaic alone had no reflexive with prefixed *n-* and Hebrew no causative theme with prefixed *sha-*. Several languages originally had a passive formed by internal vowel-change; Arabic alone exhibits the complete system; there are some traces of it in Hebrew and Aramaic, very few in the modern Arabic, and virtually none in Ass.-Bab., or, when it became literary, in Ethiopic. Again, phonetic resemblances occasionally indicated no kinship but were due to later growth. For instance, the masculine plural ending was in Hebrew *-îm* but in Aramaic, as in modern Arabic, *-în*; yet Aramaic originally had *-m*, whereas classical Arabic had *a* after the *-n* (in *-ûna* and *-îna*), where the change of *m* into *n* between two vowels is very improbable. These endings, therefore, may originally have been distinct. Great caution, too, must be exercised in drawing conclusions from points of agreement between the vocabularies of the various languages. For instance, Assyrian, Hebrew and Ethiopic had the same word for many objects which the other Semites called by different names; and the same might be said of Hebrew and Sabaean. Finally Moabite, which was otherwise indistinguishable from Hebrew (although, if the vocalization were known, its pronunciation might be found to have differed considerably), shared one striking peculiarity with Ass.-Bab. and the southern group, viz., a derived verbal theme formed by infixing *t* (*cf.* Moab. *'ltḥm*, "fought," and Arab. *iltaḥam*, "was hotly contested," with Hebr. *nilḥam*, "fought"). But to build any theory on such facts is hazardous, since the words or forms so cited are either found, though with a changed *nuance*, in at least one cognate language or actually occur with the same sense exceptionally or in poetical or archaic texts.

Certainly Arabic (with Sabaean, Mahrī and Socotrī) and Ethiopic were closely related and formed a distinct group over against the Hebraeo-Phoenician, Aramaic and Ass.-Bab. groups. Only in these southern languages are found the peculiar "inner plurals," consisting in the employment of certain forms denoting abstracts for the plural. They agree in inserting *â* between the first two consonants to enable a verb to take a direct instead of an indirect object (*e.g.*, Arab. *kâtaba*, "corresponded with," and *takâtaba*, "corresponded together," from *kataba*, "wrote"), and in using *a* between the last two consonants of the perfect in every active theme (*cf.* Eth. *'aṣdaqa* with Hebr. *hiṣdîq*, "justified"). Yet Hebrew has isolated examples of both peculiarities (e.g., *lôshēn*, "slandered," with *ô* for *â*, and *qiddash*; "sanctified," if the vocalization is correct). This is not disproved by such exceptions nor violated by the fact that the aspirated dentals *th, dh, ẓ* in Arabic are replaced in Ethiopic, as in Hebrew and Ass.-Bab., by the pure sibilants *s* (or *sh* in the latter language), *z, ṣ*, but in Aramaic by the simple dentals *t, d, ṭ*, which seem closer to the Arabic sounds. Even after the separation of the northern and southern groups all must have possessed these sounds, like Arabic, but have afterwards simplified them in one direction or another; hence accidental similarities resulted. Ethiopic kept *ḍ*, the most peculiar of them, distinct from *ṣ*, whereas Aramaic confused it with the guttural ʿ (*ʿayin*) and Ass.-Bab. and Hebrew with *ṣ*; all therefore once possessed this as a distinct sound. The sibilant *ś* (*sîn*) occurred only in Hebrew, Phoenician and old Aramaic; it must have closely resembled *sh* (*shîn*) with which Ass.-Bab. confused it, since it was represented by the same sign, and in later times was changed into an ordinary *s*. The division of the Semitic languages, therefore, into northern and southern is justifiable. It must, however, be remembered that such a division was not an instantaneous occurrence but that even after it, intercourse was maintained between tribes speaking kindred dialects and that intermediate dialects between the groups once existed. Further, Hebraeo-Phoenician and indeed Aramaic stand apart from Ass.-Bab. in more things than in the script; *e.g.*, in the preservation of the gutturals and the absence of verbal themes with *-tan-* infixed. The simplest classification is perhaps the following; A. Ass.-Bab. B. (i.) Hebraeo-Phoenician and Aramaic; (ii.) Arabic and Ethiopic.

Their connection with the Hamitic languages is disputed. They clearly, however, influenced Egyptian, which has pronouns (*cf.* Egt. *'nky* with Hebr. *'ānôkî*, "I") and pronominal affixes (*cf.* Egt. *-ty* with Hebr. *-tā*, "thou," and Egt. *-ty* with Ass.-Bab. *-at*, "she") resembling the Semitic forms, a pseudo-participle like the Accadian "permansive," certain verbal stems analogous to the Semitic themes, and many similar words (*cf.* Egt. *myw* and Ass.-Bab. *mû*, "water"). The Berber languages show similar but less frequent resemblances. Similarities, however, between Semitic and Indo-European words are either superficial (*cf.* Skt. *shash* and Hebr. *shēsh*, "six," whose root proves them unconnected) or due to borrowing (*cf.* Gk. χρυσός, which was borrowed from the Phoen. *ḥārûṣ*, "gold").

The script in all except Ass.-Bab. is derived from Phoenician and the writing runs from right to left in all except Ass.-Bab. and Ethiopic; only in a few Sabaean and early Ethiopic inscriptions is it alternate. Accadian alone had a script, borrowed from Sumerian, which primitively represented vowels, while Ethiopic very soon added them to an originally consonantal script; in both



the signs represent syllables and not letters. In the others vowel-signs, which were never regularly used, were added above and below the line, first by the Syrians in imitation of the Greek vowels and afterwards by the Hebrews and Arabs. Special numerical signs were invented or borrowed (for the so-called "Arabic numerals" are Indian) by all except the later Jews, who used letters of the alphabet for the purpose. No syllable might begin with a vowel, a breathing (*'aleph* or *hamzah*), written ', being used to support an initial vowel; there were also five gutturals of varying hardness, viz., *h, ḥ, ḫ,* '(*'ayin*) and *ġ* (*ġayin*). Arabic alone had all six gutturals; Mandaean confused all and Ass.-Bab. merged all except *ḫ*, and sometimes ' and *h* in vowels. There were also 12 sibilants and dentals as well as the ordinary consonants, which interchanged in the various languages according to definite rules; there were usually only two labials, *b* and *p* or *f*, although Hebrew had an aspirated *b* and *p* and Ethiopic two forms of *p*. The stress lay on the consonants, perhaps most of all in Syriac, and the vowels (originally only *a, i* and *u*) might be freely modified, especially through proximity to gutturals (*cf.* Ass.-Bab. *sibi* and Heb. *shebha'*, "seven").

Roots.—Almost all words go back to triconsonantal roots, although the theory which refers them utimately to biconsonantal roots is not improbable; for certain primitive words, like *dm*, "blood," are biconsonantal, and two consonants seem to run through many common roots, like *KS* through those denoting "to cut" or "strike." But the language, as now known, has passed this stage, and the parent speech, if ever there was one, is irretrievably lost. From the simple root diverse parts of speech are formed by modifying the vowels or by adding prefixes or affixes; thus from the root *qdsh* are formed the Bab. *qadishtu*, "hierodule"; Heb. *qōdhesh*, "holiness," *qādhôsh*, "holy," and *miqdāsh*, "sanctuary"; Mishn. Heb. *qiddûsh*, "betrothal"; Syr. *mqaddshûthâ*, "sanctification," and *qadhîshā'îth*, "holily"; Arab. *qaddîs*, "priest"; Eth. *qedsenā*, "holiness" and so on. This facility outweighed the rarity of compound substantives; but compound propositions and adverbs became ever more frequent.

Genders and Plurals.—The only genders are masculine and feminine, which sometimes serves for the neuter; *e.g.*, Heb. *ṭôbhāh* (fem. sing.), "good" = "goodness" and Heb. *nĕkhōḥôth* (fem. plur.), "honest things" = "honesty." The cases took terminations (sing. nom. *-u*, acc. *-a*, gen. *-i*; du. nom. *-â*, acc.-gen. *-ai* or *-ê*; pl. nom. *-û*, acc.-gen. *-î*). Classical Babylonian and Arabic exhibit all; the later languages confused them. Thus Hebrew, Aramaic and modern Arabic use *-î* (*-îm* or *-în*) and Assyrian *-ā* (*-āni*) as the universal plural ending; Hebrew and Ethiopic retain traces of the singular endings, but Aramaic and modern Arabic have discarded them. To the singular endings Arabic added *-n*, when the noun was indeterminate, and Babylonian *-m*, of which the force is obscure; to the plural Aramaic, Arabic and sometimes Ethiopic added *-n*, Hebrew and Phoenician *-m*. The feminine singular ending was *-(a)t(h)*, which became *-āh* in Hebrew and *-ah* in modern Arabic, and the plural ending *-āt(h)* or, in Hebrew and Phoenician, *-ôth;* the case-endings, when retained, followed this *-t*. There are traces of a primitive plural, formed (as in Sumerian)

by reduplication (*cf.* Ass.-Bab. *māmi* beside; *mê* from *mû*, "water"), to which the Hebrews through misunderstanding sometimes added the regular *-ôth* (*cf.* Heb. *piphiyôth* beside; *piyôth* from *peh*, "mouth"). The remarkable "inner plurals," characteristic of Arabic and less so of Ethiopic, are formed by modifying the vowels and sometimes adding preformative or afformative syllables; *e.g.*, Arab. *'awlâd* from *walad* and Eth. *welūd* from *weled*, "boy." The attempt to take a collective noun like *zākhûr*, "male(s)" as the "inner plural" of the adjective *zākhār*, "male," in Hebrew is hardly justified.

The States.—Determination and indetermination were expressed by the "states." Primarily the "absolute state," which took no termination, denoted the indeterminate, the "emphatic state" the determinate noun, as in Bibl.-Aram. *ḥēlem* (absol.), "a dream," but *ḥelmâ* (emph.), "the dream"; in Ass.-Bab. the absolute state was practically confined to the predicate, as in *sinnishtum* (emph.) *shî ûl ashshat* (absol.), "that woman (is) not a wife." In time these forms too were confused or dropped (*cf.* classical Arab. *malikun*, "a king," and *al-maliku*, "the king," with modern Arab. *malik*, "a king," and *al-malik*, "the king"). Thirdly, the "construct state," used before the genitive case, was the lightest form of the noun, dropping the afformative *-m* or *-n* (and often the singular case-ending in Ass.-Bab.) and dispensing (if there was one) with the article (*cf.* Ass.-Bab. *ashshat awēlim*, "the wife of the man"). This construction runs through the whole group, but various periphrases with prepositions or words denoting "owner" or "property" and so on are not uncommon, especially in Assyrian, Syriac and modern Arabic. Only Hebrew, Nabataean and Arabic had a definitive article (viz., *ha-*, *l-* and *al-* respectively); Ass.-Bab., like late Aramaic, did not feel the need, early Aramaic used the emphatic ending *-â*, and the south-Arabian dialects suffixed *-n* for the purpose; Ethiopic did not determine nouns, while Abyssinian used the suffix "his" (cf. *be'sī*, "man," and *be'sīhū*, "his man" = "the man"). Similarly the modern Aramaic of the *Ṭûru-'l-'Abdîn* has met the difficulty by coining the forms *ū-*, *ī-*, *āu*, "the," from the demonstrative pronoun.

Numerals.—The numerals exhibit one peculiarity not yet satisfactorily explained but characteristic of the whole group: masculine nouns take feminine numerals and *vice versa* from three to ten.

Pronouns.—Pronouns are singularly numerous. From the primary element *ha* many, containing usually the elements *d(h)*, *z*, *k*, *l* or *m* (for the remoter object) and *n* (for the nearer object) are built up; but other varieties occur, especially in the later languages. The personal pronouns, which are less numerous, rest on a common scheme: *k* or sometimes *t* for the first, *t* for the second, and *h* (or *sh* in Ass.-Bab.) for the third person. To express a possessive pronoun or the pronominal object, elements of these pronouns are suffixed to the noun or verb; *e.g.*, Ass.-Bab. *shumshu* =Hebr. *shĕmô* (for *shĕmēhû*), "his name"; or Syr. *qatleh*=Arab. *qatalahu*, "he killed him." These suffixes never denote the indirect object, except in Ethiopic and very rarely in Hebrew; only early Babylonian uses a special form in *-m* for the dative (e.g., *iddinushu*, "they gave it," but *iddinushum*, "they gave to him"). As a relative pronoun either the word used to introduce the genitive case *shā* in Ass.-Bab. and *zî* (*dî*) in Aramaic, or an originally demonstrative pronoun, *'allādhî* (*cf.* Heb. *hallāzeh* "this"), in Arabic and *za* (*cf.* Eth. *ze*, "this") in Ethiopic, is used. Hebrew employed *'ăsher*, the construct state of an old noun, meaning "the place of," "where" (*cf.* Ass.-Bab. *ashru*, "place," and *ashar*, "where") for the purpose; but *she-* was used dialectically and in late Hebrew.

Verbs.—As with nouns, so with verbs, modifications of meaning were expressed by changes in the vocalization or the addition of prefixes. Thus from the common root *q-t(ṭ)-l* Arabic formed *qatala*, "killed"; *qattala*, "massacred"; *qâtala*, "fought with"; *'aqtala*, "exposed to death"; *taqattala*, "was busied with killing"; *taqâtala*, "fought together"; *inqatala*, "was killed"; *istaqatala*, "killed himself (through over-exertion)." Assyrian had 12, Hebrew and Aramaic seven, Arabic 11, and each one or more rarer, themes; Ethiopic had altogether 23 themes. Classical Arabic alone has a passive formed from each theme by substituting *u-i-a* for *a-a-a*, as in *qutila*, "was killed," and so on; Hebrew exhibits such a passive in the intensive and causative themes, such as *quddash*, "was sanctified," from *qiddash*, "sanctified." Elsewhere, however, only the passive participle (*e.g.*, Heb. *yālûdh*, Aram. *yĕlīdh* and Eth. *welūd*, "born") has normally survived. Canaanite, like Ass.-Bab., used the "permansive" tense in both senses, though with different vowels (e.g., *laqiḥu* "they were taken," and *laqaḥu*, "they took"); but this died out, and everywhere except in the eastern group the reflexive was more and more used as a passive; *e.g.*, Heb. *nilqaḥ* beside *luqqaḥ*, "was taken," from *lāqaḥ*, "took" (*cf.* Ass.-Bab. *liqi*, "was taken," and "took") and Syr. *ethmlî*, "was filled," from *mlâ*, "filled."

The basic form was the third person singular unaugmented by prefix or affix, originally a nominal form denoting a timeless state, neither active nor passive; for example, Ass.-Bab. *nadin*, "given," whether "has given" or "has been given." Ass.-Bab. used it generally but not exclusively as intransitive or passive, although this led to ambiguity; for *kasap nadin* meant either "the money has been given" or "he gave the money." The Eastern group, assigning both uses to this form (called "permansive" as expressing a more or less permanent state), removed the ambiguity by employing case-endings; the Western dispensed with them, since it marked the transitive by *a* and the intransitive by *i* under the second consonant. A third form with *u* (*e.g.*, Ass.-Bab. *maruṣ*, "was ill," or Heb. *qāṭōn*, "was small") had always only a "stative" force. Occasionally the other groups confused the *i-* and *a-* forms (*cf.* Heb. *mālē'* and Eth. *mal'a* = Ass.-Bab. *mali*, "is full" or "has filled") but generally distinguished them (*cf.* Arab. *mali'a*, "was full," and *mala'a*, "filled"); although usually different roots were preferred (*e.g.*, Heb. *hākham*, "was wise," and *shāphaṭ*, "judged," (*cf.* Arab. *ḥakuma*, "was wise," and *ḥakama*, "judged").

The pronominal subject was affixed to the permansive tense, as being properly nominal: thus *kabit attâ*, "honourable (art) thou," gave rise to *kabtâtâ*, "thou-art-honourable"; this tense denoted a state, viz., what was complete in past time. A new tense, describing incomplete action in present or future time, was obtained by prefixing the pronominal element: thus *ta-* (from *attâ*), "thou," and *zakir* coalesced into *tazakar* (with *a* for *i* under *k*, as the sense is active), "thou dost" or "wilt remember." Finally, a tense describing incomplete action in past time was devised by modifying the vowels of the present, giving rise to *tazkur*, "thou wast remembering," which came to serve for the pure preterite "thou didst remember." The cognate languages, through using the permansive as a proper preterite, required only an imperfect for incomplete action, past, present or future, for which they adopted a form resembling the Ass.-Bab. preterite (*e.g.*, Heb. *tizkōr*, "thou wast remembering," "dost" or "wilt remember," but *zākhartā*, "thou hast remembered"). Why a form corresponding with the Ass.-Bab. *izakar*, "he does" or "will remember," was not adopted, is not clear; it may have been to avoid confusion with the preterite in certain derived themes. In some Aramaic dialects, especially Syriac and Mandaic, *l-* or *n-* was prefixed to the third person. In prohibitions, not the imperative but a tense resembling the preterite-imperfect (probably derived independently from the imperative) is used; *cf.* Ass.-Bab. *zukur* and Heb. *zĕkhōr*, "remember," but Ass.-Bab. *ē tazkur* and Heb. *'al tizkōr*, "do not remember."

Much skill was shown in circumventing the inadequacy of these tenses, notably by means of "*wāw*-consecutive" in Hebrew (*q.v.*) and the active participle in all the languages. But the need of compound tenses was soon felt. Phoenician, Aramaic and Syriac formed with the verb "to be" a true present, a pluperfect, and other tenses; modern Arabic uses it as well as *rāyiḥ*, "going," *'ammâl*, "doing," and so on, for a similar purpose, and prefixes *bi-*, "in," to the imperfect to make a present (e.g., *yiktub*, "he writes," and *byiktub*, "he is writing"). Mishnaic Hebrew formed a present by combining the participle with the pronominal subject (e.g., *'ômĕrani*, "I say," formed from *'ômēr 'ănî*, "I [am] saying"). The modern Syriac of Kurdistan has entirely discarded the old in favour of new tenses like this participial present and the participle with the verb "to be" and other formative elements.

All, especially Hebrew, being relatively deficient in compound

nouns and adjectives, use numerous circumlocutions for them; *e.g.*, Arab. *qillat ṣabr*, "littleness of patience—impatience"; all again, especially Arabic, frequently use apposition or a genitive case for an adjective; *e.g.*, Arab. *issâ'at addahab*, "the watch, the gold," or *sâ'at addahab*, "the watch of gold." Arabic alone has a special form for the comparative and superlative of adjectives, of which Hebrew preserves traces; all use a partitive preposition to express comparison; *e.g.*, Heb. "small from my brothers" = E. "smaller than my brothers." Most, but especially Hebrew and Arabic, lack adverbs, which they replace by the adverbial accusative and prepositional phrases. The syntax of all is very alike: but the Eastern languages when influenced by Sumerian tend to throw the verb to the end, the Western to the beginning of the sentence. All employ nominal clauses owing to difficulties about the verb "to be" and the absence (except in Assyrian) of a verb "to have" (*e.g.*, Arab. "with me money" = E. "I have money"). Equally common is the circumstantial clause, viz., a clause added, often asyndetically, to describe the circumstances (*e.g.*, Heb. "a tower and its head in Heaven" = E. "a tower whose top may reach unto Heaven"). Arabic is peculiar in putting the predicate in such a clause and after several verbs, notably the substantive, in the accusative case (*e.g.*, Arab. "he went out, his father [nom.] sitting" [acc.] = E. "while his father was seated"). The verb, especially in Hebrew and Arabic, when at the beginning of the sentence, often stands in the third person masculine singular (*cf.* Gk. *schēma Pindaricum*). Co-ordinating and to a greater degree sub-ordinating conjunctions, especially in Hebrew, were rare; Syriac, however, by borrowing largely from Greek (*e.g.*, Syr. *ger* = Gk. γάρ, "for") obtained a more flowing construction of sentences. Otherwise λέξις εἰρομένη, "speech strung together," chiefly with the conjunction "and," is characteristic of Semitic idiom (*e.g.*, Arab. "he was forced and did it" = E. "forced to do it"). This conjunction frequently also introduces the apodosis (*e.g.*, Heb. "if I find and I will spare" = E. "then I will spare"). So Ass.-Bab. used "and let" for "that" (*e.g.*, Capp. "see and let thy instructions come" = E. "that thy instructions come"). Subordinate clauses were not generally distinguished; but Ass.-Bab. marked verbs in them by the ending *-u* or sometimes *-a* and Arabic by *-a*. Ethiopic alone had a special form, using *yezaker*, "he remembers," as an imperfect and *yezker*, "let him remember," as a subjunctive. The corresponding form in Hebrew, though an imperfect, served also, if possible, in a shortened form, as a jussive (*e.g.*, Heb. *yizkōr*, "let him remember") and in Ass.-Bab. though a preterite, with *lû*, "let," as a precative (*e.g.*, Ass.-Bab. *lizkur*, "let him remember"). The infinitive in the accusative case, sometimes with an epithet, was often added to strengthen the verbal idea, especially in Arabic; in Babylonian a primarily exclamatory infinitive in the nominative case served the same purpose (*e.g.*, Ass.-Bab. *tabālum tatbal*, "a taking away! hast thou taken away?" = E. "hast thou indeed taken away?"). Hebrew uses constructions apparently similar to both.

The Semitic languages, therefore, shared many common characteristics; but each, although all stand more closely together than any modern languages, developed peculiarities, which appear sporadically in the others. Thus Ass.-Bab. shared some words or idioms with Hebrew, others with Syriac; Hebrew in some things resembled Phoenician or Moabite, in others Aramaic; Aramaic here touched Phoenician, there Arabic; Arabic had much in common with Ethiopic, which in some points approached Accadian and Hebrew rather than any other language. *See* ASSYRIAN; HEBREW; ARAMAIC; SYRIAC; ETHIOPIC; AMHARIC; ARABIC; YIDDISH.

(G. R. D.)

SEMLER, JOHANN SALOMO (1725–1791), German church historian and biblical critic, was born at Saalfeld in Thuringia on Dec. 18, 1725, the son of a clergyman in poor circumstances. He grew up amidst pietistic surroundings, which powerfully influenced him his life through, though he never became a Pietist. In his seventeenth year he entered the university of Halle, where he became the disciple, afterwards the assistant, and at last the literary executor of the orthodox rationalistic professor S. J. Baumgarten (1706–1757). In 1749 he became editor, with the title of professor, of the Coburg official *Gazette.* But in 1751 he was invited to Altdorf as professor of philology and history, and in 1752 he became a professor of theology in Halle. After the death of Baumgarten (1757) Semler became the head of the theological faculty of his university, and the fierce opposition which his writings and lectures provoked only helped to increase his fame as a professor. His popularity continued undiminished for more than 20 years, until 1779. In that year he came forward with a reply (*Beantwortung der Fragmente eines Ungenannten*) to the *Wolfenbüttel Fragmente* (*see* REIMARUS) and to K. F. Bahrdt's confession of faith, a step which was interpreted by the extreme rationalists as a revocation of his own rationalistic position. Even the Prussian Government, which favoured Bahrdt, made Semler painfully feel its displeasure at this new but really not inconsistent aspect of his position. But, though Semler was really not inconsistent with himself in attacking the views of Reimarus and Bahrdt, his popularity began from that year to decline, and towards the end of his life he felt the necessity of emphasizing the apologetic and conservative value of true historical inquiry. He died at Halle on March 14, 1791, worn out and disappointed at the issue of his work.

Semler was a pioneer in the criticism of the traditional canon of Scripture, in the search for the origins of the books of the New Testament, and in Church history.

Tholuck gives 171 as the number of Semler's works, of which only two reached a second edition, and none is now read for its own sake. For estimates of Semler's labours, *see* W. Gass, *Gesch. der prot. Dogmatik* (Berlin, 1854–1867); Isaak Dorner, *Gesch. der prot. Theol.* (Munich, 1867); the art. in Herzog's *Realencyklopädie;* Adolf Hilgenfeld, *Einleitung in das Neue Test.* (Leipzig, 1875); F. C. Baur, *Epochen der kirchlichen Geschichtsschreibung* (1852); and Albrecht Ritschl, *Gesch. des Pietismus* (Bonn, 1880–84).

SEMMELWEISS, IGNAZ PHILIPP (1818–1865), Hungarian physician, was born at Buda on July 1, 1818, and was educated at the universities of Pest and Vienna, where he attracted the attention of Joseph Skoda and Carl Rokitansky. He graduated M.D. at Vienna in 1844, and was then appointed assistant professor in the maternity department, under Johann Klein. In Klein's time the deaths in this department from what was then known as "puerperal fever" became portentous. The death of a colleague from a dissection wound suggested to Semmelweiss an identity with the fatal puerperal cases, and the beginning of a scientific pathology of septicaemia was made. The students often came to the lying-in wards from the dissecting-room, their hands cleansed with soap and water only. In May 1847 Semmelweiss prescribed ablutions with chlorinated lime water; in that month the mortality stood at 12·24%, before the end of the year it had fallen to 3·04%, and in the second year to 1·27%. Skoda and other physicians were convinced by these results. Klein, however, apparently blinded by jealousy and vanity, supported by other reactionary teachers, and aided by the disasters which then befell the Hungarian nation, drove Semmelweiss from Vienna in 1849. Fortunately, in the following year Semmelweiss was appointed obstetric physician at Pest in the maternity department, then as terribly afflicted as Klein's clinic had been; and during his six years' tenure of office he succeeded, by antiseptic methods, in reducing the mortality to 0·85%. He died on Aug. 17, 1865, from a disastrous wound of the right hand, a victim of the very disease for the relief of which he had already sacrificed health and fortune.

His chief publication was *Die Ätiologie der Begriff und die Prophylaxis des Kindbettfiebers* (1861). There are biographies by Hegar (1882), Bruck (1887), Duka (Hertford, 1882), Grosse (1898) and Schürer von Waldheim (1905). For the relations in the order of discovery of Semmelweiss to Lister, *see* LISTER.

SEMMERING PASS, the lowest of all the great passes across the Alps. The hospice, near the summit, was founded about 1160, but the pass was certainly used at a much earlier date. Between 1848 and 1854 a railway line (the first in any sense to cross the Alps) was constructed, but passes 282 ft. below the summit of the pass (3,225 ft.) by a tunnel about 1 m. long. The line runs from Wiener Neustadt (30½ m. from Vienna) past Bruck to Graz (139 m. from Vienna), whence it is 227 m. by rail to Trieste.

SEMMES, RAPHAEL (1809–1877), American naval officer, was born in Charles county, Md., on Sept. 27, 1809. He was

appointed midshipman in the navy in 1826, and while waiting for orders studied law and in 1834 was admitted to the bar. Semmes served in the war with Mexico; was active in superintending the landing of Gen. Scott's troops at Vera Cruz in March, 1847, and later, as volunteer aid to Gen. Worth, took an active part in the battles of the Valley of Mexico. These experiences are interestingly told in his books *Service Afloat and Ashore During the Mexican War* (1851) and *Campaign of Gen. Scott in the Valley of Mexico* (1852). In 1855 he was promoted to commander and afterwards was made naval secretary of the Lighthouse Board at Washington, in which service he was when the Civil War broke out. When Alabama, his adopted State, seceded, he resigned his commission and received an appointment of the same rank in the Confederate navy. He fitted out the packet "Sumter," in which he captured as many as 17 Northern merchant vessels, chiefly along the South American coast. Later he commanded the more famous "Alabama," a 1,016 ton ship built in England for the Confederacy, with which he made a series of daring and successful cruises lasting two years. Finally, he met the Northern ship "Kearsarge" in the English channel, and after a long seven-hour battle was forced to surrender. Twenty minutes later the "Alabama" sank and Semmes was rescued by an English yacht. When he returned home he was commissioned rear-admiral and assigned to the Confederate fleet in the James river. When Richmond was captured he blew up his ships and, with his men, joined the army of Gen. Johnston. When Johnston surrendered Semmes returned to his home in Mobile and opened a law office, to which practice he devoted the greater part of the rest of his life. He died on Aug. 30, 1877.

In addition to his books on the Mexican War he wrote *The Cruise of the Alabama and Sumter* (1864) and *Memoirs of Service Afloat* (1869).

SEMNAN, a town in Persia and administrative headquarters of the province hitherto known as "Semnan wa Damghan." It is bounded north by Astarabad and Shahrud, west by Mazanderan, Tehran and Qum, east by Khurasan and south by Yezd. The revenue of the province of Semnan and Damghan together amounted to 284,477 krans in 1926–27 (£ St. = 45 krans).

The town of Semnan is situated 145 m. E. of Tehran on the high road to Meshed, in 35° 34′ N. and 53° 22′ E., at an elevation of 3,740 ft. The water supply comes from the streams that run down from the Elburz and the principal crop of the surrounding plain is tobacco. The population was estimated by Curzon in 1890 at under 16,000 and a later estimate, 1900, gives 20,000.

Semnan is a place of great antiquity, mentioned by Ptolemy as *Samina* and cited by the oriental geographers as worthy of note for the many rivulets of water running through the streets, for the making of soft stuffs of cotton for handkerchiefs, etc., and specially for its sweet paste made from almonds and figs. The dialect of Semnan, commonly called Simnuni, has the reputation in Persia of being particularly unintelligible.

Williams Jackson, *From Constantinople to the home of Omar Khayyam* (1911); J. Bassett, "Grammatical Note on the Simnuni dialect," *J.R.A.S.*, 1916 XVI., New series.

SEMOIS (also spelt Semoy and Semoys), a river less than 120m. long rising near Arlon on the Belgium-Luxembourg frontier and flowing in a sinuous course across the lower Devonian strata of the southern Ardennes. The last 20m. of its course are in France where at Monthermé it joins the Meuse on its right bank. Bouillon is the only town on its banks; it is not navigable.

SEMOLINA, the principal material used in the manufacture of macaroni, vermicelli, spaghetti and other alimentary pastes. In English speaking countries the article sold as semolina is the wholly granular product used for making semolina puddings. The *New English Dictionary* gives a quotation showing that so long ago as 1797 semolina was used in this way. It is obtained from hard wheats, generally those of the race *Triticum Durum*, and consequently possesses certain distinctive characteristics, notably a certain toughness when it is made into a dough, and an intensely yellow colour. This toughness is essential for the manufacture of the best macaroni.

(*See* also Flour and Flour Manufacture; Middlings.)

(A. E. Hu.)

SEMON, SIR FELIX (1849–1921), English laryngologist, was born at Danzig on Dec. 8, 1849, and studied medicine at Heidelberg. He served in the Prussian Guard during the Franco-German war, afterwards continuing his medical studies in Vienna, Paris and London. After some years on the staff of the hospital for throat diseases, Golden square, London, he was appointed head of the throat department of St. Thomas's hospital, where he quickly gained a wide reputation. The *Internationales Centralblatt für Laryngologie und Rhinologie* was founded by him in 1884, and he continued to edit it until 1909. In 1885 he was elected F.R.C.P. In 1888 he obtained an appointment as laryngologist to the National hospital for the paralysed and epileptic, where he was associated with Sir Victor Horsley in researches which led to the formulation of "Semon's law," "that in all progressive organic lesions of the centres and trunks of the motor laryngeal nerves, the abductors of the vocal chords succumb much earlier than the adductors." From 1894 to 1896 he was president of the Laryngological Society of London, which he helped to found in 1893. He was knighted in 1897 and became a naturalized British subject in 1901. He retired in 1911, and died near Great Missenden on March 1, 1921. His researches led to the thyroid treatment of myxoedema, and his early diagnosis of cancer of the larynx enabled him to perform many successful operations by laryngo-fissure.

SEMO SANCUS DIUS FIDIUS, an obscure Roman deity; a god Fisios or Fisovios Sancios was also worshipped in Umbria, and appears to be the same. He had a temple at Rome on the Quirinal, in which was an ancient statue of a woman, said to be Gaia Caecilia, or Tanaquil, wife of Tarquinius Priscus. His functions are very obscure. The four parts of his name seem to be connected respectively with seed (*semen, cf.* the Semunes invoked by the *Fratres Arvales*), purity or holiness (*sancus* and *sanctus* are from the same root), Jupiter (or simply brightness, or celestial nature; Dius, root *Div*), and faith (*fides*). Hence perhaps "the spirit of sowing (or seed), pure, Jovian (or bright, or celestial), faithful." Of his ritual we know only that oaths by him were taken in the open air, the formula being *medius fidius, cf. mehercule*, "by Hercules"; that there was an opening in the roof of his temple; and that certain discs of metal were kept in the temple. The first two facts perhaps suggest a sky-god, but we know that certain deities undoubtedly not celestial (for example, Terminus, the spirit of boundaries) had similar ritual. The discs might possibly be solar symbols. On the whole, the balance of the very scanty evidence is rather in favour of supposing him to be a god of the sky, perhaps connected, as Wissowa supposes, with Jupiter, who had power to influence seed-corn (by sending rain in season?) and, being able to see what went on in the world, was a natural witness to solemn oaths. The ancients, wrongly supposing the last two members of his name to signify "son of Zeus," identified him with Hercules, a blunder which some moderns (as Preller) have fallen into.

See Wissowa in Roscher's *Lexikon, s.v.*, and *Religion und Kultus*, 2nd ed., p. 129.

SEMPACH, a small town in the Swiss canton of Lucerne, built above the eastern shore of the lake of the same name, and about 1½ m. by road north of the Sempach railway station (9 m. N.W. of Lucerne). In 1920 it had 1,180 inhabitants, German-speaking and Roman Catholics. About half an hour distant to the north-east is the site of the famous battle of Sempach (9th July, 1386), in which the Swiss defeated the Austrians, whose leader, Duke Leopold, lost his life. The legendary deed of Arnold of Winkelried (*q.v.*) is associated with this victory. The spot is now marked by an ancient and picturesque battle-chapel (restored in 1886). Some miles north of Sempach is the quaint village of Münster or *Beromünster*, where the first dated book was printed (1470) in Switzerland. For the battle of Sempach *see* Swiss Wars.

See Th. von Liebenau, *Die Schlacht bei Sempach* (Lucerne, 1886).

SEMPILL, the name of a Scottish family long seated in Renfrewshire. An early member, Sir Thomas Sempill (d. 1488), was killed whilst fighting for James III. at the battle of Sauchie-

burn, and his son John (d. 1513), who was made a lord of parliament about 1489, fell at Flodden. John's grandson, Robert, 3rd Lord Sempill (*c.* 1505–72), assisted the Scottish regent, Mary of Lorraine, in her struggle with the lords of the congregation, and was afterwards one of the partisans of Mary, queen of Scots; about 1566, however, he deserted the queen, against whom he fought at Carberry Hill and at Langside. Hugh, 12th Lord Sempill (d. 1746), fought in Spain and in Flanders, and held a command in the English army at Culloden; in 1747 he was made colonel of the Black Watch. The title passed into the Forbes family (Forbes-Sempill) in 1836.

SEMPILL, ROBERT (the elder) (*c.* 1530–1595), Scottish ballad-writer, was in all probability a cadet of illegitimate birth of the noble house of Sempill or Semple. He was probably a soldier, and must have held some office at the Scottish court, as his name appears in the lord treasurer's books in February 1567–1568, and his writings show him to have had an intimate knowledge of court affairs. He was a bitter opponent of Queen Mary and of the Catholic Church. Sempill was present at the siege of Leith (1559–1560), was in Paris in 1572, but was driven away by the massacre of St. Bartholomew. He was probably present at the siege of Edinburgh Castle (1573), serving with the army of James Douglas, earl of Morton. He died in 1595. His chief works are: "The Ballat maid vpoun Margret Fleming callit the Flemyng bark"; "The defence of Crissell Sandelandis"; "The Claith Merchant or Ballat of Jonet Reid, ane Violet and Ane Quhyt," all three in the Bannatyne ms. They are characterized by extreme coarseness, and are probably among his earlier works. His chief political poems are "The Regentis Tragedie," a broadside of 1570; "The Sege of the Castel of Edinburgh" (1573), interesting from an historical point of view; "Ane Complaint vpon fortoun . . ." (1581), and "The Legend of the Bischop of St. Androis Lyfe callit Mr. Patrik Adamsone" (1583).

See *Chronicle of Scottish Poetry* (ed. James Sibbald, Edinburgh, 1802); and "Essays on the Poets of Renfrewshire," by William Motherwell, in *The Harp of Renfrewshire* (Paisley, 1819; reprinted 1872). Modern editions of Sempill are: "Sege of the Castel of Edinburgh," a facsimile reprint with introduction by David Constable (1813); *The Sempill Ballates* (T. G. Stevenson, Edinburgh, 1872) containing all the poems; *Satirical poems of the Reformation* (ed. James Cranstoun, Scottish Text Soc., 2 vols., 1889–1893), with a memoir of Sempill and a bibliography of his poems.

SEMUR-EN-AUXOIS, a town of eastern France, capital of an arrondissement in the department of Côte-d'Or, 45 m. W.N.W. of Dijon on the P.L.M. railway. Pop. (1926) 2,787. Semur (*Sinemurum*) was a Gallic fortress in the dark ages and in feudal times a castle of the dukes of Burgundy. In the 11th century it became capital of Auxois. Its communal charter dates from 1276. The incorporation of Burgundy with France was resisted by the town, which was taken by the royal troops in 1478. During the wars of religion in the 16th century it served as refuge for the Leaguers, and though it submitted to Henry IV. at his accession its fortifications were destroyed in 1602. Semur occupies one of the finest sites in France, on the extremity of a plateau above the river Armançon, which surrounds the town on three sides. There are remains of the old encircling ramparts. The castle (13th and 14th centuries) consists of a rectangular keep flanked by four towers. Portions of it are still in use. Semur possesses a sub-prefecture. It is an important market centre for the Auxois and Morvan. Cement, leather, oil and chemical manures are among its industrial products.

SENAC DE MEILHAN, GABRIEL (1736–1803), French writer, son of Jean Sénac, physician to Louis XV., was born in Paris in 1736. He entered the civil service in 1762; two years later he bought the office of master of requests. He was successively intendant of La Rochelle, of Aix and of Valenciennes. In 1776 he became intendant-general for war, but was soon compelled to resign. His first book was the fictitious *Mémoires d'Anne de Gonzague, princesse palatine* (1786), thought by many people at the time to be genuine. In the next year followed the *Considérations sur les richesses et le luxe,* combating the opinions of Necker; and in 1788 the more valuable *Considérations sur l'esprit et les moeurs,* a book which abounds in sententious, but often excessively frank, sayings.

Sénac witnessed the beginnings of the Revolution in Paris, but emigrated in 1790, making his way first to London, and then, in 1791, to Aix-la-Chapelle. In 1793, while his recollections of the Revolution were still fresh, Sénac wrote a novel, *L'Emigré* (Hamburg, 4 vols., 1797; reprint 1904). At the invitation of Catherine II. Sénac went in 1792 to Russia and thence to Hamburg and to Vienna, where he found a friend in the prince de Ligne.

See his *Oeuvres choisies,* edited by M. de Lescure in 1862; *Lettres inédites de Madame de Créqui à Sénac de Meilhan* (1856), edited by Edouard Fournier; Louis Legrand, *Sénac de Meilhan et l'intendance du Hainaut et du Cambrésis* (1868); and the notice by Fernand Caussy prefixed to his edition (1905) of the *Considérations sur l'esprit et les moeurs.*

SÉNANCOUR, ÉTIENNE PIVERT DE (1770–1846), French author, was born in Paris in November 1770. His father desired him to enter the seminary of Saint-Sulpice preparatory to becoming a priest, but Sénancour, to avoid a profession for which he had no vocation, went on a visit to Switzerland in 1789. At Fribourg he married in 1790 a young Frenchwoman, Mademoiselle Daguet, but the marriage was not a happy one. His absence from France at the outbreak of the Revolution was ill interpreted, and his name was included in the list of emigrants. He visited France from time to time by stealth, but he only succeeded in saving the remnants of a considerable fortune. In 1799 he published in Paris his *Rêveries sur la nature primitive de l'homme,* a book containing impassioned descriptive passages which mark him out as a precursor of the romantic movement. His best known work *Obermann* (2 vols., 1804), was to a great extent inspired by Rousseau, was edited and praised successively by Sainte-Beuve and by George Sand, and had a considerable influence both in France and England. It is a series of letters supposed to be written by a solitary and melancholy person, whose headquarters are placed in a lonely valley of the Jura. He returned to France in 1803 and died at St. Cloud on Jan. 10, 1846. He wrote late in life a second novel in letters *Isabelle* (1833).

Sénancour is immortalized for English readers in the *Obermann* of Matthew Arnold. *Obermann* itself was translated into English, with biographical and critical introduction, by A. G. Waite (1903). *See* the preface by Sainte-Beuve to his edition (1833, 2 vols.) of *Obermann,* and two articles *Portraits contemporains* (vol. i.); *Un Précurseur* and *Sénancour* (1867) by J. Levallois, who received much information from Sénancour's daughter, Eulalie de Sénancour, herself a journalist and novelist; and a biographical and critical study *Sénancour,* by J. Merlant (1907).

SENATE, the assembly of old men (Lat. *senatus,* from root, *sen-,* as in *senex,* old), originally the heads of the chief families, and hence the upper council in a governmental system. The Latin word corresponds with the Greek *γερουσία* (*see* GEROUSIA), the name of the council of elders at Sparta. The Athenian Areopagus (q.v.) may in some ways be compared to the Roman senate; the Cleisthenic council (*see* BOULE) at Athens was in all respects a different body. The word, applied primarily to the Roman council (*see* below), is also used to designate the upper chamber in the legislatures of France, Italy, and the United States (q.v.); in the British legislature it is represented by the House of Lords. The title is used for the governing bodies of the universities of Cambridge and London, and also certain American colleges and universities. In the Scottish universities, the governing body is the Senatus Academicus. The College of Cardinals is the Senate of the Holy See.

THE ANCIENT ROMAN SENATE

(A) **History.**—The senate or council of elders formed the most permanent element in the Roman Constitution. The authorities ascribe its origin to Romulus, who chose out 100 of the best of his subjects to form an advisory council. In 509 B.C. it contained 300 members, and a distinction existed within it between *patres maiorum gentium* and *minorum gentium,* the heads of the greater and the lesser families. Throughout the monarchical period the senate consisted entirely of patricians. There is some connexion between the increase in the numbers of the senate and the distinction between two classes of *patres.* Probably the rise in the number of the senators was due to the incorporation of fresh

elements into the patrician community, with an increase of *gentes* (families); and the new clans were the *gentes minores* (lesser families). The appointment of senators depended entirely upon the king. It is possible that a king might change his advisers during his reign, and a new king could certainly abstain from summoning some of those convened by his predecessors. The powers of the senate at this time were very indefinite.

Under the Republic.—The abolition of monarchy and the substitution of two elected consuls did not at first bring any important change in the position of the senate. It was the advisory council of the consuls, meeting only at their pleasure, and owing its appointment to them, and remained a power secondary to the magistrates, as it had been to the king. Tradition ascribes to the first consuls some change in the class from which senators were drawn. Whatever the nature of the change, plebeians were not introduced into the senate at this time. Such a change is utterly improbable after the success of a patrician *coup d'état,* such as the expulsion of the Tarquins; and there is no evidence for the existence of a plebeian senator before the year 401 B.C. In one respect, the substitution of consuls for kings tended to the subordination of the chief magistrates to the senate. The consuls held office only for one year, while the senate was a permanent body; in experience and prestige, its individual members were often superior to the consuls of the year. The magistrate would seldom venture to disregard the advice of the senate, especially as he himself would, in accordance with steadily growing custom, become a senator at the end of his year of office. It was probably in their capacity of ex-magistrates that plebeians first entered the senate; the first plebeian senator mentioned by Livy, P. Licinius Calvus, was also the first plebeian consular tribune. Of the two powers which the senate inherited from the monarchy, the interregnum and the *patrum auctoritas,* the first had become rarer of exercise than before; for if either consul existed, interregnum could not be resorted to. The *patrum auctoritas,* however, developed into a definite right claimed by the senate to give or withhold its consent to any act of the comitia (q.v.). The influence which it had long exercised over foreign policy increased the importance of the senate in a period of constant warfare with the nations of Italy. But in the early republic, the senate remained an advising body, and assumed no definite executive powers.

In the last two centuries of the republic, a great change took place in the position of the senate. It became a self-existent, automatically constituted body, independent of the annual magistrates, a recognized factor in the Constitution, with extensive powers. Its self-existence was effected by entrusting the selection to the censors. The censorship (q.v.) was instituted in 443 B.C., and some time before the year 311 it was placed in charge of the *lectio senatus.* Conditions of selection had been imposed by 311, which made the constitution of the senate practically automatic. Ex-curule magistrates (*see* CURULE) were entitled to admission together with other persons who had done conspicuous public service; and for some time before Sulla's dictatorship little power of choice can really have rested with the censors. Sulla secured an automatic composition for the senate by increasing the number of quaestors, and enacting that all ex-quaestors should pass at once into the senate. This enactment provided for the maintenance of the number of senators, 20 ex-quaestors passing in every year. The senate's powers had now extended beyond its ancient prerogatives of appointing an interrex, and ratifying decisions of the comitia. The first of these powers had fallen into practical disuse, and the second had become a mere form by the last century of the republic. But the senate had acquired more effective control through the observance of certain unwritten rules regulating the relation between senate and magistrates. It was understood that the magistrate should not question the people on any important matter without the senate's consent, nor refuse to do so at its request; that one magistrate should not employ his veto to quash the act of another except at the senate's bidding, nor refuse to do so when directed. The earlier influence upon foreign policy developed into a definite claim put forward by the senate to conduct all negotiations with a foreign power, the terms being submitted to the people for ratification. For the organization of a new Roman province, even this formal ratification was dispensed with, and a commission of senators alone aided the victorious general in the organization of his conquests. The senate also acquired the right to distribute spheres of rule among the various magistrates. The control of finance was in the senate's hands. Three circumstances had combined to bring about this result. The censors, who were only occasional officials, were entrusted with the leasing of the public revenues; the senate directed the arrangements made by them. The details of public expenditure were entrusted to the quaestors, who, when the magistracies were multiplied, occupied an entirely subordinate position; this strengthened the position of the senate as the natural director of young and inexperienced magistrates. Thirdly, the general control exercised by the senate over provincial affairs implied its direction of the income derived from the provinces, which in the later republic formed the chief property of the State. It claimed a right, unchallenged till the time of Tiberius Gracchus, of granting occupation and decreeing alienation of public lands. Every branch of State finance was therefore in its hands. In matters of criminal jurisdiction, the senate claimed the right to set free, by its decree in case of emergency (*decretum ultimum*) the full powers of *coercitio* contained in the imperium of a magistrate, but limited normally in capital cases by laws of appeal. The exercise of this right amounted to a declaration of martial law. It was only resorted to in cases of special urgency, such as the epidemic of poisoning in 331 B.C., and the formidable preponderance of the revolutionary tribune Tiberius Gracchus in 133 B.C. The action of the senate on this last occasion evoked a vigorous protest from the people, and a law of C. Gracchus subsequently forbade any such exercise of capital jurisdiction on the part of a magistrate. The senate continued, however, to make use of this decree, and the question of its right to do so was one of the chief points at issue in the final struggle between the senatorial and democratic parties. The best known instance of this *decretum ultimum* is that of 63 B.C., when Cicero took summary action against the Catilinarians, and justified his action on the plea that the decree had authorized him to do so. The chief feature of the democratic revolution at Rome which occupied the century following the tribunate of T. Gracchus was opposition to the tenure of these extensive powers by the senate. Sulla's enactments in 81 B.C., which aimed at restoring its ascendancy, show how much power it had already lost; and his attempts to reinstate it were short-lived (*see* ROME: *History*). The Gracchi and Caesar alike found themselves obliged to override senatorial prerogative in the interests of progress, and the senate never regained the popular confidence.

Under the Empire.—Caesar's revision of the senatorial list and his increase of the senate to 900 was a return to the practice by which the early magistrates had chosen their own body of councillors. And though the arrangement for the automatic replenishing of the senate was restored, yet the influence exercised by Caesar and his successors over elections secured their control over the personnel of the senate. It was regarded in the early principate as the representative of republican institutions, and Augustus took pains to divide his authority with the senate. In legislation, indeed, the senate was supreme under the principate. The legislative powers of the comitia became very gradually extinct; but long before they had disappeared *senatus consulta* had come to take the place of *leges* in ordinary matters, and with this prerogative the princeps never directly interfered. The senate was left at the head of the ordinary administration of Rome and Italy, together with those provinces which, not requiring any military force nor presenting special administrative difficulties, were left to the care of the Roman people. It also retained control of the public Treasury (*see* AERARIUM), while the princeps administered his own treasury (*fiscus*). It gradually became the electing body for the annual magistracies; and, as entrance to it was still won chiefly through the magistracy, co-optation became practically the principle of admission. On the other hand, it lost all its control of foreign administration, and though occasionally consulted by the princeps, it was entirely subordinate to him in this department.

It was to the advantage of the early Caesars to pay deference to the senate, and so give to their rule an appearance of constitutionalism. Vespasian admitted Italians and provincials into the senate, with a view, no doubt, to increasing its value as a representative council of the empire, but it ceased to have any real control.

(B) **Procedure.**—Senatorial procedure remained comparatively unchanged throughout the republic and the first three centuries of the empire. The right of summoning the senate belonged originally to the consuls, and later to the consuls, praetors, and tribunes of the plebs. In the Ciceronian period, the right belonged to them in the above order of precedence. The magistrate who summoned the senate also presided and brought business before it. He first made statements to the house on important public affairs, and might then at his discretion ask the opinion of the house or invite other senators to speak. He was expected to follow a regular order of precedence in asking for votes or speeches. When the chief senators had expressed their opinion on the motion of the president, or made proposals of their own, the house divided on the motion, or the president put to the house the various proposals made. Under the empire, all the presiding magistrate's rights were extended to the princeps, who enjoyed also the right of giving his opinion as a private senator.

(C) **Insignia.**—The senatorial insignia were not at first distinguished from those of ex-curule magistrates. But by degrees the broad stripe (*latus clavus*) on the tunic and the red shoe (*calceus mulleus*) became distinctive of the senator (hence *laticlavius*, "a senator").

Certain disqualifications were attached to senators in republican times, chief of which was their exclusion from trade; and these were increased under the principate. Failure to observe these disqualifications, or any public disgrace or gross misconduct, was punished by removal from the senate by the censors.

THE UNITED STATES SENATE

The Senate is the smaller (often spoken of as the upper) of the two chambers of the United States Congress. It is composed of 96 members, two from each of the 48 States. The Constitution decrees that no State, whatever its size or population, may be deprived of such equal representation without its own consent. This is in contrast to the House of Representatives where States are represented in proportion to population and the larger States have a much greater voting power than the smaller States. The Senate represents regions rather than numbers. It is a concession to the theory of the equal sovereignty of States and was necessary as a part of the compromise which made a Federal Government possible (*see* United States, *Constitution and Government* for details of the Federal system). A Senator must be at least 30 years old, an inhabitant of the State for which he is elected and a United States citizen of not less than nine years standing. He is elected directly by the people of his State for a six-year term. One-third of the Senate body is elected every two years so that the change in membership and organization of the Senate is gradual. No State elects both its Senators in the same year unless an emergency vacancy should make it necessary.

Powers.—(1) *Legislative.* The Constitution provides that the legislative powers of the Senate are co-equal with those of the House except for the single provision that measures for raising revenue must originate in the House. With regard to revenue legislation, however, the Senate "may propose or concur with amendments as on other bills" and in practice this privilege enables it to change the character of such legislation as radically as it wishes. At various times one chamber or the other may have the greatest amount of legislative influence because of its better organization or better hold upon public opinion. In case of disagreement between the two houses a conference Committee representing both chambers attempts to reach a compromise.

(2) *Executive.* The two chief fields in which the Senate enters the executive domain are in its powers to reject presidential appointments and in its treaty-making power. The more important appointments of the President, according to the Constitution, must be made with the "advice and consent of the Senate." The vast majority of appointments are accepted by the Senate with little hesitation, yet rejections are by no means uncommon, and at times have been a fruitful cause of discord between the Senate and the President. Theoretically the Senate takes no initiative in the selection of appointees, but in practice the President, if he hopes for harmony with that body, will consider the wishes of members, particularly in making appointments to Federal offices within their own States. By passing the Tenure of Office Act of 1867 the Senate also claimed a share in the President's power of removal. But in the case of *Frank S. Meyers* vs. *United States*, decided by the U.S. Supreme Court in 1926, such pretensions were definitely declared unconstitutional.

The Constitution also declares that before any treaty with a foreign power can be made two-thirds of the Senators must concur. Here also the Senate theoretically takes no initiative, but the President is likely to sound the opinion of Senate leaders before proceeding with negotiations, and may wisely keep in touch with them. The Senate also has the power to amend treaties in which case it becomes necessary to reopen negotiations with the treaty nation. This power of the Senate compels a president to enter treaty negotiations under a handicap and also prevents rapid action, but on the whole it has probably done much to keep the nation free from secret treaties and entanglements and is therefore in accord with the American temper. The Senate has always shown itself very jealous of this power, and a treaty must be favorable to win the necessary two-thirds vote. Before Pres. Wilson's defeat on the League of Nations covenant the Senate had rejected important treaties submitted by Presidents Pierce, Grant, Cleveland, Roosevelt and Taft.

(3) *Judicial.* The Senate has the sole power to try all cases of impeachment, the persons so liable being the "President, Vice-President and all civil officers of the United States." Members of the Senate may be expelled by a two-thirds vote, but cannot be impeached since they are responsible only to their own States. There they may be impeached, if the State constitution so provides. Impeachment proceedings must be initiated by the House. The Senate sets a date for the hearing and on that day sits as a court. The proceedings are public, but after the evidence is taken the Senate retires behind closed doors to reach its verdict. Since impeachments are cumbersome they are rarely resorted to.

Procedure.—By the terms of the Constitution the Vice-President is the Senate's presiding officer. He has no vote except in cases of a tie. The Senate makes its own rules of procedure and in general they are simple and much less restrictive than those of the House. Every bill theoretically receives three readings, but the first two are merely nominal and are given before the bill is referred to its appropriate committee. There it receives intensive study. Friends or opponents may be admitted before the committee to present arguments, and witnesses may be summoned to give testimony. The committee may recommend, amend, delay, report adversely or drop a measure altogether. Debate, if any, upon the bill comes after it has been reported by the committee for its third reading before the Senate. Amendments may then be offered and voted upon. Debate in the Senate is not ordinarily limited as in the House. Since 1917, however, it has been possible for the Senate by a two-thirds vote to restrict each senator to an hour which will bring the debate to a close in a reasonable time. No amendments may be offered during the operative period of this rule of closure unless by unanimous consent. The rule has been used only twice, during the League of Nations debate in 1919 and the World Court debate in 1926. Despite the continued use of dilatory tactics and the prevalency of "filibusters" by minority blocs, the Senate has been slow to impose the closure rule and has jealously resisted further plans for limiting debate.

As intimated, much of the real work of the Senate is done by about thirty standing committees. From time to time select committees may be appointed to deal with specific matters. Of the standing committees those on finance, appropriations, foreign

relations, the judiciary, and interstate commerce are perhaps the most important. Senate committees contain from three to seventeen members, and every senator is assigned to one or more. Selection is made at the beginning of each Congress by special committees designated by the caucus of each party. The senior senator of the party in power is usually made the chairman of a committee. The party in power has a safe numerical margin in every important committee. Senators often stay on the same committee year after year and acquire expert knowledge in its field. In addition to the regular committees there is a "steering" committee, to determine measures warranting precedence.

Most of the Senate's meetings are public but it may vote at any time to go into "executive session" behind closed doors, which it often does in considering treaties or in discussing the confirmation of appointments. In May 1929 the discontinuance of these secret sessions was discussed.

SENEBIER, JEAN (1742–1809), Swiss pastor, was born at Geneva on May 6, 1742. He is remembered on account of his contributions to our knowledge of the influence of light on vegetation. Though Malpighi and Hales had shown that a great part of the substance of plants must be obtained from the atmosphere, no progress was made until bubbles of oxygen were observed on leaves as these were plunged in aerated water. Jan Ingenhousz proved the simultaneous disappearance of carbonic acid; but it was Jean Senebier who demonstrated that this activity was confined to the green parts, and to these only in sunlight, and first gave a connected view of the whole process of vegetable nutrition in strictly chemical terms. He died at Geneva on July 22, 1809.

See Sachs, *Geschichte d. Botanik*, and *Arbeiten*, vol. ii.

SENECA, ANNAEUS (praenomen unknown, called the Elder, *c.* 54 B.C.–A.D. 39), rhetorician, of Corduba in Spain, father, by Helvia, of L. Annaeus Seneca and granduncle of the poet Lucan. His life was mostly passed at Corduba, but on two occasions he spent some time in Rome, where he heard Ovid and Asinius Pollio. The date of his death is approximately inferred from the fact that it occurred before his son, the younger Seneca, was banished by Claudius in A.D. 41 (L. Annaeus Seneca, *Ad Helviam* ii. 4–5). Besides a lost historical work (*cf.* Senec. *De vita patris* fr. 98) he wrote *Controversiae* (ten books) and *Suasoriae* (one book). The *Controversiae* discussed 74 imaginary legal cases, exemplifying the approved method of presenting them, and illustrating various rhetorical devices. The prefaces discussed individual rhetoricians. Books I., II., VI., IX., X. are extant and we have an epitome of the whole (4th or 5th cent.).

SENECA, LUCIUS ANNAEUS (*c.* 4 B.C.–A.D. 65), second son of Seneca the elder, statesman and philosopher, was born at Corduba. He studied at Rome under the Stoic Attalus (Senec. *Ep.* 108, "When I listened to Attalus declaiming against the vices, the errors, the evils of life, I often pitied humanity and regarded him as a lofty figure beyond the stature of mankind. He used to say he was a king, but to me he seemed more than a king who could pass judgment upon kings") and Sotion (Senec. *l.c.*, "I shall not be ashamed to confess what love for Pythagoras Sotion inspired in me"). Devoting himself to rhetoric and philosophy he rapidly attained eminence at the bar, and his popularity attracted the attention of Caligula who, "despising the milder and more polished style of oratory," described Seneca's compositions as "mere prize exercises (*commissiones meras*), sand without lime" (Sueton., *Calig.* 53). His career was interrupted when in A.D. 41 Claudius, at the instigation of Messalina, banished him to Corsica. In A.D. 49 Agrippina secured his recall to become tutor to her son Domitius, afterwards the emperor Nero (Tac., *Ann.* xii. 8, Sueton., *Nero* 7), at that time 11 years of age. When Nero came to the throne, Seneca and Afranius Burrus had paramount influence with the youthful emperor (Tac. *Ann.* xiii. 2) and Seneca was probably concerned in the promising manifesto with which Nero inaugurated his reign (Tac. *Ann.* xiii. 4). The death of Burrus (A.D. 62) greatly impaired Seneca's influence (Tac. *Ann.* xiv. 52) *Mors. Burri infregit Senecae potentiam, quia nec bonis artibus idem virium erat altero velut duce amoto, et Nero ad deteriores inclinabat.* His enemies pointed out to Nero the vast and increasing wealth of Seneca, his popularity with the citizens, his rivalry with the emperor in oratory and poetry, which latter art he had cultivated more assiduously since Nero commenced poetry, his disparagement of Nero both as an equestrian and a singer: "How long was everything of distinction in the State to be attributed to the invention of Seneca? Nero surely was no longer a boy but in the flower of adult manhood. Let him doff his pedagogue—in his ancestors he had teachers enough" (Tac. *Ann.* xiv. 52). Seneca requested an interview which was granted. His speech and Nero's reply are given by Tacitus *Ann.* xiv. 53–56. The interview ended amicably, but Seneca practically withdrew into private life and was rarely seen in Rome, "as if detained at home by his weak health and his philosophic studies." (Tac. *l.c.*) Finally, in A.D. 65, on a charge of complicity in the conspiracy of Piso, he was ordered by Nero to end his life (Tac. *Ann.* xv. 61, Sueton. *Nero* 35). When the fatal message reached him, "undismayed he asked for tablets to make his will. When this was refused by the centurion, he turned to his friends and said that, since he was prevented from rewarding their services, he would leave to them the one thing, and yet the best thing, that he had to leave—the pattern of his life. . . . At the same time he reminded his weeping friends of their duty to be strong, now by his conversation, now by sterner rebuke, asking them what had become of the precepts of wisdom, of the philosophy which through so many years they had studied in face of impending evils. . . . Then he embraced his wife and, with a tenderness somewhat in contrast to his fortitude, entreated her to moderate her grief and not nurse it for ever, but in the contemplation of a well-spent life to find honourable consolation for the loss of her husband" (Tac., *Ann.* xv. 62–63).

The most important of Seneca's works are his philosophical writings, a series of essays on practical ethics, or lay sermons, as they might be called, preaching a modified Stoicism. These, with the approximate dates of composition are: *Ad Marciam de consolatione* (A.D. 40–41). *De Ira*, 3 books (41–44); *Ad Helviam de consolatione* (42); *Ad Polybium de consolatione* (43–44); *De brevitate vitae* (49); *De constantia sapientis* (55–56); *De clementia*, 2 books (55–56); *De vita beata* (58–59); *De beneficiis*, 7 books (62–64); *De tranquillitate animi* (62–63); *De otio* (63); *De providentia* (63–64); *Epistulae Morales ad Lucilium* (63–64). Enjoying in his own time an unrivalled popularity as a writer, Seneca, it is abundantly clear, did not maintain his vogue. Quintilian, in his review of Greek and Roman writers suitable for the reading of the student of oratory, defers Seneca to the last on account of the erroneous report that he condemned him utterly.

The remaining works may be dismissed briefly: (1) *Naturales Quaestiones*, 7 books (written about A.D. 63), a popular sketch of astronomy and meteorology; (2) *Ludus de morte Claudii* (*apotheosis, apocolocyntosis*) (written about A.D. 54), a short and not unamusing skit on the deification of the emperor Claudius, introducing, in the manner of the Menippean satire, snatches of verse, both Greek and Latin, in the midst of the prose. (3) Nine tragedies—*Hercules Furens, Thyestes, Phoenissae, Phaedra* (*Hippolytus*), *Oedipus, Troades* (*Hecuba*), *Medea, Agamemnon, Hercules Oetaeus*—modelled on Greek exemplars, show the rhetorical characteristics of his prose and are of small poetic merit. The *Octavia*, the only extant specimen of a *fabula praetexta* (a historical drama on a Roman subject), is proved by internal evidence to be by a later writer. (4) A number of epigrams have come down to us under Seneca's name—nine lamenting his exile in Corsica, after the fashion of Ovid in the *Tristia*, are printed in Haase (Teubner) vol. i., p. 261, *seq.* They possess no special interest or distinction.

The letters of Seneca to St. Paul—which were known to Jerome and Augustine—are universally admitted to be a forgery.

SENECA, a tribe of North American Indians of Iroquoian stock. They call themselves *Tshoti-nondawaga*, "people of the mountain." The French called them *Tsonnontouan*. Their former range was in western New York state between Seneca lake and the Genesee river. They were one of the Six Nations League of the Iroquois, and eventually became the most important tribe. On the defeat of the Erie and Neuter tribes they occupied the country west of Lake Erie and south along the Allegheny to Pennsylvania. They fought on the English side in the War of Independence. In 1926 there were 2,416 on reservations in New York State, and a few in Oklahoma and on Grand River reservation, Ontario. *See* NORTH AMERICA: *Ethnology.*

For Seneca Cosmology see *21st Ann. Report Bureau Amer. Ethnol.* (1899–1900).

SENECA FALLS, a village of Seneca county, New York, U.S.A., 40 m. W.S.W. of Syracuse, on the Seneca river (connecting Lakes Seneca and Cayuga); served by the Lehigh Valley and the New York Central railways. Pop. (1920) 6,389; and in 1930, 6,443. Hydro-electric power is generated from the 50 ft. falls in the river, and there are important manufacturing industries, making power pumps, lathes, metal letters, woollen and leather goods, folding boxes and various other articles. The village was settled about 1790 and incorporated in 1831. On July 19–20, 1848, it was the scene of the first Woman's Rights convention held in the United States.

SENECIO, a genus of plants of the composite family Compositae, one of the most numerous of all flowering-plant genera, embracing about 1,450 species, widely distributed throughout the world. It includes herbs, shrubs and even trees, a number of which are cultivated for their flowers, foliage or ivy-like habit. The leaves are alternate and sometimes all basal. The flower-heads are single or clustered, variously coloured, and usually with fertile rays, but sometimes rayless. The surrounding bracts (involucre) are usually arranged in a single series, reinforced at the base with calyx-like shorter bracts (bracteoles). The dry fruits (achenes) are crowned with a pappus of soft, whitish, often very numerous, bristles. Nine species are found in Great Britain, including *S. Jacobaea* (ragwort), a showy roadside plant with heads of bright-yellow flowers, and *S. vulgaris* (groundsel), a widespread weed. Upwards of 70 species occur in North America, most numerously in the southern and western parts of the United States. Representative American species are *S. aureus* (golden ragwort), *S. Pseudo-Arnica* (sea-beach groundsel), *S. obovatus* (round-leaved squaw-weed), *S. Balsamitae* (balsam groundsel), and *S. lobatus* (cress-leaved groundsel). Among the more widely-cultivated species are *S. Cineraria* (dusty miller), *S. cruentus* (cineraria), *S. Petasites* (velvet groundsel), and *S. mikanioides* (German ivy), a native of South Africa, now naturalized in California. (*See* CINERARIA: GOLDEN RAGWORT: GROUNDSEL.)

SENEFELDER, ALOIS (1771–1834), German inventor of lithography, was born at Prague on Nov. 6, 1771, his father Peter being an actor at the Theatre Royal. Unable to pay for the engraving of his compositions, he attempted to engrave them himself. He made numerous experiments with little success; tools and skill were alike wanting. Copper-plates were expensive, and the want of a sufficient number entailed the tedious process of grinding and polishing afresh those he had used. But his attention was accidentally directed to a fine piece of Kellheim stone which he had purchased for the purpose of grinding his ink. His first idea was to use it merely for practice in his exercises in writing backwards, the ease with which the stone could be ground and polished afresh being the chief inducement. While he was engaged one day in polishing a stone slab on which to continue his exercises, his mother entered the room and desired him to write her a bill for the washer-woman, who was waiting for the linen. Neither paper nor ink being at hand, the bill was written on the stone he had just polished. The ink used was composed of wax, soap and lamp-black. Some time afterwards, when about to wipe the writing from the stone, the idea all at once struck him to try the effect of biting the stone with aqua fortis. Surrounding the stone with a border of wax, he covered its surface with a mixture of one part of aqua fortis and ten parts of water. The result of the experiment was that at the end of five minutes he found the writing elevated about the tenth part of a line ($\frac{1}{120}$ in.). He then proceeded to apply the printing ink to the stone, using at first a common printer's ball, but soon found that a thin piece of board covered with fine cloth answered better, communicating the ink more equally. He was able to take satisfactory impressions, and, the method of printing being new, he hoped to obtain a patent for it, or even some assistance from the government. For years Senefelder continued his experiments, until the art not only became simplified, but reached a high degree of excellence in his hands. In later years the king of Bavaria settled a handsome pension on Senefelder. He died at Munich in 1834, having lived to see his invention brought to comparative perfection.

SENEGA, the dried root of the *Polygala Senega*, official in the British and United States pharmacopoeias. Senega contains an active principle, saponin, and is used chiefly as a stimulating expectorant in chronic bronchitis. It is occasionally used as a diuretic in renal dropsy. It is a cardiac depressant and having a tendency to upset the digestion, is only used in combination with other drugs in what are termed expectorant mixtures.

SENEGAL, colony of French West Africa (*q.v.*) bounded on the north by Mauritania (*q.v.*), west by the Atlantic, south by Portuguese Guinea and French Guinea, and east by the Faleme, which separates it from the colony of French Sudan (*q.v.*). Wedged into Senegal and surrounded by it save seawards is the British colony of the Gambia. The colony of Senegal has an area of 192,000 square kilometers and a population of 1,318,000 (density 707 per square kilometre) of which 5,000 are Europeans.

Physical Features.—The coast extends from the mouth of the Senegal to Cape Roxo, where the Portuguese frontier begins. The only gulf on the coast is that which lies to the south of Cape Verde and contains the island of Goree (*q.v.*). The coast in the northern part is low, arid, desolate and dune-skirted, its monotony relieved only here and there by cliffs and plateaux. Farther south it becomes marshy, and clothed with luxuriant vegetation. A little to the north of the Gambia the coast-line is much broken by the archipelago of islands formed by the Salum estuary, whilst south of the Gambia is the broad estuary of the Casamance. Between the Senegal and the Gambia and as far east as about 13° W., the country behind the seaboard is a slightly elevated and, for the most part, barren plain. Farther east is a mountainous and fertile region with altitudes of over 4,000 feet. The mountains sink abruptly towards the Niger valley, while southwards they join the Futa Jallon highlands. On the north they extend to the left bank of the Senegal and throw out spurs into the desert beyond. The Senegal (*q.v.*), its tributary the Faleme, and the upper course of the Gambia (*q.v.*) are the chief rivers which drain the country. The Salum, already mentioned, is a river-like estuary which penetrates fully 100 m. and is split into many channels. It is navigable from the sea for 60 miles. The Casamance flows between the Gambia to the north and the Cacheo to the south, and has a drainage area of some 6,000 square miles. Rising in the Futa Jallon, the river has a course of about 212 m., and at Sedhiu, 105 m. from the sea, is 1½ m. broad. The mouth of the river is fully 6 m. wide. Six to seven feet of water cover the bar at low tide, the river being navigable by shallow draught vessels for the greater part of its length.

Geology.—The low region of the seaboard consists of sandstones or clay rocks and loose beds of reddish soil, containing marine shells. At certain points, such as Cape Verde and Cape Roxo (or Rouge), the red sandstones crop out, giving to the latter its name. Clay slates also occur, and at intervals these sedimentary strata are interrupted by basaltic amygdaloid and volcanic rocks. For instance the island of Goree is basaltic. The base of the mountains is formed in certain places of clay slate, but more generally of granite, porphyry, syenite or trachyte. In those districts mica-schists and iron ores occur. Iron and gold are found

in the mountains and the alluvial deposits. Many of the valleys are covered with fertile soils; but the rest of the country is rather arid and sterile.

Climate.—There are two seasons, the dry and the rainy, the latter contemporaneous with the European summer. In the rainy season the wind blows from the sea, in the dry season the harmattan sweeps seaward from the Sahara. Along the seaboard the dry season is cool and agreeable; in the interior it is temperate in the three months which correspond to the European winter, for the rest of the year the heat is excessive. The maximum readings (90° to 100° F), which are exceptional at St. Louis, become almost the rule at Bakel on the upper Senegal. The mean temperature at St. Louis is 68° to 70° F. The rainy season begins at Goree between the 27th of June and the 13th of July. During this period storms are frequent and the Senegal overflows and floods the lowlands.

Flora and Fauna.—The principal tree is the baobab (*Adansonia digitata*), which sometimes at the height of 24 ft. has a diameter of 34 and a circumference of 104 feet. Acacias are numerous, one species, *A. adansonia*, being valuable for shiptimber. Among the palm-trees is the *ronier*, whose wood resists moisture and the attacks of insects; in some places, as in Cayor, it forms magnificent forests. The mampatas grows sometimes 100 ft. high, its branches beginning at a height of about 25 feet. *Landolphia* and other rubber plants, and the oil-palm, grow luxuriantly in the Casamance district. The karite, or shea-butter tree, is common. Wild indigo is abundant, and the cotton plant is indigenous.

The lion of Senegal and the neighbouring countries differs from the Barbary lion; its colour is a deeper and brighter yellow, and its mane is neither so thick nor so long. Other beasts of prey are the leopard, the wild cat, the cheetah, the civet and the hyena. The wild boar is clumsier than the European variety. Antelopes and gazelles occur in large herds; the giraffe is found in the region of the upper Senegal; the elephant is rare; the hippopotamus is gradually disappearing. Crocodiles swarm in the upper Senegal. Monkeys and apes of different species (the chimpanzee, the colobus, the cynocephalus, etc.), the squirrel, rat and mouse abound. The hedgehog, marmot, porcupine, hare, rabbit, etc., are also met with. Among the more noteworthy birds are the ostrich, which migrates to the Sahara; the bustard, found in desert and uncultivated districts; the marabout, a kind of stork, with its beak black in the middle and red at the point, which frequents the moist meadowlands and the lagoons; the brown partridge, the rock partridge and the quail in the plains and on the mountain sides; and the guinea-fowl in the thickets and brushwood. Along the coast are caught the sperm whale, the manatee and the codfish.

Inhabitants.—The inhabitants of Senegal are, mainly, "Moors" and allied Berber races, and Negroids. The Moors, or rather Berbers (Trarzas, Braknas and Duaish), inhabit the right bank of the Senegal. Fula (Peuls) are found in various parts of the country. Negroids, however, form the bulk of the population. The best known of these tribes are the Wolofs and Mandingos, the last-named a wide-spread group of allied peoples bearing many names such as Sarakolés and Bambaras. Mandingos inhabit the basins of the upper Niger and the upper Senegal, and the western slope of the mountains of Futa Jallon. Under the name of Wakore or Wangara they are also found in all the immense tract enclosed in the bend of the Niger. The Berbers, Fula and Mandingos are Moslems. The Wolofs and the Serers inhabit the seaboard from St. Louis to the Gambia, and the left bank of the Senegal from its mouth to Dagana. The Balanta inhabit the left bank of the Casamance; they are allied to the Mandingos. The principal languages spoken are Wolof, Fula, Serer, Mandingo and Arabic. The river Senegal marks the line of separation between Wolof and Arabic. Fula is the language of the Fula and Tukulors (Fula half-breeds); Mandingo comprises several dialects and is widely spoken. (*See* BERBERS, MANDINGA.)

Towns.—The chief towns of Senegal are Dakar (pop. 34,000, of which 1,000 are Europeans), St. Louis (pop. 18,000, of which 1,000 are Europeans), Rufisque (pop. 9,000, of which 400 are Europeans), Goree (pop. 1,000), Zighinkhor (pop. 2,500), Kaolak (pop. 1,500). On the river Senegal are the towns of Richard-toll (Richard's garden), Dagana, Podor and Bakel. Carabane, Zighinchor and Sedhiu are settlements on the Casamance river. Dakar in the peninsula of Cape Verde, capital of French West Africa, where the governor general resides, forms with Goree and several villages a special territory, administered under the direct authority of the governor general. St. Louis, Dakar, Goree and Rufisque are communes, with a franchise exercised by natives and Europeans alike.

Agriculture and trade.—The two great food crops of Senegal are millet and rice. Millet is the staple food of the natives; there are large and small varieties of millet. The mean production exceeds 400,000 tons; the river-valley produces more than half the harvest. Rice is grown farther south, in the Casamance (130,000 tons). The cultivation of ground-nuts is the chief source of wealth of Senegal; it has spread since 1840, pioneered by a French colonist. Its cultivation is important only in the regions with good transport facilities for the crop. Senegal produces more groundnuts (peanuts) than any other country, on an average 350,000 tons per annum. Rearing of cattle is practised chiefly by the Peuhls, the Toucouleurs and the Serers. Senegal, the first of the colonies of French West Africa to be developed, has the greatest trade, which forms two thirds of the total; its ports also serve as outlets for the trade of the French Sudan, the statistics of which are merged in those of the colony. Senegal imports chiefly cotton cloth, coming mostly from Great Britain; food-stuffs, flour, biscuits, rice, sugar, etc., building materials and machines (motorcars), coal and petroleum. The chief exports are ground-nuts (more than 400,000 tons, worth more than 600 million francs); the secondary products are cotton (1,000 tons, coming partly from French Sudan), gum (4,000 tons, coming from Mauritania), and skins. Total trade reaches 1,563 millions of francs (imports 823 millions, exports 740 millions). Of the imports France sends 531 millions, Great Britain 121, the United States 50; of the exports France takes 492 millions, Germany 74, Great Britain 15. The 6 principal ports of Senegal are Dakar (737,000 tons loaded and unloaded), Kaolak (200,000 tons), Rufisque (123,000 tons), Foundiougne (68,000 tons), Zighinkhor (44,000 tons), St. Louis (36,000 tons). One may note the rapid growth of Kaolak, (situated on the Salum, it is the focus of the railway from Thies to Kayes), and the decline of St. Louis.

A railway finished in 1885, 163 m. long, goes from Dakar to St. Louis, from which point the Senegal river is navigable by steamer from August to November, both inclusive, for about 500 m., the navigable reach terminating at Kayes, whence a railway runs to the Niger. Direct communication between Dakar and the Niger is afforded by a railway (667 km.) starting from Thies, a station on the way to St. Louis, and ending at Kayes, where it connects with the railway from Kayes to the Niger; a branch line of 21 km. runs from Guinguines to Kaolak; this line was completed in 1923. Telegraph lines connect the colony with all other parts of French West Africa. Dakar is in direct cable communication with Brest, and another cable connects St. Louis with Cadiz. Steamship communication between Europe and Dakar and Rufisque is maintained by several French, British and German lines. Over 50% of the shipping is French, Great Britain coming second.

(F. R. C.; A. BE.)

HISTORY

The story of the French conquests throughout West Africa is inseparably connected with the history of Senegal. Trading stations were established elsewhere on the coast, but the line of penetration into the interior was, until the last few years of the 19th century, invariably by way of the river Senegal. Hence there is a peculiar interest in the record of the early settlements on this coast. The Portuguese had some establishments on the banks of the Senegal in the 15th century; they penetrated to Bambuk in search of gold, and were for some time masters of that country, but the inhabitants rose and drove them out. Remains of their buildings are still to be seen. The first French settlement was probably made in 1626 by the *Compagnie Normande* at St. Louis

(*q.v.*), near the mouth of the Senegal river. Between 1664, when the French settlements were assigned to Colbert's West India Company, and 1758, when the colony was seized by the British, Senegal had passed under the administration of seven different companies. None attained any great success, though from 1697 to 1724 the administration was in the hands of a really able governor, André Brue, who, however, from 1703 to 1714 directed the affairs of Senegal from Paris. Brue made many exploring expeditions and was on one occasion (1701) captured by the natives, who extorted a heavy ransom. Under his direction the auriferous regions of Bambuk were revisited (1716) and the first map of Senegal drawn (1724). In the meantime (1677) the French had captured from the Dutch Rufisque, Portudal, Joal and Goree and they were confirmed in possession of those places by the treaty of Nijmwegen (1678). In 1717 the French acquired Portendic, a roadstead half way between capes Verde and Blanco. Goree and the district of Cape Verde were captured by the British under Commodore Keppel in 1758, but were surrendered to the French in 1763, and by the treaty of peace in 1783 the whole of Senegal was also restored. The British again captured the colony in the wars of the first empire (Goree 1800, St. Louis 1809) and, though the treaty of Paris authorized a complete restitution, the French authorities did not enter into possession till 1817. At that time the authority of France did not extend beyond the island of Goree and the town of St. Louis, whilst up to 1854 little was effected by the 37 governors who followed each other in rapid succession. Of these governors Captain (afterwards Admiral) Bouët-Willaumez had previously explored the Senegal river as far as Médine and was anxious to increase French influence, but his stay in Senegal (1842–1844) was too brief to permit him to accomplish much.

The appointment of General Faidherbe as governor in 1854 proved the turning-point in the history of Senegal. In the meantime the Niger had been explored, Timbuktu visited by Europeans and the riches of the region were attracting attention. Faidherbe sought to bring these newly opened-up lands under French sway, and dreamed of a French empire stretching across Africa from west to east. In the territory of West Africa he did much to make that dream a reality. On taking up the governorship he set about subduing the Moorish (Berber) tribes of the Trarzas, Braknas and Duaish, who had subjected the French settlers and traders to grievous and arbitrary exactions; he bound them by treaty to confine their authority to the north bank of the Senegal. In 1855 he annexed the country of Walo and, ascending the river beyond Kayes, erected the fort of Médine for the purpose of stemming the advancing tide of Muslim invasion, which under Omar al-Haji (Alegui) threatened the safety of the colony. In 1857 Médine was brilliantly defended by the mulatto Paul Holle against Omar, who with his army of 20,000 men had to retire before the advance of Faidherbe and turn his attention to the conquest of the native states within the bend of the Niger. The conquest of the Senegambian region by the French followed.

Conquest of Niger Regions.—The first French expedition into the heart of the Niger country was undertaken in 1863, when Faidherbe sent Lieut. E. Mage and Dr. Quintin to explore the country east of the Senegal. The two travellers pushed as far as Segu on the Niger, then the capital of the almany Ahmadu, a son of Omar al-Haji. At Segu they were forcibly detained from Feb. 1864 to March 1866. After a pause of some years, chiefly the result of the Franco-Prussian war of 1870–71, Colonel Brière de l'Isle (governor of Senegal, 1876–1881) appointed Captain Joseph S. Gallieni in 1879 to investigate the route for a railway and to reopen communications with the almany Ahmadu. The armed conquest began in 1880, and for more than 15 years was carried on by Borgnis-Desbordes, J. S. Gallieni, H. N. Frey, Louis Archinard, Col. Combes, Tite Pierre Eugéne Bonnier and other officers. Their forces consisted almost entirely of Senegalese troops. In 1881 the Niger was reached; the fort of Bamako on the Niger was built in 1883; a road was made and the building of a railway from the Senegal to the Niger was begun. In 1887 the governor of Senegal took possession of a small uninhabited group of islands, named the Alcatras, lying off the coast of French Guinea. This act had a tragic sequel. By agreement with the governor, a chieftain of the neighbouring mainland sent four of his warriors to the islands to guard the tricolor. These soldiers were, however, like the islands themselves, completely forgotten by the authorities, and, the Alcatras producing nothing but sand, the four men starved to death. In the same year (1887) Ahmadu, who had formerly been anxious to obtain British protection, signed a treaty placing the whole of his country under French protection. Besides Ahmadu the principal opponent of the French was a Malinké (Mandingo) chieftain named Samory, a man of humble origin, born about 1846, who first became prominent as a reformer of Islam, and had by 1880 made himself master of a large area in the upper Niger basin. In 1887, and again in 1889, he was induced to recognize a French protectorate, but peace did not long prevail either with him or with Ahmadu. The struggle was resumed in 1890; Ahmadu lost Segu; Nioro the capital of Kaarta was occupied (1891); Jenné was taken in 1893. Samory proved a veritable thorn in the flesh to his opponents. Wily and elusive, he made and broke promises, tried negotiation, shifted his "empire" to the states of Kong, and after numberless encounters was finally defeated on the Cavalla to the north of Liberia, and taken prisoner in Sept. 1898. He was deported to the Gabun, where he died in 1900. Timbuktu (*q.v.*) was occupied in Dec. 1893, in defiance of orders from the civil authorities. In the meantime France had signed with Great Britain the convention of Aug. 5, 1890, which reserved the country now known as Nigeria to Great Britain.

Contact with the British.—In the following years French expeditions from Senegal penetrated south-east into the hinterland of the British colonies and protectorates on the Guinea coast and descended the Niger (Feb. 1897) as far as Bussa, the limit of navigation from the ocean. These actions brought them into contact with the British outposts in the Gold Coast and Nigeria. A period of tension between the two countries was put an end to by a convention signed on June 14, 1898, whereby the territories in dispute were divided, Great Britain retaining Bussa, while France obtained Mossi and other territories in the Niger bend to which Great Britain had laid claim. This convention removed the last barrier to the linking up of the French colonies on the gulf of Guinea with the hinterland of Senegal, so that henceforth the countries of the middle Niger were free to seek, through French territory, direct access to the sea. In the same year as this convention was signed it was determined to send an expedition to Lake Chad, which should co-operate with other expeditions from Algeria and the Congo. The Senegal expedition was entrusted to Captains Voulet and Chanoine, officers who had served many years in West Africa. They were obviously affected by the climate and were victims of the moral degeneration to which all Europeans, especially those entrusted with great powers, are subject, when long in contact with races of lower standards than their own. Reports of their misconduct and cruelty reaching St. Louis, Lieut.-Colonel Klobb, of the Marines, was sent to supersede them. Colonel Klobb overtook the expedition at a spot east of the Niger on July 14, 1899. Voulet, fearing arrest and punishment, ordered his men to fire on Klobb and his escort, and the colonel was killed. Thereupon Voulet, joined by Chanoine, declared his intention to set up an independent state, and with the majority of his troops marched away, leaving the junior officers with a small remnant. Within a fortnight both Voulet and Chanoine had been killed by their own men, who returned to the French camp. Lieut. Pallier assumed command and led the force to Zinder, reached on July 29. Here, in the November following, they were joined by F. Foureau and Commandant Lamy, who had crossed the Sahara from Algeria. The combined force marched to Lake Chad, and, having been joined by the Congo expedition, met and defeated the forces of Rabah (*q.v.*).

In 1904, in virtue of another convention between Great Britain and France, the Senegal colony obtained a port (Yarbatenda) on the Gambia accessible to sea-going vessels, while the trans-Niger frontier was again modified in favour of France, that country thereby obtaining a fertile tract the whole way from the Niger to Lake Chad. During 1905–1906 the oases of Air and Bilma were brought under French control, notwithstanding a claim by Turkey to Bilma as forming part of the Tripolitan hinterland.

In 1916 the Tibesti highlands, in the central Sahara, were attached politically to French West Africa; they mark its eastern limit.

In the extreme west, in the region which merges into the Sahara the effective area of French control was increased in 1903 when Coppolani, secretary-general of French West Africa, induced the emirs of certain Trarza and Brakna Moors inhabiting a fertile region on the northern bank of the lower Senegal to place their country under the direct supervision of French officials. In the following year these regions were constituted the Territory of Mauretania. In 1905 Coppolani, who was administering this new territory, was murdered by a band of fanatics at an oasis in the Tagant plateau. During 1908–09 a force under Colonel Gouraud, after considerable fighting—the natives receiving help from Morocco—made effective French influence in Adrar Temur. An agreement with Spain concerning Rio de Oro had previously, in 1900, fixed the frontier in this direction, on paper.

Period of Development.—At first the conquered territories were administered either from Senegal or placed under military rule. The ancient kingdoms were no longer recognized; the descendants of former rulers were deprived of all titles indicating sovereignty and ranked as ordinary chiefs. Native customs were respected as far as possible and the chiefs became in effect government agents. The legal status of slavery was abolished in 1901 but no attempt was made to break up violently the system of domestic slavery, which lingered for a good many years. As the various regions occupied developed they were given separate civil establishments; by 1922 the whole of French West Africa had been divided into eight colonies with local autonomy while matters affecting them all were entrusted to a governorship-general (*see* FRENCH WEST AFRICA). Since 1823 natives had been trained as soldiers and the Senegalese furnished France with many thousands of soldiers during the World War. In Dakar Senegal possesses the only first class port in French West-Africa.

Senegal proper, in accordance with the assimilation idea, was the subject of special legislation, its government being modelled on that of a department in France. The inhabitants of "communes with full powers" (*i.e.*, St. Louis, Dakar, Goree and Rufisque) are, without distinction of race or colour, French citizens, and by the law of April 1879 they elect to the French chambers one deputy. In the rest of Senegal the natives are not French citizens and do not possess the franchise. The *circonscription* of Dakar (*i.e.*, Dakar outside the commune) and dependencies form a unit administered by an officer responsible to the governor-general.

SENEGAL, a river of West Africa, entering the Atlantic about 16° N., some 10 m. below St. Louis, after a course of fully 1,000 m. It is formed by the junction of the Bafing or Black river and the Bakhoy or White river, and its chief affluent is the Faleme. North of the Senegal the Sahara reaches the coast, and for over 1,000 miles no river enters the ocean.

The Bafing rises in the Futa Jallon highlands about 2,400 ft. above sea-level, in 10° 28′ N., 10° 5′ W., its source being within 125 m. of Konakry on the Gulf of Guinea. A little south of 12° N. the Bafing is a large stream 250 yd. wide. The Bafing follows a northward course for about 350 m., during which it descends by a series of rapids till it reaches a level of 360 ft. above the sea. The headstreams of the Bakhoy rise between 11° 30′ and 12° N. and 9° 20′ and 9° 50′ W. on the N.E. versant of the hills which here form a narrow divide between the basin of the Senegal and that of the upper Niger. The Bakhoy, in its upper course much interrupted by rapids, flows N.E., but about 12° 15′ N. turns north-westward. Its principal affluent, the Baule (Red river), and its headstreams rise farther east on the northern slopes of the hills which above Bamako shut in the Niger. The eastern headwaters of the Senegal thus drain a large area adjacent to the upper Niger. The Baule flows north and in a series of loops reaches 14° 20′ N., where it turns westward and in about 13° 30′ N. and 10° W. joins the Bakhoy. After receiving the Baule, the Bakhoy, now a river of fine proportions, flows W. by N. through rocky country in a narrow valley. In 11° 55′ W. and 13° 48′ N. it unites with the Bafing. At the confluence the Bakhoy is 800 ft. wide, the Bafing at this point having a width of 360 ft.

After the junction of the Black and White rivers the united stream is known as the Senegal. The confluence is called Bafulabé, *i.e.*, "meeting of the waters." Below Bafulabé the river flows northwest through a valley bordered on either side by hills which throw out rocky spurs, over which the Senegal descends in a succession of falls, those of Guina (160 ft.) and of Felu (50 or 60 ft.) being the most important. From the south it is joined by the Faleme, a considerable river which rises in hilly country in about 11° 50′ N. and 11° 30′ W. The first rise of the lower Senegal is due to the rains in the source region of the Faleme, the flood water passing down that stream more quickly than down the Bafing owing to its shorter course. A short distance below the Felu Falls is the town of Kayes on the left bank of the river. Between the falls and Bakel (85 m.) there are twenty-seven "narrows," of which several, such as that at Kayes, are difficult. Kayes is the limit of navigability from the sea. From that town a railway connects with the navigable waters of the Middle Niger at Kulikoro.

Below Bakel the river passes through flatter country and presents a series of great reaches. It sends off numbers of divergent channels (called *marigots*) forming several islands, the largest being that of Morfil, 110 m. long. The river attains its most northerly point, 16° 30′ N., in about 15° 10′ W. Thereafter it runs S.W. and finally due S. In the last 10 m. of its course it runs parallel to the sea, from which it is separated by a narrow line of dunes. On an island at the head of this 10 m. is St. Louis, the capital of the colony of Senegal. At this point the right branch of the river is only 500 ft. from the open Atlantic. A marigot, called the Ndiadier or Maringiouins, leaves the river 40 m. above St. Louis, pierces the dunes at flood time and reaches the sea, 50 m. N. of the mouth of the river. The Senegal indeed has what is styled an interior delta, but, with the exception of the marigot named, all the divergent branches rejoin the main stream before the sea is reached.

The comparative scantiness of its sources, the steepness of its upper course and the rapid evaporation which takes place after the short rainy season would make the Senegal an insignificant stream for more than half the year; but natural dams cross the channel at intervals and the water accumulates behind them in deep reaches, which thus act as reservoirs. In the rainy season the barriers are submerged in succession, the reaches are filled and the plains of the lower Senegal are changed into immense marshes. Lake Cayar on the right side of the lower Senegal and Lake Panieful (Guier) on the left constitute reserve basins, receiving the surplus waters of the river during flood and restoring them in the dry season. Owing to these natural "locks," the Senegal never discharges less than 1,700 or 1,800 cu.ft. per second. The lower Senegal forms the boundary between the Sahara and the western Sudan; the line of its inundations is an ethnographic march between the nomadic Berber and the settled Negro.

From July to October the level of the Senegal shows a series of fluctuations, with, however, a general increase till the end of August or beginning of September, when the maximum occurs. Boats drawing from 1 ft. to 2 ft. 6 in. can ascend to Kayes from the beginning of June to the middle of November; steamers drawing 4 ft. 3 in., from July to October inclusive; and ocean steamers, lightened so as to draw 11–13 ft., during August and September. From Mafu to the sea, a distance of 215 m., the Senegal is always navigable by vessels drawing not more than 10 ft.

The existence of the Senegal appears to have been known to the ancients. It is usually regarded as the Chretes or Chremetes of Hanno. The mouth of the Senegal, then called Senaga, was entered in 1445 by the Portuguese navigator Dinas Diaz (who thought it a western arm of the Nile), and in 1455 Cadamosto

ascended the river for some distance. Leo Africanus rightly describes its lower course as "severing by its winding channel the barren and naked soil from the green and fruitful." It was not until 1637 that the explorations of the upper river began, Jannequin, Sieur de Rochefort, in that year ascending the river some 200 m. above St. Louis. In 1697 André Brüe reached the island of Morfil, and in 1698 he penetrated past the Felu Falls. At that period geographers regarded the Senegal as the termination of the Niger, a theory held until Mungo Park's demonstration of the eastward course of that stream. Park himself added much to the knowledge of the upper basin of the Senegal. It was not until 1818 that the source (*i.e.*, of the Bafing) was located, by Gaspard Mollien.

See G. Mollien, *Découverte des sources du Sénégal et de la Gambie* (Paris, ed. 1889), with introduction by L. Ravaisson-Mollien; J. Ancelle, *Les Explorations au Sénégal et dans les contrées voisines* (Paris, 1886); M. Olivier, *Le Sénégal* (Paris, 1908); Captain Fromaget, "L'Hydrographie du fleuve Sénégal," in *B.S.G. Comm. Bordeaux*, xxxii. (1909); Hardél, *Le régime du fleuve Sénégal in B.S.G. de l'Afrique occidentale* (1907).

SENEGAMBIA, a term used to denote the region between the rivers Senegal and Gambia on the west coast of Africa. The country south of the Gambia as far as Sierra Leone was formerly also regarded as part of Senegambia. As a geographical expression Senegambia fell into disuse towards the end of the 19th century. It forms part of French West Africa.

SENESCHAL (sĕn'ĕ-shal), a title equivalent to "steward." The seneschal began presumably as the major-domo of the German princes who settled in the empire, and was predecessor of the mayors of the palace of the Merovingian kings. But the name seneschal became prominent in France under the Capetian dynasty. The seneschal, called in mediaeval Latin the *dapifer,* was the chief of the five great officers of State of the French court between the 11th and the 13th centuries. His functions were described by the term *major regiae domus,* and *regni Franciae procurator*—major-domo of the royal household, and agent of the kingdom of France. The English equivalent was the lord high steward, but the office never attained the same importance in England as in France. Under the earlier Capetian sovereigns the seneschal was the second person in the kingdom. He inherited the position of the mayor of the palace—had a general right of supervision over the king's service, was commander-in-chief of the military forces, was steward of the household and presided in the king's court in the absence of the king. It was the vast possibilities of the office which must have tempted the counts of Anjou of the Plantagenet line to claim the hereditary dapifership of France, and to support their claim by forgeries. At the close of the 11th century the seneschalship was in the hands of the family of Rochefort, and in the early part of the following century it passed from them to the family of Garlande. The power of the office was a temptation to the vassal, and a cause of jealousy to the king. The Garlandes came to conflict with the king, and were suppressed by Louis VI. in 1127. After their fall the seneschalship was conferred only on great feudatories who were the king's kinsmen—on Raoul of Vermandois till 1152, and on Thibaut of Blois till 1191. From that time no seneschal was appointed except to act as steward at the coronation of the king. The name of the seneschal was added with those of the other great officers to the kings in charters, and when the office was not filled the words *dapifero vacante* were written instead. The great vassals had seneschals of their own, and when the great fiefs were regained by the Crown, the office was allowed to survive by the king. In the south of France, Périgord, Quercy, Toulouse, Agenais, Rouergue, Beaucaire and Carcassonne were royal *sénéchaussées.* In Languedoc the landlords' agent and judicial officer, known in the north of France as a *bailli,* was called *sénéchal.* The office and title existed till the Revolution.

SENIGALLIA or **SINIGAGLIA** (anc. *Sena Gallica*), a city and episcopal see of the Marches, Italy, in the province of Ancona, on the coast of the Adriatic, 15 m. by rail N. of Ancona. Pop. (1921) 12,382 (town), 25,327 (commune). It is situated at 14 ft. above sea-level, and presents a modern appearance, with wide streets. The castle, originally built by Cardinal Albornoz (1355), was restored by Baccio Pontelli (*see* OSTIA) in 1492. The church of S. Maria delle Grazie outside the town is also by him. The ancient *Sena Gallica* was a city of Umbria. The name Gallica distinguishes it from Saena (Siena) in Etruria. A colony was founded there by the Romans after their victory over the Senones, about 280 B.C. It was destroyed by Pompey in 82 B.C. Ravaged by Alaric, fortified by the exarch Longinus, and again laid waste by the Lombards in the 8th century and by the Saracens in the 9th, Senigallia was at length brought so low by the Guelph and Ghibelline wars, and especially by the severities of Guido de Montefeltro, that it was chosen by Dante as the typical instance of a ruined city. In the 15th century it was captured and recaptured again and again by the Malatesta and their opponents. Sigismondo Malatesta of Rimini erected strong fortifications round it in 1450–55. Sixtus IV. assigned the lordship of the town to the Della Rovere family. After 1631 it formed part of the legation of Urbino.

SENIOR, NASSAU WILLIAM (1790–1864), English economist, was born at Compton, Berks, on Sept. 26, 1790, the eldest son of the Rev. J. R. Senior, vicar of Durnford, Wilts. He was educated at Eton and Magdalen College, Oxford; took the degree of B.A. in 1811, was called to the bar in 1819, and in 1836, during the chancellorship of Lord Cottenham, was appointed a master in chancery. On the foundation of the Drummond chair of political economy at Oxford in 1825, Senior was elected to fill the post, which he occupied till 1830, and again from 1847 to 1852. In 1830 he was requested by Lord Melbourne to inquire into the state of combinations and strikes, to report on the state of law and to suggest improvements in it. Senior was a member of many royal commissions. He died at Kensington on June 4, 1864.

His writings on economic theory consisted of an article in the *Encyclopaedia Metropolitana,* afterwards separately published as *An Outline of the Science of Political Economy* (1836), and his lectures delivered at Oxford, several of which were separately printed. A collection of them appeared in French under the title of *Principes Fondamentaux d'Économie Politique* (1835). Senior also wrote works on administrative and social questions. His contributions to the reviews were collected in volumes entitled *Essays on Fiction* (1864); *Biographical Sketches* (1865, chiefly of noted lawyers); and *Historical and Philosophical Essays* (1865). In 1859 appeared his *Journal kept in Turkey and Greece in the Autumn of 1857 and the Beginning of 1858.*

Senior regards political economy as a purely deductive science, derivable from four elementary propositions. The premises from which it sets out are, according to him, not assumptions but facts. The science concerns itself, however, with wealth only, and can give no practical counsel for political action: it can only suggest considerations which the politician should keep in view in studying the questions with which he has to deal. In several instances Senior improved the forms in which accepted doctrines were habitually stated. He also did excellent service by pointing out the disadvantages of Ricardo's terminology—as, for example, his use of "value" in the sense of "cost of production," and of "high" and "low" wages in the sense of a certain proportion of the product as distinguished from an absolute amount, and his peculiar employment of the epithets "fixed" and "circulating" as applied to capital. He shows, too, that in numerous instances the premises assumed by Ricardo are false.

Besides adopting some terms, such as that of "natural agents," from Say, Senior introduced the word "abstinence"—which, though obviously not free from objection, is for some purposes useful—to express the conduct of the capitalist which is remunerated by interest; but in defining "cost of production" as the sum of labour and abstinence necessary to production he failed to see that an amount of labour and an amount of abstinence are disparate, and do not admit of reduction to a common quantitative standard. He added some important considerations to what had been said by Smith on the division of labour.

(J. K. I.; X.)

SENJ (Magyar, *Zengg*), a town of Croatia-Slavonia, Yugoslavia, on the Adriatic sea. Pop. (1921) 3,037. It lies at the entrance to a long cleft among the Velebit mountains, down

which the *bora* sweeps with such violence as often to render the harbour unsafe. The town is the seat of a Roman Catholic bishop, and has a cathedral, a gymnasium and some ancient fortifications. It carries on a small trade in tobacco, fish and salt, and is connected with the cable to Krk (Veglia). The captaincy of Senj was established in the 15th century by King Matthias Corvinus of Hungary, as a check upon the Turks, and subsequently, until 1617, it was the stronghold of the Uskoks (*q.v.*).

SENLIS, a town of northern France, capital of an arrondissement in the department of Oise, on the right side of the Nonette, a left-hand affluent of the Oise, 34 m. N.N.E. of Paris by the Northern railway on the branch line (Chantilly-Crépy) connecting the Paris-Creil and Paris-Soissons lines. Pop. (1926) 5,607. Senlis can be traced back to the Gallo-Roman township of the Silvanectes, which afterwards became Augustomagus. Christianity was introduced by St. Rieul probably about the close of the 3rd century. During the first two dynasties of France Senlis was a royal residence and generally formed part of the royal domain; it obtained a communal charter in 1173. In the middle ages local manufactures, especially that of cloth, were active. The burgesses took part in the Jacquerie of the 14th century, then sided with the Burgundians and the English; whom they afterwards expelled. The Leaguers were there beaten in 1589 by Henry I., duke of Longueville, and François de La Noue. The bishopric was suppressed at the Revolution.

Senlis lies in a valley, in the midst of the three great forests of Hallatte, Chantilly and Ermenonville. It has Gallo-Roman walls, 23 ft. high and 13 ft. thick. They enclose an oval area 1,024 ft. long from east to west and 794 ft. wide from north to south. At each of the angles formed by the broken lines, of which the circuit of 2,756 ft. is composed, stood a tower; originally 28, there remain 16; they are semicircular in plan, and up to the height of the wall are unpierced. The Roman city had two gates; there are now five. The site of the praetorium was afterwards occupied by a royal castle, of which there are ruins dating from the 11th, 13th and 16th centuries. Near Senlis the foundations of a Roman amphitheatre have also been discovered. The old cathedral of Notre Dame (12th, 13th and 16th centuries) was begun in 1155 on a vast scale, but the transept was finished only under Francis I. At the west front there are three doorways and two bell towers, of which the right-hand tower (256 ft. high) consists, above the belfry stage, of a very slender octagonal drum with open-work turrets and a spire with eight dormer windows. The episcopal palace dates from the 13th century; the old collegiate church of St. Frambourg was built in the 12th century in the style which became characteristic of the "saintes chapelles" of the 13th and 14th centuries; St. Pierre (chiefly of the 15th and 16th centuries) serves as a market.

SENNA, a popular purgative, consisting of the leaves of two species of *Cassia* (natural order Leguminosae), viz. *C. acutifolia* and *C. angustifolia.* These are small shrubs about 2ft. high, with numerous lanceolate leaflets arranged pinnately on a main stalk with no terminal leaflet; the yellow flowers are borne in long-stalked racemes in the leaf-axils, and are succeeded by broad flattish pods about 2in. long. *C. acutifolia* is a native of many districts of Nubia, but is grown also in Timbuctoo and Sokoto. The leaflets are collected twice a year, dried by exposure to the sun, packed in large bags made of palm leaves, conveyed by camels to Assouan and Darao and thence to Cairo and Alexandria, or by ship by way of Massowah and Suakim. The leaflets form the Alexandrian senna of commerce. *C. angustifolia* affords the Bombay, East Indian, Arabian or Mecca senna of commerce. This plant grows wild in the neighbourhood of Yemen and Hadramaut in the south of Arabia, in Somaliland, and in Sind and the Punjab in India. It is also cultivated in the extreme south of India, and there grows larger leaves, which are known in commerce as Tinnevelly senna. American senna is *Cassia marilandica.*

The British Pharmacopoeia recognizes both *Senna Alexandrina* and *Senna Indica.* The active ingredient is cathartic acid, a sulphur containing glucoside of complex formula which is combined with calcium and magnesium to form soluble salts. Cathartic acid can easily be decomposed into glucose and cathartogenic acid. The leaves contain at least two other glucosides, sennapicrin and sennacrol, but as these are insoluble in water, they are not contained in most of the preparations of senna. Senna also contains a little chrysophanic acid.

Of the numerous pharmacopoeial preparations three must be mentioned. The *confectio sennae,* an admirable laxative for children, contains senna, coriander fruit, figs, tamarind, cassia, pulp, prunes, extract of liquorice, sugar and water. When coated with chocolate it is known as Tamar Indien. The *pulvis glycerhizae compositus* contains two parts of senna in twelve, the other ingredients being unimportant. A third preparation, rarely employed nowadays, is the nauseous "black draught," once in high favour. It is known as the *mistura sennae composita,* and contains sulphate of magnesium, liquorice, cardamoms, aromatic spirit of ammonia and infusion of senna.

Senna stimulates the muscular coat of the bowel, the colon being more particularly affected. As some congestion of the rectum is thereby produced, senna is contra-indicated whenever haemorrhoids are present. The drug has the advantage of not producing subsequent constipation.

SENNACHERIB, son and successor of Sargon, mounted the throne on the 12th of Ab. 705 B.C. His first campaign was against Babylonia, where Merodach-baladan had reappeared. The Chaldaean usurper was compelled to fly and Bel-ibni was appointed king of Babylon in his place. In 701 B.C. came a great campaign in the west, which had revolted from Assyrian rule. Sidon and other Phoenician cities were captured, but Tyre held out, while its king Lulia (Elulaeus) fled to Cyprus. Ashdod, Ammon, Moab and Edom now submitted, but Hezekiah of Judah with the dependent Philistine princes of Ashkelon and Ekron successfully defied the Assyrian army (*see* HEZEKIAH). The following year Sennacherib made his son Assur-nadin-sum king in place of Bel-ibni and drove Merodach-baladan out of the marshes in which he had taken refuge. A few years later he had a fleet of ships built near Birejik on the Euphrates by his Phoenician captives; these were manned by Ionians and transported overland to the Euphrates and so to the Persian gulf. Then they sailed to the coast of Elam, and there destroyed the colony of Merodach-baladan's followers at Nagitu. In return for this unprovoked invasion the Elamites descended upon Babylonia, carried away Assur-nadin-sum (694 B.C.) and made Nergal-yusezib king. Three years later a great battle was fought at Khalulē on the Tigris between the Assyrians on the one side and the Elamites and Babylonians on the other. Both sides claimed the victory, but in 689 B.C. Sennacherib captured Babylon and razed it to the ground. Some time previously he had overrun the mountain districts of Cilicia. On the 20th of Tebet 681 B.C. he was murdered by his two sons, who fled to Armenia after holding Nineveh for 42 days. He is famous as the builder of the palace of Kuyunjik at Nineveh, 1,500ft. long by 700ft. broad, as well as the great wall of the city, 8m. in circumference.

See S. Smith, *Camb. Anc. Hist.* iii. ch. III. (A. H. S.)

SENNAR, a country of north-east Africa, part of the Anglo-Egyptian Sudan. Its boundaries have varied considerably, but Sennar proper is the triangular-shaped territory between the White and Blue Niles north of 10° N. This region is called by the Arabs "The Island of Sennar" and by the negro inhabitants "Hui." The northern part, where the two Niles approach nearer one another, is also known as El Gezira, *i.e.,* "the Island." South-east Sennar stretches to the Abyssinian hills. By the Sudan administration this region has been divided into *mudirias* (provinces), one, including the central portion, retaining the name of Sennar. The present article deals with the country as a whole.

In general Sennar is a vast plain, lying for the most part much higher than the river-levels and about 2,000 ft. above the sea, its western part, towards the White Nile, being largely wilderness. From the plain rise isolated granitic hills, attaining heights of 1,000 to 2,000 ft. above the general level. Jebel Segadi is red granite of the finest quality.

Sennar lies in the region of light rain, increasing in the south-east districts to as much as 20 in. in the year. The rainy season is from July to September. The climate is generally unhealthy

during that period and the months following. The temperature, which rises at times to over 120° Fahr., is also very changeable, often sinking from 100° during the day to under 60° at night.

The soil, mainly alluvial, is naturally very fertile, and wherever cultivated yields abundant crops, durra being the principal grain grown. Many kinds of vegetables, and cotton, wheat and barley are also grown. The forest vegetation includes the *Adansonia* (baobab) which in the Fazogli district attains gigantic proportions, the tamarind, of which bread is made, the deleb palm, several valuable gum trees (whence the term Sennari often applied in Egypt to gum-arabic), some dyewoods, ebony, ironwood and many varieties of acacia. In these forests are found the two-horned rhinoceros, the elephant, lion, panther, numerous apes and antelopes, while the crocodile and hippopotamus frequent the rivers. The chief domestic animals are the camel, horse, ass, ox, buffalo (used both as a beast of burden and for riding), sheep with a short silky fleece, the goat and the pig, which last here reaches its southernmost limit.

The country is occupied by a partly settled, partly nomad population of an extremely mixed negroid character. The great plain of Sennar is mainly occupied by Hassania Arabs in the north, by Abu-Rof (Rufaya) Hamites of Beja stock in the east as far as Fazogli, and elsewhere by the negroid Funj and the group of tribes collectively known as Shangalla. The chief towns are on the banks of the Blue Nile. They are: Wad Medani 148 m. above Khartum, one of the most thriving towns in the eastern Sudan; Sennar, 241 m. above Khartum, the capital of the Funj empire and chief town of the *mudiria* of Sennar—of the ancient city little remains except a mosque with a high minaret; and Roseires, 426 m. from Khartum and the limit of navigation up stream from that city. Near the Abyssinian frontier are Fazogli (left bank) and Famaka (right bank) on a navigable stretch of the Blue Nile above the rapids at Roseires and close to the Tumat confluence and the gold district of Beni Shangul. On the river Dinder is the town of Singa. A railway, built in 1909–1910, connects Khartum, Wad Medani and Sennar with Kordofan, the White Nile being bridged near Goz Abu Guma.

History.—Sennar, lying between Nubia and Abyssinia, was in ancient times under Egyptian or Ethiopian influence and its inhabitants appear to have embraced Christianity at an early period. In the 7th or 8th centuries A.D. there was a considerable emigration of Arabs into the country. Christianity very gradually died out. The Funj who had meantime settled in Sennar became the dominant race by the 15th century. They adopted the Mohammedan religion and founded an empire which in the 17th and 18th centuries ruled over a large part of the eastern Sudan. This empire was finally overthrown by the Egyptians in 1821.

SENONES, a Celtic people of Gallia Celtica, who in Caesar's time inhabited the district which now includes the departments of Seine-et-Marne, Loiret, and Yonne. From 53–51 B.C. they were engaged in hostilities with Caesar. In 51 B.C. a Senonian named Drappes threatened the Provincia, but was captured and starved himself to death. From this time the Gallic Senones disappear from history. In later times they were included in Gallia Lugudunensis. Their chief town was Agedincum (later Senones, whence Sens).

A branch of the Senones, called Σένωνες, Senōnes, by Polybius, crossed the Alps about 400 B.C. and settled on the east coast of Italy from Ariminum to Ancona, in the so-called *ager Gallicus*, and founded the town of Sena. In 391 B.C. they invaded Etruria and besieged Clusium. The Clusines appealed to Rome, whose intervention led to war, the defeat of the Romans at the Allia (July 18, 390 B.C.) and the capture of Rome. For 100 years the Senones were at war with Rome, but were finally subdued and expelled (283 B.C.) by P. Cornelius Dolabella. Nothing more was heard of them in Italy.

For ancient authorities, *see* A. Holden, *Altceltischer Sprachschatz*, ii. (1904); for the Gallic Senones, *see* T. R. Holmes, *Caesar's Conquest of Gaul* (1899); for the subjugation of the Cisalpine Senones by the Romans, *see* T. Mommsen, *History of Rome* (Eng. trans.), bk. ii. ch. vii.

SENS (sons), a town of north-central France, capital of an arrondissement, department of Yonne, 70 m. S.E. of Paris on the P.L.M. railway. Pop. (1926) 14,641. Sens (*Agedincum*) was the capital of the Senones, one of the most powerful peoples of Gaul. It was not finally subdued by the Romans till after the defeat of Vercingetorix. On the division of Gaul into 17 provinces under the emperor Valens, *Agedincum* became the metropolis of the 4th Lugdunensis. Theatres, circuses, amphitheatres, triumphal arches and aqueducts were all built in the town by the Romans. It was the meeting-point of six great highways. The inhabitants, converted to Christianity by the martyrs Savinian and Potentian, held out against the Alamanni and the Franks in 356, against the Saracens in 731 or 738, and finally against the Normans in 886. The early feudal government of Sens was by counts, hereditary in the middle of the 10th century, and their quarrels with the archbishops, etc., were serious until, in 1055, the countship was united to the royal domain. Several councils were held at Sens, notably that of 1140, at which St. Bernard and Abelard met. The burgesses in the middle of the 12th century formed themselves into a commune which carried on war against the clergy. This was suppressed by Louis VIII., and restored by Philip Augustus. Sens massacred the Protestants in 1562, and it was one of the first towns to join the League. Henry IV. entered it in 1594, and deprived the town of its privileges. In 1622 Paris, hitherto suffragan to Sens, was made an archbishopric, and the bishoprics of Chartres, Orleans and Meaux were transferred to the new jurisdiction. In 1791 the archbishopric was reduced to a bishopric of the department of Yonne. Suppressed in 1801, the see was restored in 1817 with the rank of archbishopric. The town was occupied by the Allies in 1814 and by the Germans in 1870–71.

Sens stands on the right bank of, and on an island in, the Yonne near its confluence with the Vanne. The cathedral of St. Étienne (1140–16th century), one of the earliest Gothic buildings in France, is additionally interesting because the architecture of its choir influenced through the architect, William of Sens, that of the choir of Canterbury cathedral. The west front is pierced by three portals; that in the middle has good sculptures, representing the parable of the virgins and the story of St. Stephen. The right-hand portal contains remarkable statuettes of the prophets.

To the south of the cathedral are the 13th century official buildings, restored by Viollet-le-Duc, on the first story of which is the synod hall, vaulted with stone and lighted by beautiful grisaille windows. A Renaissance structure connects the buildings with the archiepiscopal palace, of the same period. The church of St. Savinian, the foundation of which dates from the 3rd century, has a Romanesque crypt. The museum of Sens contains some precious mss., notably a famous missal with ivory covers, and a collection of sculptured stones from the old Roman fortifications, themselves built from the ruins of public monuments at the beginning of the barbarian invasions. Sens is the seat of a sub-prefect, and has a tribunal of commerce, a chamber of commerce and a board of trade arbitrators. Among the industries are flour-milling, tanning and the manufacture of iron goods, boots and shoes, brushes, chemicals and cutlery; there is trade in wine, grain, wood, coal and wool, shared by the port on the Yonne.

SENSITIVITY, a term used to define the degree to which a radio receiving set responds to signals of the frequency to which it is tuned.

SENTENCE, in law, the term signifying a judgment of a court of criminal jurisdiction imposing a punishment such as a fine or imprisonment. It is given orally by the presiding judge or magistrate, and may be altered before it is entered. Concurrent sentences are those which run from the same date in respect of convictions on various counts or on various indictments at the same assizes or sessions. A cumulative sentence is the sum total of consecutive sentences passed in respect of each distinct offence of which an accused person has been found guilty at the same time and court. It is for the court to decide in its discretion whether the sentences shall be concurrent or consecutive. In England a sentence, in trials before a court of assize, begins to run from the first day of the sitting of the court, but in that of courts of quarter sessions from the time the sentence is pronounced unless the court otherwise orders.

The same differentiations apply in the United States.

SENTIMENT, in psychology, means a constellation or system of emotional dispositions related to some person or object. Love, friendship, and reverence, *e.g.*, are sentiments.

See FEELING; EMOTION; A. Shand, *Foundations of Character* (1922); PSYCHOLOGY, and the bibliography given there.

SENTINUM, an ancient town of Umbria, Italy, lying to the south of the modern town of Sassoferrato, in the low ground. The foundations of the city walls are preserved, and a road and remains of houses have been discovered, including several mosaic pavements. In the neighbourhood the battle took place in which the Romans defeated the combined forces of the Samnites and Gauls in 295 B.C. It was taken and destroyed in 41 B.C. by the troops of the Emperor Augustus, but revived under the Empire. It was a municipium, not a colonia.

SENUFO, a tall, long headed people of the French Sudan and Ivory Coast, with long, wide noses. The Senufo have numerous subdivisions, notably the Minianka, Pomporo, Tagwana, Djimini, Diamala, Nafana, etc., all speaking a language related to the Volta group. Each tribe is subdivided into clans having each its tabu animal, and the tribes are split up into independent chiefdoms. The Senufo have a number of age-classes with progressive initiation, and they are animist in religion though a few are Muslims. They are agriculturalists and live in houses that are either thatched or have platform roofs. Inheritance goes to the uterine brother, or maternal nephew; the son is excluded.

See Delafosse, "Le Peuple Siena ou Senoufo," *Revue des Études Ethnographiques et Sociologiques,* Vols. i., ii. (1908–09).

SENUSSI and **SENUSSITES,** the names respectively of a Muslim family (and especially its chief member) and of the fraternity or sect recognizing the authority of the Senussi.

Seyyid or Sidi (*i.e.,* Lord) Mohammed ben Ali ben Es Senussi el Khettabi el Hassani el Idrissi el Mehajiri, the founder of the order, commonly called the Sheikh es Senussi, was born near Mostaganem, Algeria, and was called es Senussi after a much venerated saint whose tomb is near Tlemsen. The date of his birth is given variously as 1791, 1792, 1796 and 1803. He was a member of the Walad Sidi Abdalla tribe of Arabs and his descent is traced from Fatima, the daughter of Mohammed. As a young man he spent several years at Fez, where he studied theology. When about 30 years old he left Morocco and travelled in the Saharan regions of Algeria, preaching a reform of the faith. From Algeria he went to Tunisia and Tripoli, gaining many adherents, and thence to Cairo, where he was opposed by the Ulema of El Azhar, who considered him unorthodox. Leaving Egypt Senussi went to Mecca, where he joined Mohammed b. Idris el Fassi, the head of the Khadirites, a fraternity of Moroccan origin. On the death of el Fassi Senussi became head of one of the two branches into which the Khadirites divided, and in 1835 he founded his first monastery at Abu Kobeis, near Mecca. While in Arabia Senussi visited the Wahhabites, and his connection with that body caused him to be looked upon with suspicion by the Ulema of Mecca. It was at Mecca, however, that Senussi gained his most powerful supporter, Mohammed Sherif, a prince of Wadai, who became in 1838 sultan of his native State, then the most powerful Mohammedan kingdom in the central Sudan. Finding the opposition to him at Mecca too powerful Senussi quitted that city in 1843 and settled in Cyrenaica, where in the mountains near Derna he built the *Zawia Baida,* or White Monastery. There he was in close touch with all the Maghribin, gaining many followers among the Tripolitans and Moroccans. The spread of the *Senussia* was, however, not viewed with favour by the Turks, who at that time ruled Cyrenaica. Probably with the desire to avoid pressure from the Turks, Senussi removed in 1855 to Jaghbub, a small oasis some 30m. N.W. of Siwa. Here he died in 1859 or 1860, leaving two sons, one Mohammed Sherif (named after the sultan of Wadai), born in 1844, and the other, el Mahdi, born in 1845. To the second son was left the succession. It is related that as the younger son showed a spirit in all things superior to that of his brother the father decided to put them to the test. Before the whole *zawia* at Jahgbub he bade both sons climb a tall palm tree and then adjured them by Allah and His Prophet to leap to the ground. The younger lad leapt at once and reached the ground unharmed; the elder boy refused to spring. To el Mahdi, "who feared not to commit himself to the will of God," passed the birthright of Mohammed Sherif. Mohammed appears to have accepted the situation without complaint. He held the chief administrative position in the fraternity under his brother until his death in 1895.

The Second Senussi.—Senussi el Mahdi, only 14 when his father died, enjoyed all his father's reputation for holiness and wisdom, attributes consistent with all that is known of his life. Mohammed Sherif, the sultan of Wadai, had died in 1858, but his successors the sultan Ali (who reigned until 1874) and the sultan Yusef (reigned 1874–98) were equally devoted to the *Senussia.* Under the Senussi el Mahdi the *zawias* of the order extended from Fez to Damascus, to Constantinople and to India. In the Hejāz members of the order were numerous. In most of these countries the Senussites occupied a position in no respect more powerful than that of numbers of other Muslim fraternities. In the Hausa States (*i.e.,* north Nigeria) the *Senussia* made little headway, the Muslims there acknowledging the headship of the sultan of Sokoto. In the eastern Sahara and in the central Sudan the position was different. From the western borders of Egypt south to Darfur, Wadai and Bornu, west to Bilma and Murzuk, and north to the coast lands of Tripolitania, Senussi el Mahdi became the most powerful sheikh, acquiring the authority of a territorial sovereign. The oases in the Libyan desert were occupied and cultivated by the Senussites, trade with Tripoli and Benghazi was encouraged, law and order were maintained among the savage Bedouin of the desert. But the eastern Sahara is among the most desolate and thinly populated parts of the world, and of more importance to the order was the influence possessed by the sheikh in the central Sudan.

Although named el Mahdi by his father there is no evidence to show that the younger Senussi ever claimed to be *the* Mahdi, though so regarded by some of his followers. When, however, Mohammed Ahmed, the Dongalese, rose against the Egyptians in the eastern Sudan and proclaimed himself *the* Mahdi, Senussi was disquieted. He sent an emissary via Wadai to Mohammed Ahmed, this delegate reaching the Mahdi's camp in 1883 soon after the sack of el Obeid. "The moral and industrial training of the Senussi" [delegate], writes Sir Reginald Wingate, "revolted from the slaughter and rapine he saw around him. The sincere conviction of the regeneration of the world by a mahdi whose earnest piety should influence others to lead wholesome and temperate lives, the dignity of honest labour and self-restraint, these were the sentiments which filled the mind of the emissary from Wadai" (*Mahdiism and the Egyptian Sudan,* 1891).

The sheikh Senussi, there is reason to believe, shared the lofty views which Wingate attributes to his agent. He decided to have nothing to do with the Sudanese Mahdi, though Mohammed Ahmed wrote twice asking him to become one of his four great khalifs. To neither letter did Senussi reply: he warned the people of Wadai, Bornu and neighbouring States to abstain from Sudan affairs. The Darfurian revolt of 1888–89 against the khalifa Abdullah was nevertheless carried out in the name of the Senussi.

Contact with the French.—The growing fame of the Senussi sheikh once more aroused anxiety among the Turks, the sultan, Abdul Hamid II., seeing with alarm that in many parts of Tripolitania and in Benghazi the power of the sheikh was greater than that of the Ottoman governors. In 1889 the sheikh Senussi was visited at Jaghbub by the pasha of Benghazi at the head of some troops. This event led the sheikh (1894) to leave Jaghbub and fix his headquarters at Jof in the oases of Kufara, a place sufficiently remote to secure him from any chance of sudden attack. By this time a new danger to Senussia had arisen; the French were advancing from the Congo towards the western and southern borders of Wadai. In 1898 Senussi, wishing to range together all the States menaced by the French advance, sought to reconcile Rabah Zobeir (*q.v.*) and the sultan of Bagirmi; neither of those chieftains belonged to the Senussi order and the sheikh's appeal was unavailing. In Wadai, Sultan Yusef's successor, Ibrahim, who ascended the throne in 1898, showed signs of resenting the advice of the sheikh, stirred, perhaps, by the overthrow of the

khalifa Abdullah at Omdurman. Senussi retaliated, says Capt. Julien in his history of Wadai, by prohibiting the people of Wadai from smoking tobacco or drinking merissa, the native beer, "which is to the Wadaiin what the skin is to the body." Sultan Ibrahim rejoined that his people would fight and die for merissa; rather than give it up they would renounce Senussiism. The sheikh had the wisdom to give way, declaring that in response to his prayers Allah had deigned to make an exception in favour of the faithful Wadaiins. Ibrahim died in 1900 and his successors fell again under the influence of the sheikh.

In 1900 Senussi el Mahdi left Kufara for Dar Gorane, on the western confines of Wadai. There, at Geru, on the top of a rocky hill, he built and strongly fortified a *zawia*. Senussi's object was to try to stem the advance of the French, who in this same year had slain Rabah in battle and occupied Bagirmi. The sheikh sought to prevent the French from occupying Kanem, a country north-east of Lake Chad and bordering the Sahara, that is, impinging on what was considered Senussi land. Thus, for the first time, the Senussites came into conflict with a European Power. There had been for some time a belief among certain French and British travellers in north Africa that the Senussites would proclaim a *jihad* or holy war, and that they would have the support of all the Muslims of north and west Africa. This belief was founded partly on the supposed tenets of the order and partly on an exaggerated conception of the strength of the Senussites. The Senussi warriors proper, those who owned direct allegiance to the head of the order, numbered a few thousands at most. For the rest the Senussi sheikh depended upon his spiritual influence and its effect in inducing the peoples who had embraced his doctrines to act as he wished. Moreover, the record of the first and second Senussi chiefs shows them to have acted on the defensive. Senussi el Mahdi, in opposing the French, undertook no war of aggression, nor was there any great rally of the tribes to his banner. In Kanem he was left to fight with his Bedouin followers and such help as the people of Kanem were able to give. A *zawai* was built at Bir Allali (an *entrepôt* for the trade of Tripoli with the Chad countries) and strongly garrisoned. War ensued and continued for over a year, but after a severe engagement Bir Allali was captured by a French column in Jan. 1902. Senussi el Mahdi was much discouraged by the loss of Kanem and died shortly afterwards, on May 30, 1902, at Geru. There he was buried, in the *zawai-el-Taj*. But for years the Bedouin believed him to be alive and to have gone on "a secret journey."

At the time of the death of Senussi el Mahdi his sons were minors and the chieftainship went to his nephew, Ahmed esh Sherif, an ambitious man, not without ability, but lacking the wisdom of his predecessors. Ahmed continued his uncle's policy of resisting the French, but despite his efforts, after a long and bitter struggle lasting from 1904–11, Wadai was conquered by them. (*See* WADAI.) In the central Sudan the prestige of the Senussites waned and the advances made by the sheikh Ahmed to Ali Dinar, the sultan of Darfur, were not at that time reciprocated. With Egypt, and with the British authorities in Egypt, the Senussi maintained friendly relations. Ahmed, in view of the activity of the French, had again fixed his headquarters at Jof in the Kufara oases; and in these and the other oases of the Libyan desert he was master. That the desert had been recognized by France as within the British sphere gave him no concern. In Egypt the number of adherents to the order was increasing, and at Alexandria Mohammed el Idris, the eldest son of Senussi el Mahdi, lived in some state, receiving Senussi notables from many lands.

The Invasion of Egypt.—Meanwhile the sheikh Ahmed had succumbed to the Pan-Islamic movement which Abdul Hamed II., the sultan of Turkey, had revived and his successor continued. In consequence the Senussites gave substantial aid to the Turks when in 1911 the Italians invaded Tripolitania and Cyrenaica. After the Turks had been compelled to acknowledge defeat Ahmed continued the war with Italy, helped by Turkish troops who, in violation of the Treaty of Lausanne, had remained in the country. When the World War began the Italians held only a strip of coast land; the Senussites were masters of the interior of Cyrenaica. Terms of accommodation were discussed in the later half of 1914 and an arrangement might have been reached had not Sidi Ahmed refused to accept the position of a "protected Bey." In the spring of 1915 the Senussites were again attacking Italian ports.

At this time a number of Turkish officers and Arabic-speaking German officers had been smuggled into Cyrenaica and by heavy bribes and gross flattery they worked upon the vanity and cupidity of the sheikh Ahmed to proclaim a *jihad* and invade western Egypt. Ahmed hesitated; his hesitation was known to the British in Egypt, and in Nov. 1915 Mohammed el Idris was sent from Alexandria to his cousin to arrange with him "to get rid of his Turkish advisers in return for a sum of money." It was too late; Ahmed was already well supplied with Turco-German gold and armaments. At the end of 1915 Ahmed invaded western Egypt. The *muhafizia* or Senussite regular troops numbered at most 5,000; the Turkish troops about 1,000; but the real danger was that any Senussite success might cause a rising among the Bedouin of western Egypt and in the Nile valley. Owing to the prompt measures taken by Gen. Sir John Maxwell (commanding in Egypt) the Senussites failed to gain victories; the invaders were eventually repulsed and by Feb. 1917 Sidi Ahmed—who in Nov. 1916 had been given by the Turks the title of "viceroy of Africa"—was completely defeated. He retired to the oasis of Jaghbub. (For the military operations *see* SENUSSI, OPERATIONS AGAINST THE.) The failure of this invasion seemed to show definitely that the Senussi brotherhood was not so powerful, either politically or spiritually, as had been imagined. The Germans and Turks had done their utmost by exploiting Senussi influence to cause trouble in directions other than Egypt. In the Sudan Ali Dinar, the sultan of Darfur, had been won over, but he was decisively beaten by an Egyptian force under Maj. P. V. Kelly in May 1916; and elsewhere in the Anglo-Egyptian Sudan the Senussi had few adherents. Further west, towards Lake Chad, there was some trouble, but the French, pushing north from Kanen, had seized the Saharan borderlands and had captured Ain Gallaka (in Borku), the Senussi southern base, in Nov. 1913. During the World War this and other French outposts formed an effective barrier against Senussi raids. In the hinterland of Tripolitania Senussi influence was strong and, the Italians being compelled to withdraw to the coast, Mohammed el Abid, a brother of the Senussi sheikh, ruled in Fezzan until the summer of 1917. Discords in Tripolitania, however, showed clearly that tribal rivalries were stronger than religious bonds.

Relations with the Italians.—Mohammed el Idris and other Senussi chiefs had not approved Sidi Ahmed's invasion of Egypt; Idris from his residence in Egypt had gained a knowledge of affairs which Ahmed lacked, and he was a peaceably inclined man. With Idris the Italian and British Governments entered into an agreement in 1917; the Senussi chiefs acknowledged Idris as "Grand Senussi," and in Aug. 1918 the defeated and discredited Ahmed found it convenient to quit Cyrenaica. He was conveyed by a German submarine from Misurata to Pola, whence he went to Turkey, still claiming to be head of the brotherhood. In 1919 Idris sent his brother Rida on an embassy to Rome, and, by the Accord of Regima, Nov. 1920, Idris acknowledged Italian suzerainty. He was given the hereditary title of emir (prince), with jurisdiction over the oases of Kufara, Jaghbub, Jalo, Aujela and Jedabia. Peaceful relations continued for some time, but Italy under Fascist rule found the situation irksome. There was also evidence that Idris was encouraging the insurgents in Tripolitania who in July 1922 had invited him to become their leader and prince. Declaring the position incompatible with the national dignity of Italy the Fascist Government denounced the agreements with the Senussi early in 1923. Idris himself had in January of that year withdrawn to Egypt, where he remained. Seemingly he suffered no loss of spiritual prestige, upon which his friends declared he set more store than on temporal authority. In Cyrenaica Senussite resistance to the Italians was organized by the sheikh Rida. It was of a guerilla character.

The Italians, however, were placed in an advantageous position to control Senussi activity by an agreement made with Egypt on

Dec. 6, 1925. This agreement gave them the sovereignty over the oases of Jaghbub, while south of that place the frontier was drawn along the 25th degree of E. long., thus including Kufara in Cyrenaica. Jaghbub was occupied by Italian troops in Feb. 1926 without opposition. It is important as containing the tomb-mosque of the founder of the Senussi sect and a *zawia* for the training of the *ikhwan* (brethren).

In 1927 the Italians undertook a regular campaign in Cyrenaica, with such effect that on Jan. 3, 1928, Sidi Rida surrendered. He was exiled to Sicily. In the spring of the same year Jalo and other oases were occupied. Operations against the tribesmen were continued with vigour, so that by 1929 Kufara alone remained to the Senussites. These remote oases were visited in 1920–23 by Hassanein Bey, Rosita Forbes and Bruneau de Laborie. All three drew a pleasing picture of Senussi culture which however includes slavery. The only other Europeans known to have visited Kufara except a French prisoner of war were Gerhard Rohlfs and Anton Stecker, who ventured there in 1879, and had to flee for their lives.

Tenets of the Order.—The Senussi *ikhwan* (brethren) are not probably a very numerous clan, but they have followers and adherents in many lands. Moreover, while other dervish fraternities are mystical and latitudinarian in theology, and only sporadically meddle in politics, the Senussites have exercised a distinct political influence and have sought to revive the faith and usages of the early days of Islam. The order is in a sense an outcome of the Wahhabite movement, but, as gathered from the writings of Mohammed el Hechaish, a Tunisian sheikh, and other trustworthy sources, appears to be neither mystical nor puritan. There is less of secrecy about their rites than is usual in Muslim fraternities. The use of tobacco and coffee is forbidden, but the drinking of tea is encouraged, and the wearing of fine clothes is allowed. While they profess to belong to the Malikite rite (one of the four orthodox sects of Islam), the Senussites are charged by the Ulema of Cairo with many deviations from the true faith; chiefly they are accused of interpreting the Koran and Sunna without consulting one of the recognized glosses. Thus the Egyptian theologians regard the Senussites as inaugurating a new rite rather than forming a simple fraternity; in this, if not in puritanism, resembling the Wahhabites. Apart from their theological beliefs their chief work, before they were confronted by the activities of European Powers, seems to have been colonization and the encouragement of trade. Wells were dug and oases cultivated, rest houses built along caravan routes, merchants from Tripoli, Bornu, Wadai and Darfur welcomed. Such was the report of Mohammedan writers and of French and British political agents; for few Europeans had opportunities of making personal observations. At the oasis of Siwa (Jupiter Ammon), however, Senussites were in contact with the Egyptian administration. There for many years the agent of the Senussi sheikh dwelt in amity with the Egyptian authorities.

The missionary zeal of the Senussites is undoubted. Outside the regions adjacent to their headquarters adherents of the order are drawn from a higher social rank than the generality of Muslim secret societies. Its chief agents are personages of wealth and importance and highly educated in oriental lore. They are in general on good terms with the rulers of the countries in which they live, as instanced in 1902 by the conferment of the Legion of Honour on the head of the *zawia* at Hillil in Algeria. These agents make regular tours to the various *zawias* placed under their charge and expound the Senussi doctrines at the Muslim universities.

BIBLIOGRAPHY.—L. Rinn, *Marabouts et Khouan*, a good historical account up to the year 1884; O. Depont and X. Coppolani, *Les Confréries religieuses musulmanes* (Algiers, 1897), an authoritative work. Si Mohammed el Hechaish, "Chez les Senoussia et les Touareg," in *L'Expansion col. française* for 1900 and the *Revue de Paris* for 1901; these are translations from the Arabic of an educated Mohammedan who visited the chief Senussite centres; an obituary notice of Senussi el Mahdi by the same writer appeared in the Arab journal *El Hadira* of Tunis, Sept. 2, 1902; a condensation of this article appears in the *Bull. du Com. de l'Afr. française* for 1902; "Les Senoussia," an anonymous contribution to the April supplement of the same volume, is a judicious summary of events, a short bibliography being added; Capt. Julien, in "Le Dar Ouadai," published in the same *Bulletin* (vol. for 1904), traces the connection between Wadai and the Senussi. *See* also Rosita Forbes, *The Secret of the Sahara-Kufara* (1921); Bruneau de Laborie, "Du Cameroun au Caire par le Tchad et le désert de Libye," in *La Géographie* (May 1924); A. SENUSSI, OPERATIONS AGAINST THE. Military activity of the Senussi from 1900 to 1910 had been directed against the French in the regions between Lake Chad and the Nile Basin. There was evidence of an increase of adherents to the sect in Egypt and Arabia; in north-west Africa and the Sudan it had made practically no headway. During 1911 the Senussi Sheikh, Sidi Ahmed, aided the Turks in their campaign against Italy in Cyrenaica. After the treaty of Lausanne, in Oct. 1912, by which Turkey agreed to evacuate Tripoli and Cyrenaica, Sidi Ahmed continued the war against the Italians, who were powerless to penetrate into the interior.

At the outbreak of war in 1914 the Germans and Turks saw in the Senussi a powerful instrument for attacking the British position in Egypt and the Sudan. For long Sidi Ahmed resisted the efforts to embroil him with Egypt, with which he had always maintained good relations. But the adherence of his enemy, Italy, to the Allied cause in May 1915 gave his Turkish advisers a powerful lever and finally the influence of Nuri Bey, a half-brother of Enver, prevailed.

The plan instigated by the Turks and Germans was for simultaneous advances on Egypt along the coastal strip and by the oases leading from Siwa to the Nile. At the same time the sultan of Darfur was to rise, invade Kordofan and advance on Khartoum. The danger to the British in Egypt and the Sudan was not so much in the military force actually at the command of Sidi Ahmed and his allies as in the spiritual authority he exercised and the possibility of a religious rising.

Hostilities began on Nov. 15, 1915. The small garrisons of Es Sollum and other advanced posts were withdrawn, and Mersa Matruh was made the base for the British operations. The difficulty was to collect a sufficient force, for during the Gallipoli operations Egypt had been practically denuded of troops. The force assembled under Maj.-Gen. A. Wallace consisted of Yeomanry, Territorials, Australians, New Zealanders, Indians and Egyptians. The Senussi leader had a few Turkish troops with him, about 5,000 of his own regular forces and a varying number of irregular tribesmen.

A Decisive Engagement.—Gen. Wallace succeeded in striking a severe blow at the enemy on Christmas Day, 1915, but the rainy season and a lack of troops and transport prevented any further attempt to bring the enemy to battle till Feb. 1916. On Feb. 20, Maj.-Gen. W. E. Peyton, who had succeeded Gen. Wallace, began an advance to re-occupy Es Sollum. On Feb. 26 at Agagya, about half-way to Es Sollum, a decisive engagement was fought. The infantry, which included two South African battalions, captured the Senussites' position. In the pursuit the Dorset Yeomanry, by a fine charge, broke the enemy and captured Jafar Pasha, an able Baghdadi Arab who commanded the Senussites. There was little further fighting. Es Sollum was re-occupied on March 14, the enemy retiring into Cyrenaica. During Feb. and April 1916, the Senussites, under Sidi Ahmed himself, occupied the Bahariya, Farafra, Dakhla and Kharga oases, but made no further advance. The British had at the time no forces available for re-occupation, but kept the oases under observation by aeroplane.

Meanwhile the rebellious sultan of Darfur, Ali Dinar, in May 1916, was attacked and defeated by a force from the Sudan under Lieut.-Col. P. V. Kelly. The sultan himself was killed in November. By Oct. 1916 the British had organized a camel corps and light car patrols, and proceeded to re-occupy the oases. Sidi Ahmed retired to Siwa, where he was attacked and defeated at the beginning of Feb. 1917 by a force of armoured cars from Es Sollum under Brig.-Gen. H. W. Hodgson. This action at Siwa discredited the Senussi and removed the danger to Egypt.

During 1917 and 1918 Turkish and German influence amongst the Senussites declined and Sidi Ahmed's own position was discredited. In the summer of 1918 he found it advisable to leave Cyrenaica for Turkey and was succeeded by Sidi Mohammed el Idris, the son of Senussi-el-Mahdi. The new Grand Senussi concluded agreements with Great Britain and Italy, recognizing Italian sovereignty. In 1925 a rectification of frontier was made between Egypt and Italy, Jaghbub being transferred to the Italian sphere.

SEONI or **SEONI-CHAPARA,** a town and district of British India in the Jubbulpur division of the Central Provinces. The town is 2,000 feet above sea level, half way on the great northern road between Nagpur and Jubbulpur. Population (1921) 12,772. It is a favourite station, being well-wooded and has a fine tank and good public gardens. It is the headquarters of the district and "the Original Seceders from the Church of Scotland" have established an excellent mission there.

The district of Seoni forms part of the Satpura tableland, containing the head-waters of the Wainganga. It is largely covered with forests and some 40% of the inhabitants belong to aboriginal tribes. Area 3,216 square miles. The population of the district, 348,871 by the census of 1921, though far above the figure of 1872, shows a large fall during the preceding decade, a result of influenza, famine and relapsing fever, but also partially due to fluctuations in seasonal migrations. The north of the district is drained by the tributaries of the Narbada, the south by the Wainganga and its affluents. There are many plateaux and valleys scattered over its rugged surface, but its chief plain is the Haveli, between Seoni town and the Chaurai tract of Chhindwara, from which it is divided by the Pench river. The east and south-east of the district consists of light siliceous land on which the Ponwars, akin to those of Balaghat and Bhandara, have made many tanks for irrigating rice. The black soil plains and valleys produce wheat, and the rugged areas grow minor oil seeds, hemp and small millets. The northern portion of the district round Lakhnadon is especially hilly and poor. There are many beautiful spots among the forests in the north and the south, especially in the Koraighat leading down to the Nagpur plain.

Besides the great northern road connecting the districts of Jubbulpur and Nagpur, there is a road from Lakhnadon to Narsinghpur by which rice is carted from the large rice market of Barghat for sale in the Narbada valley. The Satpura railway system runs rather athwart the old trade routes and has not yet fully captured the cart traffic, but has greatly developed the centre and north-east of the district. The population includes nearly 16,000 Mohammedans, 137,000 Animists, the rest being Hindus. In literacy the district is very backward, because of the large aboriginal element. There are some large landed estates and the chief cultivating castes, Kurmis, Lodhis, Malis and Ahirs, are of the same type as those of more advanced plains districts.

SEOUL, the capital of Korea (Chosen), situated in 37° 34′ N. and 127° 6′ E., at an altitude of 120 ft., 25 m. from Chemulpo, its seaport, and 4 from Mapu, its river-port. Pop. (1925) 302,711. It lies in a basin among granite hills, nowhere exceeding 2,627 ft., remarkable for their denudation and their abrupt black crags and pinnacles. A well-built, crenelated stone wall from 20 to 30 ft. high, about 11 m. in circuit, and pierced by 8 gateways with double-roofed gate towers, surrounds it. The native houses are built of stone or mud, deeply eaved, and either tiled or thatched. Above these rise the towers of the Roman Catholic cathedral, the high curved roofs of the royal audience halls, the palace gateways, and the buildings of the Russian and French legations. The antiquities are the Bell Tower, with a huge bronze bell dated 1468, a marble pagoda elaborately carved, but not of Korean workmanship, seven centuries old, and a "Turtle-Stone" of about the same date. Seoul has an electric tramway and is the centre of the railway system of the country.

SEPARATOR (CREAM): *see* DAIRY FARMING.

SEPARATOR, MAGNETIC, is a device for the separation of iron or steel, and of feebly magnetic ores, for the purification of materials and the prevention of damage to machines. There are a great many designs of machines, including numerous continuous feed types for handling large quantities of material. One common form has a rotating drum carrying magnets on which the material falls, the magnetic portions clinging to the drum, to be brushed off. Another type has a belt passing over two pulleys, the belt being fitted with magnetized feelers. A larger type with long conveyor belt is employed in mining practice for the separation of weakly magnetic minerals from non-magnetic, such as wolfram from tin, etc. A series of magnets above the belt deal with the material in its passage below them. Some machines are portable, to work at dumps or tips, while for treating house refuse a rather large fixed separator supplied by a conveyor belt lifts tins and other iron pieces out of the waste and places them automatically into a chute. Used foundry sand can be dealt with by a machine which recovers small splashes of iron, brads, chippings, etc., and also sieves and grades the sand ready for use again. Mixed iron and brass turnings are separated in the rotary drum class of apparatus, while some separation, as for the pottery and china trade, is effected in a wet trough device. Many kinds of powders and seeds, cocoa-beans, tea, tobacco, etc., are treated by a magnetic separator. Substances that have to go through a crusher are treated magnetically to avoid the risk of damage by "tramp" iron.

SEPARATOR, STEAM, also termed a steam drier, a device fixed in a line of steam piping to separate the water of condensation from the steam. The steam, which travels at about a mile a minute (90 ft. per second) is usually caused to flow in a spiral direction around a central pipe in the separator, as in the Lancaster and Tonge type of machine. The inertia of any particles of water which may be in the steam flowing at this speed causes them to continue in a spiral direction to the lower portion of the receiver. The water is thrown outwards, while the drier portion of the steam stays in the centre and is carried off by the central pipe. The ribs in the lower part carry off the water and any dirt separated from the steam, and also act as a brake on the revolving wet steam, thus slowing it down and allowing any particles of water not separated by centrifugal force to fall by gravity to the bottom.

SEPIA is a dark brown pigment obtained from the ink-sacs of cuttlefish (Gr. σηπία, cuttlefish, *q.v.*). The ink-sacs (which are speedily removed on capture and dried to prevent putrefaction) are digested with dilute alkali, the solution is filtered and the colour precipitated with dilute hydrochloric acid, washed, filtered and dried. It is fairly permanent and inert and is used as an artists' water colour particularly in monochrome. *See* PAINTS, CHEMISTRY OF.

SEPOY. The Anglo-Indian word for a native soldier of the British native army of India in contradistinction to *gorā*, a "fair-complexioned (European) soldier." The word is derived from the Persian, *Sipahi*, from *Sipah*, soldiers, an army. The expression *sepoy* was in use in Southern India before the East India Company had troops in Bengal, and was probably introduced by the Portuguese.

SEPPINGS, SIR ROBERT (1767–1840), English naval architect, was born at Fakenham, Norfolk, and in 1782 was apprenticed in Plymouth. For an invention simplifying repairs on the keels of ships Seppings received £1,000 from the Admiralty, and in 1804 was a master shipwright at Chatham. Despite opposition, he introduced important improvements in ship-construction. He increased the longitudinal strength of the vessels by a system of diagonal bracing, and strengthened the bows and stern, so that they offered better protection to the crews and permitted a powerful armament to be fitted. Seppings was surveyor of the navy from 1813 to 1832. He died at Taunton on Sept. 25, 1840.

SEPSIS, a term in medicine denoting infection of a wound or collection of fluid or dead material by bacteria usually conveyed from without. Etymologically the term signifies putrefaction and at first it was thought that the wound was putrefying as dead animal material putrefies. This view was found to be too narrow

under the advances made by knowledge in bacteriology and the term now embraces conditions differing widely in pathology and severity.

In one group, that to which the names *sapraemia* and *septic intoxication* are given, the condition is in reality putrefactive. Where dead protein material is contained within a cavity and putrefactive bacteria gain access to it, these bacteria multiply, use the protein as food and form therefrom waste products that are poisonous to animals. These poisons are absorbed into the patient's body by the veins and lymphatics in the walls of the cavity and produce fever, wasting, sweating, etc., characteristic of the toxic condition. But the essential point is that they are the products of putrefactive bacteria which cannot live in the circulating blood. Hence the factory of the poisons is *physiologically outside* the body and removal of the dead protein by drainage or washing out the cavity at once stops the formation of the poisons, they are no longer absorbed, the symptoms disappear and the patient recovers.

In the other group the general conditions may be identical, apparently, but the bacteria concerned are not those of putrefaction; they are pathogenetic and capable of living within the blood and tissues of the patient. Here the factory of the poison is *physiologically within* the body and removal of dead protein by drainage or washing out the cavity is incapable of any noteworthy influence on the course of the disease. This group is known as *septicaemia* or *septic infection* with a subgroup *pyaemia* if the bacteria concerned give rise to foci of suppuration. The micro-organisms concerned in this group are chiefly streptococci and staphylococcus pyogenes aureus.

Together the two groups form the condition of "blood poisoning" and it is clear that the second group is infinitely the more dangerous. Diagnosis between them is not always easy but sapraemia does not occur in the absence of a relatively large cavity with much putrescible material therein, whereas a minute scratch, as in conducting a post-mortem examination, may suffice for the introduction of streptococci that occasion a fatal septicaemia. Nevertheless, with such primary conditions as a wound at the bottom of which there is pent up blood clot or exudation, a collection of fluid in the abdomen or a joint cavity after operation or a uterus after parturition, particularly if it has not contracted well and still contains blood clot or portions of afterbirth, the symptoms may depend on either sapraemia or septicaemia and diagnosis can only be made by noting the results of clearing out the infected cavity, and bacteriological examination of the contents of the cavity and the patient's blood.

The pathology of sapraemia needs no further remark than that the bacteria concerned are mainly the proteus group (*see* BACTERIOLOGY) and that they are introduced into the putrescible material from without by instruments, hands, etc. But the septicaemic group requires more consideration for in many instances the source of the infection is not obvious.

Septicaemia and Pyaemia.—In the pre-Listerian era (*see* LISTER: *Antiseptics*) septicaemia and pyaemia with their allies, hospital gangrene, malignant oedema, erysipelas and in maternity hospitals, puerperal fever, were rife to a degree that is now almost incredible and there is no doubt that infection was carried by doctors, nurses and students from one case to another by hands, instruments and sponges. With the introduction of antiseptics (*q.v.*) and later asepsis this source of danger was reduced enormously and surgical operations and childbirth became the relatively safe procedures that they are at the present day. Even now when in such a case septicaemia unfortunately occurs a strict enquiry is always conducted to determine if possible the source of infection and a commencement is made with doctor, nurses, students.

But cases of septicaemia sometimes occur when the entire procedure appears to have been blameless and the question arises whether in these cases the origin of the blood poisoning does not lie in the patient. The whole subject is bound up with those of susceptibility and immunity (*q.v.*), the behaviour of micro-organisms in producing infective disease (*see* BACTERIA AND DISEASE) and the bacterial flora of the animal body, particularly the alimentary tract. It may be granted that septicaemia can only occur if the causal organisms have gained access to the blood, that invasion may take place with a minute inoculation, if the susceptibility of the patient be very great (*i.e.*, his defensive mechanisms be impaired) or the organisms be highly virulent and that *probably* the operation wound or the puerperal uterus is the seat of invasion, the organisms being introduced from without. Nevertheless it is not impossible that operation or parturition has impaired the patient's natural defences and that the invading micro-organisms have come from the intestines, where streptococci normally exist in great numbers and several varieties, or from such a focus as a septic tooth cavity, middle ear disease, chronic appendicitis, a gonococcal infection or even endocarditis. Such foci have long been recognized as occasional starting points of pyaemia.

Pyaemia differs from septicaemia chiefly in the facts (1) that the invading organisms are pyogenetic, usually staphylococcus pyogenes aureus, but sometimes varieties of streptococci or diplococcus pneumoniae; (2) that the infection is rarely so great that micro-organisms can be recovered from the circulating blood by bacteriological culture; (3) that abscesses are formed where the bacteria become lodged, that is, in the smaller arterial ramifications often in muscles, around joints and, secondarily, from those foci in the lungs and pleural cavities. A special variety of pyaemia occurs in ulcerative endocarditis in which particles of the inflammatory material on the mitral or aortic valves with the entangled micro-organisms are carried away in the blood stream.

Symptoms and Treatment.—The existence of sapraemia or septicaemia is signalized by rise of temperature in a patient who has a wounded and absorbing surface (*i.e.*, within the first three days after operation, injury or parturition). The extent of rise varies, temperatures of 101° and 102° F being common; thereafter the temperature may remain high with irregular but small remissions or there may be daily remissions over a large range of degrees, *e.g.*, evening 103° F, morning 99° F. Probably these differences depend upon the amount of poison being formed and absorbed from time to time. In pyaemia temperature conditions are similar but obviously pyaemia cannot be diagnosed before the septic abscesses have begun to form; this is generally first shown by the appearance of a painful and reddened focus. The primary wound usually becomes red and oedematous, the lymphatic glands draining the area are enlarged and painful and may suppurate and there may be lymphangeitis (*see* LYMPHATIC SYSTEM, DISEASES OF).

As regards treatment, apart from the removal of dead material by drainage and lavage which is rapidly effective in sapraemia treatment of this condition is usually unnecessary. In septicaemia and pyaemia the sole rational treatment is by antisera (*see* SERUM THERAPY). Full doses of a polyvalent antistreptococcus serum should be given in all cases and the strength of the patient should be husbanded to the fullest possible extent. The conditions are extremely grave, but hope should never be abandoned so long as life remains. (W. S. L.-B.)

SEPT (sĕt or sĕpt), a clan, applied to the families of Ireland, and sometimes used of East Indian tribes (probably Lat. *saeptum*, an enclosure).

SEPTEMBER, the seventh month of the old Roman year, in which it had 30 days assigned to it (Lat. *septem*, seven). In the Julian calendar, while retaining its former name and number of days, it became the ninth month. The Ludi Magni (Ludi Romani) in honour of Jupiter, Juno, and Minerva began on Sept. 4. September was called "harvest month" in Charlemagne's calendar, and it corresponds partly to the Fructidor and partly to the Vendémiaire of the first French republic. The Anglo-Saxons called the month *Gerstmonath*, barley month, that crop being then usually harvested. It is still called *Herbstmonat*, harvest month, in Switzerland.

SEPTUAGINT, THE, the earliest Greek translation of the Old Testament, so named from the legend of its composition by 70 (Lat. *Septuaginta*, LXX), or more exactly 72, translators sent from Jerusalem to Alexandria at the request of Ptolemy II. Philadelphus (288–247 B.C.) by the high priest Eleazar. The

Letter of Aristeas to *Philocrates* (*see* ARISTEAS) which unfolds a fantastic story is certainly spurious, though it contains some elements of truth; *e.g.*, that the work was the result of collaboration and was approved by the Jewish community in Alexandria. The king's share in the business is quite secondary, but we know that Ptolemy Philadelphus was a ruler of eclectic literary tastes, and he may well have encouraged an enterprise which not only appealed to his own curiosity but would promote the use of the Greek tongue among the large Jewish population of his city.

That population had been steadily increasing since the time of Alexander the Great, and while remaining loyal to the Hebrew faith had lost its knowledge of the Hebrew tongue, without acquiring that Aramaic equivalent which had become the common speech of Palestine, and in which the law and the prophets were expounded in the synagogues of Palestine. Faced by sheer necessity, the pious Jews of Alexandria were resolved to understand the Scriptures which were read to them in their own synagogues, and they overcame the age-long prejudice of the authorities at Jerusalem against the *writing* of Scripture in any but the old holy form.

It was natural to begin with the law, and the Greek version of the Pentateuch dates from the beginning of the 3rd century B.C. In the 2nd century B.C., when it had become customary to read not only the law but the prophets in public worship, the bulk of this second section of the Hebrew scriptures was similarly translated. In each case the work was done by a small company, but afterwards the enterprise became more casual. From the prologue to Ecclesiasticus we learn that about 130 B.C. portions of the third division of the Hebrew Bible—the "Writings"—were also extant in Greek, but these were private ventures made not so much to meet the direct need of the synagogue as those of a public now becoming interested in the growing series of translations of the Hebrew sacred books. Philo (*c.* A.D. 40) seems to have known the Greek versions of all the O.T. books except Esther, Ecclesiastes, Canticles and Daniel.

As the work of translation went on so gradually, the compass of the Greek Bible came to be somewhat indefinite. The law always maintained its pre-eminence as the basis of the canon; but the prophetic collection changed its aspect by having various writings incorporated with it according to an arbitrary arrangement by subjects. In some books the translators made considerable additions to the original, *e.g.*, those to Daniel, and these became a part of the Septuagint. To some extent the widening of the O.T. canon in Greek must be laid to the account of Christians. The Septuagint does not keep the triple Hebrew division of law, prophets (which included history) and writings, but groups its books according to subject-matter, law, history, poetry, prophecy, a divergence which was important for the history of the O.T. canon in the Christian Church. The early Christians generally accepted the LXX. canon, which through the Old Latin, despite Jerome's Vulgate adoption of the Hebrew canon, passed into the West and into Latin Bibles, where the Apocrypha are still included.

After the destruction of the temple at Jerusalem in A.D. 70 there was a reaction against the LXX., a movement connected with the strict definition of the canon and the fixing of an authoritative Hebrew text by the rabbis of Palestine. But long usage had made it impossible for the Jews to do without a Greek Bible, and to meet the need a new version was prepared in accurate correspondence with the Pharisaic text and canon. This was the version of Aquila, which took the place of the LXX. in the synagogues, and long continued in use there. Later versions were produced by Theodotion (whose Daniel even got into LXX. mss.) and Symmachus (*see* BIBLE: OLD TESTAMENT, *Texts and Versions*). The vocabulary and accidence of the Greek of the Septuagint are substantially those of the κοινὴ διάλεκτος or Hellenistic Greek spoken throughout the empire of Alexander. The language of the Pentateuch attains the higher level of the papyri of the early Ptolemaic age; that of the prophets reflects the less literary style of the papyri of *c.* 130–100 B.C. In the latest parts of the translation Dr. St. John Thackeray notes two opposing influences: (*a*) the growing reverence for the letter of Scripture, tending to a pedantic literalism; (*b*) the influence of the Atticistic school, strongest in free writings like 4 Macc. but leaving its mark also on 4 Kings. In syntax especially the LXX. is strongly tinged with Hebraisms, and there are many passages where it is almost impossible to extract any rational meaning.

In some cases a book bears the marks of two hands, *e.g.*, Jeremiah i.–xxviii. is from another hand than xxix–li., and so with Ezekiel, where xxviii.–xxxix. stands apart from the remainder. In these cases probably one man dictated, the other translated, and then they changed over. Isaiah is more akin to classical Greek; like the Pentateuch and 1 Macc., *i.e.*, is good κοινή. The two chief mss. of Judges vary so much as to point to different recensions. In some books, especially Jeremiah xxv.–li., the order of the LXX. is totally different from that of the Massoretic Hebrew (*cf.*, also Proverbs xxiv.–xxix.). In some cases, *e.g.*, Job, the original LXX. text was much shorter than that of the Massoretes; in Esther and Daniel there are numerous additions. Apart from its being the oldest translation of considerable extent that ever was written, the Septuagint was "the first step towards that fusion of the Hebraic with the Hellenic strain which has issued in the mind and heart of modern Christendom." It is also the starting point for the history of Jewish interpretation and the Jewish view of Scripture. Hence its importance as a document of exegetical tradition, especially in lexical matters, may be easily understood. It was largely composed before the close of the O.T. canon, and in it alone are preserved several Jewish writings that never became canonical. As the book which at last codified the dialect of biblical Greek, it is a key to the N.T. and its dependent literature. To many its chief value is that it is the only independent witness for the text of O.T. which we have to compare with the Massoretic text. Its critical value is unfortunately greatly impaired by the corrupt state of its own text. As we have not the version itself in authentic form we cannot reconstruct with certainty the Hebrew text from which it was made. The difficulties in getting behind the confusion of versions and recensions and of weighing the patristic evidence are very formidable. The chief uncial mss. are, as for N.T. ℵ A, B, of which A and B are largely complete, but though both of Egyptian origin, vary considerably. A may represent the edition of Hesychius, B that of Origen. When the arduous task of reconstructing the text of LXX. has been achieved, there still remains the problem of its relation to the Hebrew. The Hebrew text from which the LXX. translators worked was often divergent from that represented by the Massoretic text, but we need not assume that in cases of difference the Greek is to be preferred. The LXX. translators made some palpable mistakes; their knowledge of Hebrew was often inadequate; they occasionally interpreted as well as translated, and they sometimes introduced local colour. Yet there is no doubt that much (*e.g.*, in 1 Sam.) may be learned from the Septuagint; all one can say is that each case must be treated on its own merits.

Amongst recent studies of the Septuagint may be mentioned the theory of Dr. M. Gaster that it is a Palestinian work, a first step towards a Targum, written for the masses rather than for synagogue worship, and "an answer to Greek pretensions," a carrying of the war against Hellenism into the enemy's camp. But neither this nor the quaint notion of Wutz that the LXX. translators worked not from Hebrew mss. but from a transliterated text, *i.e.*, Hebrew written in Greek characters, has met with any acceptance. More fruitful are the suggestions made by Dr. St. John Thackeray as to the "liturgical" aspect of the Greek Bible. The LXX. was first printed in the Complutension Polyglot (1514–17), but before this was published in 1521, Aldus had published another edition in 1519. H. B. Swete's compact edition in 3 vols. (1887–94; revised 1895–99) gives the text of B so far as available, then A or ℵ, with variant readings from the chief uncials. The larger Cambridge edition (1906, in progress) by A. E. Brooke and N. McLean follows the same plan with the text, but its apparatus includes all the uncials, the best minuscules and the chief versions and patristic quotations.

(A. J. G.)

SEPULCHRE, CANONS REGULAR OF THE HOLY, an order said to have been founded in 1114 (or, according to other accounts, during the rule of Godfrey of Bouillon in Jerusalem) on the rule of St. Augustine. Pope Celestine III., in 1143, confirmed the Church and Canons of the Holy Sepulchre in all their possessions, and enumerated several churches both in the Holy Land and in Italy belonging to the Canons.

See the *Catholic Encyclopaedia*, article "Sepulchre, Canons Regular."

SEPULCHRE, THE HOLY. The authenticity of this site has been much disputed. From N.T. data it is evident that the tomb of Joseph of Arimathea was near Calvary, which adjoined a high road and was outside the City walls, but perhaps quite near, as the Romans crucified criminals in such situations. On which side of the City it lay is not recorded. There is no reference in Christian literature of the first three centuries to the "empty tomb." Even if the tomb was venerated—as one might suppose probable—there must have been a break in the possibility of access to it at the destruction of Jerusalem by Titus (A.D. 70) and again in the more complete devastation after Bar Kokba's rebellion and whether any tradition regarding the site survived is doubtful. When (A.D. 135) Hadrian rebuilt the City, calling it Aelia Capitolina, he is stated by Eusebius to have erected a Temple of Aphrodite over the site of the Holy tomb. In A.D. 325 the remains of this pagan shrine were removed by Macarius and under these were found an ancient Jewish tomb. The rock around was cut away, the tomb chamber was isolated and a circular building—the Anastasius—was erected around it. That this is the same tomb as that shown today is indisputable though the actual roof and much of its walls were destroyed (A.D. 1010) by orders of the Chalif Hakim.

The situation of this tomb presents topographical difficulties. Thus the site is now so much the centre of Jerusalem as to make it difficult to accept its genuineness. It must however be remembered that in earlier times the City extended further south and the present position of the walls is in no small measure the result of veneration for the Traditional Sacred Sites. The course of the ancient northern walls is one which is still unsolved. The "First Wall" ran from the neighbourhood of the existing Jaffa Gate eastwards to the wall of the Temple enclosure and the "Second Wall," which began at the Gate Ganath—a site on the "First Wall" unidentified—ran round the northern quarter of the City to the fortress of Antonia. It is admittedly difficult—but not impossible—to plot out a wall running this course, which would exclude the Holy Sepulchre, but actually, no remains of a City wall following such a possible course have been found. Some authorities claim that the existing northern City wall is not, as many suppose, on the general lines of the third wall, but on those of the second wall, making the traditional site impossible. This view has certainly been strengthened by the recent excavation of extensive remains of a more northern wall, which by position and construction may be the third wall built, but not completed by King Herod Agrippa (about A.D. 41).

The traditional view being so difficult, speculation naturally suggested alternative sites. Thus—among others—in 1730 Korte of Altona suggested one west of the Jaffa Gate, Clarke in 1812 one south of the Zion Gate and Barclay one east of St. Stephen's Gate. In 1842 Otto Thenius promulgated his theory that the Crucifixion must have taken place above Jeremiah's Grotto, outside the Damascus Gate. This theory—with the addition of a tomb to the west of this hill claimed to be the true Sepulchre—has had many supporters notably General Gordon. It must be admitted that no site lends itself better to a spectacular reconstruction of the Crucifixion Story but it presupposes that the centuries have made but little change in the topography of the City and the archaeological evidence is entirely against it. The fact is that while the claims of the Holy Sepulchre rest upon uncertain tradition and the archaeological evidence raises difficulties, no other site can be said to have any serious validity.

The Church of the Holy Sepulchre is a collection of buildings mainly of mediaeval origin and only the most scanty traces of the work of Constantine the Great have been found. The circular building, round the little Greek Chapel covering the tomb, is certainly in the original position of the Circular Anastasius of the fourth century. The various ancient branches of the Church hold property in the collection of buildings around, and all have rights in the rotunda and the Sepulchre itself—a position which has led to many bitter disputes.

SEQUANI, in ancient geography, a Celtic people who occupied the upper basin of the river Arar (Saône), their territory corresponding to Franche-Comté and part of Burgundy. Before the arrival of Caesar in Gaul, the Sequani had taken the part of the Arverni against their rivals the Aedui, and hired the Germans under Ariovistus to help them (71 B.C.). But although they thus defeated the Aedui, the Sequani were worse off than before, for Ariovistus deprived them of a third of their territory and threatened to take another third. The Sequani appealed to Caesar, who drove back the Germans (58), but at the same time compelled the Sequani to surrender all that they had gained from the Aedui. The Sequani therefore joined in the revolt of Vercingetorix (52) and shared in the defeat at Alesia. Under Augustus, the district known as Sequania formed part of Belgica. After the death of Vitellius, the inhabitants refused to join Iulius Civilis and Iulius Sabinus in revolt against Rome and drove back Sabinus, who had invaded their territory. A triumphal arch at Vesontio (Besançon), which in return for this service was made a colony, possibly commemorates this victory. Diocletian added Helvetia, and part of Germania Superior to Sequania, which was now called *Provincia maxima Sequanorum*. Fifty years later (A.D. 355) Vesontio was sacked by the barbarians. Under Julian it recovered some of its importance as a fortified town, and was able to withstand the attacks of the Vandals. Later, the Sequani became merged in the newly formed kingdom of Burgundy.

SEQUENCE DATING. A sequence date (adopted in Germany as *Staffelzahl*) is a dating by relation to things earlier and later in arbitrary units, not by years. All history is mainly concerned with the order of events; the dates A.D. are of much less consequence than the connection of cause and effect. To know that the Armada preceded the Stuarts is essential; that it was 15 years earlier is a detail. In ages where no dated history exists our endeavour must be to put what we know into its true order.

The most obvious kind of evidence of sequence is in geology, when strata lie deposited one on the other, and similarly in human settlements when buildings or refuse heaps are superimposed. Such evidence is finally conclusive, where accidents do not occur. (*See* STRATIGRAPHY.) But changes do occur, and may upset the evidence. Strata may be deficient where contact is sought, or may have been separated by a sill of molten rock, or have suffered overthrust by compression, or even been altogether inverted. In strata of man's works burrowing animals or men may upset order and let objects shift far down, or throw them up; dyed wool occurred in a prehistoric grave, but it had been carried down by a rat for lining its nest; the Persians dug granaries 20 feet deep through many centuries of town levels.

Another kind of evidence of sequence is that from the style of objects. Suppose in a great mansion that the room in which each master had died was left with its furniture untouched. If we could thus compare the surroundings of each generation we should

have little or no doubt as to the sequence of the rooms. The changes of fashion—Victorian. Regency, French Revolution, Georgian—would make it impossible to mistake the order, so as to put a Chippendale sofa between the '51 and '62 Exhibition periods. There is the ancient equivalent of such successive rooms in the funeral outfit for the dead. Each generation varied the forms of its objects—pottery, weapons, ornaments—and the connection of the varieties can thus be traced. (*See* TYPOLOGY.)

Establishing a Dating.—If, then, we are able to put a large number of graves into their relative order, we need to be able to denote each part of the series. This may be done by dividing a series of, say, 1,000 graves into 50 parts, of about 20 graves in each part. Thus we have a series of divisions that may be numbered consecutively, and so form a chain of periods, though not of equal periods of years; they are periods of equivalent mortality or productivity. Yet such numbers of the periods, or sequence dates, constitute as true a history as if they specified the date in years. The stages of perceptible change are not so close together as single years; they may be most nearly generations, or centuries, or even millennia in early ages of man. The method of numbering them in order gives the handle by which to use the history of prehistoric ages, as familiarly as we refer to the years or centuries of written history. An ancient dating by numbers is already familiar in the naming of the successive dynasties of Egypt from 1 to 30; a mode of reference which avoids the differences of opinion about the dates in years.

The Material for Study.—The basis for starting the sequence dates must be a simple notation of all the variations of common objects, especially pottery. A set of drawings of every form of pottery dealt with must be put into some systematic order (such as from the most open plate to the most closed bottle). Each principal form must be numbered (say, 1 to 99), lesser variations having a letter, as 34c, 34m. This notation can be applied to each different kind of pottery. Thus every pot found can be expressed, for instance, as B17d (Black pottery, form 17, variety d), or F85t. This numbered series of drawings is termed a *corpus*, and with it the pottery in a grave can be recorded completely for future study, without taking it away. Such records are necessary material for discovering the sequence of the graves.

The Method of Working.—Some starting connection is needful, either in a related series of forms or a link to historic times, or some stratification of a site. For instance, a long series of degradations of a globular pot to a cylinder and of a handle into a cord pattern, served to start the interpretation of the later prehistoric pottery of Egypt. Or, on the other method, the Badarian settlement was divided by a layer of rock chips, while it was deserted; the pottery from under the chips was certainly then the older.

Having got thus some intimation, by style or by place, which of two groups A and B is the older, the next stage is to group all graves containing A types and none of B, and arrange them in order of the proportion of A types; those with 5, 4, 3, 2, 1 or 0 types like A being ranked in that order. Similarly those with B types on the other side away from A. In this way the order is arranged as forms like A, 0, 1, 2, 3, 4, 5, 6, then A, A and B types conjoined, B, 6, 5, 4, 3, 2, 1, 0 like B. Thus a rough breaking up into many groups in approximate order can be made statistically.

Having a rough classing the next process is to deal with each type individually. It is obvious that if a series were arranged in true order of succession, a disturbance to a false order would be more likely to scatter types than to concentrate them in their range. Hence the shortest possible range of each type is the most probable. Then outlying examples of each type in the series of graves must be examined to see whether that grave could be brought nearer to the other examples of the type, without dispersing any other type which is associated with it. This process may be graphically imagined by supposing that every example of a type is tied to all other examples of it by an elastic cord in tension. Then a scattered type will tend to pull itself together, provided it does not increase the tension of the cord of another type. The whole process might be solved mechanically by such a model.

Method in Practice.—The way to handle all this material is to take for each grave a slip of card, about 7in. long and ½in. high. Rule it into as many spaces as there are kinds of pottery, A, B, C, etc., about half a dozen. Enter in its respective space the number of each type of pot in the graves, in order of numbers. Then place all the cards in a column, so that a hundred grave contents can be reviewed in a height of 25in., laid on a tray. Ten such trays allow of a review of every pot in a thousand graves at once, on a table about six ft. wide. Usually only two or three trays need to be seen at once. Each type is searched in turn, every example noted (by putting a drawing pin point up at each place); the earliest and latest are then examined to see what associated types are with them, and if moving these extreme slips will make divergence in other types. This is a process which has to be repeated many times, each time getting a better concentration of each type. Where several types found together have to be searched in all their connections, a different pattern of drawing pin can be used to mark each type.

Results.—The eventual result is a classing of, say, 1,000 graves in nearly their original order. Each selected grave should contain at least five different types of pottery. Next the whole series can be divided into numbered groups, modifying the groups so as to divide at the beginning or end of prominent types. When these groups are consecutively numbered, then each type of pot can have its limits in sequence dates; say from 42 to 48. Some simple types will have a very long range; other decorated types may have been made by only one generation. The more elaborate a type the more it demands concentration. In mechanical parallel the tension of the elastic cord will be greatest for the peculiar types.

The Sequence Date of Graves.—The different types of pottery in a grave will each give a fresh limitation of the possible range, as in the following cases, from Abydos:—

B 22b 30–37	W 55 72–78	B 38a 43–66
B 25f 30–50	R 26 55–80	W 42 62–72
P 11a 31–63	L 17c 51–78	R 23c 36–80
P 11b 35–71	L 36a 58–80	R 65a 49–68
	L 53a 48–74	R 80 41–72
		L 53c 54–80
Limits 35–37	72–74	62–66

These dates of graves serve then to date all the other objects found in the grave. A fresh series of graves will sometimes slightly extend one or two of the ranges already found for a type; but the graves with sufficient varieties work out with a very small range of uncertainty. The scale of 50 parts, 30–79, which was adopted for Egypt, is not at all too minute in its subdivision, as the resulting dates work out to two or three units. Twenty-five years after this was done the scale has been continued back to S.D. 20–29 to include the still earlier prehistoric age of Badari.

Precautions.—In forming a *corpus*, various of the 99 numbers should be left unused where a large step lies between types, so as to leave numbers for future discoveries; similarly in assigning letters for varieties, especially where a large difference exists. In ages where a good dating is already known by records, it is best to make larger groups (as 33–37), and place all the forms in order of date, as this will point to their true relation.

For applying the system of sequences precautions are needed. First, there must be a sufficient series of dated graves, each containing many varieties of pottery. For an entirely fresh country at least 500 grave groups are wanted; for joining on an extension to an existing system a few dozen graves will give a preliminary view, useful as a framework for fresh evidence. Secondly, all kinds of evidence must be taken into account, not only forms, but decoration, relation to other forms, descent of a type, peculiar personalities in the work, and not only pottery but all other material of which there may be enough to give an indication, as ivory, stone, flintwork, and metal. Thirdly, the historical view should have consistency. If there is a large change of types at any point of the dating, this may modify the arrangement of the slips.

The final aim of archaeology is to have a separate *corpus* of types of each great period of each country, not only for pottery but for all other classes of objects. Thus the whole of the materi-

al products of the past can be put in an organized connection, and so give a definite basis for our knowledge of man's ability and purpose. (W. M. F. P.)

SEQUESTER, VIBIUS (4th or 5th century A.D.), the supposed author of an alphabetical list of geographical names occurring in the Roman poets. Several of the names given cannot be traced; the compiler perhaps had access to sources no longer extant.

Editions by C. Bursian (Zürich, 1867), and in A. Riese, *Geographi Latini minores* (1878); *see* also Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), 445, 1.

SEQUESTRATION. In law, the term "sequestration" has many applications; thus it is applied to the act of a belligerent power which seizes the debts due from its own subjects to the enemy power; to a writ directed to persons, "sequestrators," to enter on the property of the defendant and seize the goods (*see* EXECUTION); to the action of taking profits of a benefice to satisfy the creditors of the incumbent. As the goods of the church cannot be touched by a lay hand, the writ is issued to the bishop, and he issues the sequestration order to the churchwardens who collect the profits and satisfy the demand. Similarly when a benefice is vacant the churchwardens take out sequestration under the seal of the Ordinary and manage the profits for the next incumbent. In the Scots law of bankruptcy the term "sequestration" is used of the taking of the bankrupt's estate by order of the court for the benefit of the creditors.

SEQUIN, the French form of Ital. *zecchino,* the name of a Venetian gold coin, first minted about 1280, and in use until the fall of the Venetian republic. It was worth about nine shillings. It bore on the obverse a figure of St. Mark blessing the banner of the republic, held by a kneeling doge, and on the reverse a figure of Christ. Milan and Genoa also issued gold sequins. The word in Italian was formed from *zecca,* Span. *zeca,* a mint, an adaptation of Arabic *sikka,* a die for coins.

The term "sequin" is used for small discs made of thin metal, tinfoil, celluloid or other composite material, highly glazed and brightly coloured, and applied as trimming for ladies' dresses.

SEQUOIA, a genus of conifers (*see* GYMNOSPERMS) forming one of several surviving links between the firs and the cypresses. The two species are evergreen trees of immense size, indigenous to the west coast of North America. Both bear their round or ovoid male catkins at the ends of the slender terminal branchlets; the ovoid cones, either terminal or on short lateral twigs, have thick woody scales dilated at the extremity, with a broad disk depressed in the centre and usually furnished with a short spine; at the base of the scales are from three to seven ovules, which become reversed or partially so by compression, ripening into small angular seed with a narrow winglike expansion.

SEQUOIA SEMPERVIRENS, SHOWING BRANCH WITH GREEN CONES AND MALE CATKINS. (A) CROSS SECTION OF A CONE

The redwood of the Californian lumbermen, *S. sempervirens,* abounds on the Pacific coast from the southern borders of Oregon southward to Salmon Creek canyon, about 12 m. south of Punta Gorda, Monterey county, California, forming a narrow mountain forest belt, rarely extending more than 20 or 30 m. from the coast or beyond the influence of ocean fogs, or more than 3,000 ft. above sea-level. (*See* C. S. Sargent, *Manual of the Trees of North America,* 2nd ed., 1922.) It grows to a gigantic size, from 200 to 340 ft. in height, with a diameter of from 10 to 15, or even to 28 ft., at the much-buttressed base. It is the tallest American tree. In old age the huge columnar trunk rises to a great height bare of boughs, while on the upper part the branches are short and irregular.

The bark is red, like that of the Scots fir, deeply furrowed, with the ridges often much curved and twisted. When young the stem rises straight and tapering, with somewhat irregular whorls of drooping branches, the lower ones sweeping the ground—giving an elegant conical outline. The twigs are densely clothed with flat spreading linear leaves of a fine glossy green above and glaucous beneath; in the old trees they become shorter and more rigid and partly lose their distichous habit. The cones, from $\frac{3}{4}$ to 1 in. long, are at first of a bluish-green colour, but when mature change to a reddish brown; the scales are very small at the base, dilating into a broad thick head, with a short curved spine below the deep transverse depression. From the great size of the trunk and the even grain of the red cedar-like wood it is a valuable tree: it splits readily and evenly, and planes and polishes well; cut radially, the medullary plates give the wood a fine satiny lustre; it is strong and durable, but not so elastic as many of the western pines and firs. Sargent describes it as the most valuable timber tree of the forests of Pacific North America. In England the tree grows well in warm situations, but suffers much in severe winters. It was discovered by Archibald Menzies in 1795 and was first described as *Taxodium sempervirens,* under which name it was known until distinguished by Stephan Endlicher as a new genus in 1847.

The only other member of the genus is the giant sequoia or "big tree" of the Sierra Nevada, *S. gigantea,* the largest of known conifers; it is confined to the western portion of the great Californian range for a length of about 260 miles, at an altitude of from 5,000 to 8,400 ft. above the sea, and forms extensive forests, or, in the northern part of the area, isolated groves, such as the Calaveras grove, the Mariposa grove, and others. The leaves of this species are awl-shaped, short and rigid, with pointed apex; closely adpressed, they completely cover the branchlets. The young tree is more formal and rigid in growth than *S. sempervirens,* but when old the outline of the head becomes cylindrical, with short branches sparsely clad with foliage sprays. The bark, of nearly the same tint as that of the redwood, is extremely thick and is channelled towards the base with vertical furrows; at the root the ridges often stand out in buttress-like projections. The average height is about 275 ft. with a diameter near the ground of 20 ft.; but specimens from 300 to 320 ft. tall, with trunks 25–35 ft. thick, have been found.

The famous group known as the Mammoth grove of Calaveras in California, containing over 90 large trees, stands in 38° N., about 4,370 ft. above the sea, between the San Antonio and Stanislaus rivers. It was discovered by A. T. Dowd, a hunter of Murphy's Camp, in 1853. The tree was made known to science by W. Lobb, who sent specimens to John Lindley in England. Some trees in the Mariposa grove rival these in size: one measures 101 ft. round the root, and a cut stump is 31 ft. in diameter.

The longevity of the big trees is very great. A tree under 1,000 years of age may be regarded as still youthful. Huntington counted the annual rings of woody growth in 79 trees that were more than 2,000 years old and in 4 that exceeded 3,000 years.

The wood of both sequoias makes excellent lumber, especially that of the coast redwood. Because of this, the original forests of these magnificent trees have been very greatly depleted. In 1925 the total cut of redwood lumber in California and Oregon was 510,639,000 bd.ft., valued at the mill at $17,356,620.

In early geological times the sequoias occupied a far more important place in the vegetation of the earth. They occur in the Lower Chalk formations, and in Tertiary times were widely diffused; the genus is represented in the Eocene flora of Great Britain, and in the succeeding Miocene period was widely distributed in Europe and western Asia. It is presumed that in the Glacial epoch the genus was exterminated except in the areas in western North America where it still persists.

In earlier geological times the sequoias occupied a far more important place in the vegetation of the earth than at present, and it is interesting to note that fossil cones, branches and leaves of these trees were known to science many years before the living species were discovered. Instead of being confined chiefly within the limits of a single State they were once distributed over four

continents. The most ancient positively identified sequoia was recently discovered in the Upper Jurassic of France. In Lower Cretaceous times sequoias were widespread in North America and Europe. In Tertiary times they were still more widely diffused, occurring in the Eocene flora of Great Britain and attaining their maximum development in the Miocene period. Fossiled trunks, 6 ft. to 10 ft. in diameter and 30 ft. high, still standing erect, in deposits in the Yellowstone region (Miocene), are scarcely distinguishable in the microscopical characters of the wood from the living species. During the glacial period the sequoias were exterminated except in the limited area in North America where they still persist.

See E. W. Berry, *Tree Ancestors* (Baltimore, 1923).

SERAING, town, province of Liége, Belgium. Pop. (1925), 41,352. It is on the Meuse, above Liége, and owes its importance to John Cockerill, who, in partnership with King William I. of the Netherlands, founded what is still called the "John Cockerill company," making machinery, with headquarters in the old summer-palace of the prince-bishops of Liége.

SERAMPORE, a town of British India, in the Hooghly district of Bengal, on the right bank of the river Hooghly, opposite Barrackpore, on the East Indian railway, 12 m. from Howrah. Pop. (1921) 33,197. The Danes established themselves here in 1755 and called the town Frederiksnagar. With the rest of the Danish possessions in India, it was acquired by purchase by the English in 1845.

SERAO, MATILDA (1856–1927), Italian novelist and journalist, was born at Patras in Greece. Her father was an Italian, a political emigrant, and her mother a Greek. She was a telegraph clerk in Naples, but early attracted notice by short stories contributed to the press. Her novel, *Fantasia* (1883), first definitely established her as a writer full of feeling and analytical subtlety. She spent the years between 1880 and 1886 in Rome, where she published volumes of short stories and also novels, all dealing with the life of the people: *Cuore Infermo* (1881), *Fior di Passione* (1883), *La Conquista di Roma* (1885), *La Virtù di Checchina* (1884) and *Piccole Anime* (1883). With her husband, Edoardo Scarfoglio, she founded *Il Corriere di Roma*, the first Italian attempt to model a daily journal on the lines of the Parisian press. The paper was short-lived, and when it was given up Matilda Serao established herself in Naples, where she edited *Il Corriere di Napoli* and in 1891 founded *Il Mattino*, which became the most popular daily paper of southern Italy. Between 1890 and 1902 she produced *Paese di Cuccagna, Ventre di Napoli, Addio Amore, All' Erta Sentinella, Castigo, La Ballerina, Suor Giovanna della Croce, Paese di Gesù*, novels in which the character of the people is rendered with sensitive power and wide sympathy. Most of these have been translated into English. She died on July 25, 1927.

SERAPHIM, plural of the Hebrew noun *sārāph*, is the name of the supernatural beings attendant upon Yahweh in Isaiah's vision, Isaiah vi. 2, 6. Each has six wings, and apparently human feet, hands and voice. They chant in antiphon the praise of Yahweh. Representations of such mixed figures were to be found at the entrance to oriental temples, where they served as guardians of the gate, and they also are depicted upon coins of the Roman period. It is not unlikely that this feature in the prophet's vision was due to his seeing such figures at the entrance to the Temple and hearing the chants of the choir immediately before he passed into ecstasy. It is noteworthy that "the thresholds were moved" (*v.* 4) at the voice of the seraphim. The singular noun is used in Numbers xxi. 8, Isaiah xiv. 29, xxx. 6, where it is rendered "fiery serpent": accordingly it has been supposed that the seraphim were originally serpentlike in form.

SERAPION or SARAPION (*fl. c.* 350), bishop of Thmuis in the Nile Delta and a prominent supporter of Athanasius in the struggle against Arianism (sometimes called, for his learning, Scholasticus), is best known in connection with a prayer-book or sacramentary intended for the use of bishops. This document, contained in a collection of Egyptian documents in an 11th-century ms. at the Laura on Mount Athos, was published by A. Dmitrijewskij in 1894, but attracted little attention until independently discovered and published by G. Wobbermin in 1899. It is a celebrant's book, containing thirty prayers belonging to the mass (19–30, 1–6), baptism (7–11, 15, 16), ordination (12–14), benediction of oil, bread and water (17), and burial (18), omitting the fixed structural formulae of the rites, the parts of the other ministers, and almost all rubrication, except what is implied in the titles of the prayers. The name of Serapion is prefixed to the anaphora of the mass (1) and to the group 15–18: but whether this indicates authorship is doubtful; for whereas the whole collection is bound together by certain marks of vocabulary, style and thought, 15–18 have characteristics of their own not shared by the anaphora, while no part of the collection shows special affinities with the current works of Serapion.

But his name is at least a symbol of probable date and provenance: the theology, which is orthodox so far as it goes, but "conservative," and perhaps glancing at Arianism, shows no sign that the Macedonian question has arisen; the doxologies, of a type abandoned by the orthodox, and by *c.* 370 treated by Didymus of Alexandria as heretical; the apparent presupposition that the population is mainly pagan (1, 20); the exclusive appropriation of the mass to Sunday (19; cp. Ath. *ap. c. Ar.* 11), whereas the liturgical observance of Saturday prevailed in Egypt by *c.* 380: the terms in which monasticism is referred to—together point to *c.* 350; the occurrence of official interpreters (25) points to a bilingual Church, *i.e.*, Syria or Egypt; and certain theological phrases (ἀγέννητος, ἐπιδημία, μόνη καθολικὴ ἐκκλησία) characteristic of the old Egyptian creed, and the liturgical characteristics, indicate Egypt; while the petition for rains (23), without reference to the Nile-rising, points to the Delta as distinguished from Upper Egypt. The book is important, therefore, as the earliest liturgical collection on so large a scale, and as belonging to Egypt, where evidence for 4th-century ritual is scanty as compared with Syria.

The rites form a link between those of the *Egyptian Church Order* (a 3rd- or early 4th-century development of the Hippolytean Canons, which are perhaps Egyptian of *c.* 260) and later Egyptian rites—marking the stage of development reached in Egypt by *c.* 350, while exhibiting characteristics of their own.

See J. Wordsworth, *Bishop Sarapion's Prayer-Book* (1899).

SERAPIS, a famous Graeco-Egyptian god. The statue of Serapis in the Serapeum of Alexandria was of purely Greek type and workmanship—a Hades or Pluto enthroned with a basket or corn measure on his head, a sceptre in his hand, Cerberus at his feet, and (apparently) a serpent. It was proclaimed as the anthropomorphic equivalent of a much revered and highly popular Egyptian beast-divinity, the dead Apis, assimilated to Osiris. The Greek figure probably had little effect on the native ideas, but it is likely that it served as a useful link between the two religions. The god of Alexandria soon won an important place in the Greek world. The anthropomorphic Isis and Horus were easily rendered in Greek style, and Anubis was prepared for by Cerberus. The worship of Serapis along with Isis, Horus and Anubis spread far and wide, reached Rome, and ultimately became one of the leading cults of the west. The destruction in A.D. 385 of the Serapeum of Alexandria, and of the famous idol within it, after the decree of Theodosius, marked the death-agony of paganism throughout the empire.

It is assumed above that the name Serapis (so written in later Greek and in Latin, in earlier Greek Sarapis) is derived from the Egyptian Userhapi—as it were Osiris-Apis—the name of the bull Apis, dead and, like all the blessed dead, assimilated to Osiris, king of the underworld. There is no doubt that Serapis was before long identified with Userhapi; the identification appears clearly in a bilingual inscription of the time of Ptolemy Philopator (221–205 B.C.), and frequently later. It has, however, been contended by an eminent authority (Wilcken, *Archiv für Papyrusforschung*, iii. 249) that the parallel occurrence of the names Sarapis and Osorapis (Userhapi) points to an independent origin for the former. But doublets, *e.g.*, Petisis-Petēsis, are common in Graecisms of Egyptian names. *See* EGYPT: *Religion*.

SERBIA (*Srbiya*), formerly an inland kingdom of south-eastern Europe, situated in the north of the Balkan Peninsula, now incorporated in Yugoslavia (*q.v.*). The frontier, as defined by the Berlin Treaty of 1878, was, roughly speaking, indicated by rivers in the north, and by mountains in the south. In the north, between Verciorova and Belgrade, the Danube divided Serbia from Hungary for 157 m.; and between Belgrade and the border village of Racha the Save divided it from Croatia-Slavonia for 80 m. In the north-west the Drina flowed for 102 m. between Bosnia and Serbia; in the north-east the Danube, for 50 m., and the Timok for 23 m., constituted respectively the Rumanian and Bulgarian boundaries. Various mountain ranges marked the frontiers of Bosnia on the west, Turkey on the south-west and south, and Bulgaria on the south and south-east. According to the survey carried out by the Serbian general staff in 1884 the area of the country was 18,782 sq.m.

HISTORY

The Serbs (*Srbi*, as they call themselves) are a Slavonic nation, ethnically and by language the same as the Croats (*Hrvati, Horvati, Croati*). The Croats, however, are Roman Catholics and use the Latin alphabet, while the Serbs belong to the Orthodox Church and use the Cyrillic alphabet, augmented by special signs for the special sounds of the Serb language. (*See* SLAVS.)

The earliest mention of the Serbs is to be found in the ninth century; the origin of the name which appears alike in Lusatia and the Balkans is obscure. Nothing is known of their earlier history except that they lived as an agricultural people in Galicia, near the source of the river Dniester. In the beginning of the 6th century they descended to the shores of the Black Sea. Thence they began to move westerly along the left shore of the Danube, crossed that river and occupied the north-western corner of the Balkan Peninsula. According to the emperor Constantine Porphyrogenitus, the emperor Heraclius (610–640) invited the Serbs to settle in the devastated north-western provinces of the Byzantine empire and to defend them against the incursions of the Avars. According to newer investigations, Heraclius only made peace with them, confirming them in the possession of the provinces which they already had occupied, and obtaining from them at the same time the recognition of his suzerainty. Their known history as a Balkan nation begins towards the middle of the 7th century.

The Zhupaniyas.—In their new settlements the Serbs did not form at once a united political organization. The clans more or less related to each other, occupied a certain territory, which as a geographical and political unit was called *Zhupa* or *Zhupaniya* (county), the political and military chief of which was called *Zhupan*. The history of the Serbs during the first five centuries after their arrival in their present country was a struggle between the attempts at union and centralization of the Zhupaniyas into one state under one government, and the resistance to such union and centralization. The more powerful Zhupan was tempted to subjugate and absorb the less powerful Zhupaniyas. If successful, he would take the title of *Veliki Zhupan* (Grand Zhupan). But such unions were followed again and again by decentralization and disruption. The earlier history of the Serbs on the Balkan territory is especially turbulent and bloody, one of the minor causes being the struggle between the ancient Slavonic order of inheritance, according to which a Zhupan ought to be succeeded by the oldest member of the family and not necessarily by his own son, and the natural desire of every ruler that his own son should inherit the throne.

This internal political process was complicated by the struggle between the Greek Church and Greek emperors on the one side and the Roman Catholic Church and the Roman Catholic Powers (Venice and Hungary) on the other, for the possession of exclusive ecclesiastical and political influence. The danger increased when the Bulgarians came, towards the end of the 7th century, and formed a powerful kingdom on the eastern and south-eastern frontiers of the Serbs. Practically from the 8th to the 12th century the bulk of the Serbs was under either Bulgarian or Greek suzerainty, while the Serbo-Croat provinces of Dalmatia acknowledged either Venetian or Hungarian supremacy.

The Visheslav Dynasty.—The first Serb princes who more or less successfully united several Zhupaniyas into one state, belonged to what might be called "the Visheslav dynasty." Zhupan Visheslav lived in the beginning of the 9th century, and seems to have been the descendant of that leader of the Serbs who signed the settlement treaty with the emperor Heraclius towards the middle of the 7th century. His ancestral Zhupaniya comprised Tara, Piva, Lim (the neck of land between the Montenegro and Serbia of pre-war days). Visheslav's son Radoslav, his grandson Prissegoy, and his great-grandson Vlastimir, "the first clear personality" of Serbian history, continued his work. Vlastimir successfully defended the western provinces of Serbia against the Bulgarians, although the eastern provinces (Branichevo, Morava, Timok, Vardar, Podrimlye) were occupied by the Bulgars. The Bulgarian danger, and probably the successful operations of the Greek emperor Basil the Macedonian (867–886), determined the Serbian Zhupans to acknowledge again the suzerainty of the Greek emperors. One of the important consequences of this new vassalship to the Byzantine empire was that the entire Serbian people embraced Christianity, about 879—a process begun, however, by Latin priests between 642 and 731. In all important transactions the Serbians were led by the Grand Zhupan Mutimir Visheslavich (d. 890). During the reign of his heirs almost all the Serbian provinces were conquered by the Bulgarian Tsar Simeon (924). In 931 Chaslav, one of the princes of the Visheslav dynasty, liberated the largest part of the Serbian territory from Bulgarian domination, but to maintain that liberty he had to acknowledge the Byzantine emperors as his suzerains.

The Princes of Zeta and the First Serb Kingdom.—Towards the end of the 9th century the political centre of the Serbs was transferred to Zeta (or Zenta: *see* MONTENEGRO) and the Primorye (Sea-Coast). The prince (sometimes called king) of Zeta, Yovan Vladimir, tried to stop the triumphal march of the Bulgarian Tsar Samuel through the Serb provinces, but in 989 was defeated, made prisoner and sent to Samuel's capital, Prespa. The historical fact that Vladimir married Kossara, the daughter of Samuel, and was sent back to Zeta as reigning prince under the Bulgarian suzerainty, forms the subject of the first Serb novel, *Vladimir and Kossara*, as early as the 13th century. Vladimir, who seems to have been a noble-minded man, was murdered by Samuel's successor, the usurper Tsar Vladislav (1015). By the Christians of both churches in Albania he is to this day venerated as a saint. But after the death of Samuel the Bulgarian power rapidly lost the Serb provinces, which, to get rid of the Bulgarians, again acknowledged the Greek overlordship. About 1042, however, Prince Voislav of Travuniya (Trebinje), cousin of the assassinated Vladimir of Zeta, started a successful insurrection against the Greeks, and united under his own rule Travuniya, Zahumlye (the modern Herzegovina) and Zeta. His son Michael Voislavich annexed the important Zhupaniya of Rashka (Rascia or Rassia), and in 1077 was addressed as king (rex) in a letter from Pope Gregory VII. His son Bodin enlarged the first Serb kingdom by annexing territories which up to that time were under direct Greek rule. After Bodin's death the civil wars between his sons and relatives materially weakened the kingdom. Bosnia reclaimed her own independence; so did Rashka, whose Grand Zhupans came forward as leaders of the Serb national policy, which aimed at freedom from Greek suzerainty and the union of all the Serb Zhupaniyas into one kingdom under one king. The task was difficult enough, as the Byzantine empire, then under the reign of the energetic Manuel Comnenus, regained much of its lost influence. About the middle of the 12th century all the Serb Zhupaniyas were acknowledging the suzerainty of the Byzantine emperors.

The Nemanyich Dynasty and the Serb Empire.—A change for the better began when Stephen Nemanya became the Grand Zhupan of Rashka (1159). He succeeded in uniting all the Serb countries except Bosnia under his rule, and although he never took the title of king, he was the real founder of the Serb kingdom and

of the royal dynasty of Nemanyich, which reigned for nearly 200 years. His youngest son, Prince Rastko, secretly left his father's court, went to a convent in Mount Athos, where Stephen Nemanya died as the monk Simeon at Chiliandarion in 1200, became a monk, and afterwards, under the name of Sava, the first archbishop of Serbia. As such he established eight bishoprics and encouraged learning. He is regarded as the great patron of education among the Serbs, as a saint, and as one of the greatest statesmen. After Stephen Nemanya and Sava the most distinguished members of the Nemanyich dynasty were Stephen Urosh I. (1243–76), his son Milutin (1281–1321) and Stephen Dushan[1] (1331–1355). Urosh married Helen, a daughter of the exiled Latin Emperor of Constantinople, Baldwin II., and through her kept friendly relations with the French court of Charles of Anjou in Naples. He endeavoured to negotiate an alliance between Serbs and French for the partition of the Byzantine empire. His son Milutin continued that policy and increased his territory by taking several fortified places from the Greeks; but later he joined the Greeks under the emperor Andronicus against the Turks. Milutin's bastard's son, Stephen Dushan, was a great soldier and statesman. Seeing the danger which menaced the disorganized Byzantine empire from the Turks, he tried to prevent the Turkish invasion of the Balkan peninsula by replacing that empire by a Serbo-Greek empire. He took from the Greeks Albania, Epeiros, Thessaly and Macedonia (excepting Salonika). Towards the end of 1345 he proclaimed himself "emperor of the Serbs and the Greeks," and was solemnly crowned at Skoplje on Easter Day 1346. At the same time he raised the archbishop of Ipek (Petch), the primate of Serbia, to the dignity of patriarch. Three years later he convoked the *Sabor* (parliament) at Skoplje to begin a codification of the laws and legal usages. The result was the publication, in 1349, of the *Zakonik Tsara Dushana* (Tsar Dushan's Book of Laws), a code of great historical interest which proves that Serbia was not much behind the foremost European states in civilization. In 1355 Dushan began a new campaign against the Greeks, the object of which was to unite Greeks, Serbs and Bulgars and prevent the Turkish power taking root on European ground. While making preparations for a siege of Constantinople he died suddenly at Deabolis on Dec. 20, 1355. Under his only son Stephen Urosh V., a young man of nineteen, his brother Simeon Urosh and some of the powerful viceroys of Dushan's provinces made themselves independent. The most prominent amongst them was Vukashin, who proclaimed himself king of Macedonia. He wished to continue Dushan's policy and to expel the Turks from Europe, but in the battle on the Maritza on Sept. 26, 1371, his army was destroyed and he was slain. Two months later Tsar Urosh died, and the rule of the Nemanyich dynasty ended.

The Turkish Invasion: Kosovo.—After a few years of indecision and anarchy the Sabor met at Ipek in 1374 and elected Knez (count) Lazar Hrebelyanovich, a kinsman of Urosh, as ruler of the Serbs. He tried to stop the further disruption of the empire and to organize a Christian league against the Turks. This was the real cause of the Turkish attacks on Bulgaria and Serbia in 1389, which resulted in the subjugation of Bulgaria and in the defeat of the Serbs at Kosovo (June 15, 1389). No event has made such a deep impression on the Serbs as the battle of Kosovo —probably because the flower of the Serb aristocracy fell in that battle, and because both the tsar of the Serbs, Lazar, and the sultan of the Turks, Murad I., lost their lives. The Sultan was killed by the Serb knight or voyvode Milosh Obilich (the later alteration of the inelegant Kobil "son of a brood-mare"). There exists a cycle of national songs—sung to this day by the Serb bards (*guslari*)—concerning this battle.

The Despotate.—After the battle of Kosovo Serbia existed for some seventy years (1389–1459) as a country tributary to the sultans but governing itself under its own rulers, who received from the Greek Emperor and bore the Greek title of "despot." The first despot was Tsar Lazar's eldest son, Lazar II, or "Stephen the Tall," who was an intimate friend of Sigismund IV., king of Hungary and emperor of the Germans. Being childless, Stephen appointed his nephew, George Brankovich, to be his successor. George worked to establish an alliance between Serbia, Bosnia and Hungary. But before such an alliance could be arranged, Murad II. attacked Serbia in 1437 and forced George to seek refuge in Hungary, where he continued to work for a Serbo-Hungarian alliance and organized an expedition, under the joint command of the Despot George and of Hunyádi János, which defeated the Turks in a great battle at Kunovitsa in 1444. The sultan was forced to restore all the countries previously taken. At the age of ninety George was wounded in a quarrel with the Hungarian governor of Belgrade, Michael Szilagyi, and died on Dec. 24, 1456. His youngest son Lazar III. succeeded him, but only for a few months. Lazar's widow Helena Palaeoliogina offered Serbia to the pope, hoping thereby the secure the assistance of Roman Catholic Europe against the Turks. Indeed, for a few months, a Roman Catholic prince, Stephen Tomashevich, son of the king of Bosnia, who had married Lazar III.'s daughter, was "despot" at the then capital of Semendria. But no one in Europe moved a finger to help Serbia, and Sultan Mohammed II. occupied the country in 1459, with the aid of the anti-Catholic Serbs, making it a pashalik under the direct government of the Porte.

For fully 345 years Serbia remained a Turkish pashalik, enduring all the miseries which that lawless régime implied (*see* TURKEY: *History*). But the more or less successful invasions of the Turkish empire in Europe by the Austrian armies in the 18th century—invasions in which thousands of Serbs always participated as volunteers—prepared the way for a new state of things.

1400–1909

The defeat of Kosovo reduced Serbia to a passive rôle: she looked on helplessly when the Turks overran Bulgaria (1393) and when Sigismund of Hungary's new crusade ended in the disaster of Nicopolis (1396). The Turks thus entrenched themselves firmly to the south and east, and all that Stephen Lazarević could hold was the country lying between the Danube, Save, Drina and Timok, as far south as Niš. Stephen paid tribute to the Sultan and served as his vassal at Angora (1402), afterwards escaping to Byzantium and receiving from Manuel II. the title of Despot. In this dignity he was succeeded in 1427 by his nephew George Branković, who married a Cantacuzene and maintained himself by alliance with the Eastern Empire and Hungary. King Sigismund seized Belgrade and forced George to transfer his capital to the Danubian fortress of Smederevo (Semendria), but compensated him with huge grants of land in Southern Hungary. Though he gave his daughter Mara in marriage to Sultan Murad (1433), George was attacked and expelled by the Turks in 1439 and only recovered his dominions thanks to King Ladislas of Hungary's victorious Balkan campaign in 1443. The Turkish triumph at Varna next year ended all hope of a general Christian Coalition, and the rest of George's reign is filled by precarious intrigue and negotiation with Turk, Hungarian and Venetian, with Skanderbeg and the new ruler of Hercegovina. George died at the age of 80 in 1456, in the same year that John Hunyády died after his successful defence of Belgrade against Mohammed II. George's son Lazar only survived him one year, the succession was disputed, and in 1459 Smederevo and all Serbia were finally overrun by Mohammed. The fall of Bosnia (1463) and of Hercegovina (1483) set the seal to Turkish predominance in the Balkans. The only fragments of Southern Slav territory to retain independence were the Ragusan Republic (Dubrovnik) and Montenegro. Under the Sultans Selim I. (1512–20) and Suleiman I. (1520–66) the Turks resumed the offensive northwards: in 1521 Belgrade was wrested from Hungary, and in 1526 the battle of Mohács broke Hungary's powers of resistance, and led to her partition. The numerous Serb colonies which had been formed along the Danube and in Southern Hungary after the conquest of Serbia, shared the fate of the Magyars: the Banat of Jajce, Syrmia and parts of Croatia and Dalmatia were also seized by the Turks, whose constant raids into Croat and Slovene territory forced the Habsburgs to organize the defensive Military Frontiers (*q.v.*).

[1] *Dushan* is a term of endearment, derived from *dusha*, "the soul," and not, as formerly believed by Western philologists, from *dushiti*, "to strangle."

Serbia Under Turkish Rule.—Serbia, like Bulgaria, felt the full weight of Turkish rule, for they were the direct road of strategic advance westwards. The Serbian aristocracy was wiped out—save in Bosnia, where it accepted Islam to save its lands and thus became a-national in feeling: the peasantry was bled mercilessly by the *haratch* (bloodtax), their children thus supplying the Turkish army with recruits and becoming the instrument of their own subjection. Only the Church kept the national spirit alive. In 1557 the grand Vizier Mohammed Sokolović, a native of Herzegovina, revived the Patriarchate of Peć (Ipek) in favour of his brother Makarij: and this See avoided the Hellenizing influences which submerged the Bulgarian sister Patriarchate of Ohrid. Native literature almost ceased to exist, though fragments of culture survived in the monasteries. During the 16th century Serb was still the *lingua franca* of the Peninsula, spoken by the local Begs and Pashas and freely used in correspondence between the Porte and Ragusa or John Zápolya of Hungary: this explains the attempt of the Slovenes, Primus Truber and Baron Ungnad, to win over to Protestantism the Balkan Slavs, and even the Turks, by issuing from Urach and Tübingen Slav books in Latin, Cyrillic and Glagolitic type. Under Turkish rule the Serbs were increasingly agricultural, Balkan trade being mainly in the hands of Vlachs and Ragusans. The mining industry was abandoned, and Sarajevo, Mostar and Novipazar grew in importance. Ragusan efforts declined rapidly after the earthquake of 1667: while colonies of exiled Sephardim Jews from Spain became prominent trading factors. In the 17th century there grew up a class of broken men, known as Hajduks, round whom popular legend and poetry centred: the most notable examples were in Montenegro (*q.v.*) and among the Uskoks (*q.v.*), of Dalmatia.

In the long war waged by the Habsburgs to recover Hungary, Croat and Serb soldiers played a great part in the Imperialist armies. It seemed as though Leopold I. might emancipate at least the western half of the Balkan Peninsula. In 1690 he issued a proclamation to the Christian population, urging them to rise against their oppressors and promising his protection: and on the strength of this the Patriarch, Arsen Crnojević, with 36,000 Serbian families, migrated to Hungary. Two charters assured their recognition as a nation, freedom of religion and the right to elect their patriarch and *voivode*. These privileges were not observed, Arsen's successors were not allowed to call themselves Patriarchs, and the office of *voivode* remained unfilled. But the tide of Serb emigration continued; in the 18th century the Serbs formed flourishing centres at Karlovci (Karlowitz), Novi Sad (Neusatz), Kikinda etc.; and in the repeopling of the Banat and Bačka under Charles VI. and Maria Theresa they played a part only second to the Germans.

The Treaty of Karlowitz (1699) restored all Hungary save the Banat to Habsburg rule: after Eugène's victories the Treaty of Požarevac (Passarowitz, 1718) not merely won back the Banat, but converted Belgrade and the northern portion of Serbia (known as the Šumadija) into an Austrian province. During the next 20 years the hopes of the whole race turned towards Vienna, and such culture as the Serbs possessed centered in the towns of southern Hungary and the Military Frontiers. But the constant diversions of western policy and the exhaustion following the long wars prevented the Habsburgs from extending their conquests farther southwards: and when in 1737 they renewed hostilities with Turkey, they suffered reverses and by the Treaty of Belgrade (1739) restored to the Porte all territory south of the Danube and Save. This, following upon the abortive rising in 1735 (due to non-fulfilment of the Leopoldine charter), increased the disillusionment of the Serbs, who henceforth turned their eyes increasingly towards Russia; numerous Serb colonies were founded north of Odessa by the Empress Elizabeth. In the Turkish war of 1769–74 Catherine the Great issued a manifesto to the subject Christian populations, while Austria remained inactive: and the Treaty of Kuchuk Kainardji (1774) formally recognised Russia's claim to champion Orthodox and Slav interests. In 1787, when Russia and Austria again made joint cause against Turkey, the Serbs formed irregular bands in the latter's service, and Loudon's capture of Belgrade was the chief exploit of the war. When foreign complications forced Leopold II. to conclude peace and restore Belgrade (1792), the Serbs again saw their hopes dashed: but a new spirit was stirring, and the Turkish commissioner who saw one of the fortresses evacuated by a well armed and drilled detachment of native Serbs, exclaimed in just alarm to the Austrians, "Neighbours, what have you made of our rayah?"

Serbia's War of Independence.—During the next decade the rapid decay of the central Turkish authority placed outlying provinces at the mercy of insubordinate and rapacious soldiers: in Serbia there was a sharp conflict between the Pasha of Belgrade, Hadji Mustafa, and the Janissaries quartered throughout the country. These latter allied themselves with Pasvan Oglu, the Pasha of Vidin, who successfully defied two sieges by regular Turkish armies (1796–98) and on his reconciliation with the Porte induced it to support the Janissaries against Mustafa, whose mildness had earned him the name of "Mother of the Serbs." Finally the four "Dahis," or military chiefs, murdered Mustafa in Dec. 1801, subjected Serbia to their lawless rule, and when the Serbs protested to Constantinople, organized a massacre of many of their foremost leaders (Feb. 1804). Fortunately a notable substitute was found in Karageorge (*q.v.*), who led an insurrection against the Dahis and decisively defeated the Pasha of Bosnia at Mišar in Aug. 1805, storming the citadel of Belgrade in the following December. Though at first the insurgents professed loyalty to the Sultan, the breach became irreparable when in March 1807 Suleiman Pasha and his 200 Janissaries, after having duly evacuated the fortress, were treacherously murdered on their way to the frontier. This was followed by the complete ejection of the Turks from the whole Pashalik of Belgrade. Kara George, combining in a primitive manner the functions of commander-in-chief and chief of state, summoned the first Skupština or assembly of notables, created a Senate on western models and laid the rudiments of administration and education. Finding his overtures to Vienna (through Archduke Charles and the Aulic War Council) rejected, he turned to Russia, and in July 1807 negotiated a convention with Rodofinikin, the first Russian agent in Belgrade. The young state gallantly cooperated with Russia in her war with the Porte, and the Treaty of Bucharest (1812) included clauses which are the first international recognition of Serbia, secured to her a limited autonomy and to Russia a permanent right of interference on her behalf. On the other hand, its reinstatement of Turkish garrisons in Belgrade and other fortresses was a bitter disappointment to the Serbs, who had hoped for complete independence. Moreover, the withdrawal of Russian forces in the south owing to Napoleon's Moscow campaign encouraged the Porte to attempt the reconquest of Serbia in the summer of 1813. By October all resistance was crushed, and Kara George forced into flight. But the new Pasha, Suleiman Skopljak, revived many of the worst features of the old regime, defied the Treaty and in Dec. 1814 beheaded or impaled nearly 200 of the younger notables. On Palm Sunday 1815, then, Miloš Obrenović (*q.v.*), again raised the standard of revolt. By August Serbia was virtually free, and Miloš by diplomatic tact and moderation secured his recognition by the Porte as "Supreme Chief" (Vrhovni Knez) of Serbia. He further reassured the Porte by arranging the secret assassination of Kara George, who had returned from exile in the hope of heading a movement for full independence. Thus began the long feud between two rival dynasties.

Serbia as Autonomous State.—In 1817 Miloš secured from the Skupština the recognition of his hereditary right, but this status was confirmed by the Sultan only in 1830, after the Convention of Akkerman (1826) and the Treaty of Adrianople (1829) had provided for Serbian autonomy on fuller lines than those laid down at Bucharest in 1812. The *hatti sherif* of 1830 still further defined that autonomy and in 1833 Miloš was able to occupy the Six Districts till then in dispute with the Turks. Turkish garrisons were retained in Belgrade, Šabac, Smederevo, Užice and two other places, and Turkish residents were henceforth restricted to these towns. In home affairs Miloš developed highly autocratic tendencies, opposed representative institutions and used his position to

enrich himself. In 1835, however, a serious conspiracy forced him to summon a Skupština, and though the new constitution which it voted never came into force owing to the hostility of the Porte and the Powers, another was promulgated by *hatti sherif* of the Sultan in 1838, instituting a Council of State or Senate and a Cabinet of four ministers. These years witnessed the curious spectacle of the two autocracies, Russia and Turkey, working to restrict the Prince's autocratic powers, while the Western Liberal Powers, Britain and France, favoured their extension. Fortunately the efforts of Palmerston's agents, Colonel Hodges and Lord Ponsonby, were unsuccessful. In 1839 Miloš was forced to abdicate and withdraw, and government was carried on by the so-called "Defenders of the Constitution" (Ustavobranitelji), led by Vučić and Petronijević, first in the name of Miloš's eldest son Milan, and on his death a month later, of the second son Michael (*q.v.*). In 1842 Michael also was abandoned by the army and popular feeling and driven into exile. The Skupština, instead of electing Thomas Vučić as he himself had hoped, now summoned to the throne Alexander, son of Kara George, a man of mediocre ability and weak will. The hostility of Tsar Nicholas delayed recognition for many months, but in June 1843 a newly elected Skupština unanimously confirmed the election of Prince Alexander.

Alexander Karageorgjević.—The new reign was a period of growth and transition, in which a civil code was promulgated (1844), the judicial system completed (1846), a state printing press set up, the National Museum and Serbian Scientific Society founded. Primary and secondary education was encouraged, and an increasing number of young Serbs began to visit French and German universities. The publication of Vuk Karadžić's version of the New Testament (1847) was a landmark in literary progress: and his great services in collecting popular tales, ballads and proverbs and issuing the first scientific Serbian grammar and dictionary were crowned by his philological reforms and a new phonetic Serbian orthography, which, following parallel lines with Gaj's revision of Croat orthography, made Serbo-Croat literary unity a reality and thus laid the basis for political unity.

In foreign policy Alexander leaned towards Austria. The racial war in Hungary which followed the revolution of 1848 (*see* Hungary and Croatia-Slavonia) caused great excitement in Serbia, numerous volunteers flocking across the river to help their Serb kinsmen against the Magyars—notably the Senator Stephen Knićanin. There were close confidential relations between Alexander, the Patriarch Rajačić and Meyerhofer, the Austrian Consul-General, who afterwards became governor of the autonomous *Vojvodina* established by Austria (1849–59). The Prince's chief minister Garašanin, an enthusiast for Western culture, but also infected by the Slavophil ideas current in Prague, travelled to the Court of Napoleon III. to appeal for French help, but Tsar Nicholas regarded him as a pupil of Kossuth and Mazzini and forced his dismissal upon the reluctant Prince. In the Crimean War Serbia found it difficult to choose between her suzerain and her protector, and maintained an uneasy armed neutrality which at least prevented an Austrian occupation. The Treaty of Paris (1856) brought Serbia one stage nearer to independence: she was now placed under a special guarantee of the signatory Powers, and was assured full autonomy in administration, legislation, religion and trade. The Turkish garrisons remained, but armed interference in Serbian affairs was henceforth forbidden, save by consent of the Powers (§ 21). Thus a quite illogical situation arose, in which the sovereign rights of the Porte were restricted by the Powers, who substituted a virtual protectorate of their own for that of Russia.

The Return of Miloš and Michael.—In 1858 discontent against Alexander's weak rule culminated in an attempt of the oligarchy to establish a kind of *Kaimakamate* or regency. But the new Assembly through which they hoped to secure this result, was almost as hostile to Vučić and his friends as to the Prince, and in December, after proclaiming Alexander's deposition, promptly recalled Miloš Obrenović, who skilfully secured the Porte's approval before returning. The leading oligarchs were imprisoned, and Vučić died in prison under suspicious circumstances. Miloš, now nearly eighty, governed as highhandedly as ever, but was quick enough to check any encroachments on the part of the Porte. In September 1860 he was succeeded by Michael, Serbia's ablest modern ruler, who introduced more Western methods of government, but set himself to strengthen the princely power: by the new Constitution of 1861 he had the right to nominate and dismiss members of the Council, and ministers were responsible to him and to it jointly, not to the Skupština. Helped by a French officer, Captain Mondain, as Minister of War, he completely reformed the Serbian army, and in 1862 when the Turks in the fortress of Belgrade bombarded the town, he pressed the question of complete evacuation upon the Powers. The opposition of Britain and Austria postponed a solution, though the Turkish garrisons were reduced to four and the Turkish civil population withdrawn from Serbia. But in 1867 (Austria having lost prestige after the war of 1866 and Stanley following less Turcophil lines than Russell) the Powers persuaded the Porte to hand over the four fortresses, though the Turkish flag was still to fly beside the Serbian. Michael meanwhile pursued far-reaching designs of policy, negotiated with Kossuth and Cuza, worked out plans with the exiled Bulgarian committee for a joint Serbo-Bulgarian state, corresponded with the Croat and Serb leaders in Habsburg territory and concluded secret alliances with Montenegro, Greece and Rumania, for joint action against the Turks. These ambitious dreams suddenly collapsed on June 10, 1868, when Michael was murdered in the park of Topčider, outside Belgrade, by adherents of the rival dynasty.

Prince Milan and the Eastern Crisis.—The conspiracy failed, and Michael's cousin and only male heir, Milan (*q.v*), was elected Prince at the age of 14. The Regency, led by Blaznavac, the Minister of War, and Jovan Ristić, governed till Milan's majority in 1872. The new constitution which it introduced in 1869, by abolishing the senate and giving wider powers to the Skupština, was a step towards parliamentary government: but in certain directions the princely power was still further entrenched, and the demand for constitutional revision dominated internal politics during Milan's reign. In foreign policy the regency showed Austrophil leanings, but the visit of Prince Milan to the Tsar at Livadia in Oct. 1871 marked a turn in favour of Russia. Milan, a man of real ability, but a neurasthenic, lacking in morals or powers of endurance, failed to win the affection of the nation, preferred the amusements of Paris or Vienna, and saw his dynasty steadily losing ground. The Bosnian insurrection of 1875 (whose leaders aimed at union with their kinsmen in Serbia and Montenegro), and the resultant European crisis aroused intense excitement in Serbia, and the prince would have risked his throne had he left the insurgents to their fate. In May 1876 the Liberal cabinet concluded an alliance with Montenegro, and answered the Porte's refusal to entrust Milan with the administration of Bosnia-Hercegovina, by declaring war. But the Serbian army, though swelled by Russian volunteers and led by a Russian general, was ill prepared and unable to resist the Turks, whose victory at Aleksinac forced the prince to appeal to the tsar's protection. Turkey only consented to grant Serbia an armistice after Russia had addressed an ultimatum to the Porte (October) and Serbia's position remained in suspense during the Conference of Constantinople (December), but after its failure she found it necessary to conclude peace with Turkey on the basis of the *status quo* (March 1, 1877) and thus was reduced to a passive rôle throughout the critical period of the Russo-Turkish War. On Dec. 15, five days after the fall of Plevna, Milan again declared war upon Turkey, but was coldly received by the Russians, who were now much more interested in Bulgaria than in Serbia. Hence the Treaty of San Stefano, imposed by victorious Russia on March 3, 1878, provided a purely "Big Bulgarian" solution of the Balkan problem, Serbia acquiring only Niš and Pirot, and Bosnia-Hercegovina being reserved for special autonomy. The opposition of the Great Powers prevented the enforcement of San Stefano, and the Congress of Berlin decided the fate of the Balkans for another generation. Serbia saw her Bosnian kinsmen, for whom she had unsuccessfully

waged war, assigned by European mandate to Austria-Hungary, who also obtained the right of garrisoning the Sanjak of Novipazar, thereby securing her strategic line of advance upon Salonica and separating Serbia from Montenegro. Serbia herself obtained only the recognition of full independence, and the right to annex Niš, Pirot and Vranje, Austria vetoing her possession of Kosovo and "Old Serbia," and Russia not merely opposing her exaggerated claim to Vidin, but wishing to assign Niš to Bulgaria. The Russian delegates at Berlin, Gorchakov and Shuvalov, received Ristić with indifference and urged him to come to terms with Austria-Hungary. Ristić, completely disillusioned at the failure of a Russophil policy, resigned office in 1880, and Milan henceforth looked to Vienna.

Serbia and Austria-Hungary.—On June 28, 1881, a secret alliance for ten years was signed between Serbia and Austria-Hungary, by which the former undertook not to conclude any political treaty without Vienna's previous consent, and to prevent on her territory any "political or religious agitation" against the Dual Monarchy. The latter, in return, promised to use "her whole influence" in favour of the Obrenović, to recognise Serbia as a kingdom, and in the event of fresh Balkan complications to sanction her expansion in the Vilayet of Kosovo and Central Macedonia, though not in Novipazar. Behind the back of the Premier Piroćanac, Milan gave a still more explicit personal pledge and offered Haymerle a secret declaration "in whatever terms you care to notify to me, and annulling completely the effect of" the Premier's qualifying note. Milan's dealings with the court of Vienna are among the most humiliating incidents in Serbian history. They culminated in May 1885 in a contingent offer to withdraw from Serbia in favour of the Habsburgs and a request that in the event of his own death Austria-Hungary should prevent his son Alexander from mounting the throne as a minor, and should take charge of his education, or if she could not obtain possession of his person, should occupy Serbia by force of arms. Neither Kálnoky nor Francis Joseph responded, rightly regarding the offer as the outcome of an unbalanced mind.

Serbia Under King Milan.—On Feb. 22, 1882, the Skupština proclaimed Serbia a kingdom. But the internal situation remained unsatisfactory. The compensation to Turkish landlords in the new territory, and the building of railways, under the terms of the Berlin Treaty, necessitated foreign loans, and hence increased taxation. An attempt was made on Milan's life in 1882, and in 1883 there was an abortive rising at Zaječar, which was used as a pretext for savage measures of repression against the newly formed Radical Party. Milan by his favouritism and personal policy envenomed the party struggle, and the scandals of his private life and his undignified quarrel with Queen Natalie undermined the prestige of the dynasty. Serbia's rash and unprovoked attack upon Bulgaria, after the union of Eastern Rumelia in 1885, was mainly the work of Milan himself, who hoped to regain popularity by foreign conquest and regarded Bulgarian unity as a blow to the Balkan balance of power. The Serbian advance on Sofia was suddenly arrested by Prince Alexander's victory at Slivniča: the Bulgarian army in its turn invaded Serbia and thanks to unpreparedness, bad leadership and panic on the Serbian side, would probably have entered Belgrade, had not Austria-Hungary threatened armed intervention. Kálnoky explained to his German ally, who feared increased Austro-Russian friction, that he had acted not for the sake of Serbia or Milan, but on account of the moral effect upon Serbia's kinsmen inside the Dual Monarchy. The Treaty of Bucharest (March 1886) restored the *status quo,* but Serbia's prestige in Europe was effectually eclipsed for over two decades. King Milan's personal situation was undermined, and the divorce scandals of 1888 were the last straw. In the winter of that year he initiated a new and more liberal constitution (Dec. 22, 1888—N.S. Jan. 5, 1889), which provided for an extended franchise, closer parliamentary control, irremovability of judges and liberty of the press. From Milan's point of view this was devised as a *beau geste,* such as might rehabilitate the dynasty in popular favour. It was followed by his abdication (March 1889) in favour of his only child Alexander, then only 13: and a regency was formed by the veteran Ristić, with Generals Protić and Belimarković. A month before withdrawing from Serbia, Milan renewed the secret treaty with Austria-Hungary for another six years: as redrafted, it pledged the latter to protect the Obrenović dynasty, especially against "hostile incursions directed from Montenegro," and in the event of a Balkan upheaval to support Serbia's "territorial extension" southwards. Her definition of this as meaning "the valley of the Vardar as far as circumstances shall permit," amounted to the endorsement of Serbian as against Bulgarian claims in Macedonia.

King Alexander.—The regents, despite their own conservative leanings, found it necessary to entrust power to the Radical Party, under General Sava Grujić, which had a strong majority behind it: and its first achievement was to improve Serbian finances, reducing the deficit from 14,000,000 dinars in 1889 to 4,000,000 in 1890 and to 686,000 in 1891. But internal progress was still delayed by the constant interference and public wrangling of Milan and Natalie, and even after the ex-king's solemn renunciation had been endorsed by parliament (March 1892) he plotted in the background, with Austrian backing. The party struggle between Radicals and Liberals had reached a deadlock, when on April 14, 1893, the young king, by a sudden *coup d'état* ejected the regents, proclaimed himself of age and superseded the Liberal cabinet by one drawn from the moderate Radical wing. As, however, its first act was to impeach some of its predecessors, party feeling ran as high as ever, and turned into anti-dynastic lines. Alexander, whose character bore traces of a hereditary taint and whose education had suffered fatally from his parents' misconduct, grew up suspicious, callous and arbitrary. Early in 1894 he recalled Milan from his Parisian amusements, and on his advice suspended the constitution of 1889, reestablishing the more reactionary one of 1869. The Radicals went into violent opposition, but the situation was temporarily saved by a cabinet under the Progressive leader Stojan Novaković, whose position was however undermined by the King's refusal to sanction his project of constitutional reform, on a two-chamber basis, and also by friction with Austria-Hungary, the secret treaty with whom lapsed in 1895. At the elections of 1897 the Radicals maintained their majority, but Alexander refused to call them to power and formed a Cabinet under Dr. Vladan Gjorgjević, the doctor and intimate friend of King Milan, and known as a pronounced Russophobe. Milan was appointed commander-in-chief, and though he increased the army by one-third, and worked hard at its reorganization, his methods of favouritism did much to introduce the spirit of faction and conspiracy into the officers' corps. An attempt on his life in 1899 was used as a pretext for drastic measures against all the Radical leaders, some of whom, without serious proof, were sentenced to banishment or hard labour.

The End of the Obrenović Régime.—Dr. Gjorgjević's efforts to secure the succession by finding Alexander a wife from some reigning dynasty were checkmated by the King's rash decision in the summer of 1900 to marry his mistress Draga Mašin (née Lunjevica), the widow of a Czech engineer, a woman much older than himself. This decision led to a final breach between Alexander and Milan, who ended his dissolute existence at Vienna early in 1901: it led the Gjorgjević cabinet to resign out of protest at so suicidal a step: it was keenly resented in the country and isolated the dynasty in Europe. Emancipated from his father's influence in foreign policy, Alexander now flung himself into the arms of Russia and in return induced the Tsar to stand sponsor at his marriage. But at home he was the object of universal aversion, and only made matters worse by dabbling in illegal political experiments. In April 1901 he promulgated a new constitution, based on an adaptation of the Novaković project, establishing a second chamber and guaranteeing liberty of the press and of association. But in the winter of 1902 he reverted to open reaction, appointed General Cincar Marković premier, and in April 1903 suddenly suspended his own Constitution, removed all the officials and senators appointed under it, dissolved both Chambers and then declared the Constitution to be once more valid. In June new elections were conducted under such official terrorism that the whole opposition held aloof. The

country was full of unrest, wild rumours circulated, and it was widely believed that Queen Draga intended to secure the succession for her two brothers. Prompted by this untenable situation, a widespread military conspiracy was hatched, and on June 10, 1903, Alexander and Draga were assassinated in the palace of Belgrade, under peculiarly atrocious circumstances. Draga's two brothers, the Premier and the Minister of War shared the same fate. The details of the plot had been worked out in a well-known café in Vienna, and there is reason to believe that both the Austro-Hungarian and Russian Governments were aware of what was on foot, but allowed matters to take their course.

Serbia After the Murders of 1903.—The Obrenović régime was held in such universal odium in Serbia that the removal of its last representative, and hence of the old and grievous dynastic feud, was greeted with relief rather than horror. The regicides at once formed a cabinet representing all parties, reestablished the constitution of 1901 and convoked parliament for June 15. It unanimously elected Prince Peter Karageorgević, son of the ex-Prince Alexander to the vacant throne, and then restored the constitution of 1889, acknowledged as the most liberal of all those under which Serbia had been governed. Thus the shortlived senate disappeared, the franchise was extended, and the practice of tampering with such fundamental institutions as the bench, the press and the right of assembly received a salutary check. The new king found himself in a position of extreme delicacy, for the regicides were at first all-powerful politically. Austria-Hungary and Russia, indeed, at once congratulated him on his accession, but in Dec. 1903 all the Powers represented at Belgrade protested against the Government's weak attitude towards the regicides, and it was not till 1906 that a British Minister was appointed to return to Belgrade. The sinister incident of the murder of the Novaković brothers in the Belgrade state prison caused a reaction of feeling against the regicides, and the Radical Party, predominant since the murder, split into two sections, the Old and the Young, the former evolving steadily towards extreme conservatism. Their chief merit was a further reform of the finances; in 1903 there had been a deficit of 11,500,000 dinars, in 1904 and 1905 there were surpluses of 6,500,000 and 4,700,000. Under Dr. Paču as finance minister confidence revived both at home and abroad.

In foreign policy the Radicals concluded in June 1905 a customs convention with Bulgaria, which was intended to lead to a political alliance and common action in the Balkans. But it was prematurely disclosed (probably by the deliberate design of Prince Ferdinand) just as negotiations between Vienna and Belgrade for a new commercial treaty were nearing the final stage. Early in 1906 Austria-Hungary peremptorily vetoed Serbia's ratification of the Bulgarian agreement, and when the Government demurred, broke off the Austro-Serbian negotiations and closed her frontiers to Serbian imports. The result was a prolonged tariff war, due largely to the increased political influence of the Agrarians both in Austria and Hungary and their desire to prevent Serbia from extending her market for livestock and agricultural produce in Vienna and other cities. Serbia was also embarrassed by Austria-Hungary's further demand that she should order the guns and munitions which she required, at the Škoda works rather than in Western countries. This too was firmly resisted, and the orders were placed with Schneider-Creusot. In the end Serbia was surprisingly successful in finding fresh markets, *e.g.*, in Egypt: in the first year of the tariff war her foreign trade only diminished by 300,000 dinars, in 1907 it had again increased by 10,000,000 dinars, and after a drop in 1908, which was still inferior to the pre-war figure, it continued to grow steadily, keeping pace with improved finances.

The Bosnian Crisis.—The "Pig War" touched every Serbian peasant in his pocket, and was a heavy blow to such Austrophil sentiments as still lingered. Friction between Serbia and Austria-Hungary became more acute when in October 1908 Baron Aehrenthal proclaimed the annexation of Bosnia-Hercegovina, without consulting the other signatories of the Treaty of Berlin, on which Austria-Hungary's mandate of occupation rested. During the prolonged international crisis that followed (Oct. 1908–March 1909), excitement in Serbia became intense, and the wilder spirits clamoured for war against the Dual Monarchy. After a secret session of the Skupština, the Foreign Minister, Dr. Milovanović, undertook a mission to the courts of Europe and pressed Serbia's claim for the cession of a strip of territory linking up Serbia with Montenegro and with the Adriatic and securing the much needed independence for her commerce. Popular sentiment had never abandoned the hope of union with the Serbs of Bosnia, but the Government retained sufficient sanity to frame its demands within the limits of the possible. Austria-Hungary, however, though while annexing Bosnia she had simultaneously evacuated the Sanjak (partly to prevent Italy from claiming compensation under Clause 7 of her alliance) resolutely refused any territorial concession to Serbia, declining also to enter an international Congress until the Powers stood committed to endorse the annexation. Serbia received encouragement from Russia, one aspect of the crisis being the acute rivalry between the two Foreign Ministers, Aehrenthal and Izvolsky, who regarded himself as having been duped at their Buchlau meeting in September 1908. In January 1909 Milovanović declared in the Skupština that the Bosnian question was one of European interest, that Austria-Hungary's Balkan mission was ended and that she must not drive Serbia to despair. The war fever grew, Austria-Hungary mobilised and a very dangerous situation had arisen when Russia, yielding to a German ultimatum, recognised the annexation and advised Serbia to submit. On March 31, 1909, on the collective advice of the Triple Entente and Italy, she addressed a Note to Vienna, recognising "the fait accompli created in Bosnia" as "in no way affecting her rights." A few days earlier Crown Prince George, who had been the soul of the war party, abdicated his right of succession, owing to the report that he had mortally injured his valet in a fit of passion: his younger brother Alexander thus became Heir Apparent.

(R. W. S.-W.)

THE WAR ERA

The Balkan League.—The annexation of Bosnia marked a turning-point in Serbian history. Henceforth public opinion, supported by prominent statesmen in every party, was practically unanimous in regarding a conflict with Austria-Hungary as sooner or later inevitable. Aehrenthal's policy inevitably strengthened the tendencies towards the creation of a Balkan League, and these were accelerated by the political unrest evoked throughout the Balkan peninsula by the Young Turk revolution. At first the inclusion of Turkey in such a league was openly advocated by Russia, and favoured by Milovanović and Venizelos. But the increasing chauvinism of the Young Turks in Macedonia led Venizelos to discuss with Bulgaria measures of common defence against a possible Turkish attack. Negotiations followed between Sofia and Belgrade in the winter of 1912. Secret treaties of alliance were concluded on March 13, 1912, between Serbia and Bulgaria and on May 29 between Bulgaria and Greece. There was no actual treaty binding Serbia and Greece, while the Serbo-Montenegrin treaty, concluded in Sept. 1912, was less political than military, and provided for separate though parallel action.

By the first of these each State was bound to assist the other with all its forces in the event of an attack, and in particular in the event of any Great Power trying to annex any portion of Turkey's Balkan possessions. If internal troubles should arise in Turkey, either ally might initiate proposals for military action, and any point upon which agreement was not reached should then be referred to Russia for decision. Special provision was made for possible conquests, Serbia recognizing Bulgaria's rights over the territory lying east of the Rhodope mountains and the Struma river, and Bulgaria similarly recognizing Serbia's rights north and west of the Šar mountains. The districts lying between these limits, the Aegean and the Lake of Okhrida were to form "a distinct autonomous province," but should their partition prove inevitable, then Serbia undertook to make no claim beyond a line drawn from the Lake of Okhrida to near Kriva Palanka on the old Turco-Bulgarian frontier and including Skoplje, but not Monastir, Prilep or Veles. In the event of a dispute the

tsar was to act as arbitrator, and Bulgaria undertook to accept the more southerly line as its new frontier with Serbia if the tsar should decide in its favour. In the event of war Bulgaria undertook to place at least 200,000, Serbia at least 150,000 men in the field against Turkey. If either Turkey or Rumania attacked Bulgaria, Serbia was to send 100,000 men to her aid, while she on her part must provide 200,000 men in support of Serbia in the event of an attack by Austria-Hungary.

Internal disorder spread rapidly throughout Turkey-in-Europe after 1911; and the repressive policy adopted by the Committee of Union and Progress towards all non-Turks culminated in a reign of terror at the parliamentary elections of 1912, a recrudescence of Komitadji activities and a fresh Albanian rising. The premature death of Milovanović on July 1 both deprived Serbia of her ablest modern statesman, and removed one of the few restraining influences in any Balkan capital. On Sept. 12 Pašić, who placed almost unreserved reliance on Russian support, became premier at the head of a purely Old Radical cabinet.

Nothing could now have arrested the growing anarchy in Turkey. Public opinion in Belgrade and Sofia was roused by a massacre of Bulgarians at Kočana on Aug. 1. By the middle of the month Skoplje, and the entire district recognized by the secret treaty as Serbian, were in the hands of the insurgent Albanians. The proposals for reform put forward by Count Berchtold on Aug. 20 prompted the Balkan Allies to hasten their preparations, and before the Powers had taken any collective action, they mobilized almost simultaneously (Oct. 1). At the last moment the Porte announced its intention to enforce the Vilayet Law of 1880, which had from the first remained on paper. Soon after, the Powers addressed a conciliatory Note to Constantinople and simultaneously warned the Allies that even in the event of their victory no change in the territorial *status quo* would be tolerated. The four allies decided to precipitate events, and before any further Note could reach them, the King of Montenegro, by an act of undoubted collusion, declared war upon Turkey. On Oct. 13 the other three Balkan Governments presented to the Porte a series of far-reaching demands, culminating in racial autonomy for all the nationalities of the Ottoman Empire; and four days later the Turks, without even deigning to answer the note, declared war on Serbia and Bulgaria (*see* BALKAN WARS).

The First War.—The rapid and overwhelming success of the Allies radically transformed the situation. By the end of Nov. Turkish rule in Europe was restricted to the Chatalja lines, the Gallipoli Peninsula and the three fortresses of Adrianople, Janina and Scutari. The Serbs in particular, after the victories of Kumanovo and Monastir, were in actual occupation of all Macedonia west of the Vardar and had reached the Adriatic at Durazzo and Medua.

Kumanovo was much more than an ordinary victory. It restored to Serbia that self-confidence which had been so gravely shaken by the rebuffs and scandals of the previous 30 years; and throughout the Yugoslav provinces of Austria-Hungary it was hailed as an atonement for Serbia's downfall on the field of Kosovo and as a pledge of her new mission as the Southern Slav Piedmont. Austria-Hungary at first adopted a waiting attitude, but as the Serbs approached the Adriatic she suddenly ordered a general mobilization, and suppressed all public expressions of feeling, while the official press of Vienna and Budapest adopted a menacing tone towards Serbia. Great prominence was given to the alleged insults offered to Prochaska, Austro-Hungarian Consul at Prizren, and for some weeks public opinion was allowed to believe that he had been shamefully mutilated by Serbian officers. It only transpired long after that Prochaska had been entirely unmolested by the invaders, but had received definite instructions from Vienna to create an "incident" such as might provide a pretext for action. The Austro-Hungarian Chief of Staff and War Minister, Generals Conrad and Auffenberg, are known to have favoured a radical solution of the Southern Slav question by immediate war with Serbia; and similar views were held by the leading Ballplatz officials, Macchio, Kanya and Forgács. But both the emperor and Francis Ferdinand were averse to war, and Germany, finding Italy restive as to any change in the Balkan *status quo*, exercised a moderating influence over Vienna in connection with the fourth renewal of the Triple Alliance (Dec. 7).

Meanwhile, the success of the Balkan Allies, and the general relief with which public opinion hailed the downfall of Turkish rule in Europe, led the Powers to accept the accomplished fact. The Turks, seeing themselves isolated in Europe, made overtures of peace as early as the 11th to King Ferdinand, who was not willing to consider them until his troops had been checked before Chatalja.

The Conference of London.—The armistice of Dec. 3 was followed by a peace conference in London on Dec. 16, at which Serbia was represented by Novaković, Nikolić and Vesnić. After a month of fruitless negotiations, complicated by a revolution in Constantinople, the Balkan Delegates broke off the negotiations on Jan. 28. The Council of Ambassadors initiated by Sir Edward Grey continued to sit in London, and devoted especial attention to the Albanian problem and to the friction produced between Albanians and Serbs by the latter's presence on the Adriatic.

When war was resumed on Feb. 3 the brunt fell upon Bulgaria, and the Serbs, being complete masters of Macedonia, were free to contribute 47,000 men and a siege train of 38 guns to the operations against Adrianople, which held out until March 26. The dispute which arose as to whether Shükri Pasha had surrendered to the Bulgarians or to the Serbs was in itself quite unprofitable but was a symptom of the friction which was daily increasing between the two allies. The final phase of the war concentrated round Scutari, which Montenegro and Serbia made desperate efforts to reduce. Even the announcement that the Council of Ambassadors had definitely assigned Scutari to the new Albanian state, only strengthened the resolve of King Nicholas to create a fresh *fait accompli*. But Austria-Hungary upheld her veto, and on March 20 addressed a severe note to Montenegro and dispatched a strong naval squadron to the Southern Adriatic. Realizing the danger of Austro-Hungarian intervention, the Powers on March 31 joined Vienna in ordering Montenegro to cease hostilities, and on her refusal established a naval blockade of her strip of coast. On April 23 Scutari surrendered to the Montenegrins, but the Powers, after a crisis of some weeks, eventually compelled the Montenegrins to surrender it to Admiral Burney, as commander of the international fleet.

Negotiations were resumed in London on May 20. By the Treaty of London (May 30, 1913) Turkey ceded to the four allies conjointly the island of Crete and all territory lying to the west of the Enos-Midia line, while the settlement of Albania and the Aegean Islands was referred to the Great Powers.

The Second Balkan War.—The Balkan Allies were now faced by the thorny problem of dividing the spoils. Macedonian autonomy, which the treaty had laid down as the ideal solution, was from the first abandoned by all parties. Between Bulgaria and Greece there was no territorial bargain, and no obvious means of reaching one, while Serbia as early as Jan. 23 formally raised the question of a revision of the Serbo-Bulgarian treaty. She claimed compensation for four reasons: (1) that she had furnished her ally with military support far in excess of her bargain; (2) that she had absolved Bulgaria from her military obligations in Macedonia; (3) that she had loyally continued the war three months after her own work was done; and (4) that the acquisition of Adrianople by Bulgaria radically modified the basis upon which the bargain rested. But if her attitude can be justified, it must be on the broader ground that Austria's veto on her obtaining a port in Northern Albania had upset her whole basic calculation, leaving the Vardar valley her only possible alternative outlet; and this involved her retention of Veles, Prilep, Monastir and Okhrida as well as the "disputed zone."

While Russia strained every effort to avert a conflict, Bulgaria was encouraged by the openly Serbophobe tone of the official press in Vienna and Budapest; and King Ferdinand had already ordered General Savov to hasten the transference of the army from the Thracian to the Macedonian front, when on May 27, Pašić, under pressure from the Serbian Opposition, publicly committed his Government to the demand for treaty revision. This hastened the resignation of the pacific Gvešov. His successor Danev opposed the

suggestion that the Premiers should meet at St. Petersburg, contended that Russia had already prejudged the case by even considering revision, and relied increasingly upon Austria-Hungary. Serbia and Greece, realizing the danger, concluded first a military convention, and then a definite treaty of alliance for ten years (June 1). While the first of these provided for mutual military support in case of a Bulgarian attack upon either ally, the second extended the *casus foederis* to an attack by a third Power. Both the wording and the events of the moment make it clear that the intention was to guard against an Austro-Hungarian attack upon Serbia.

The tsar's personal appeal to the kings of Serbia and Bulgaria in the name of "the Slav Cause," fell on deaf ears (June 8). On June 13 Bulgaria rejected the proposal of the Powers in favour of parallel demobilization, and her attitude stiffened still further after the speech of the new Hungarian premier, Count Tisza, who emphasized the right of the Balkan States to settle differences in their own way—*even by war*—and declared that Austria-Hungary could not allow any other Power to acquire special prerogatives in the Peninsula (June 19).

Danev rejected Russia's fresh proposals for a compromise and reiterated the demand for the joint occupation of Macedonia. With Sazonov's sharp reply bidding Bulgaria to expect nothing more from Russia, St. Petersburg's influence over Sofia ended. On the night of June 29, without previous declaration of war, the Bulgarian armies made an almost simultaneous attack upon the Serbs and Greeks in the hope of seizing and holding the coveted districts of Macedonia until the foreign intervention which King Ferdinand believed to be imminent settled the dispute on a basis of *beati possidentes*. This is borne out, not merely by captured dispatches, but by the fact that when Putnik's forces everywhere held their own, Savov on July 1 telegraphed the order to stop hostilities. But that very afternoon the Serbian counter-offensive opened, and after a desperate struggle of nine days on the Bregalnica front (July 1–9), the Bulgarians were obliged to abandon the whole Ovčepolje, the strategic key to central Macedonia.

The Treaty of Bucharest.—By July 17 the Serbs had forced back the Bulgarians at all points to the frontier of 1912, and could henceforth adopt a mainly defensive attitude, while Greeks, Rumanians and Turks continued to advance. The appeals of Sofia to the Powers to enforce upon Turkey respect for a treaty concluded under their auspices were disregarded; and Western public opinion was not inclined to save Bulgaria from the consequences of her own act. Meanwhile Austria-Hungary was held back from intervention by both her allies—Italy, who viewed with alarm the Balkan activities of any outside Power and was determined to insist upon compensation, and Germany, who feared the loss of Rumania for the Triple Alliance and the consequent derangement of the military balance in Europe. Italy indeed made it clear to Vienna that she would not recognize the *casus foederis* of the Triple Alliance as applicable to such a case; and the combined pressure of Rome and Berlin, coupled with the certainty of Russian aid to Serbia, again averted war at the last moment. Bulgaria was forced to sign an armistice on July 31 and to open peace negotiations at Bucharest with her four Christian neighbours.

By the Treaty of Bucharest (Aug. 10) Serbia acquired all Macedonia west of the Vardar, and to the east the districts of Štip (Istib) and Kočana: Bulgaria retained possession of a dangerous salient at Strumnica, which enabled her to threaten Serbia's only railway connection with the Aegean. The Treaty of Constantinople, which was concluded between Bulgaria and Turkey (Sept. 29) and deprived the former of the greater part of Thrace, did not directly concern Serbia; but the indifference shown by her and her new allies, and still more by Britain and Russia, to Turkey's violation of a treaty which was their joint work, and indeed was morally binding upon them, was to be dearly paid for by Bulgaria's attitude in the World War. The treaties marked a new orientation in the Near East. Slav co-operation was replaced by mutual hatred, which threw defeated Bulgaria into the arms of Turkey and predisposed both for alliance with Berlin; Rumania's ties with the Triple Alliance were sensibly loosened, while Greece was drawn in two directions by dynastic attractions and party rancours.

The Albanian Conflicts.—Austria-Hungary now concentrated her attention upon Albania, and thereby rendered still more acute the relations between Serbs and Albanians. The summons addressed to Belgrade by the Great Powers for the withdrawal of the Serbian troops (Aug. 19) was a signal for further trouble. Late in Sept. there was a formidable Albanian rising, and the insurgents seized Dibra and even Okhrida, and forced Serbia to remobilize. In October the Serbs, in response to a peremptory demand from Austria-Hungary, withdrew their troops, but sent an effective Note to the Great Powers, begging them to enjoin upon their Albanian protégés a respect for the frontiers created for their benefit.

By Christmas 1913 the situation in the new territory was rapidly becoming normal, but its administration left much to be desired, and the closing of Bulgarian schools, the expulsion of Exarchist clergy and occasional excesses against the Moslem population caused serious unrest and discontent. The Pašić administration became absorbed in defending itself against the increasingly violent onslaughts of the Opposition, which on March 4, 1914, withdrew from the Chamber as a protest against alleged unconstitutional action of the Government in budget matters. But though the tension was increased by the activities of a powerful military society known colloquially as "The Black Hand," and by the seizure of its club premises by the Minister of the Interior, Protić, the Government was still in office in the summer. The visit of Crown Prince Alexander and Pašić to St. Petersburg early in February had given rise to rumours of a new Balkan League under Russian auspices; but the return of Radoslavov to power in Sofia had really made any such plan impracticable.

Murder of the Archduke.—On June 24 King Peter, incapacitated by ill-health, appointed Prince Alexander as regent, and simultaneously dissolved parliament, Pašić having in April pledged himself to the elections for a "Great Skupština" for constitutional changes. Only four days later the assassination of the Archduke Francis Ferdinand and his wife at Sarajevo revived the latent Austro-Serbian conflict in an acuter form than ever. The authors of the crime, Princip and Cabrinović, belonged to a group of Bosnian Serb students, mostly under the age of 20, who gave terrorist expression to the universal discontent aroused by Austro-Hungarian repression throughout her Yugoslav provinces. The victories of Serbia during the Balkan Wars and the openly hostile policy pursued towards her by Vienna and Budapest had assured to her in the eyes of public opinion the position of a Yugoslav Piedmont. Though the initiative unquestionably rested with the Bosnians themselves, it was proved that the assassins had been in Belgrade and had been secretly smuggled across the Drina into Bosnia, after receiving hand grenades and revolvers from the Serbian Komitadjis Major Tankosić and Ciganović. On these facts the Ballplatz sought to establish the complicity, or at least the foreknowledge, of the Serbian Government, yet despite the compromising admissions of Ljuba Jovanović, the theory is improbable. The country itself was exhausted by two wars; the Albanian campaign in the previous autumn had shown the reluctance of the peasant soldiers to return to the colours, and it was now the eve of harvest. Military stocks were alarmingly low; the young Prince had only just assumed the reins of government: the position of the Cabinet was shaky, and a fierce electoral campaign was opening. Delicate negotiations with Montenegro for a customs and military union, and perhaps even a dynastic arrangement, were still pending. Serbia had every conceivable motive for avoiding aggressive action. After the tragedy, it is difficult to see what other course her Government could have pursued; its one grave omission was failure to offer a thorough inquiry, without waiting for any suggestion from Vienna.

Ultimatum to Serbia.—The secret of the ultimatum was jealously guarded, and the long delay created, as was intended, a false sense of security in some quarters. Its delivery at Belgrade, which took place at 6 P.M. on July 23, was carefully timed for the moment after President Poincaré's departure from St. Petersburg after his state visit; the object being to disorganize the diplomacy of the allies. The ultimatum, after reminding the Serbian Government of its formal undertakings of March 31, 1909,

charged it with "culpable tolerance" of terrorist propaganda directed against Austria-Hungary, and accused Serbian officers and functionaries of planning the Sarajevo murders. It therefore demanded that the Narodna Odbrana and any similar society guilty of anti-Austrian propaganda should be dissolved, that objectionable passages should be expunged from Serbian educational works, that all officers or officials whom Austria-Hungary might name as guilty of propaganda should be dismissed, and that the Belgrade Government should not merely arrest certain specified persons charged with complicity, but should order the trial of others, allow Austro-Hungarian delegates to take part in the inquiry and accept the collaboration of Austro-Hungarian officials "in the suppression of the subversive movement."

The general impression produced by this document upon European opinion is best summarized in the words of Sir E. Grey, who telegraphed the next day to Sir M. de Bunsen that he "had never before seen one State address to another independent State a document of so formidable a character." The fifth demand in particular, that of collaboration, he pointed out, "would be hardly consistent with the maintenance of Serbia's independent sovereignty." None the less, Serbia in her reply actually consented to "such collaboration as agrees with the principle of international law, with criminal procedure and with good neighbourly relations." Only on one point did she reply definitely in the negative—the share of Austro-Hungarian officials in the actual inquiry would, it was argued, be a violation of the Constitution and the criminal code; but even this could be met by "communications in concrete cases." As a final proof of sincerity, Serbia offered to submit any outstanding points to the decision of The Hague Tribunal or even to the Great Powers which had imposed upon her the declaration of March 31, 1909. Thus Serbia for the third time in six years offered to submit herself to the verdict of The Hague (the two previous occasions being the Bosnian crisis and the Friedjung trial), and each time Austria-Hungary rejected the proposal.

Austria-Hungary had left a period of 48 hours for either reply or mediation. The official documents published in Berlin and Vienna since the war make it abundantly clear that the Ballplatz deliberately couched the note in such terms as to be unacceptable. They also reveal that even William II. (to judge from his marginal notes) was impressed by the moderation of the Serbs, regarded Vienna's essential wishes as fulfilled and expressed the view that Giesl ought to have remained in Belgrade. His ministers, however, had failed to support Sir E. Grey's proposal for a prolongation of the time limit, and were thus responsible for bringing Russia into action. On July 27 the tsar replied to a despairing appeal of the prince regent for assistance to Serbia by a telegram strongly urging him to "neglect no step which might lead to a settlement," but conveying the assurance that "Russia will in no case disinterest herself in the fate of Serbia." On July 28 Austria-Hungary formally declared war upon Serbia. Henceforward the Austro-Serbian quarrel is merged in the larger diplomatic conflict between Alliance and Entente; and the reader may be referred to the special articles dealing with that subject.

Opening of the World War.—When Baron Giesl presented the ultimatum, Pašić had been absent electioneering in the provinces; but he at once returned to Belgrade, and on July 25 mobilization was ordered, and the seat of government and the archives were hastily transferred to Niš. In view of so grave a crisis elections became impossible, and as parliamentary sanction was more than ever necessary, the Government was forced to ignore the fact of dissolution and to call the previous Skupština once more into existence. At its first meeting in Niš on Aug. 1, the entire Opposition endorsed the Government's action, and for the moment party life was in abeyance. But after Serbia's early military successes, the enforced evacuation of Belgrade (Nov. 29) brought the latent political crisis to a head. On Dec. 13 the purely Radical cabinet was succeeded by a Coalition Government, in which Pašić remained Premier, but the leaders of all parties save the Liberals received portfolios. It was, however, in this blackest week that the Skupština unanimously endorsed the Government's declaration that its foremost war aim was "the liberation and union of all our Serb, Croat and Slovene brethren not yet set free." This was the first public step of Serbia in favour of Yugoslav unity.

The brilliant offensive initiated on Dec. 2 by General Mišić and the I. Army cleared Serbian soil for the third time from invaders, and an enormous booty was captured. But the enemy left deadly infection behind him, and by the early spring of 1915 exhausted Serbia was immobilized by a typhus epidemic which is estimated to have caused about 300,000 deaths among the civil population. Serbia's negative rôle during 1915 was due not only to exhaustion but to considerations of high policy. Meanwhile the Entente was eagerly working for the intervention of Italy and of Bulgaria, neither of whom could receive adequate satisfaction save at the expense of Serbian aspirations. During the winter pressure was repeatedly brought to bear upon Niš to make territorial concessions to Bulgaria in Macedonia; but the one and only condition upon which Serbia could safely have considered this—namely, that the Allies should guarantee Yugoslav unity in the event of victory—was precluded by their parallel negotiations with Italy, whose official policy it was to prevent, not to further Yugoslav unity, and to whom by the Treaty of London, concluded on April 26, 1915, no less than 700,000 Yugoslavs were assigned. The fact that the concealment of this treaty from Serbia was made an absolute condition by Rome did not tend to diminish the reserve of Belgrade, which almost immediately learned the essential facts through St. Petersburg. The Serbs were more conscious than ever of the value to them of the Vardar valley, which would form part of any serious concessions to Bulgaria, whom they also believed to be tied to Vienna and Berlin by a secret compact. They were further handicapped by the attitude of Greece, who in the autumn of 1914 exercised her right of veto, under the Serbo-Greek Treaty, upon any cession of territory to Bulgaria and was prepared to demand Monastir as compensation. After the Dardanelles failure Bulgaria leaned increasingly towards Germany, and the concrete proposals addressed to Sofia by the Entente on May 28, over Serbia's head, came two months too late.

The Conquest of Serbia.—On Sept. 6 Bulgaria concluded a secret alliance with the Central Powers. Meanwhile the Serbian Government was unduly optimistic as to Greek and Rumanian intervention, and its disbelief in a German invasion was encouraged by Allied military opinion, which clung obstinately to the illusion that Bulgaria might enter on the Entente side, and therefore vetoed the Serbian general staff's plan for an immediate attack upon Sofia before the Bulgarian army was ready (Sept. 27). Next day Sir Edward Grey in the House of Commons announced that in the event of Bulgaria's aggression, "our friends in the Balkans" would receive help "without reserve and without qualification." Relying on the fulfilment of this pledge, the Serbs devoted their main effort to checking the Austro-German advance and remained on the defensive towards Bulgaria. The danger was increased by King Constantine's repudiation of Greece's treaty obligations towards Serbia and the overthrow of Venizelos. That statesman, however, had inquired of the Allies as early as Sept. 23 whether, if Bulgaria declared war on Serbia, and if Greece asked Serbia to supply the 150,000 men stipulated by the Serbo-Greek Treaty for such a contingency, France and Britain would assume Serbia's obligation for her; and an affirmative answer was received within 48 hours.

On Oct. 6 the rupture with Bulgaria was complete. The fatal delays in sending the promised troops, coupled with Allied insistence that the Serbs should hold back Mackensen to the last moment, belong to military history; but their results were eminently political. At the critical moment of the Bulgarian menace to the Niš-Salonika railway there were at Salonika not 150,000 Allied troops ready for action, but 35,000 French and 13,000 British, the latter under strict injunctions from London not to cross the frontier into Serbia (*see* General Sarrail, *Mon Commandement en Orient*, p. 27). Niš was decorated to welcome Allies who never came. The whole Serbian plan of campaign collapsed, and the armies, losing control of the railway southwards, retired precipitately through the passes leading to the plain of Kosovo. General Sarrail, informed that he must not expect reinforcements, was forced to arrest his belated offensive

northwards (Nov. 12) and soon to withdraw to the west of the Vardar. The Serbs were thus cut off from Allied help, lost Skoplje and only just escaped being cut off between the converging Austro-German and Bulgarian armies.

The final retreat of the Serbian Army and Government across the inhospitable snowy mountains of Albania and Montenegro stands out as one of the great tragedies of the war. After dreadful sufferings the fugitives were conveyed by Allied transports to Corfu, which for the remainder of the war became the seat of the Serbian Government and a base for the convalescence and reorganization of the army. Notable assistance was rendered by British voluntary units, and some idea of the generous response of the British public to Serbia's need may be gathered from the fact that the Serbian Relief Fund from first to last collected over £1,000,000, in money and material, and employed over 700 workers in Serbia, Albania, Corfu, Salonika, Corsica, Biserta and France; while the Scottish Women's Hospitals, under Dr. Elsie Inglis, performed notable services for the Serbs both on the Balkan and the Russian fronts.

Conquered Serbia was divided for administrative purposes between Austria-Hungary and Bulgaria; all that remained to the Serbs was a fragment of territory south of Monastir. Bulgaria, officially declaring the Serbian State to have ceased to exist, enrolled all men of military age throughout the occupied territory, and in Feb. 1917 extended this to include the whole male population. It refused to recognize the Serbian Red Cross and seized the Serbian Legation in Sofia; all Serbian schools, law courts and inscriptions were Bulgarized, libraries and collections were either destroyed or removed to Bulgaria, the Serbian clergy were evicted or executed. A formidable rising in the mountains behind Kursumlje was brutally repressed, with over 2,000 executions (March 1917). The war aims now repeatedly avowed by Sofia were the annexation not only of Macedonia, but of Kosovo, Prizren and the whole upper Morava and Timok valleys; a common frontier with Hungary; and the prevention of Yugoslav unity. Radoslavov more than once proclaimed Bulgaria's resolve to keep all her conquests (see *Vossische Zeitung*, Oct. 10, 1916), and his official organs declared that Serbia's reconstitution, "no matter under what form, would be a perpetual menace to Balkan peace." Austria-Hungary showed much greater reserve, airing from time to time various alternative schemes for a vassal Southern Slav State under the Habsburgs, keeping Prince Mirko of Montenegro as a possible candidate for its throne and employing agents in Switzerland to sow dissension among the exiles.

The Serbs in Exile.—Soon after the establishment of the Serbian Government at Corfu party rivalries began to revive. The deputies were scattered, an independent press was impossible and regular Allied subsidies made the Government virtually immune from serious democratic control. The supersession of the Voivode Putnik and almost all his staff caused great indignation; and though the whole Serbian Coalition must bear the responsibility, it was known to be the work of Pašić and his colleague Protić, then still out of office. In Aug. 1916 an attempt is alleged to have been made upon the life of the prince regent at the front, and the Government proceeded in the winter—while the joint advance under Sarrail was crowned by the capture of Monastir from the Bulgarians—to order numerous arrests on a charge of conspiracy and murder. The conspiracy trial which opened in Salonika in Jan. 1917, and was conducted behind the shelter of a strict military censorship, resulted in a death sentence upon nine Serbian officers, and notably of Colonel Dimitriević (*q.v.*), head of the "Black Hand." There is no doubt that Dimitriević favoured a military *coup d'état* against his Radical enemies, and that he had his hand in the Sarajevo murder; but the evidence for a plot against Prince Alexander was clearly inadequate, and he was the victim of rival military and political cliques. This trial revived all the old party dissensions: the reactionaries had triumphed on the very eve of the collapse of their chief support, the Tsarist Government. Pašić found himself between two fires—the need for a more democratic restatement of foreign policy, and the demand of the Young Radical and Progressive parties for a revision of the Salonika trial. Refusal led to their withdrawal from the Cabinet, and its reconstruction on a purely Old Radical basis under Pašić and Protić.

The last occasion when all parties co-operated was on July 20, 1917, when the Declaration of Corfu, drawn up between Trumbić for the Yugoslav Committee and Pašić for the Serbian Government, met with unanimous approval. It affirms that the Serbs, Croats and Slovenes constitute a single nation, and demands complete national unity under the Karagjorgjević dynasty, a constitutional democratic and parliamentary monarchy and the reference of all details to a Constituent Assembly after the war. Pašić, having strengthened his position abroad by a visit to Paris and London, declined to convoke parliament for four months after the legal period had expired. At last, as the result of a direct appeal of its president to the Crown, it met in Corfu on Feb. 12, 1918, and the Government resigned, but after weeks of fruitless negotiation for a Coalition Ministry was allowed to resume office. In April, the Opposition, which numbered 60 as against 64 Old Radicals, withdrew in a body from the Chamber, thus leaving the Government without the quorum of 84 required by the Serbian Constitution.

During the spring and summer of 1918 there was acute tension among the rival Serbian groups, and the real initiative in the Yugoslav question and in the political campaign against Austria-Hungary passed to Trumbić, Beneš, Lansing and the Allies and to the leaders of the movement inside the Dual Monarchy. On April 8, 1918, a "Congress of the Oppressed Nationalities of Austria-Hungary" was opened in Rome, based on the agreement reached a month earlier in London between Trumbić, on behalf of the Yugoslav Committee, and Andrea Torre, representing an influential committee of Italian deputies and senators. The result was immediate in two directions. The propaganda organized on the Italian front by the various national committees led to wholesale defections from the Austro-Hungarian army, and contributed materially, according to the high command's own admission, to the failure of the last Piave offensive in June. Meanwhile the Roman Congress was deliberately imitated inside the Dual Monarchy by an imposing Congress at Prague: it was attended by Czech, Polish, Rumanian, Slovak and Yugoslav delegates—among the latter Radić and Pribičević—and adopted a pledge of mutual support in the cause of unity and independence.

During 1918 the initiative among the Yugoslavs of the Monarchy fell more and more into the hands of the Slovenes, led by Father Korošec. The official recognition accorded to the Pact of Rome by Lansing in the name of America (May 31) was a fresh encouragement; and Korošec, after constituting a Yugoslav National Council for the furtherance of unity, convoked a new Slav Congress at Ljubljana on Aug. 18, at which the Catholic hierarchy and clergy took a prominent part. In the early autumn, at the Emperor Charles's instance, Count Tisza visited Zagreb, Sarajevo and Dalmatia with the object of promoting a Hungarian solution of the Southern Slav question, but met everywhere with a blank refusal. After the surrender of Bulgaria (Sept. 30) the Czech and Yugoslav spokesmen in the Reichsrat were still less conciliatory and insisted on separate representation at the peace negotiations and the absolute right to decide their own future state allegiance.

The Collapse of Austria-Hungary.—Events now followed each other with lightning speed. On Oct. 4 Austria-Hungary in a note to America accepted President Wilson's speeches as a basis of discussion, and on the 8th Baron Hussarek admitted that the Monarchy's internal structure must be modified and "full-grown nations" determine their own future. This only precipitated the collapse, and while Count Tisza voiced Hungarian public opinion in declaring the basis of the Dual system to be shattered, the Yugoslav National Council was transplanted from Ljubljana to Zagreb and strengthened by the inclusion of representatives of all parties (Oct. 10). On the 16th the Hungarian Government declared in favour of Personal Union, and next day Hussarek published an Imperial Proclamation, dated Oct. 16, dividing *Austria* (not Austria-Hungary) into four federal units (German, Czech, Yugoslav and Ukrainian), and leaving the Poles to make their own decision. Korošec, in the name of the Czech and Yugoslav Clubs

unreservedly rejected this stillborn project and claimed that the future of both nations was an international problem which only the Peace Conference could solve.

Henceforth the Yugoslavs acted independently of both Vienna and Budapest; and when on Oct. 21 the news of President Wilson's answer to Count Burián's final Peace Note (refusing to negotiate save on the basis of a recognition of Czechoslovak and Yugoslav national claims) became generally known, the old régime vanished almost as if by magic. Extraordinary scenes took place in many towns, the troops tearing off their military badges with the Habsburg arms and trampling them underfoot. National councils were speedily formed in Dalmatia and Bosnia, which arranged for the disarmament of the troops pouring northwards from the broken Albanian and Macedonian fronts. As early as the 23rd a Croat regiment stationed in Fiume disarmed the Magyar militia and took possession of the town. On the 24th Count Andrássy was appointed Joint Foreign Minister, but the machinery of State had ceased to work, and both the Austrian and Hungarian Cabinets were *in statu demissionis.*

On the 28th, the military command in Zagreb handed over its authority to the National Council, and next day the Diet proclaimed the independence of Croatia from Hungary and assumed control of Fiume. The arsenals of Pola and Cattaro were already in the hands of the insurgents; and the Emperor Charles, in the hope either of winning the favour of the new régime in Zagreb or throwing an apple of discord between it and the Entente, signed a decree on Oct. 31 making over the whole Austro-Hungarian fleet to the Yugoslav State—a step which was interpreted by the Italian Nationalists as a proof of collusion between Zagreb and Vienna.

On the other hand, the action of the Supreme Council in Paris in prescribing the frontier line of the Secret Treaty of London as the line of occupation under the Austro-Hungarian Armistice was keenly resented by the Yugoslavs as a breach with Wilsonian principles. The Allies very properly insisted that the fleet must be surrendered into their hands, but before this could take place a deplorable incident occurred in Pola harbour, the "Viribus Unitis" being blown up by an Italian mine, with a Yugoslav admiral and crew on board. In Italy Baron Sonnino's frankly anti-Slav attitude threw Signor Orlando and the Pact of Rome into the shade; and the Consulta worked hard to prevent Yugoslavia's recognition by the Allies.

Rival Programmes.—That this recognition had not already been accorded before the collapse of the Central Powers began was due to disunion among the Yugoslavs themselves. Pašić, free from the restraints of a coalition and from all parliamentary control, had reverted to his original Pan-Serb standpoint, and steadily declined to reconstruct his Cabinet on a wider Yugoslav basis. Trumbić on his part could not enter a purely Serbian Cabinet without prejudicing that freedom of choice of his compatriots in the Dual Monarchy upon which the moral case of the Yugoslavs depended. A series of incidents, such as Pašić's dismissal of the Serbian Ministers in London and Washington for their Yugoslav sentiment, proved the difference of outlook to be not merely personal but fundamental. When on Aug. 9 Balfour officially recognized the Czechoslovak National Council as "trustees of the future Czechoslovak Government," he was ready to extend a similar recognition to the Yugoslav cause, but as a preliminary condition he very reasonably insisted upon unanimity between those who claimed to represent the rival groups of Yugoslavs. But every effort to bring Pašić and Trumbić together was unavailing, and when in the last week of Oct. the rival statesmen moved from London to Paris, all hope of Yugoslav recognition before the Peace Conference had vanished, owing to the stiffening in the attitude of Italy.

To meet the impending danger, the Zagreb Government urgently invited the assistance of the Serbian army, which during the final advance contained a large proportion of Yugoslav volunteers. The first Serbian troops entered Fiume on Nov. 18, and a most dangerous situation arose between them and the Italians in Istria and Dalmatia, which was only very partially mitigated by the dispatch of American military and naval forces to Trieste and Fiume. Much of the blame falls upon the Supreme Council, which shrank from the only effective means of allaying friction —immediate Allied occupation of the disputed zone, pending the decision of the Peace Conference.

The Union.—The equivocal attitude of the Entente towards the new State, and Italy's insistence upon a fulfilment of the Treaty of London, naturally hastened the process of union. On Nov. 23 the Zagreb National Council proclaimed the union of the territories under its control with the kingdoms of Serbia and Montenegro, and invited the prince regent of Serbia to assume the regency of the new State. This decision (passed with only one dissentient voice, but that, unhappily, Stephen Radić, the peasant leader) took formal effect on Dec. 1, when Prince Alexander, at the formal request of 24 delegates from Zagreb, proclaimed the union. Meanwhile on Nov. 26 a hurriedly convoked National Assembly at Podgoriča had proclaimed the deposition of King Nicholas and his dynasty and the union of Montenegro with Serbia in the new united State. The first Yugoslav Cabinet was constituted under Protić as Premier and Korošec as Vice-Premier; Trumbić became Foreign Minister; other portfolios were divided more or less equally between Serbia and the new territories. SERBIAN CAMPAIGNS (1914–1915). The 1914 operations and the conquest of Serbia in 1915 are described below, while an account is given of the Allied operations in Macedonia, 1915–8, and of the reconquest of Serbia, under the heading SALONIKA CAMPAIGNS.

I. 1914 CAMPAIGN

The Austro-Hungarian problem in starting a campaign against Serbia was complicated by the prospect of Russian intervention in Galicia; the Austrian staff had, accordingly, drawn up two plans of concentration.

Alternative Austro-Hungarian Plans.—The first plan, in case of war against Serbia and Montenegro, called Concentration

B (Balkan), involved the employment of seven corps. The second plan, in case of war with Russia and Serbia, called Concentration R (Russia), involved the employment against Russia of nine corps; against Serbia and Montenegro of a minimum group of three corps and the formation of a reserve (four corps) which could be directed as required towards the Russian frontier or those of Serbia and Montenegro.

Convinced at first that they would have to deal only with the southern Slavs, Austria-Hungary ordered, on July 26, the partial mobilization required for Concentration B; but, owing to complications with Russia, general mobilization was proclaimed on July 31. To avoid confusion, the Austro-Hungarian staff decided to allow Concentration B to be completed before withdrawing the reserve provided for in plan R.

Serbian Mobilization.—The Serbian general mobilization, ordered on July 25, yielded 490,000 men at the outset, and some 43,000 more between August and September. Montenegro declared war on Austria-Hungary on Aug. 5, 1914. Her forces amounted to about 50,000 militia with very little artillery, and were of no direct assistance to Serbia, though they occupied the attention of three Austrian mountain brigades. Circumstances compelled Serbia to adopt a purely defensive strategy. Her army, commanded by the Crown Prince Alexander, with Voivode Putnik as chief of staff, was therefore concentrated in a central position enabling it to operate either towards the Sava and Danube or towards the Drina.

After the withdrawal according to Concentration R of the Austrian II. Army, the Serbs had a superiority not only in numbers but also in quality, 90% of them having fought in the 1912–13 wars, and three-quarters of their guns being better than the Austrians'. On the other hand, Austria's equipment and resources in ammunition were far superior.

Jadar Operations, and Cer Battle: Aug. 16–24.—North Serbia is a mountainous country, devoid of good communications, particularly in the northwest, whilst the actual frontier was formed on the north by the formidable obstacle of the Danube and Sava, on the west by the Drina, a river not very broad but swift and difficult to bridge. The plan for the invasion of Serbia, drawn up by Conrad von Hötzendorff and Moltke in consultation, involved a concentric advance from all fronts, but was vitiated by the withdrawal of the II. Army. Potiorek, however, who feared an advance of the Serbs over the Drina to excite insurrection among their kinsmen in Bosnia, launched, on his own responsibility, a preventive offensive.

On the night of Aug. 11–12, the Austrian V. Army (VIII. and XIII. Corps) and elements of IV. and IX. Corps from the II. Army began to cross on a wide front from Drenovac on the Sava to Ljubovija on the Middle Drina, successfully driving back the Serbian frontier detachments. The Serbians moved to oppose the enemy, and by the evening of the 15th their II. Army occupied positions on a line south of Šabac, across the Cer and Iverak ridges and the Jadar valley, connecting with their III. Army who had moved forward from Valjevo to Zavlaka and Krupanj. Their I. Army had taken over the whole northern front as far as Obrenovac.

On the 16th, after severe fighting, the Austrian XIII. Corps drove back the left and centre of the Serbian III. Army, capturing Krupanj and threatening the Valjevo-Osečina road behind the Serbian positions. On the right of the II. Army the Serbs were also forced to give way, but in the centre a local counter-attack secured for the Serbs the important position of Kosaningrad (Aug. 18). This enabled the II. Army Commander Stepanović, to launch on the 19th a counter-stroke along the Cer and Iverak ridges, which swept the Austrian VIII. Corps down in and over the Drina. The Austrian right wing (VI. Army), which had concentrated around Vingrad, less hard pressed, and better organized for mountain warfare, retired in good order, but by the 22nd the whole river front was again occupied by the Serbs. The Austrian II. Army fared no better, losing prisoners and guns in their retreat over the Sava.

By the 24th the first invasion of Serbia was ended, with a loss of about 50,000 men to the Austrians. The Austrian commander-in-chief had greatly underestimated the military value of the forces opposed to him, while, on the Serbian side, Putnik's management of his forces and his choice of the moment and place of counter-attack were masterly.

Syrmian Operation, and Drina Battle.—Meanwhile, no events had taken place on the northern front east of Obrenovac other than the evident withdrawal of the Austrian II. Army. Putnik decided to throw his I. Army across the Sava into Syrmia in order to secure the line Mitrovica-Fruška range—Danube to Semlin and Belgrade. This would enable the Serbs to invade Bosnia without fear of a sudden attack on their north flank and rear.

After making good crossings on the night of Sept. 5–6, the I. Army occupied Semlin and was progressing towards its objective when the situation on the Drina front caused its recall. For, on the Austrian side, Potiorek was reorganizing his forces for a new thrust across the Drina. His VIII., XIII., XV. and the major part of his XVI. Corps bordered the Drina from the Sava to Ljubovija.

Potiorek's second offensive opened on the night of Sept. 7–8. In the north the VIII. Corps only succeeded in securing a bridgehead at Parašnica, but in the south the IV. and the right of the XIII. Corps crossed in force between Zvornik and Ljubovija, driving back the Serbian left. By the 11th, the situation was serious enough to compel Serbian G.H.Q. to order the transfer of the I. Army from Syrmia to Valjevo-Pecka. On the 13th, the Austrian XIII. Corps threatened to cut the Serbian line in two, but, on Sept. 16, a strong counter-attack was launched by the I. Army against the Austrian right. Even so, the Serbs barely succeeded in holding up the invaders, whom they failed to drive back over the rivers. Meanwhile the Užice Army and the Montenegrins had successfully undertaken a series of operations designed to prepare the way for the offensive over the Drina, but, being forestalled by the Austrian attack, they had no practical results.

Kolubara and Rudnik Operations.—The Serbs suffered severely from the unfamiliar conditions of trench warfare and a shortage of ammunition, and Potiorek decided to make a third attack, although winter was near at hand. The new offensive opened with an attack in the Mačva, which drove back the Serbs to the line Dobrava-Cer ridge. The main Austrian attack, however, again took place in the Zvornik area, where the Serbian centre had to be withdrawn. Putnik, after attempting to cover Valjevo, decided to try and hold up the Austrian advance on the so-called "Kolubara line." The weather was terrible, but the Austrians, pushing along the Maljen ridge, attacked on the 17th, and drove the Serbs off that ridge. The Austrian left made good the passage of the Lower Kolubara by the 25th.

Putnik now resolved to give up Belgrade and to fight for time so as to last out until the arrival of ammunition enabled him to launch a counter-offensive. He therefore withdrew his forces during the night of Nov. 29–30 to a line with its flanks resting at Obrenovac and on the Lower Morava, its centre on the Rudnik Massif. The Austrians entered Belgrade on Dec. 1.

On the arrival of munitions Putnik undertook a counter-offensive; it opened on Dec. 3 with an attack of the I. Army under Mišic, which drove a deep wedge in the enemy lines. Further north the II. and III. Armies made little progress at first, the Serbian right being seriously threatened by a counter-attack (Dec. 6–9) effected by Krauss's and VIII. Corps. In the south, however, Mišic's Army swept the Austrians back towards Valjevo and Užice with such success that, on the 9th, Potiorek ordered a general retreat on Belgrade, Šabac and Loznica. All the Serbian armies then took up the pursuit, but mud and exhaustion prevented them from turning the Austrian retreat into a rout. By Dec. 16, Belgrade had been re-occupied, while Šabac, Loznica and Bajina Bašta had been retaken. Putnik's decisive victory gave Serbia peace for a few months, but her losses had been very heavy—69,000 killed or died of sickness, 18,000 wounded and some 15,000 prisoners.

II. THE CONQUEST OF SERBIA, 1915

The third expedition having ended in failure, Potiorek was

relieved of his command, a portion of his troops transferred to other fronts, and General Tersztianski left with a much weakened force. The latter, however, were incapable of taking the offensive, their sorely depleted ranks being further devastated by an epidemic of typhus. Meanwhile Falkenhayn (*q.v.*) had become convinced of the necessity of opening up direct railway communications with Turkey, and, the active support of Bulgaria having been secured, a new combined offensive was prepared for the autumn under a German commander, Marshal Mackensen.

His forces consisted of the Austrian III. Army (two Austrian, one German Corps), under Kövess, concentrated in Syrmia; the German XI. Army (three corps) under Gallwitz, in Banat; the Bulgarian I. Army (four double size divisions), under Bojadiev, between Vidin and Tsaribrod; and the Bulgarian II. Army, under Tokorov, between Kyustendil and Strumitsa.

The Serbian dispositions were influenced by the threat from the east which the Western Powers had forbidden Serbia to meet by a preventive offensive, and by the hope of assistance from Salonika. Serbian fighting strength was not more than 200,000; but the help of Greece was invoked under the 1913 treaty, and that of the Western Powers promised. Putnik deployed three-fifths of his forces facing north and guarded the route to Salonika with the rest.

Mackensen's Attack.—Mackensen assembled a mass of heavy artillery and modern appliances, and a heavy preliminary bombardment opened on Oct. 5, the 6th being fixed as the day of attack for Kövess and Gallwitz and the 11th for the Bulgars. Kövess's main crossing, undertaken by two corps with the support of an intense bombardment, took place at Belgrade. After three days' fierce fighting, bridgeheads were secured and the Serbs forced to evacuate their capital (Oct. 9–10). His third corps, who crossed the Lower Drina and Sava, were held up in the Mačva. Simultaneously after a demonstration at Orsova and a Bulgarian threat towards Negotin, two of Gallwitz's corps secured crossings at Ram, and over Temessziget (Ostrovo) Island, but his third corps was held up near Semendria.

On the 11th Putnik began a steady policy of fighting successive delaying actions on the northern front, keeping back the Bulgars on the right and rear in order to gain time for the arrival of French and British aid, the first elements of which (British 10th, French 156th Div.) had started to land at Salonika on Oct. 3. Whilst heavy fighting was going on in the Morava valley and the mountains to the west, the Bulgarian advance began to threaten Pirot and the Salonika railway. Vranje was occupied on Oct. 16, whilst further south Todorov occupied Skoplje (Üsküb) on Oct. 21, thus cutting the Salonika line, and driving a deep wedge between the Serbs and the advancing Anglo-French force under Sarrail.

Until then the Austro-German armies from the north had made but slow progress, but the Bulgarian successes on his right forced Putnik to withdraw his left and centre concentrically towards Kraljevo-Kruševac. From Nov. 1 onwards a desperate effort was made by the Serbs to hold the arc Čačak-Kragujevac-Jagodnja-Nish-Leskovac. The Bulgars were held back at Bela Palanka, but the Germans and Austrians advanced steadily. Kragujevac fell with its arsenal on Nov. 1, and by the 9th Nish fell. The Orient railway, Falkenhayn's objective, was now clear from Germany to Constantinople.

Final Serbian Effort.—Making a further effort to envelop the Serbian right, the Bulgar II. Army moved out fanwise from Vranje on Priština and from Skoplje (Üsküb) on Kačanik and the Babuna pass, whilst its left was heavily engaged with considerable Anglo-French forces from Lake Doiran to Krivolak and Kavadar. In a last attempt to break through to the south Putnik assembled the remnants of five divisions round Priština and struck at the Bulgar II. Army on the 9th, driving back its right to Vranje and towards Kumanovo. But the arrival of part of the Bulgar I. Army from Leskovac on his left rear and the pressure of the Germans and Austrians from the north made it impossible for Putnik to persist; he then decided to escape through Albania with what could be saved of his army.

Between Nov. 20 and 25, the historic plain of Kosovo Polje witnessed another last effort of the Serbian people, then everything flowed away towards Peć, Djakovica and Prizyen. The pursuit ceased in the first week of December. The Bulgar II. Army then turned south and drove the Anglo-French force over the Serbian border. By Dec. 16 this force had withdrawn to Salonika (*see* SALONIKA CAMPAIGNS). Montenegro was completely occupied by the third week in Jan. 1916.

The end of the pursuit did not mean rest and reorganization for the remnant of the Serbian Army. A midwinter march through the Albanian mountains brought those whom its rigour left alive to the coast of the Adriatic. Thence they were transferred to Corfu, and later to Salonika, where the Western Powers provided food, clothing, equipment and stores, mitigating to that extent a disaster which might have been prevented by a more vigorous policy towards Bulgaria and Greece, and the earlier dispatch of the reinforcements which were ultimately sent.

See WORLD WAR: BIBLIOGRAPHY. (T. G. G. H.)

SERBO-BULGARIAN WAR (1885). The Berlin Congress of 1878, by its revision of the treaty of San Stefano, created two states in the Balkan Peninsula: the principality of Bulgaria, owning a nominal suzerainty to Turkey, and the autonomous province of Eastern Rumelia, presided over by a Turkish governor-general, and apparently intended to remain in close relations with the porte. This settlement ended when the movement for a united Bulgaria culminated (Sept. 1885) in a revolution in the Rumelian capital, Philippopolis. Prince Alexander of Bulgaria, recognizing that the movement was irresistible, placed himself at its head, and, proceeding to Philippopolis, formally accepted the government of the united Bulgarian states. As it was assumed that the sultan would reassert his claim by force of arms, the Bulgaro-Rumelian forces were concentrated as rapidly as possible near the Turkish frontier. Prince Alexander, however, had taken the step of acknowledging the sultan's suzerainty; and Turkey was not inclined to begin a war which would probably cause a revolt in Macedonia and might end by rendering Russian influence paramount in Bulgaria. But, while a conference of ambassadors was vainly discussing the situation at Constantinople, the Gordian knot was cut by the announcement that Serbia, seeking compensation for the aggrandizement of Bulgaria, had constituted herself the champion of the treaty of Berlin. King Milan had issued orders for the Serbian army mobilization on the very day of Prince Alexander's proclamation at Philippopolis, and large forces were concentrated (Oct. 1–12) on the Bulgarian frontier. On the 19th the prince ordered troops to the quarter thus threatened, but it seems certain that, whilst in eastern Rumelia every preparation had been made for war, Prince Alexander had so little expectation of, and wish for, a war with Serbia, that few measures were taken to supply the needs of a field army on that side.

Unlike the Serbian army, which contained few permanent units and consisted mainly of militiamen, the standing army of Bulgaria, trained and commanded by Russian officers since 1877–78, was organized on the German system of filling up relatively strong *cadres* to war strength and forming additional units. When fully mobilized the field army numbered about 55,000 men. The Rumelian forces (militia) consisted in all of about 35,000 men. Besides these, there was the "Bandit brigade" of Capt. Panitza, an irregular force some 3,000 strong. This force did good service as a flying right wing of the main army. In the Bulgarian army the whole of the staff and superior officers, as well as about half the regimental captains, were Russians. When the mobilization of the Bulgarian and Rumelian forces was decreed the Russian officers were at once withdrawn, and the heavy task of creating a staff and selecting young officers for all the superior commands had to be undertaken in face of the enemy. Moreover, when on Nov. 14, Milan declared war, the Bulgarian forces were mostly far away on the Turkish frontier. The Serbian main army (under King Milan), and the army of the Timok promptly crossed the frontier and soon came in contact with small forces of the enemy. On the Timok little or nothing of importance took place throughout the war, as the forces opposing the army of the Timok near Vidin effectually neutralized that force. In front of Dragoman and Trn the Bulgarians fell back, engaging in stubborn rearguard combats at every favourable

place. The Serbian "Army of the Nishava" advanced but slowly and with hesitation, while the most strenuous exertions were made by Prince Alexander and his newly formed staff to collect their far-distant troops in the Slivnitza position. Every commander was given the simple order to march on Slivnitza. The civilian population was warned to be ready with supplies to meet the troops by the roadside, and under these peculiar conditions and extraordinary difficulties of country and weather, the Bulgarians marched on the decisive point at the highest possible speed of man and horse. Some remarkable marches are recorded: the 8th infantry, 4,500 strong, covered 59m. in 32 hours, leaving only 62 men behind; the troops that were sent up by rail were packed in open trucks, 60 men to a truck. The furious energy displayed had its reward on the field of battle. Before the last shot of the battle of Slivnitza was fired, nearly half of the entire forces of Bulgaria and Rumelia were in the lines, and 14,000 men more faced the army of the Timok at Vidin. With the main army—a striking display of what could be accomplished by patriotism and vigour—were 56 pieces of artillery, most of which had been dragged over the Balkan passes in mid-winter.

The position of Slivnitza, barring the high road between Nish and Sofia, had been extensively fortified, but when the Serbians opened their attack on Nov. 17, there were but few troops available to occupy the works. On the right of the Bulgarian line was the Meka Krud height; here fighting went on through the short winter day, which ended with a gallant, and for the time successful, counter-attack by six Bulgarian battalions led by Capt. Benderev. The prince, not yet ready for the offensive, withdrew these troops to their original position. In the centre, near the high road, a hot and, at one moment of the day, almost successful attack of the Serbs ended with their complete repulse. The latter had had 17,000 men against the Bulgarians' 11,000; yet they had, owing mainly to faults in the superior leading, been unsuccessful. Next day their chances of victory would be even less, for the defenders were hourly reinforced from Sofia, and on the 18th were actually somewhat superior in numbers. On this day the Serbs made a very heavy attack on the Bulgarian left wing, which was eventually repulsed, though not without great difficulty, by the newly arrived troops from Sofia. Later a half-hearted attack was made on the centre, and from his position on Meka Krud Benderev again attacked the Serbian "Danube" division. On this day a Serbian division pushed the Bulgarians out of Breznik, but made no farther advance either on Sofia or on the left flank of the Bulgarians at Slivnitza, in spite of orders to do so. On the 19th alarm and consternation at Sofia, caused by the presence of hostile forces at Breznik, were so great that Alexander left the command in the hands of his chief of staff, Major Guchev, and hurried back to the capital in order to organize the defence. The Serbian leader was, however, as inactive on the 19th as on the 18th, and when he at last moved forward towards Slivnitza it was only with a portion of his force; this was driven back, by a detachment from the left wing of the Bulgarian position, to Rakita. Meanwhile, the active Benderev had reopened his attack on the Danube division. Twice he was repulsed, but finally at about 3 P.M. his battalions carried the heights held by the Serbs. A little before this the Bulgarian centre likewise moved forward, and, though a final attack of the Serbs on the gap caused by the absence of the Bulgarian troops detached towards Breznik came near to success, the prince returned to the battlefield to find his troops everywhere victorious and driving the enemy before them. Two days later, reorganized and reinforced, the Bulgarians took the offensive and carried the Dragoman pass.

On the 25th Prince Alexander received at Tsaribrod proposals for an armistice from King Milan; these were not accepted, and the Bulgarian army, crossing the frontier, advanced in several columns upon Pirot, where the army of the Nishava took up a defensive position in the town and on the surrounding heights. A two-days' engagement followed (Nov. 26 and 27). On the 26th the Bulgarians were successful, but a heavy counter attack on the following day almost snatched the victory out of their hands, and it was only after a severe contest lasting 11 hours that the Serbs finally gave way. The Bulgarians were not permitted to reap the fruits of their success. As they were preparing to pursue the defeated and now greatly demoralized enemy on the 28th, the Austrian minister at Belgrade arrived at headquarters and hostilities ceased. The intervention of Austria saved the Serbian army, which was greatly demoralized, and was now threatened by the united Bulgarian force of nearly 55,000 men. On the same day the army of the Timok was repulsed with heavy loss in an attack on Vidin.

Serbia escaped almost unpunished from her war of aggression. The young Bulgarian army, with its improvised staff and newly-appointed field officers, displayed admirable marching power and fighting qualities, and the Rumelian militiamen proved themselves to be good soldiers. The Serbs had, however, fought with great bravery also, and the victory must be ascribed in the main to the personal influence, the strenuous exertions and the sound military judgment of Prince Alexander; and the brief but decisive campaign set the seal to Bulgarian unity.

SERBO-CROAT LANGUAGE AND LITERATURE.

Apart from the occasional differences that are to be found in vocabulary and also, to a slight extent, in grammatical usage, the Serb and Croat literary languages are identical, although the former is written in the Cyrillic and the latter in the Latin alphabet. The spoken dialects represent, in general, a transition from Slovene in the West to Bulgarian in the East. The uniformity of the literary language, which is based on the central dialects, is so complete that books with precisely the same text are frequently published in both characters, and it is therefore usual in scientific, and not uncommon in popular, works to speak of the Serbo-Croat language, a term which has quite ousted that prevalent in the first half of the 19th century, namely Illyrian. The names Serb and Croat were borne in the 9th century by some of the tribes which, about two centuries earlier, penetrated into the North-Western parts of the Balkan peninsula. The other tribal names, including *Slovinski, i.e.*, Slavonic, which was used to designate the Western form of the language as late as the 18th century, have now been absorbed by Serb and Croat or replaced by modern territorial names, such as Bosnian, Dalmatian, etc.

Together with Slovene and Bulgarian, which however is sometimes grouped apart, Serbo-Croat forms the Southern branch of the Slavonic group of languages in the Indo-European family. The vowel system is simple, and the clarity with which all vowels, long or short, accented or unaccented, are pronounced, is reminiscent of Czech. A specifically Serbo-Croat characteristic is the passage of both *ŭ* and *ĭ*, in circumstances when a full vowel was developed, into *a*. On the other hand, neither the replacement of the back vowel *y* by *i*, nor the loss of nasality by *ǫ* and *ę*, nor the development of a vowel *r* is peculiar to Serbo-Croat.

The consonants have undergone comparatively few changes since the Common Slav period, the most notable being that of *tj* to *ć* (a sound not unlike that in English *tune*) and of *dj* to *đ* (also written *dj, gj*, and resembling English *dune*). The difficult consonantal groups which have arisen in some of the Slavonic languages after the abandonment of the old rule which tolerated only open syllables, are rare in Serbo-Croat, as the vowel *a* has been frequently developed from the earlier semi-vowels, and this has facilitated pronunciation. Moreover, with the exception of *lj* and *nj* (pronounced like Italian *gl* and *gn*), there are no such palatal or palatalised consonants as occur in West Slavonic or Russian.

The morphological and syntactical peculiarities of the language

present no special points of interest: the case system of the noun has been well preserved in the singular, but there has been a generalization of one case (in origin a dual) to express three in the plural. The dual has only survived in traces. In the verb, the use of the infinitive and, in quite recent times, of the aorist and imperfect also is declining, the language following in this latter respect the lines struck out at a much earlier date by the Eastern and Western branches of the family. One interesting characteristic of Serbo-Croat is the enclitic use of pronouns and unaccented forms of the copula, which are put, contrary to the usage of most modern languages, as early as possible in the sentence, but always after the first word.

Serbo-Croat has retained a free accentuation, with the exception that in the literary language a polysyllable may not be accented on the last syllable; all vowels, whether long or short, may have a rising or a falling intonation.

This musical intonation and the clarity of the vowels, together with the absence of difficult consonant sounds, have combined to make Serbo-Croat (which has often been compared with Italian) the most melodious of all the Slavonic languages. It is easier for a foreigner to acquire with approximate accuracy than the sister languages.

The vocabulary has been affected by Turkish (especially in the East), and less so by Italian (in the Western dialects), but the efforts made during the last hundred years to expel foreign words have been largely successful.

It is usual to distinguish three dialects, according to the word used for the interrogative pronoun "what." That area which uses *što* is by far the largest and embraces the dialects on which the literary language has been based. The *kaj* dialect is spoken in the north-western part of the kingdom, especially Croatia, and, in this and other respects, links up with Slovene. The *ča* dialect is steadily losing ground and is now chiefly spoken in a small part of the Croatian littoral, along the Dalmatian coast and in some of the islands. Its interest for philologists lies in its having preserved with great fidelity the accent on that syllable which bore it in original Slavonic.

The treatment of original *ě* forms another criterion of classification into dialects; *e* is the Eastern development, and *(i)je* the Western. The literary, *što*, language uses both *(i)je* and *e*, *(i)je* prevailing in Bosnia, Hercegovina, Montenegro and Croatia, and *e* in Serbia. There are dialects which have *i* for original *ě*, but they are not used for literary purposes.

The dialects spoken in Macedonia increasingly approximate to Bulgarian as the frontier is reached, but the study of their precise relationship to Serb and Bulgarian has been frequently impeded by the political bias of the investigators, and the interest they present is exclusively philological.

Until the 19th century there was no common literary language, most works being written in a form of Church Slavonic more or less tinctured, according to the education of the writers, by genuine Serb or Croat and, subsequently, also by the form of Church Slavonic used in Russia. The first works to be written in a language which faithfully mirrored a spoken dialect and was wholly uninfluenced by the Church language, belong to the end of the 15th century and are due to a band of Dalmatian poets, most of whom had been schooled in Italy and were familiar with Italian literature. Their activity covered a wide range and was almost wholly poetical in form. The influence of Italian models is everywhere obvious, and extends even to syntax, phraseology and style. Although the writers generally use their native dialect, it is possible to trace the beginnings of a literary language. The best work of this Dalmatian school belongs to the 16th century; it declined afterwards, and by the end of the 18th century had become negligible.

In the meanwhile Serbia continued to use the mongrel literary language of the Church, which, in spite of the strenuous efforts made by some 18th century scholars to assert the claims of the popular idiom, continued to remain all-powerful until the reforms of Vuk Stefanović Karadžić (1787–1864). His great collection of songs, popular stories and proverbs, gathered throughout the length and breadth of his country, the magnificent and pure language of his own writings, and his amazing industry and linguistic sureness, have created a literary language of great flexibility and beauty.

BIBLIOGRAPHY.—1. Linguistic connections and grammars: A. Leskien, *Grammatik der Serbo-Kroatischen Sprache* (owing to the author's death only the first volume has appeared; the most scientific grammar, with full bibliographical references to the earlier literature, dialects, etc., Heidelberg, 1924); D. Subotić and N. Forbes, *Serbian Grammar* (a good descriptive grammar—2nd edition, 1926); M. Rešetar, *Elementar-Grammatik* (more advanced; published in both Cyrillic and Latin script. 2nd edition, Zagreb, 1922); A. Meillet et A. Vaillant, *Grammaire de la langue serbo-croate* (1924). The chief native work, which also treats the syntax fully, is by T. Maretić: *Gramatika i stilistika hrvatskoga ili srpskoga književnog jezika* (Zagreb, 1899). 2. Dictionaries: V. Karadžić, *Lexicon serbico-germanico-latinum* (3rd edition: Belgrade, 1898); F. Iveković and I. Broz, *Rječnik hrvatskoga jesika* (in 2 parts; Zagreb, 1901); S. Ristić and J. Kangra, *Rečnik srpskohrvatskog i nemačkeg jezika* (Belgrade, 1928; the Serbo-Croat-German part only has so far appeared); the Academy Dictionary, begun in 1880, is not yet completed. For English users, the *New English-Croatian and Croatian-English Dictionary* of F. A. Bogadek (Pittsburgh, 1926) is helpful, but it does not mark the accents. (N. B. J.)

LITERATURE

As far as present knowledge goes, the origin of Yugoslav literature was in the 9th century, when the "Slav Apostles" Cyril and Methodius, with their disciples, translated church books from Greek into Old Slavonic. The earliest Yugoslav mss. are of Slovene origin, the "Monuments" from the monastery of Freising (*Brizinski Spomenici*) in the 9th or 10th century, consisting of a form of confession, a sermon and a prayer. A stone inscription in a church on the island of Krk, called *Baščanska ploča* (1100), is the earliest known Croatian record. The first recorded Serbian mss. are the decree of the Ban of Bosnia (1189) and the *Miroslavljevo jevangjelje*, a gospel written in the 12th century for Miroslav, prince of Zahumlje.

Serbian translations from all branches of Byzantine literature, ecclesiastical and secular, are numerous. Of the early original works the most important are biographies and chronicles. It is known that four biographers wrote in the 13th century, the first being Archbishop Sava or St. Sava (d. 1236). Both Sava and his brother King Stephen wrote brief accounts of their father's life; the monks Domentian and Theodosius wrote longer works on the life of St. Sava. In the 14th century Archbishop Danilo (d. 1346) is the only known biographer. He wrote *The Lives of Serbian Kings and Archbishops*. To the 15th century belong Camblak and Constantine "the philosopher." The latter wrote *The Life of Despot Stephen Lazarević*, under whose patronage the monastery of Manasija became a literary centre. The chronicles may be divided into (1) *letopisi*, short works of Serbian history, (2) *rodoslovi*, largely dealing in genealogy and (3) *hronografi*, general writings on Roman, Byzantine and Hebrew history.

The Croats, having come under the influence of the Latin Church, did not produce an early national literature of any importance. Practically the only works of secular literature were those on jurisprudence and legal statutes; the "Code of Vinodol" (1238) and the "Statute of Krk" (1388).

The 16th and 17th Centuries.—While the other peoples of Europe progressed the Yugoslavs were doomed to lose their independence at the hands of the Turks. Literature in Cyrillic script was almost wiped out in Serbia, Bosnia and Montenegro. The Glagolitic literature in Croatia suffered repression from Rome and Venice. The first Cyrillic printed book is ascribed to Cetinje, 1494, and the first Glagolitic to Venice, 1483. Dalmatia by reason of geographical position and political relations, was saved from the general overthrow, and the city of Ragusa became a literary centre. The first influence was that of the troubadours, as shown in the lyrics of Š. Menčetić (d. 1527) and Gj. Držić (d. 1501). Their work has come down in a collection of 620 songs in Serbo-Croat. The Carnival burlesques of Florence also had their imitators, the principal being A. Čubranović (d. 1530?). The most prolific writer of the 16th century was the Benedictine monk M. Vetranović (1482–1576). His most original work is the "Hermit" (*Remeta*), in which his own retired existence is compared with the gay life of Dubrovnik. A reaction from Italian influence, in favour of the Greek and Latin classics, makes itself felt in the work of D. Ranjina (d. 1607) and D. Zlatarić (d. 1609) in the second half of the 16th century. M. Držić (b. *c.* 1519), a

writer of Plautine comedies, strikes original ground in his *Dundo Maroje* (1550). The 17th century is the golden age of Ragusan literature. There are three outstanding names in poetry. Ivan Gundulić (1558–1638), the greatest poet produced by Dubrovnik, owes his fame to his epic *Osman*, and his pastoral play *Dubravka*. I. Bunić (d. 1658) excelled in lyrics, especially love songs (*Plandovanja*). J. Palmotić (d. 1657) was a creator of national drama with his *Pavlimir*. A decline set in in the 18th century, though it was marked by the establishment of literary academies. Two names may be mentioned: A. Glegjević, (d. 1728), a playwright, and I. Gjorgjić (d. 1737), the only gifted poet of the republic in this century.

Conditions in Dalmatia generally were not favourable to literature, owing to the domination of Venice and Hungary, and the incursions of the Turks. M. Marulić (d. 1524), wrote the epic *Judita* (1521), the first book printed in the vernacular. H. Lucić's (d. 1553) *Robinja* is one of the earliest attempts in European drama to create a secular romantic play. P. Hektorović (d. 1567) is noteworthy for his *Ribanje* ("Fishing and Fisherman's Talk"), while P. Zoranić's pastoral *Planine* may be considered the first novel in Serbo-Croat literature. More important are the collections of popular poems that began to be made in the 18th century. The outstanding work of A. Kačić (1702–60), *Razgovor Ugodni*, a national chronicle from the earliest times, contains numbers of these. It was published in Venice four years before Percy published his *Reliques of Ancient English Poetry*.

In the Slovene, Bosnian and Croatian portions of Jugoslav lands, the literary development was largely directed by Jesuits and Franciscans, following on the counter-Reformation. The Franciscans in Bosnia published numerous religious works in the *štokavski* dialect, which gradually attained supremacy as the literary medium of Serbo-Croat.

References to popular poetry have been traced to Serbian biographies of the 13th century and to Dalmatian poets of the 15th. This poetry, known as *narodne pesme* (people's songs), corresponds to the popular ballads of other European countries. Modern collections have brought the number of popular ballads up to nearly 10,000. Other evidences of popular literature are a large number of folk-tales. The chief collector of all these as well as of the popular songs was Vuk Karadžić (1787–1864).

The 18th Century.—The first writings of the modern period appear among those Serbs and Croats who had remained under Habsburg rule. They were not based on previous native tradition, but on modern European literature. In an effort to preserve their orthodoxy, the Serbs imported books written in the Russian recension of Old Church Slavonic, thus creating an artificial literary language known as "Slav-Serbian" (*Slaveno-Srpski*), the effect of which was to retard the development of the vernacular. Among the early writers Zaharija Stefanović Orfelin and Jovan Rajić are the most important; the former produced in 1768 a Review in the vernacular, while the latter, besides a history of the Slavs (the Southern Slavs in particular), written in the "Slav-Serbian" language, wrote also a vernacular epic. But the real father of modern Serbian literature is Dositej Obradović (1739–1811), who after early training in a monastery started on a series of journeys to different European countries. The result was his *Life and Adventures* (1783), followed by his *Counsel of Sound Reason*, his *Fables* and his *Ethics*. An encyclopaedic writer rather than an original thinker, his work was directed towards the enlightenment not only of his countrymen, but of Yugoslavs in general. His work was continued by P. Solarić and other disciples.

Among the Croats three writers of this period are worthy of mention, the Jesuit A. Kanižlić, the Franciscan M. Katačić, and an army officer A. Reljković (1732–98). The latter, the greatest Croatian writer of the 18th century, is best known for his *Satyr, or the Wild Man* (1762).

Among the Slovenes practically nothing had been done from the days of P. Trubar (1508–86), a Protestant writer, till the late 18th century, when V. Vodnik (1758–1819) laid the foundations of modern Slovene literature. The formation of the Illyrian Provinces (1809) under Napoleon tended to revive the national spirit.

The 19th Century saw the consolidation of efforts to establish firmly the Serbo-Croat vernacular based on the most widely extended *što*-dialect. The leaders were Vuk Karadžić for the Serbs, and Ljudevit Gaj (1809–72) for the Croats. Vuk, under the influence of the Slovene scholar J. Kopitar, began to devote himself to collecting traditional songs. He succeeded in interesting Goethe and the brothers Grimm in Serbian popular poetry. His efforts to establish the "civil" as opposed to the "church" spelling were brought to fruition by Gj. Daničić (1825–82), who laid the foundations of Serbian philology. The Illyrian movement under Gaj, which aimed at first at the linguistic union of all the Yugoslavs, in its earlier stages had favoured the *kaj*-dialect and the old spelling, but soon the *što*-dialect was adopted and the spelling reformed; and in 1836 one single literary language became the common property of the Serbs and Croats. The movement produced a number of poets, among whom are P. Preradović, who wrote lyrics of love and patriotism, and I. Mažuranić, author of an epic on the *Death of Smail Aga Čengić* (an incident of the Montenegrin rising of 1840), which counts among the gems of Serbo-Croat literature (Eng. trans. by J. W. Wiles). The Serbs viewed the Illyrian movement with sympathy in so far as its aim was a literary union with the Croats, and their literature made considerable progress. Poetry on classical models is represented by L. Mušicki. B. Radičević broke with this scholastic tradition by composing poems in the pure vernacular, expressive of sincere and passionate feelings. A contemporary of these two, the Bosnian S. Milutinović, was much admired in his time for his patriotic poetry. Greater than any of these was Petar Petrović Njegoš (1813–51), prince-bishop of Montenegro. His masterpiece is an epic *Gorski Vijenac* ("The Garland of the Mountains"). No other poet has been able so to penetrate the spirit of the people and to depict their character. The outstanding dramatist of this period is J. Popović (1806–86). Influenced by European literature, he produced a number of comedies both of "character" and of "manners" and is considered the founder of modern Serbian drama.

By the middle of the century the centre of the literary activities of the Serbs was transferred from Budapest to Novi Sad, a town in the heart of the Serbian population in southern Hungary. Here a "Young Serbian Movement," based on a return to popular poetry and tradition, became very active. Lyric poetry is represented by J. Jovanović and Gj. Jakšić. The realistic novel was initiated by J. Ignatović. Drama in verse had many followers, the most important being L. Kostić, translator of several plays of Shakespeare, and K. Trifković. The movement towards autonomy in Croatia after Solferino was accompanied by revived interest in the language. The prominent figure in the movement is Bishop Strossmayer, founder of the Yugoslav Academy in 1867 and the university at Zagreb in 1874. Literary journals sprang up. A series of prose writings and historical novels by A. Šenoa and J. E. Tomić did much to create a reading public, while a school of literary criticism was initiated by F. Marković. I. Trnski's lyrics and epics on national subjects kept alive the patriotic fire. The Slovenes were similarly affected by improved political conditions, and the freedom of the press. F. Prešern (1800–49) may be considered the greatest modern Slovene poet. F. Levstik's simple lyrics and prose writings make him the central figure till the coming of J. Stritar (1836–1923), "the creator of the cultured and civilized speech."

In the early '70s the influence of the German romantics was replaced by that of the Russian realists, and the new tendencies in western European thought were introduced through Russian channels. The champion of the new ideas was S. Marković, who had studied in Russia. The new ideas found expression chiefly in the novel and short story, the former having its best exponents among the Croats, while the Serbs excelled in the latter. The first efforts of the new school were mainly directed towards the painting of village and peasant life. The founder of this school in Serbia was M. Glišić. He is excelled in artistry by L. Lazarević whose gifts of observation and composition made him one of the greatest of Serb writers. J. Veselinović is a master of lyrical descriptions of nature. Conditions of life in Croatia offered more material for the larger canvas of the novel. L. Babić Gjalski may be considered the founder of the realistic novel of psychological interest, a field

in which he was followed by Borislavić, V. Novak and others. Among the Slovenes important names are J. Kersnik, whose powers were especially shown in the delineation of female character, and I. Tavčar, who was particularly interested in philosophical problems. Apart from novelists, two Yugoslav writers, Lj. Nenadović of Serbia and Lj. Vuličević of Dalmatia, must be mentioned as excellent examples of the best modern prose.

Poetry is overshadowed by the novel and story during this period. The most distinguished poet was the Serb, V. Ilić, a disciple of Pushkin. Among the Croats an original lyric vein is displayed by S. Kranjčević, whose themes were freedom and patriotism, whilst the Slovene A. Askerc was a vigorous writer of ballads and romances. A less known field of Yugoslav literature to which attention has only recently been directed is the popular poetry of the Muslims of Bosnia and Herzegovina.

The 20th Century has witnessed a closer *rapprochement* between the different sections of Yugoslav literature and in particular between Serbia and Croatia. A close association between the different authors, an interchange of literary contributions and the co-operation between the Royal Academies of Belgrade (founded in 1886) and Zagreb and the Slovene "Matica" (1864) at Ljubljana are all symbols of approaching unity, though it is perhaps too soon to speak of one and the same "Serbo-Croat," still less of one and the same "Yugoslav" literature.

In the matter of literary influences, that of Russia has tended to decrease, being supplanted in Serbia by that of France, and in Croatia and Slovenia by the "Moderna" movement which unites to French symbolism Scandinavian influences with Ibsen and Strindberg and German with Hauptmann and H. Bahr. In poetry the new fashion among the Croats was introduced by V. Vidrić. The patriotic poetry of V. Nazor entitles him to be considered their greatest modern lyrist. Of Serbian poets the most representative are J. Dučić, M. Rakić and S. Ćorović. Since Prešern the greatest interest in Slovene poetry attaches to O. Župančić. Croatia has continued to maintain its supremacy in the field of the novel and the drama with Gjalski and I. Vojnović, and newcomers are J. Kosor, M. Begović, M. Ogrizović and S. Tucić. The Serbs have given proof of their proficiency in the writing of stories by the work of B. Stanković, P. Kočić and M. Uskoković. The only names of importance in drama are B. Nušić and V. Jovanović. In Slovene literature the outstanding figure is the novelist I. Cankar.

A notable feature of the realistic period was a steady development of literary criticism, especially among the Serbs. In the '90s Lj. Nedić, educated in Germany, broke with the old formalism, and introduced a criticism free from bias and convention. Among the Croats and Slovenes, the union of creative and critical faculties in the same writer is more frequent, as exemplified in Marković, Levstik and Stritar. Under French influence, there is a marked advance in subtlety of judgment, leading often to hypercriticism. The scope of criticism has also widened so as to embrace social and political problems. J. Skerić (d. 1914) held the first place as a many-sided critic in Serbia, and exercised a profound influence on the movement towards Yugoslav unity. B. Popović represents in Serbia the school of Sainte-Beuve and Faguet, and his brother P. Popović has made a name as a literary historian. S. Jovanović, the historian and sociologist, ranks as one of the best stylists in Yugoslav literature. A development of fairly recent date is the increasing number of women poets, story writers, essayists and critics; *e.g.*, Isidora Sekulić among the Serbs, Z. Kveder among the Croats.

BIBLIOGRAPHY.—For Serbian literature *see* the works of P. Popović, J. Skerlić and A. Gavrilović; for Croatian those of Gj. Šurmin, V. Vodnik and D. Bogdanović; for Slovene I. Grafenauer and I. Prijatelj. A brief survey of the three literatures is given by P. Popović in *Jugoslovenska Književnost* (1918); M. S. Stanojevic, *Early Yugoslav Literature*, vol. i. A.D. 1100–1800 (1922), is at present the only work in English. *The Slavonic Review* (London: School of Slavonic Studies) has published articles on *Serbian Traditional Folk Poetry* by D. P. Subotić, and a *Survey of Modern Slovene Literature* by J. Vidmar. The *Heroic Ballads of Serbia*, trans. by G. R. Noyes and L. Bacon (Boston, 1913) and the *Ballads of Marko Kraljević* by D. H. Low (1922) give brief accounts of Serbian popular poetry. For the early period consult M. Murko, *Geschichte der ältern südslavischen Literaturen* (Leipzig, 1908). (D. Su.)

SERENA or LA SERENA, a city of Chile, capital of the province of Coquimbo, on the south bank of the Coquimbo river about 5 m. from the sea. Pop. (1920) 15,240. It has a good water supply, lighted and well-paved streets, tramway service and several small industries, including brewing and the making of fruit conserves. The annual rainfall is only 5·6 in. and its mean annual temperature is 59·2° F. Its railway connections include a line to Coquimbo (9 m.), its port, one to the Tamaya copper mines, and a narrow-gauge line up the valley of the Elqui to Guanta, through a region celebrated for its fruit. It is also in direct railway communication with the national capital via the "longitudinal" system.

Serena was founded by Juan Bohón in 1544, on the opposite side of the river, and was named after Pedro Valdivia's birthplace in Estremadura, Spain. It was destroyed by the Indians soon after, and was rebuilt on its present site in 1549 by Francisco de Aguirre.

SERENUS "of Antissa," Greek geometer, probably not of Antissa but of Antinoeia or Antinoupolis, a city in Egypt founded by Hadrian, lived most probably in the 4th century, between Pappus and Theon of Alexandria. Two treatises of his have survived, viz., *On the Section of the Cylinder* and *On the Section of the Cone*, the Greek text of which was first edited by Edmund Halley along with his Apollonius (Oxford, 1710), and is now available in a definitive critical edition by J. L. Heiberg (*Sereni Antissensis Opuscula*, Leipzig, 1896). A Latin translation by Commandinus appeared at Bologna in 1566, and a German translation by E. Nizze in 1860-61 (Stralsund). Besides these works Serenus wrote commentaries on Apollonius, and in certain mss. of Theon of Smyrna there appears a proposition "of Serenus the philosopher, from the Lemmas" to the effect that, if a number of rectilineal angles be subtended, at a point on a diameter of a circle which is not the centre, by equal arcs of that circle, the angle nearer to the centre is less than the angle more remote.

The book *On the Section of the Cylinder* states as its primary object the correction of an error on the part of certain geometers of the time who supposed that the transverse sections of a cylinder were different from the elliptic sections of a cone. When this has been done, Serenus shows (Prop. 20) that "it is possible to exhibit a cone and a cylinder cutting one another in one and the same ellipse." Other propositions naturally deal with subcontrary and other circular sections of a scalene cylinder or cone.

The treatise *On the Section of the Cone*, though Serenus claims originality for it, is unimportant. (T. L. H.)

SERENUS, SAMMONICUS, Roman savant, author of a didactic medical poem, *De medicina praecepta* (probably incomplete). The work (1,115 hexameters) contains a number of popular remedies, borrowed from Pliny and Dioscorides, and various magic formulae, amongst others the famous Abracadabra (*q.v.*), as a cure for fever and ague. It concludes with a description of the famous antidote of Mithradates VI. of Pontus. It is uncertain whether the author was the famous physician and polymath who was put to death in A.D. 212 at a banquet to which he had been invited by Caracalla, or his son, the tutor of the younger Gordian. The father, who was one of the most learned men of his age, wrote upon a variety of subjects, and possessed a library of 60,000 volumes, bequeathed to his son.

The editio princeps (ed. Sulpitius Verulanus, before 1484) is very rare; later ed. by J. G. Ackermann (Leipzig, 1786) and E. Bährens *Poetae Latini minores*, iii.; *see* also A. Baur, *Quaestiones Sammoniceae* (Giessen, 1886); M. Schanz, *Geschichte der römischen Literatur*, iii. (1896); W. S. Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), 374, 4, and 383, 1.

SERER, a vigorous, coarse-featured people of Senegal. They speak a language that is related to Wolof and Fulani, and were for long subject to the Wolof, but with a paramount chief for their own race in the Sine country. The upper land-owning class lends or hires land to the lower class, slavery being unknown. There is no artisan caste amongst the Serer, but there is a caste of musicians and singers. Descent is patrilineal, the paternal uncle being head of the family. Marriage is endogamous. The Serer are cultivators and cattle-raisers, and their villages are subdivided into different quarters. The dead are buried outside the village and provided with arms and grave-furniture. The

bodies of *griots* are wrapped in cloth and placed in hollow baobab trunks. The people are animists, believe in sorcery, and practise the ordeal by redwood and red-hot irons.

See Bérenger-Feraud, *Les Peuplades de la Sénégambie* (1879); A. Hovelacque, *Les Nègres de l'Afrique Sus-Équatoriale* (1889); Dr. Lasnet, *Une mission au sénégal* (1900).

SÉRES, the chief town of the Séres province of Greek Macedonia, 43 m. by rail N.E. of Salonica. Pop. about 40,000, almost wholly Greek immigrants settled after 1922. A very few Bulgarians remain. In 1912 only 30% of the population was Greek. Séres is built in a district so fertile as to have borne among the Turks the name of Altin Ovassi, or Golden Plain. It is the seat of a Greek archbishop and patriarch. It consists of the old town, *Varosh,* situated at the foot and on the slope of the hill crowned by the old castle, and of the new town built in the European fashion on the plain, and forming the commercial centre. There is a large trade in rice and cereals, and the other exports include tobacco, cotton and hides.

Séres is the ancient *Sirrhae,* mentioned by Herodotus in connection with Xerxes's retreat, and by Livy as the place where Aemilius Paulus received a deputation from Perseus. In the 14th century, when Stephen Dushan of Serbia assumed the title emperor of Serbia, he chose Sirrhae as his capital; and it remained in the hands of the Serbians till its capture by Sultan Murad II. (1421–1451). In 1913 the city was looted and largely burnt by Bulgarian troops during the Greek advance up the Struma valley. It later fell into Greek territory but was occupied by the Bulgarian army in 1916 until Oct. 1918. It suffered severely from bombardment but has been largely rebuilt since. It is now the administrative centre for the control of refugee settlements in the Struma valley.

SERFDOM. The notion of serfdom is distinct from those of freedom and of slavery. The serf is not his own master: to perform services for other persons is the essence of his status, but he is not given over to his lord to be owned as a thing or an animal—there are legal limits to the lord's power. Serfdom is very often conceived as a perpetual adherence to the soil of an estate owned by a lord, but this praedial character is not a necessary feature of the condition. Hereditary serfdom may sometimes assume the shape of a personal relation between servant and master. Serfdom will be formed naturally in cases when one barbarous community conquers another, but is not able to destroy entirely the latter or to treat its members as mere chattels, but this mitigated form may be brought about as well by the paucity or comparative weakness of the victors as by the difficulty for them to draw income from pure slaves. In a state of backward agriculture and natural economy it will sometimes be more profitable for the conquerors as well as for the conquered to leave the dependent population in their own households and on their own plots, at the same time taxing them heavily in the way of tribute and services. Such an arrangement clearly obtained in several of the agricultural states of ancient Greece. The Penestae of Thessaly appear as a remnant of a distinct tribe settled on the confines of Macedonia and at the same time as a class of tributary peasants serving Thessalian aristocrats. The Mnoitae, Klarotae and Aphamiotae of Crete were more or less in the same position. Even in the case of the Helots of Sparta, who were made to perform services to any Spartiate who might require them to do so, features of a similar tributary condition are apparent. The chief work of the Helots was to provide a certain quantity of corn, wine and oil for the lords of the shares on which they were settled; personal services to other Spartiates were exceptional. Pollux in his account of the Helots places them distinctly in an intermediate position between free men and slaves. The fact that in these instances governments had a good deal to say in the regulation of the status of such serfs is well worth noting: it explains to a great extent the legal limitations of the power of the lords. Even downright slaves belonging to the state or to some great temple corporation were treated better than private slaves by the Greeks.

We shall not be astonished to find, therefore, in the Hellenistic states of Asia a population of peasants who seem to have been in a condition of hereditary subjection and adherent to the glebe on the great estates of the Seleucid kings. They were certainly not slaves, but their condition was closely bound up with the cultivation of the estates where they lived. The regulation by the state of the duties and customary status of peasants on government domains turns out to be one of the roots of serfdom in the Roman world, which in this respect as in many others follows on the lines laid down by Hellenistic culture. It is important for our purpose to notice that the condition of *coloni* was developed as a result of historic necessity by the working of economic and social agencies in the first centuries of the Roman empire and was made the subject of regular legislation in the 4th and 5th centuries. In the enactments of Justinian, summing up the whole course of development (C.J. xi., 48, 23), two classes of coloni are distinguished—the *adscripticii,* representing a more complete state of serfdom, and the free coloni, with property of their own. But the whole class, apart from minor variations, was characterized by the idea that the peasants in question were serfs of the soil on which they were settled, though protected by the laws in their personal and even in their praedial status. Thus the ascription to the soil, although originally a consequence of ascription to the tributes (*adscriptio censibus*), became the mark of the legal status of serfdom. The emperors actually tried in their legislation to prevent the landowners from evicting their coloni and from raising their rents. In this way fixity of tenure and service was aimed at and to a certain degree enforced by the state.

With the break-up of the Roman empire, the weak governments which took the place of imperial authority were not able to maintain the discipline and judicial power which would have been necessary to guarantee the tenure and status of the serfs. And yet serfdom became the prevailing condition for the lower orders during the middle ages, custom and economic requirements producing checks on the sway of masters. The direction of events towards the formation of serfdom is already clearly noticeable in Celtic communities. In Wales and Ireland the greater part of the rural working classes was reduced not to a state of slavery, but to serfdom. The male slave (W. *caeth*) does not play an important part in Celtic economic arrangements: there is not much room for his activity as a completely dependent tool of the master. The female slave (*cumal*) was evidently much more prominent in the household. Prices are reckoned out in numbers of such slaves and there must have been a constant call for them both as concubines and as household servants. As for male workmen, they are chiefly *taeogs* in Wales, that is half-free bondmen with a certain though base standing in law. Even these, however, could not be said to form the social basis for the existence of an upper free class. The latter was numerous, not wealthy as a rule, and had to undertake directly a great part of the common work, as may be seen from the extent of the free and servile tenures on the estates carved out for English conquerors in Wales and Ireland. Anyhow, the taeog class of half-free peasants stands by the side of the smaller tribesmen as subjected to heavier burdens in the way of taxation and services in kind. In Wales they are distributed into *gavells* and *gwelys,* like the free tribesmen themselves and thus connected with the land, but there is nothing to show that this connection was deemed a servitude of the glebe. The tie with the lord is after all a personal one.

The Germanic tribes moved on similar lines. The slaves had their separate households, while the masters exacted tribute from them in the shape of corn, cattle or clothes, and the serfs had to obey to the extent of rendering such tribute (Tacitus, *Germania,* 21). This means, of course, that it was in the interest of the master to levy tribute and not to organize slave labour. After the conquest of the provinces by the Germanic invaders the Roman stock of coloni naturally combined with German tributary peasants to form mediaeval serfdom. A half-free group is marked off in the early laws under the designation of *liti, lazzi, aldiones.* But in process of time this group was merged with freedmen, settled slaves (*servi casati*) and small freedmen into the numerous class of serfs (*servi, rustici, villani*) which appears under different names in all western European countries. The customary regulations of the duties of an important group of this class in regard to their lords are clearly expressed in the Bavarian law (7th century): serfs settled on the estates of the church have to work,

as a rule, three days in the week for their masters and are subject to divers rents and payments in kind. The regulations in question, although entered in a legal text, are not a legislative enactment but the result of a slow process of adjustment of claims between the ecclesiastical landowners and masters on one side and their rural dependents on the other. There can be no doubt that they were largely representative of the conditions prevailing on Bavarian estates belonging not only to the church but also to the duke and to lay lords. The old English *Rectitudines singularum personarum* (11th century) present other variations of the same customary arrangements. The rustic class appears in them to be differentiated into several subdivisions—the *geneats* performing riding duties and occasional services, the *gebúrs* burdened with week work and the *cotsets* holding cottages and performing light work in the shape of one day in the week and services to match (*see* VILLENAGE). Of these various groups that of the gebúrs corresponds more closely to the continental serfs (*coloni, Hörige, unfreie Hintersassen*).

The dualism characteristic of mediaeval serfdom, its formation out of debased freedom and rising servitude, may be traced all through the history of the middle ages. French jurists of the 13th century, *e.g.*, lay stress on a fundamental difference in law between the complete serf whose very body belongs to his lord (*cf.* the German *Leibeigenschaft*) and the villein or *roturier,* who is only bound to perform certain duties and ought not to be further oppressed by the landowners on whose soil he is settled (Beaumanoir, *Coutume de Beauvaisis*). But the same texts which draw the line between the two classes make it clear that there were no other guarantees to the maintenance of the rights of the superior rustics than the moral sense and the self-interest of their masters. It must be added, however, that even in the darkest times, economic forces provided some protection for the peasants who had lost the means of appealing to legal remedies. Lords who did not wish to see their estates deserted had to submit to the rule of custom in respect of exactions. And the screen of rural custom proved sufficient to allow of the growth of some property in the hands of the toiling class, a result which in itself rendered possible further emancipation.

A very instructive example of the formation of serfdom is presented by the history of Russia. Personal slavery in the sense in which it existed in the West was practised in ancient Russia (*kholopi*) and arose chiefly from conquest, but also from voluntary subjection in cases of great hardship and from the redemption of fines and debts (*cf.* the O. Eng. *wite-theow*). The great mass of the peasantry was originally free. Even when landownership was appropriated by the crown, the ecclesiastical corporations and the nobles, the tillers of the land retained their personal freedom and were considered to be farmers holding their plots under contracts. They were free to leave their farms provided they were able to effect a settlement in regard to all outstanding rent arrears and debts. The custom of the country gradually took the shape of a simultaneous resettlement of all conditions of rural occupation about St. George's day (Nov. 24), that is after the gathering of the harvest and the practical winding up of rural work.

Such was the legal state of affairs up to the end of the 16th century. A great change supervened, however, through the slow working of economic and political causes. The peasants settled under the sway of nobles and churches could very seldom produce a clean bill in regard to their money relations with the landlords. Thus, they gradually lapsed into a state of perpetual subjection from which they could not emancipate themselves by legal means. On the other hand, the growth of the Muscovite state with its fiscal governmental requirements involved a watchful repartition of burdens among the population and led ultimately to a system of collective liability in which the farms were considered chiefly as the sources of taxable income. The government was directly interested in maintaining their efficiency and in preventing migrations and desertions which led to a weakening of the taxpaying communities. A third aspect of the question must also not be disregarded, namely, the keen competition between landowners trying to attract settlers to their estates at the expense of their needy or less powerful neighbours. The first legislative measures of the Moscow rulers directed towards the establishment of a servile class similar to the Roman coloni fall into the first years of the 17th century (A.D. 1601, 1606) and consist in enactments against landowners depriving their neighbours of the tillers of their estates. But matters were clearly ripe for a wider application of the view that the peasant ought to stick to the soil, and the restoration of the Muscovite empire under the Romanovs brought with it the consolidation of all rural arrangements around this principle. Peter the Great regularized and completed this evolution by effecting a comprehensive cadastre and census of the rural population. The ultimate result was, however, not only the fixity of peasant tenures, but the subjection of the entire peasant population as a separate class (*Krepostrie*) to the personal sway of the landowners. The state insisted to a certain extent on the public character of this subjection and drew distinctions between personal slavery and serfdom. In the midst of the peasants themselves there lived a consciousness of their special claims as to tenant right. But, in fact, serfdom naturally took the form of an ugly ownership of live chattels on the part of a privileged class. Emancipation was brought about in the 19th century by economic causes as well as by humanitarian considerations. Private enterprise and the free application of capital and labour were hindered in every way by the bondage of the peasant class. Even such a necessary measure as that of moving cultivators to the rich soil of the south was thwarted by the adherence of the northern peasantry to the glebe. After several half-hearted attempts directed in the course of Nicholas I.'s reign to face the question while safeguarding at the same time the rights and privileges of the old aristocracy, the moral collapse of the *ancien régime* during the Crimean war brought about the Emancipation Act of Feb. 19, 1861, by which some 15 millions of serfs were freed from bondage. The most characteristic feature of this act was that the peasants, as distinct from household servants, received not only personal freedom but allotments in land in certain proportions to their former holdings. The state indemnified the former landowners, and the peasants had to redeem the loan by yearly payments extending over a number of years.

If we turn back from this course of development to the history of serfdom in the West striking contrasts appear. As we have already noticed, mediaeval serfdom in the West was the result of a process of customary feudal growth hardly interfered with by central governments. The loosening of bondage is also, to a great extent, prepared by the working of local economic agencies. Villeins and serfs in France rise gradually in the social scale, redeem many of the onerous services of feudalism and practically acquire tenant-right on most of the plots occupied by them. Tocqueville has pointed out that already before the revolution of 1789 the greater part of the territory of France was in the hands of small peasant owners, and modern researches have confirmed Tocqueville's estimate. Thus feudal overlordship in France had resolved itself into a superficial dominion undermined in all directions by economic realities. The fact that there still existed all kinds of survivals of harsh forms of dependence, *e.g.* the bondage of the serfs in the Jura Mountains, only rendered the contrast between legal conditions and social realities more pointed. The night of Aug. 4, 1789 put an end to this contrast at one stroke and the further history of rural population came to depend entirely on the play of free competition and free contract.

In the evolution of serfdom in Germany the regulating influence of government made itself felt to a greater extent, especially in the east. The colonization of the eastern provinces and the struggle against the Slavs necessitated a stronger concentration of aristocratic power, and the reception of Roman law during the 15th and 16th centuries hardened the forms of subjection originated by customary conditions. It may be said in a general way that Germany occupied in this respect, as in many others, an intermediate position between the west of Europe and Russia. Emancipation followed also a middle course, being brought about chiefly by governmental measures, although the ground was to a great extent prepared by social evolution. The reforms of Stein and Hardenberg in Prussia, of the French and of their clients in South

Germany, opened the way for a gradual redemption of the peasantry. Personal serfdom (*Leibeigenschaft*) was abolished first, hereditary subjection (*Erbunterthätigkeit*) followed next. Emancipation in this case was not connected with a recognition of the full tenant-right of the peasants; they had to part with a good deal of their land. To the last the landowners were not disturbed in their economic predominance, and succeeded very well in working their estates by the help of agricultural labourers and farmers. In the West the small peasant proprietorship had a better chance, but it arose in the course of economic competition rather than through any general recognition of tenant-right. On the whole serfdom appears as a characteristic corollary of feudalism. It grew up as a consequence of customary subjection and natural husbandry; it melted away with the coming in of an industrial and commercial age.

SERGE. A general term denoting several varieties of worsted twill fabrics, but more particularly that employed for men's suitings and women's costume, dress and coating fabrics. Serge fabrics are produced with a distinct twill weave and are of a coarser and somewhat rougher texture than the lighter grades of worsted fabrics. They are usually based on the even-sided regular twill weaves, as the four-end two-and-two ($\frac{2}{2}$) twill, and the six-end three-and-three ($\frac{3}{3}$) twill weave, according to the character of texture required and the purpose for which it is intended.

Thus, serge of lighter and medium textures suitable for women's wear, are usually based on the two-and-two twill weave, whilst the three-and-three twill weave is better suited for serge of heavier, closer and stronger textures, as this weave, by permitting of a relatively freer interlacement of the warp and weft threads thereby allows of the employment either of coarser and stronger yarn or else of a greater number both of warp and weft threads per inch being inserted in the fabric produced.

Serge fabrics are usually woven from Botany worsted yarns of counts ranging from 2/30's down to 2/18's, and with the number of warp threads and picks per inch varying according to the counts of yarn employed, and the weight and character of texture required, and of which there are innumerable grades and qualities ranging between extreme limits chiefly according to the particular use for which they are intended. Worsted yarn for the warp and woollen yarn for the weft, or else all worsted yarn both for warp and weft, of the better grades of wool, are employed in the superior qualities of serge fabrics.

So-called silk serges are used for women's dress and coating fabrics, while lighter grades of silk serge are used for coat and dress linings and also for umbrella covers. The description of "serge" is also applied to many other varieties of fabrics having the general textural features and other characteristics of serge fabrics. (H. N.)

SERGEANT: *see* Serjeant.

SERGIPE, a small Atlantic State, north-eastern Brazil (originally Sergipe d'el-Rey). Its area is 8,319 sq.m. Its population in 1920 was 477,064, three-fourths of which were half-castes and negroes. The São Francisco forms its northern boundary, and the drainage of the northern part of the State is northward and eastward to that river. The southern half of the State, however, slopes eastward and is drained directly into the Atlantic through a number of small rivers, the largest of which are the Irapiranga, the Real and the Cotinguiba. These are navigable for short distances, but are obstructed by sand-bars at their mouths. The surface of the State resembles in part that of Bahia, with a zone of forested lands near the coast, and back of this a higher zone of rough open country, called *agrestes.* There is a sandy belt along the coast, and the western frontier is slightly mountainous. The intermediate lands are highly fertile, especially in the forested region, where the rainfall is abundant. Further inland the year is divided into wet and dry seasons with occasional prolonged droughts. These districts are pastoral. The lower fertile lands are cultivated for sugar, cotton, maize, tobacco, rice, beans and *mandioca*—sugar being the principal product. Rubber and some other natural products are exported. There is a railway which runs from Aracajú northward to Capella, and one running southward to Bahia. The only manufacturing industries of importance are cotton-mills, sugar factories and distilleries, one of the largest sugar usines in Brazil being located at Riachuelo near Laranjeiras.

The capital of the State is Aracajú (pop. 37,440), on the lower course, or estuary, of the Cotinguiba river, near the coast. The bar at the entrance to this river is exceptionally dangerous, and the port is frequented only by coasting vessels of light draught. The town stands on a sandy plain, and there are sand dunes within the city limits. The public buildings are a large plain church with unfinished twin towers, the Government palace, the legislative halls, a normal school and public hospital. The other principal towns are Estancia (pop. 1920, 15,868); Laranjeiras (12,661); Capella (19,563); Lagarto (26,084); São Christovão, formerly Sergipe d'el-Rey (14,093), and Maroim (7,998).

SERGIUS, ST., usually associated with St. Bacchus, one of the most celebrated martyrs of Christian antiquity. His festival is on Oct. 7, and the centre of his cult was Resafa, or Rosafa, in Syria. This town, also called Sergiopolis, acquired importance as a place of pilgrimage, and became a bishop's see (Le Quien, *Oriens Christ.* ii. 951). According to their *Acta* (which, however, have little authority), SS. Sergius and Bacchus were soldiers.

See *Acta sanctorum* (October), iii. 833–883; *Analecta Bollandiana* xiv. 373–395.

SERGIUS, the name of four popes.

Sergius I., pope from 687 to 701, came of an Antiochene family which had settled at Palermo. He was elected after a fierce struggle between two other candidates, Paschal and Theodore. In the second year of his pontificate he baptized King Ceadwalla of Wessex at Rome. For rejecting certain canons of the Trullan (Quinisext) council of 692, Justinian II. commanded his arrest and transportation to Constantinople, but the militia of Ravenna and the Pentapolis forced the imperial protospatharius to abandon the attempt to carry out his orders. Sergius was followed by John VI. as pope.

Sergius II., pope from 844 to 847, a Roman of noble birth, elected by the clergy and people to succeed Gregory IV., was forthwith consecrated without waiting for the sanction of the emperor Lothair, who accordingly sent his son Louis with an army to punish the breach of faith. A pacific arrangement was ultimately made, and Louis was crowned king of Lombardy by Sergius. In this pontificate Rome was ravaged, and the churches of St. Peter and St. Paul robbed, by Saracens (August 846). Sergius was succeeded by Leo IV.

Sergius III., elected pope by one of the factions in Rome in 898, simultaneously with John IX., was expelled from the city by his adversaries. He reappeared in 904, seized the two claimants, Leo V. and Christopher, who were disputing the succession of Benedict IV., and had them strangled. His adherents rallied round the vestiarius Theophylact, a powerful Roman functionary, and his wife, Theodora. Sergius is reputed to have been the lover of Theodora's daughter Marozia, by whom he is said to have had a son, who became pope as John XI. Sergius was very hostile to the memory of Pope Formosus, and refused to recognize any of the ordinances celebrated by him, thus causing grave disorders. He also affected to consider as anti-popes, not only John IX., but also his successors down to and including Christopher. He restored the Lateran basilica, which had fallen down in 897. He died on April 14, 911, and was succeeded by Anastasius III.

Sergius IV., pope from 1009 to 1012, originally bore the name of Bucca porca (*Os porci*). He was a mere tool in the hands of the nobility of the city; he was succeeded by Benedict VIII.

SERGIYEVO (Sergiev), a town of Russia in the province of Moscow, in 56° 23′ N., 38° 5′ E. It grew up around the

monastery or *lavra* of Troitsko-Sergiyevskaya, one of the most important architectural and historic relics of the Russian Middle Ages. It was formerly greatly venerated in Russia and visited by thousands of pilgrims; the inhabitants (31,413 in 1900) were renowned for their carved and painted ikons and wooden souvenirs sold to the visitors. After the 1917 revolution it was converted into a museum. The electro-technical academy of the Red Army has been located in the town and a textile artel has been formed. The population in 1926 was 21,391.

A small wooden church erected by the monk Sergius was burned by the Tatars in 1391, and the cathedral of the Trinity (Troitsk) built in the Vladimir Suzdal style in 1422 stands on the site. It contains a number of ikons, including one by Rublev. The Uspensky (Assumption) cathedral was erected in 1585 and in the southern part of the monastery is the church of Sergius, beneath which are the spacious rooms where in pre-revolution times dinners were distributed gratis to pilgrims. The bell tower of the monastery, 320 ft. high has a bell weighing 64 tons. Several monasteries of lesser importance existed in the neighbourhood. The monastery acquired so much wealth that walls 25 to 50 ft. in height and fortified by nine towers were erected in 1513 and within them were the two cathedrals, several churches, buildings for the monks and pilgrims, including a hospital, and a theological academy. Ivan the Terrible made the Sergiyevo monastery the centre of the ecclesiastical province of Moscow in 1561.

SERI, a tribe of Tiburon island and adjacent parts of Sonora, reputed one of the most primitive in America. Alone among all their neighbours they are non-agricultural, subsisting on shell-fish, turtles, pelicans and cactus fruit. They make pottery and navigate boat-shaped rush rafts. They are said to be matrilineal, but the statement needs authentication. Although sometimes reckoned an independent stock, they form part of the larger Hokan group (*q.v.*), and seem to be specially related to the Yuman peoples (*q.v.*). *See* W. J. McGee, *Bur. Am. Ethn. Rep.* XVII. (1898).

SERIEMA or **CARIAMA** (*Cariama cristata*), a South American bird, belonging to the family *Cariamidae*, allied to the cranes (*q.v.*) and trumpeters, which, owing to its long legs and neck, stands some 2ft. high. The beak and legs are red, the plumage grey above and dull white beneath with bluish skin round the eyes. It inhabits the *campos* of Brazil, extending inland as far as the Matto Grosso, living in high grass, where it runs swiftly. The nest is built in bushes or trees and contains two eggs. The young are hatched covered with grey down. The seriema feeds on insects, snails, reptiles and berries.

THE SERIEMA OF SOUTH AMERICA

An allied bird, *Chunga burmeisteri*, inhabits Argentina. It is darker and has shorter legs.

See W. H. Hudson, *A Naturalist in La Plata.*

SERIES. The following notations will be used freely throughout this article. The modulus of x, denoted by $|x|$, means the absolute numerical value of x, when x is real; and when x is complex of the form $a+ib$, it means the positive square root of a^2+b^2. The expression $f(x)\to l$, $x\to a$, means that $f(x)$ tends to a limit l, as x tends to a in any manner; if we write $x\to a+$ or $x\to a-$, this means that as x tends to a it always remains greater than a or less than a respectively. If n is a positive integer $f(n)\to l$ means that $f(n)$ tends to the limit l as n tends to infinity. The symbol $O(x)$ means "of the order of x." The symbol $\geqq$ means "greater than or equal to" and the symbol $\leqq$ means "less than or equal to." Logarithms, wherever mentioned, are to the base e.

A set of numbers $u_1, u_2, u_3, \cdots$ corresponding unequivocally to the set of positive integers $1, 2, 3, \cdots$ is called a sequence (*see* NUMBER SEQUENCES). The terms of a sequence, written in order, with the sign of addition between every adjacent two, thus $u_1+u_2+u_3+\cdots$, are said to form a series. If the sum of the first n terms of the series, $u_1+u_2+u_3+\cdots+u_n$, is denoted by s_n, the study of the series is the study of the sequence $s_1, s_2, s_3, \cdots$. If the number of terms is unlimited the series is said to be an infinite series. The series itself may be denoted by Σu_n. If s_n tends to a finite limit S, as n tends to infinity, the series is said to be *convergent* and S is said to be its *sum*. Such a series is often said to *converge* to S. If s_n tends to infinity, positive or negative, the series is said to be *divergent* and to *diverge* to $+\infty$ or to $-\infty$, as the case may be. When the symbol ∞ is written alone, it denotes $+\infty$. If s_n oscillates between two numbers a and b, the series is said to *oscillate finitely*. If s_n may assume positive or negative values, increasing numerically without limit, the series is said to *oscillate infinitely*. In modern writings all series which are not convergent are usually called divergent, the distinction being specified if necessary.

The chief problem connected with an infinite series is to discover whether it is convergent. The formal necessary and sufficient test for convergence is that, ϵ being any arbitrary small positive number, it is possible to find an integer ν, such that $|s_m-s_n|<\epsilon$, provided only that $m\geqq\nu$ and $n\geqq\nu$. As, however, it is generally impossible to find any compact expression for s_n, this test cannot be applied directly. We can, however, draw some useful conclusions from it. For example we must have $u_n\to 0$, and if $u_n\to 0$ and never increases we must have $nu_n\to 0$. The first shows at once that a series in which u_n is $x^n \sin n\theta$, cannot be convergent unless $|x|<1$. The second shows that the series $\Sigma 1/n$ is divergent. Neither condition is at all sufficient. The series $\Sigma 1/n \log n$, for example, is divergent, although $nu_n\to 0$. Since it is generally impossible to appeal directly to s_n, tests have to be constructed which depend on u_n. It may be said at once that completely general tests, both necessary and sufficient, have not been nor are likely to be found. Series can be constructed to defy any test, however delicate. But tests exist which are adequate to deal with nearly all such series as are likely to occur in applications.

Series of Positive Terms. The Ratio Tests.—There is an important difference between series in which all the terms, at least after some stage, are all of one sign and those in which the terms persist in being of variable sign. If the terms are all positive the terms of the sequence s_n are steadily increasing and it is not only a necessary but also a sufficient condition for s_n to tend to a limit that a number A can be found, such that $s_n<A$, for all values of n. If no such number can be found, then $s_n\to\infty$. A series of positive terms cannot oscillate. If the terms are of variable sign, the condition $|s_n|<A$ is necessary but is sufficient only to exclude infinite oscillation.

One of the simplest tests applicable to series of positive terms is that, if Σv_n and Σu_n are two series of positive terms, then the convergence or divergence of one implies the convergence or divergence of the other, if u_n/v_n tends to a finite limit, or if two positive numbers A and B can be found, such that $A>u_n/v_n>B$. In this way, convergence of Σu_n can be deduced from that of a series Σv_n, whose convergence or divergence is readily established. Thus Σn^{-2} is convergent if $\Sigma\{n(n+1)\}^{-1}$ is convergent. But if $v_n=\{n(n+1)\}^{-1}$, $s_n=1-1/(n+1)$, and $s_n\to 1$, so that Σv_n is convergent and therefore Σn^{-2} is convergent. If $u_n/v_n\to 0$, then Σu_n is convergent, if Σv_n is convergent, but both series may be divergent. If u_n and v_n may have variable signs, the existence of a limit for u_n/v_n is no indication that the convergence of Σv_n implies that of Σu_n.

In most series of positive terms required in applications the terms tend to zero, steadily diminishing. To such series we can apply a test called *Cauchy's condensation test*, viz., that $\Sigma\phi(n)$ is convergent, if $\Sigma a^n\phi(a^n)$ is convergent, a being any positive integer. We have also Maclaurin's test, viz., that if $u_n=\phi(n)$,

$$\int_1^n \phi(x)dx-s_n \text{ tends to a finite limit; so that the convergence or}$$

divergence of $\Sigma\phi(n)$ occurs with that of $\int_1^n \phi(x)dx$. By either test we show readily that the series

$$\Sigma n^{-p},\quad \Sigma n(\log n)^{-p},\quad \Sigma n\log n\{\log(\log n)\}^{-p},$$

and so on, are each convergent if $p>1$ but divergent if $p \leqq 1$.

A series of tests, called the ratio-tests, applicable only to series in which $u_n \to 0$ steadily, is of great historical as well as of great practical interest. The more elaborate of them are associated with the names of A. De Morgan, A. Cauchy, J. Bertrand and others and can be proved by means of the comparison test and the convergence or divergence of the series just mentioned. They are most readily established by means of a general theorem associated with the names of Dini and Kummer, which is as follows: If a function $f(n)$ can be found such that

$$f(n)\frac{u_n}{u_{n+1}} - f(n+1) \to l > 0,$$

or, if not tending to a limit, is always greater than some fixed positive number, the series Σu_n is convergent. If, moreover, $\Sigma\{f(n)\}^{-1}$ is divergent, then, if $f_n(n)\dfrac{u_n}{u_{n+1}} - f(n+1) \to l < 0$, or is never positive, Σu_n is divergent. By taking $f(n)$ in succession as $1, n, n\log n, \cdots$ we obtain the following series of tests:

(1) If $u_n/u_{n+1} \to l > 1$, or u_n/u_{n+1} is always greater than some fixed number >1, Σu_n is convergent. If $u_n/u_{n+1} \to l < 1$, or never exceeds unity, Σu_n is divergent. If $l=1$, nothing is settled unless u_n/u_{n+1} always remains <1. Σu_n is then divergent. This is known as D'Alembert's test. If this fails we may proceed to the next test, known as Raabe's test.

(2) If $n\{u_n/u_{n+1} - 1\} \to l$, then Σu_n is convergent if $l>1$, divergent if $l<1$. If $l=1$, nothing is settled. There are the same modifications as in test (1). If this fails we may proceed to the next test.

(3) If $\{n(u_n/u_{n+1} - 1) - 1\}\log n \to l$, then Σu_n is convergent if $l>1$, divergent if $l<1$, and nothing is settled if $l=1$, with the same modifications as before.

The following rule will cover most cases. If u_n/u_{n+1} can be expressed in the form $1+\mu/n+O(n^{-\lambda})$, $\lambda>1$, then Σu_n is convergent if $\mu>1$, divergent if $\mu \leqq 1$.

Alternative forms of the second and third tests are as follows: If $n\log(u_n/u_{n+1}) \to l$, or $\log n \log\{n\log(u_n/u_{n+1})\} \to l$, the series is convergent, if $l>1$, divergent if $l<1$, and so on. There are still other forms of these tests, superficially different but essentially the same.

Another test, known as Cauchy's test, of great theoretical importance, is the following. If $u_n^{1/n} \to l < 1$, or if, after some stage, $u_n^{1/n}$ is never greater than l, some fixed number <1, Σu_n is convergent. If $u_n^{1/n} \to l > 1$, or if after any stage, there are an unlimited number of integers n for which $u_n^{1/n}$ is as great as unity, the series is divergent. For under these conditions u_n cannot tend to zero. This test is applicable to series in which u_n does not tend steadily to zero, as for instance the series $\Sigma a^n \sin^2 n\theta$, where $a<1$. For $u_n^{1/n}$, though it tends to no definite limit, cannot exceed a. It may be remarked that, if u_{n+1}/u_n has a limit, $u_n^{1/n}$ has the same limit, though the converse is not necessarily true.

If the terms of a convergent series of positive terms are deranged according to any law to form a new series, the new series is also convergent and its sum is that of the original series. If Σu_n is convergent so is $\Sigma a_n u_n$, where a_n is any positive number less than some fixed number independent of n. Similar results hold for a divergent series of positive terms. It is generally possible from these considerations to determine the convergence or divergence of a series of positive terms, in which u_n does not tend steadily to zero.

Series Whose Terms Are of Variable Sign. Absolute Convergence.—When a series consists of terms not all of the same sign, it may happen that the series $\Sigma|u_n|$ is convergent. In this case Σu_n is convergent and is said to be *absolutely convergent*. The positive terms alone form a convergent series and the negative terms alone form another convergent series. If the terms of such a series are deranged to form a second series, the second series is convergent and its sum is the same as that of the original series. If $\Sigma|u_n|$ is divergent, the series is said to be *non-absolutely* or *conditionally convergent*. The positive terms alone form a divergent series and the negative terms alone form a second divergent series. Its sum depends upon the order of its terms. It has been proved by Riemann that the terms of such a series can be arranged to form a series which shall converge to any assigned sum or even to diverge. The series $1-\frac{1}{2}+\frac{1}{3}-\frac{1}{4}+\frac{1}{5}-\frac{1}{6}+\cdots$ is convergent, its sum being $\log 2$. The series $1+\frac{1}{3}-\frac{1}{2}+\frac{1}{5}+\frac{1}{7}-\frac{1}{4}+$, obtained by rearranging its terms, is convergent but its sum is $\frac{3}{2}\log 2$. The series $\dfrac{\log 2}{2}-\dfrac{\log 3}{3}+\dfrac{\log 4}{4}-\dfrac{\log 5}{5}+\cdots$ is convergent, but the series $\sum\left\{\dfrac{\log(4n-2)}{4n-2}+\dfrac{\log 4n}{4n}-\dfrac{\log(2n+1)}{2n+1}\right\}$, obtained by rearranging its terms, is divergent.

Such tests as exist for series of this type, which are not absolutely convergent, depend upon a theorem known as *Abel's Lemma*, which is that, if $a_1, a_2, a_3, \cdots$ is a steadily decreasing set of numbers, then $a_1u_1+a_2u_2+\cdots+a_nu_n$ is less than a_1A and greater than a_1B, where A and B are respectively the greatest and least of the expressions

$$u_1,\ u_1+u_2,\ u_1+u_2+u_3, \cdots\ u_1+u_2+\cdots+u_n.$$

It follows that, if Σu_n is convergent and a_n is steadily increasing or steadily decreasing to a finite limit, then $\Sigma a_n u_n$ is convergent. It follows also that, if $|u_1+u_2+\cdots+u_n|$ is always less than some fixed number independent of n, and a_n decreases steadily to zero, then $\Sigma a_n u_n$ is a convergent series. A particular case is that, if a_n decreases steadily to zero, the series $\Sigma a_n \cos(n\theta+\alpha)$ is convergent. A still more particular case is that the series $a_1-a_2+a_3-a_4+\cdots$ is convergent. Such a series is called an alternating series.

If Σv_n is a convergent series and u_n/v_n tends to a limit l, different from zero, it cannot be inferred, if u_n and v_n are not always of the same sign, that Σu_n is also convergent. It may however happen that the convergence or divergence of the series $\Sigma(u_n - lv_n)$ can be readily established. If this series is convergent, then Σu_n is convergent. If it is not convergent, then Σu_n is not convergent. For example, if $v_n=(-1)^{n-1}n^{-p}$, then Σv_n is convergent, if p is positive. If $u_n=(-1)^{n-1}/\{n^p+(-1)^{n-1}\}$, then $u_n/v_n \to 1$. Now $v_n-u_n=n^{-p}/\{n^p+(-1)^{n-1}\}$, which is always positive and is convergent or divergent with the series n^{-2p}, and so is convergent only if $2p>1$. Hence Σu_n is convergent only if $2p>1$.

Series of Complex Terms.—A series of complex terms $\Sigma(a_n+ib_n)$ can only be convergent if Σa_n and Σb_n are separately convergent. If $\Sigma|a_n+ib_n|$ is convergent, the series is said to be absolutely convergent. In this case Σa_n and Σb_n are each absolutely convergent, and the converse also holds. Certain tests can be extended to series of complex terms. Thus by an extension of Maclaurin's Integral test the series $\Sigma n^{-\mu}$, where $\mu=\alpha+i\beta$, may be shown to be convergent only if $\alpha>1$. The following is an extension of the ratio-test. If $u_n/u_{n+1}=1+\mu/n+O(n^{-k})$, $k>1$, then the series is absolutely convergent if the real part of μ is greater than 1 and is not convergent at all in any other case.

Double Series.—A double series is formed by the addition of terms $a_{m,n}$ depending on two integers. We may suppose the term $a_{m,n}$ to occupy the point whose cartesian co-ordinates referred to two axes are m,n. The sum of all the terms inside the rectangle bounded by the axes and the lines $x=m+1$, $y=n+1$ may be denoted by $s_{m,n}$. The double series may be said to converge if $s_{m,n}$ tends to a definite limit as m and n each tend *independently* to infinity. Other methods of summation are as follows. Keeping n fixed we may try to sum the infinite series $a_{n,1}+a_{n,2}+\cdots$. If this converges to a sum A_n, we may then sum the infinite series $A_1+A_2+\cdots$. If this series converges we call the sum the sum by rows of the double series. We can similarly investigate a sum by columns. But it does not follow that, if the double series has a sum in the first sense, it has a sum either by rows or columns equal to this sum. This does actually happen when the rows and columns are both convergent and the double series is convergent in the first sense. If the double series is not convergent in the

first sense, the sums by rows and columns may both exist but are not necessarily equal, nor does the fact that the sums by rows and columns both exist and are equal imply that the double series is convergent in the first sense.

Another method of summation is to form a single series Σc_n, where $c_m = a_{1,m} + a_{2,m-1} + \cdots + a_{m,1}$. If this series is convergent, its sum is called the sum of the double series by *diagonals*. The existence of this sum does not imply the existence of any other sum. If all the terms of a double series are positive, then, if it can be summed in any way, it can be summed in every other way and all the sums are the same, and are unaffected by any derangement of its terms. The idea of absolute convergence may be extended to double series. Tests for double series of positive terms may be obtained analogous to those for single series. Thus, if $f(x, y)$ is positive and steadily decreases to zero as x and y increase, the double series $\Sigma\Sigma f(m, n)$ and the double integral $\int^\infty\int^\infty f(x, y)dx\,dy$ are convergent or divergent together. Thus the double series $\Sigma\Sigma(m^2+n^2)^{-\alpha}$ is convergent if $\alpha > 1$, but divergent otherwise, a result having an application of fundamental importance in the theory of elliptic functions. Triple and multiple series are obvious extensions of double series.

Multiplication of Series.—The most interesting case of double series is perhaps that furnished by the multiplication of series. We are able to exhibit the product of the series Σu_n and Σv_n as a double series $\Sigma\Sigma u_m v_n$. If Σu_n converges to a sum U and Σv_n converges to a sum V, then since $s_{m,n}$ is equal to

$$(u_1+u_2+\cdots+u_m)(v_1+v_2+\cdots+v_n) \quad \text{so that} \quad s_{m,n} \rightarrow UV,$$

the double series is always convergent in the first sense. The sum usually taken as the product of the two series is however the sum of the double series by diagonals, that is, Σw_n, where

$$w_n \equiv u_1 v_n + u_2 v_{n-1} + \cdots + u_n v_1.$$

This arises from the fact that the formal product of the two series $\Sigma u_n x^n$, $\Sigma v_n x^n$ arranged in powers of x, is $\Sigma w_n x^n$. The chief theorems concerning this product, sometimes specifically alluded to as Cauchy's product, are

(1) *Cauchy's theorem.* If Σu_n and Σv_n converge absolutely to the sums U and V respectively, then Σw_n converges absolutely to UV.

(2) *Merten's theorem.* If Σu_n converges absolutely to U and Σv_n converges, but not absolutely, to V, then Σw_n converges to UV.

(3) *Abel's theorem.* If Σu_n converges to U and Σv_n converges to V and Σw_n is convergent, then Σw_n converges to UV.

(4) *G. H. Hardy's theorem.* If Σu_n converges to U and Σv_n converges to V and $|nu_n| < K$ and $|nv_n| < K$, where K is some fixed number, then Σw_n converges to UV. Further, if we take a third series, whose terms satisfy the same condition, the Cauchy product of this series and Σw_n is convergent, and so on for any finite number of such series.

The product of two convergent alternating series

$$u_1 - u_2 + u_3 - \quad \text{and} \quad v_1 - v_2 + v_3 - \cdots$$

is convergent, if $w_n \rightarrow 0$, this condition being both necessary and sufficient. This theorem is due to Pringsheim who has shown that a sufficient condition is that $\Sigma u_n v_n$ should be convergent. This is not necessary, nor can there be any necessary and sufficient condition based on the product $u_n v_n$. If $u_n = v_n = (n \log n)^{-\frac{1}{2}}$, the product is convergent. If $u_n = n^{-1}$ and $v_n = (\log n)^{-1}$, the product is not convergent, although in each case $u_n v_n = (n \log n)^{-1}$. It may be noted that, if Σu_n and Σv_n are both convergent, the series Σw_n cannot be strictly divergent, although it may oscillate, the range of oscillation being possibly infinite.

Series of Terms Containing a Variable. Uniform Convergence.—If the terms of a series contain a variable x, real or complex, and if the series $\Sigma u_n(x)$ is convergent for values of x in a certain interval, if x is real, or within a certain region, if x is complex, the sum of the series, which we may denote by $S(x)$, determines a function of x within that interval (or region). If each term of the series is a continuous function of the variable, it does not follow that the function $S(x)$ is continuous. For if we find the limit of $S_n(x)$, as n tends to infinity, for general values of x and then give x a particular value a, it is not at all certain that we shall obtain the same result as if we put x equal to a, before proceeding to the limit. Thus, if $S_n(x) = 1/(1+nx)$, $S_n(x) \rightarrow 0$ for all values of x, positive or negative; but $S_n(0) = 1$ and therefore the sum of the series, when $x = 0$, is 1. Thus the function determined by the sum of the convergent series in which $S_n(x) = 1/(1+nx)$ is discontinuous at $x = 0$. Discontinuity in a function defined by the sum of an infinite convergent series of continuous functions is always accompanied by a phenomenon known as *non-uniform convergence.* The term *uniform convergence* is due to Weierstrass and the idea, though not unknown to Abel, was developed about the middle of the 19th century by him and by Sir G. G. Stokes, Seidel and Arndt. The fundamental notion of uniform convergence is this:—the formal condition that the series $\Sigma u_n(x)$ should be convergent is that, given any arbitrarily small positive number, ϵ, it is possible to find an integer ν, such that $|S_{n+p}(x) - S_n(x)| < \epsilon$, for all values of p if $n \geqq \nu$. The least value of ν, or the least that can be found in practice, depends not only on ϵ but on x, and may be denoted by $\nu(x)$. It may happen that an integer K can be found, depending only on ϵ and not on x, such that for every value of x in the interval (or region) of convergence $K > \nu(x)$. In this case the series is said to converge *uniformly* to $S(x)$ in the interval (or region). If however it happens that, N being any arbitrarily chosen number, however large, we can always find a value of x in the interval, such that $\nu(x) > N$, then the series is non-uniformly convergent. If we consider $S_n(x) = 1/(1+nx)$ and determine ν such that $|S_n(x)| < \epsilon$, $n \geqq \nu$, we must have $\nu \geqq (\epsilon^{-1} - 1)/x$, x positive, and $\nu \geqq (\epsilon^{-1} + 1)/|x|$, x negative. Thus in any interval which does not include zero, there is uniform convergence; for, if a is the lower limit of the interval if x is positive, or $-b$ is the upper limit of the interval if x is negative, we can take ν to be the next integer above $(\epsilon^{-1} - 1)/a$ or $(\epsilon^{-1} + 1)/b$. But evidently we can take x sufficiently near to zero to require $\nu > N$, any assigned integer, however great. Hence the series is not uniformly convergent in any interval which includes zero.

One of the most important properties of a function defined by a convergent infinite series of functions of a variable is that it is continuous in any interval (or region) in which the series is uniformly convergent. If the series has a discontinuity at any point, it cannot be uniformly convergent throughout any interval containing that point. It does not however follow that non-uniform convergence necessarily involves discontinuity. If $s_n(x) = x/(1+nx)$, the sum of the series for all values of x, zero included, is zero, but the series is not uniformly convergent in a range which includes zero.

A less artificial looking series is the series $\Sigma \frac{1}{n} \sin n\theta$, which is convergent for all real values of θ. If $0 < \theta < 2\pi$, the series converges to $\frac{1}{2}(\pi - \theta)$, but clearly, if $\theta = 0$ or 2π, its sum is zero. Hence there cannot be uniform convergence throughout any interval which includes 0 or 2π. Actually the series is uniformly convergent in any range given by $0 < \delta < \theta < \delta' < 2\pi$.

Tests for uniform convergence are not numerous nor are they always very simple. One very simple test, which covers most applications, is known as the *Weierstrass M-test.* It is this. If a number U_n can be found such that $|u_n(x)| \leqq U_n$ for all values of x in an interval (or region) and ΣU_n is convergent, then $\Sigma u_n(x)$ is uniformly convergent throughout the interval.

Thus the series $\Sigma x^n \cos\{\phi_n(x)\}$, where $\phi_n(x)$ is any real function of x, is uniformly convergent in any interval a to b, where $|a|$ and $|b|$ are each less than unity.

It has been remarked that the series $\Sigma a_n \sin n\theta$, where a_n decreases steadily to zero, is convergent for all real values of θ. Such a series is uniformly convergent in any range that does not include zero or a multiple of 2π. That it should be uniformly convergent in any range whatever it is necessary and sufficient that na_n should tend to zero. This is practically the only type of series for which a condition for uniform convergence, necessary as well as sufficient, exists.

If $\Sigma u_n(x)$ converges uniformly to $S(x)$ throughout the interval a to b, then $\int S(x)dx=\Sigma\int u_n(x)dx$, if both the upper and lower limits of integration are not outside the interval. It is not absolutely necessary that uniform convergence should exist for term-by-term integration, as it is called, to be valid, but no better completely general conditions are known. One case may be mentioned where term-by-term integration is valid over a range which contains a point of non-uniform convergence and that is if $|s_n(x)|<K$, some fixed number, for all values of n and for all values of x within the range of integration.

For term-by-term differentiation we have the theorem that $\Sigma \dfrac{d}{dx} u_n(x) = \dfrac{d}{dx}S(x)$, at all points of an interval throughout which the series on the left-hand side is uniformly convergent. But this condition is not necessary.

It should be noted that even when the series $\Sigma u_n(x)dx$ is uniformly convergent throughout any interval, however large its upper limit, term-by-term integration with infinity as the upper limit is not always possible. The series for e^{-bx}, viz.

$$1-bx+\frac{b^2x^2}{2!}-\frac{b^3x^3}{3!}+\cdots$$

is uniformly convergent in any interval $(-N, +N)$, however large N may be, and so is the series obtained by multiplying each term by e^{-x}.

But $\displaystyle\int_0^\infty e^{-x}(1-bx+\frac{b^2x^2}{2!}-\cdots)dx=1-b+b^2-b^3+\cdots$ which is equal to $(1+b)^{-1}$, the value of $\displaystyle\int_0^\infty e^{-(1+b)x}dx$, only if $|b|<1$; the series of integrated terms not being convergent otherwise.

Absolute convergence and uniform convergence are quite distinct. Neither implies the other. The series $\Sigma(-1)^n(n+x^2)^{-1}$, where x is real, is uniformly convergent in any interval. For $|S_{n+p}(x)-S_n(x)|<1/(n+1+x^2)<1/(n+1)$ and therefore $<\epsilon$, if $n+1>\epsilon^{-1}$, a condition independent of x. Yet the series is not absolutely convergent for any value of x. On the other hand the series $\Sigma\{1(1+nx)-1/(1+\overline{n+1}x)\}$ is absolutely convergent for all values of x, but is not uniformly convergent throughout any interval which includes $x=0$.

The following important theorem, known as Tannery's theorem, is based upon an idea similar to that of uniform convergence. Let $u_1(n)$, $u_2(n)$, $\cdots$ be a sequence of numbers each involving n. Let $S(n)\equiv u_1(n)+u_2(n)+\cdots$ where the series is infinite or stops at a term $u_p(n)$, where p depends on n and becomes infinite with n. Let $u_r(n)$ tend to u_r as n tends to infinity, and let it be possible to find U_r, independent of n, such that $|u_r(n)|<U_r$ for all positive values of n and the series ΣU_r is convergent. Then $S(n)$ tends to a limit, as n tends to infinity, which is the sum of the series Σu_r. By means of this theorem we can prove that the exponential series $\Sigma z^n/(n!)$ is the limit of $\left(1+\dfrac{z}{n}\right)^n$ as n, a positive integer, tends to infinity. We can also deduce the expansions of $\cos\theta$ and $\sin\theta$ as power series in θ from the identities

$$\cos\theta=\cos^n\frac{\theta}{n}\left\{1-\frac{n(n-1)}{1\cdot 2}\tan^2\frac{\theta}{n}+\cdots\right\}$$

and

$$\sin\theta=\cos^n\frac{\theta}{n}\left\{n\tan\frac{\theta}{n}-\frac{n(n-1)(n-2)}{1\cdot 2\cdot 3}\tan^3\frac{\theta}{n}+\cdots\right\}.$$

The treatment of these deductions given in many elementary textbooks is quite unsound.

Power Series.—A type of series of great interest and importance is the *Power series, i.e.*, a series whose general term is of the form $a_n(x-h)^n$, where x is a variable, real or complex, and h is a constant. There is no loss of generality in taking h as zero. Such a series is convergent throughout a certain interval if x is real and throughout the interior of a certain circle with its centre at the origin if x is complex. For values of the variable outside this interval (or region) the series ceases to be convergent. The radius of the circle is the limit of $|a_n/a_{n+1}|$, if this limit exists, or the reciprocal of the limit of $|a_n|^{1/n}$, if this limit exists. If neither of these limits exists, the radius is the reciprocal of the upper limit of $|a_n|^{1/n}$, that is, the greatest number G such that an infinite set of integers (not consecutive) can be found such that for every such integer $|G-|a_n|^{1/n}|<\epsilon$, where ϵ is an arbitrarily assigned small positive number. For instance, if $a_n=\sin n\theta$, G is evidently unity, though neither of the other limits exists. If x is restricted to be real, then x must lie on that diameter of the circle which is the axis of real numbers. The circle is called the *circle of convergence*. The radius of the circle may in some cases be indefinitely great, as in the case of the exponential series and the sine and cosine series, which are convergent in the interior of any circle, however great its radius, or the circle may shrink to a point as with the series $1!+2!x+3!x^2+\cdots$ which is convergent for no value of x except zero. For points on the circle itself, the series may or may not be convergent. For example, if we take the binomial series $1+nz+\dfrac{n(n-1)}{2!}z^2+\cdots$, where n is not a positive integer, the circle of convergence is the circle $|z|=1$. If n is positive the series converges absolutely for every point on the circle. If n is negative but $n+1$ is positive, the series converges, but not absolutely, at every point of the circle except $z=-1$. If $n+1$ is not positive, the series does not converge at any point of the circle.

A power series converges absolutely and uniformly throughout the interior of its circle of convergence. It can be integrated or differentiated term by term at all points of the interior of the circle. Two power series in the same variable cannot represent the same function in any region without being identical.

An important theorem on power series is *Abel's theorem.* If Σa_nx^n converges to $f(x)$ for $|x|<1$, and if Σa_n converges to a sum S, then $\lim f(x)x\to 1-=S$.

But the existence of $\lim f(x)x\to 1-$ does not necessarily imply the convergence of Σa_n. It was shown by Tauber that the condition $na_n\to 0$ is sufficient to secure the convergence of Σa_n if $\lim f(x)x\to 1-$ exists. More recently J. E. Littlewood has shown that the condition $na_n<K$, some fixed number, is sufficient. The alternative $na_n>-K$ is also sufficient, but is really the same thing since the convergence of $\Sigma -a_n$ necessitates that of Σa_n. Also no less stringent condition is generally sufficient. Such questions as the representation of a function by a Fourier series (*q.v.*) or as a series of Legendre polynomials or other standard functions are outside the scope of this article and are treated elsewhere.

Non-convergent Series. Summability. Asymptotic Series.—A series that is not convergent cannot have a sum in the ordinary sense. Nevertheless it is possible to modify the definition of the sum of a series so that a sum can be assigned to a non-convergent series and the sums of such series can be used in applications as if they were the sum of ordinary convergent series. Euler used such sums to obtain accurate results. Their use by writers whose mathematical insight was less acute than Euler's frequently led to grave errors and great mathematicians of the early 19th century, such as Abel and Cauchy, deliberately excluded from analysis the use of any such series and refused to accept as sound any demonstration involving their use. Towards the end of the 19th century interest in such series was revived and their treatment put on a sound footing. The subject of such series has received much attention in this century and many important contributions have been made to it by English mathematicians. Only the briefest sketch of it can be given here. The idea of the sum of a non-convergent series is based on the following principle. If certain limiting operations connected with a convergent series result in a finite limit which is the sum of the series, it may happen that the same operations applied in connection with a non-convergent series result in a finite limit. The non-convergent series is then said to be *summable* and the limit thus found is said to be its sum. For example, if the series

$$a_0+a_1x+a_2x^2+\cdots,$$

is convergent for $|x|<1$, its sum being $f(x)$, and if Σa_n is conver-

gent with a sum S, then S is the limit of $f(x)$ as x approaches 1 from below. But $f(x)$ may tend to a limit in this way without Σa_n being convergent and we may regard this limit, if it exists, as the sum of the series Σa_n, when it is not convergent. Thus the series $1-x+x^2-x^3+\cdots$ converges to $(1+x)^{-1}$, if $|x|<1$, and we may regard the series $1-1+1-1+\cdots$ as having a sum, which is $\frac{1}{2}$. A classical method of summing a non-convergent series, due to E. Borel, is the following. The integral

$$\int_0^\infty e^{-x}\sum_0^n \frac{a_n x^n}{n!}dx$$

is equal to $a_0+a_1+\cdots+a_n$. It may happen that the infinite series $\sum_0^\infty \frac{a_n x^n}{n!}$ converges to a sum $\phi(x)$ and that $\int_0^\infty e^{-x}\phi(x)dx$ has a definite value. In this case the series is said to be summable and the resulting sum to be "*Borel's sum.*" If we apply this method to the series $1-t+t^2-t^3+\cdots$ we obtain as the sum $(1+t)^{-1}$, which is the actual sum when the series is convergent. Another classical method is that of E. Césaro. If a_n has a limit, $b_n\equiv(a_1+a_2+\cdots+a_n)/n$ has the same limit, but b_n may have a limit, although a_n oscillates. Hence, although the sequence $s_1, s_2, \cdots$ may not have a limit, it may happen that

$$(s_1+s_2+\cdots+s_n)/n$$

has a limit. If this happens, the series is said to be summable $(C1)$. The Cauchy product of any two convergent series is summable $(C1)$. If this mean has not a limit we may repeat the operation, and so on any number of times. Actually Césaro uses as his rth mean the quotient of $s_n+A_1s_{n-1}+\cdots+A_2s_{n-1}$ by $1+A_1+\cdots+A_{n-1}$, where A_r is the coefficient of x^r in the expansion of $(1-x)^{-r}$ by the Binomial Formula (*q.v.*). If this rth mean gives a limit the series is said to be summable (Cr). A series, summable (C, r) is also summable $(C, r+1)$ and so on. It is not true that an arbitrary series can be summed by any of Césaro's means or by any known method. A striking and important theorem connected with Césaro's means, due to G. H. Hardy, is that a series which is summable $(C1)$ is convergent, if its terms are such that $na_n<K$ (or $na_n>-K$), and no less stringent condition is sufficient in complete generality.

A different application of non-convergent series is the representation of functions by means of so-called asymptotic series. These series when carried to infinity are not convergent but are such that it is possible to estimate at any stage the order of the difference between the function and the expansion, and it may happen that a few terms of the expansion give a good approximation. For a function of a variable x, such expansions are usually power series in $1/x$, and the difference between the value of the function and the first n terms of the expansion is $O\{(n+1)!/x^{n+1}\}$. Now $(n+1)!x^{n+1}$ decreases so long as $n+1$ is less than x, though afterwards it increases without limit, and when x is very large the least value of $(n+1)!/x^{n+1}$ is very small, so that the first n terms of the expansion will give a very good approximation to the value of the function. One of the best known of such expansions is Stirling's formula,

$$\log(n!)=(n+\tfrac{1}{2})\log n-n+\tfrac{1}{2}\log(2\pi)+\theta/12n,$$

where $0<\theta<1$. The term $\theta/12n$ can be replaced by a formal development as a power series in n^{-1}, but it is not convergent for any value of n.

Summation of Series. Asymptotic Representation of the Sum of n Terms of a Series.—If u_n can be decomposed into a number of expressions of the form $a^n\phi(n)$, where a is some fixed number, real or complex, and $\phi(n)$ is a polynomial in n, then it is possible to find a compact expression for s_n, but there is no other type of series for which the same property holds with complete generality. Included in this type are the ordinary arithmetic and geometric progressions; for the harmonic series Σn^{-1} and generally Σn^{-r} no exact expression for s_n can be found. The sum of the first n terms of the series Σn^r, where r is a positive integer, can be expressed as a polynomial in n or $n+\frac{1}{2}$, of degree $r+1$, by means of the identities

$$e^x+e^{2x}+\cdots+e^{nx}=(e^{nx}-1)/(1-e^{-x})=(e^{(n+\frac{1}{2})x}-e^{\frac{1}{2}x})/(e^{\frac{1}{2}x}-e^{-\frac{1}{2}x}).$$

The first polynomial is

$$\frac{n^{r+1}}{r+1}+\tfrac{1}{2}n^r+\frac{r}{2!}B_1n^{r-1}-\frac{r(r-1)(r-2)}{4!}B_2n^{r-3}+\cdots$$

where $$1-\tfrac{1}{2}x+B_1\frac{x^2}{2!}-B_2\frac{x^4}{4!}+B_3\frac{x^6}{6!}-\cdots$$

is the expansion of $x/(e^x-1)$ as a power series in x.

The numbers $B_1, B_2, B_3\cdots$ are called Bernoulli numbers (*q.v.*). They have been tabulated as far as B_{90}. The second polynomial involves the coefficients in the expansion of $x/(e^{\frac{1}{2}x}-e^{-\frac{1}{2}x})$, that is, $x\{(e^{\frac{1}{2}x}-1)^{-1}-(e^x-1)^{-1}\}$, which can therefore be expressed in terms of Bernoulli numbers. If r is odd, Σn^r can be expressed as a polynomial $f(\xi)$ of degree $\frac{1}{2}(r+1)$ in ξ, which denotes n^2+n, and $\Sigma n^{r-1}=(2n+1)f(\xi)/r$. Unless r is very large the coefficients in the polynomial can be determined fairly easily from the identity $n^r=f(n^2+n)-f(n^2-n)$. The sum of the rth powers of the first n *odd* integers can be expressed as a polynomial of degree $r+1$ in n, containing no odd powers of n, if r is odd, and no even powers of n, if r is even, divisible by n in either case.

It is often possible to obtain asymptotic formulae for the sum of the first n terms of a series. Two functions $\phi(n)$ and $\psi(n)$ are said to represent each other asymptotically if the ratio $\phi(n)/\psi(n)$ tends to unity as n tends to infinity and we write $\phi(n)\backsim\psi(n)$. If $u_n=\phi(n)$, which is steadily decreasing,

$$s_n-\int_1^n\phi(x)dx$$

tends to a finite limit and we can write $s_n\backsim\int_1^n\phi(x)dx$. Thus, if $u_n=n^{-1}$, $s_n\backsim\log n$. Stirling's formula for $\log(n!)$ is an asymptotic formula for s_n, when $u_n=\log n$. The limit of $1+\frac{1}{2}+\cdots+\frac{1}{n}-\log n$ is an important number in analysis. It is called Euler's constant and is denoted by C or sometimes by γ.

It is often possible to find the sum of a convergent series although no expression for s_n can be obtained. By means of the infinite products for the trigonometrical functions it can be shown that the sum of Σn^{-r}, when r is an *even* positive integer, is a rational multiple of π^r, and that the sum of $\Sigma(-1)^n(2n+1)^{-r}$, when r is an *odd* positive integer, is a rational multiple of π^r. The sum of a series can be found occasionally by the help of Euler's constant. Thus the sum of the first $2n$ terms of the series $\Sigma(-1)^{n-1}n^{-1}$ is equal to $s_{2n}-s_n$, where $u_n=n^{-1}$, which is equal to

$$(s_{2n}-\log 2n)-(s_n-\log n)+\log 2.$$

Since $(s_{2n}-\log 2n)$ and $s_n-\log n$ each tend to C, Euler's constant, the sum of the series is $\log 2$. For since the series is convergent its sum is the limit of the sum of the first $2n$ terms. By a somewhat similar method we can prove that the sum of the series $\Sigma(-1)^n(\log n)/n$ is $C\log 2-\frac{1}{2}(\log 2)^2$.

Methods of obtaining approximations to the sum of a series and of converting slowly converging series into more rapidly converging series belong to the Calculus of Finite Differences (*q.v.*).

Infinite Products.—If from a sequence of numbers (v_n) we form a sequence (p_n) in which $p_n=v_1v_2v_3\cdots v_n$, then, if p_n tends to a finite limit, *distinct from zero*, the infinite product $\Pi(v_n)$ is said to be convergent. The infinite product is said to diverge to infinity or to zero, if p_n tends to infinity or to zero. If p_n oscillates, the infinite product is said to oscillate.

If the product is convergent p_n/p_{n-1} must tend to unity, so that v_n must be of the form $1+u_n$, where u_n tends to zero. In considering the question of the convergence of infinite products we may, without any loss of real generality, consider only products in which $|u_n|<1$ for all values of n.

The convergence of an infinite product can be discussed directly by means of certain inequalities, due to Weierstrass (*see* Bromwich, *Theory of Infinite Series*); but the results may be obtained readily from the fact that the infinite product $\Pi(1+u_n)$ is con-

vergent, if the series $\Sigma\log(1+u_n)$ is convergent, divergent to $+\infty$ (or to zero), if the series is divergent to $+\infty$ (or $-\infty$), and oscillatory, if the series is oscillatory. If u_n is complex, $\log(1+u_n)$ is the principal value of the logarithm: that is, the value which tends to zero with u_n. We see from the above why we regard an infinite product as diverging to zero rather than converging to zero.

If u_n is real and one-signed, then $\log(1+u_n)$ is one-signed and so also is $\log(1-u_n)$. Since

$$\{\log(1+u_n)\}/u_n \to 1 \text{ and } \{\log(1-u_n)\}/u_n \to -1,$$

it follows that $\Sigma\log(1+u_n)$ and $\Sigma\log(1-u_n)$ are each convergent or divergent according as Σu_n is convergent or divergent. Hence if u_n is real and positive $\Pi(1+u_n)$ and $\Pi(1-u_n)$ are each convergent, if Σu_n is convergent. If Σu_n is divergent $\Pi(1+u_n)$ diverges to ∞ and $\Pi(1-u_n)$ diverges to zero.

If u_n is either real or complex $|\log(1\pm u_n)| \leqq \log\{1/(1-|u_n|)\}$, so that $\Sigma\log(1\pm u_n)$ is absolutely convergent, if Σu_n is absolutely convergent, and therefore if Σu_n is absolutely convergent, $\Pi(1+u_n)$ is convergent and also $\Pi(1+|u_n|)$. Such a product is said to be absolutely convergent. The order of its factors may be rearranged according to any law to form a new infinite product, which will converge to the same limit as the original product.

If Σu_n is not absolutely convergent, we use the fact that if $|u_n|<1$, $\log(1+u_n)=u_n-A_n u_n^2$, where $A_n<$some fixed number, independent of n (but varying of course with different sequences). If u_n is real, A_n is positive. From this it follows that, when u_n is real, if Σu_n is convergent but not absolutely convergent, then $\Pi(1+u_n)$ and $\Pi(1-u_n)$ are convergent, if Σu_n^2 is convergent. If Σu_n^2 is divergent, $\Pi(1+u_n)$ and $\Pi(1-u_n)$ both diverge to zero. If u_n is complex and Σu_n is convergent, but not absolutely, then $\Pi(1+u_n)$ and $\Pi(1-u_n)$ are both convergent, if $\Sigma|u_n|^2$ is convergent. This condition is not necessary. It should be mentioned that convergent infinite products $\Pi(1+u_n)$ can be constructed, in which Σu_n and Σu_n^2 are both divergent to $+\infty$.

If u_n contains a variable x and is written as $u_n(x)$, then a convergent infinite product $\Pi\{1+u_n(x)\}$ defines a function of x. For such products there is a theory of uniform convergence similar to that developed in connection with infinite series.

Corresponding to Tannery's theorem we have the theorem that, if $F(n)=\prod_{r=1}^{p}\{1+u_r(n)\}$, and $u_r(n)$ satisfies the conditions of Tannery's theorem, then $F(n)$ tends to a limit, which is the value of the convergent infinite product $\Pi(1+u_r)$. We can by this theorem deduce from the identity,

$$\sin\theta = (2n+1)\sin\frac{\theta}{2n+1}\prod_{r=1}^{n}\left\{1-\sin^2\frac{\theta}{2n+1}\operatorname{cosec}^2\frac{r\pi}{2n+1}\right\},$$

that the infinite product $\Pi\left(1-\frac{\theta^2}{r^2\pi^2}\right)$ converges to $(\sin\theta)/\theta$.

A particular case is the infinite product for $\pi/2$, viz.

$$\tfrac{2}{1}\cdot\tfrac{2}{3}\cdot\tfrac{4}{3}\cdot\tfrac{4}{5}\cdot\tfrac{6}{5}\cdot\tfrac{6}{7}\cdots,$$

discovered by Wallis.

Weierstrass has shown that, if $a_1, a_2, a_3, \cdots$ is an infinite sequence, in which $|a_n|$ never decreases and tends to infinity with n, and is such that $\Sigma\,|a_n|^{-1}$ is divergent, we can find polynomials $g_n(z)$, such that the infinite product $\Pi(1-z/a_n)e^{g_n(z)}$ is absolutely convergent for all values of z. Here we do not say that the series diverges for the values $z=a_1, a_2, \cdots$ because, if the factor $(1-z/a_n)$ is omitted, the remaining infinite product is convergent when $z=a_n$. We say that $z=a_n$ is a zero of the function determined by the infinite product. One simple example is provided by taking the sequence to be $-1, -2, -3, \cdots$. The simplest factor that can be associated with $(1+z/n)$ is $e^{-z/n}$, so that the infinite product $\Pi(1+z/n)e^{-z/n}$ is convergent. Since $1+\frac{1}{2}+\cdots+\frac{1}{n}-\log n$ tends to Euler's constant C, it follows that $n^{-z}(z+1)(z+2)\cdots(z+n)/n!$ tends to a limit as n tends to infinity. The reciprocal of the function of z defined by this limit has been denoted by Gauss by $\Pi(z)$. It is also $\Gamma(z+1)$, where $\Gamma(z)$ is the Gamma-function. Further details of functions defined by infinite products belong to the theory of functions. As with infinite series, so with infinite products, we may have doubly and multiply-infinite double products, and the treatment of such products may be made to depend on series. The function defined by the doubly-infinite product

$$z\Pi(1-z/\Omega)e^{z/\Omega+\frac{1}{2}z^2/\Omega^2},$$

where $\Omega=2m\omega_1+2n\omega_2$, ω_1 and ω_2 being any two numbers whose ratio is complex, and m and n have any positive or negative integral values, simultaneous zero values alone being excluded, is Weierstrass's Sigma-function, fundamental in the theory of elliptic functions.

Bibliography.—*See* the article, "Algebräische Analysis," by A. Pringsheim and G. Faber, in the *Encyklopädie der mathematischen Wissenschaften* (Leipzig, 1898, etc., vol. ii., ch. i.). The elementary treatment of series may be found in W. P. Milne, *Higher Algebra* (1913); F. Bowman, *Algebra* (1925–27); and in great detail in G. Chrystal, *Introduction to Algebra* (1898, 4th ed. 1920). More advanced treatment can be found in G. H. Hardy, *A Course of Pure Mathematics* (1908, 4th ed. 1925); E. T. Whittaker and G. N. Watson, *A Course of Modern Analysis* (1902, 4th ed. 1927); T. J. I'A. Bromwich, *An Introduction to the Theory of Infinite Series* (1908, 2nd ed. 1926); E. W. Hobson, *Theory of Functions of a Real Variable* (1907, 3rd ed. 1927 etc.). Except that the 2nd ed. of Bromwich omits the question of summability and Hobson is restricted to real variables, these last two works are practically exhaustive. A very complete treatment is given in K. Knopp, *Theorie und Anwendung der unendlichen Reihen* (1922, Eng. Trans., 1928). For particular portions of the theory, refer to E. Borel, *Leçons sur les séries divergentes* (1901) and to others of the series of monographs on the theory of functions edited by Borel. Numerous important contributions to the theory will be found in the publications of recent years of the London Mathematical Society and the Cambridge Philosophical Society. A paper by G. H. Hardy in the *Proceedings* of the C. P. S., vol. xiv. (May 1918), entitled "Sir George Stokes and the Concept of Uniform Convergence," will be found of particular interest. (A. E. J.)

SERINGAPATAM, a town of India, formerly capital of the state of Mysore, situated on an island of the same name in the Cauvery river. Pop., including the suburb of Gaujam (1921) 7,217. The town is chiefly noted for its fortress, which figured prominently in Indian history at the close of the 18th century, twice sustained a siege from the British, and was finally stormed in 1799. After its capture the island was ceded to the British, but restored to Mysore in 1881. The island of Seringapatam is about 3 m. in length from east to west and 1 in breadth. The fort, which occupies the western side, immediately overhanging the river, contains the railway station on the line from Bangalore to Mysore. At the eastern or lower end of the island is the Lal Bagh or "red garden," containing the mausoleum built by Tippoo Sultan for his father, Hyder Ali, where Tippoo himself also lies.

SERJEANT or **SERGEANT,** the title (1) of a non-commissioned officer in the army and of a subordinate officer of police to which the spelling "Sergeant" now applies; the designation also, with the spelling "Serjeant," of (2) certain officials of the royal household and (3) the name formerly given to the highest rank of barristers in England and Ireland (*see* Serjeant-at-Law). In the middle ages *serviens* had a variety of applications from the *serviens de pane et mensa*, the domestic servant of a monastery, to the *servientes de armis*, the serjeants-at-arms of monarchs, and vassals who held by a special service (*see* Serjeanty). The *serjeants* (*fratres servientes*) formed also an important division of the great military orders (*see* Saint John of Jerusalem, Knights of the Hospital of, and Templars). Du Cange (*Glossarium*, *s.v.* "Serviens") gives many other instances.

Military Title.—In the 13th century on the continent of Europe the term Sergeant referred to a foot-soldier, but gradually it became attached to the tenant in charge of a knight's party on service, and usually a tenant who had seen some service. With the abolition of armies on feudal lines, the sergeant became an important member of a company in a regiment, and in the 17th century he was always "elected" to his position by the captain. He had great powers of authority over the men but Barry (1634) counsels him not to "slashe or cutt soulders with his swourde,

except uppon juste occationes." Up to the 19th century the insigne of office of a sergeant was the halberd. All military writers of the 16th, 17th and 18th centuries allot innumerable duties to the sergeant, which clearly indicate that he was the captain's right-hand man in all matters of drill and interior economy (*see* MAJOR). The term is not found in organised cavalry until the 18th century and even now it is not used in the British Household Cavalry, the equivalent rank therein being "corporal-of-horse." In 1641 Hexham states that there should be 2 sergeants to a private company and 3 to a colonel's or double company, the senior being termed the "Eldest Sergeant."

In modern armies sergeant is the N.C.O. rank immediately above corporal. A lance-sergeant is a corporal holding an appointment of a temporary nature between the ranks of corporal and sergeant. As it is now the almost universal practice to indicate in a N.C.O.'s title the particular duties he performs, the word sergeant forms part of numerous titles, *e.g.*, orderly-room sergeant, band-sergeant, signalling-sergeant.

Serjeants-at-Arms.—In the British royal household there are eight serjeants-at-arms, whose duties are ceremonial; they have to be in attendance only at drawing-rooms, levees, State balls and State concerts. There are also two other serjeants-at-arms to whom special duties are assigned, the one attending the Speaker of the House of Commons and the other the lord chancellor in the House of Lords, carrying their maces and executing their orders. The Speaker's serjeant-at-arms is the disciplinary officer of the House of Commons, whose duty it is to expel members at the order of the Speaker and to arrest and keep in custody those persons condemned to this punishment by the authority of the House. The serjeants-at-arms have no special uniform. At court they wear any naval, military or civil uniform to which they may be entitled, or the court dress of those holding legal appointments, but not entitled to wear robes, *i.e.*, a suit of black cloth, with knee-breeches, lace bands and ruffles, a black silk cocked hat with rosette and steel loop and a sword. A silver collar of office is worn on special occasions.

In the United States, the executive officer of certain legislative bodies is called the sergeant-at-arms.

SERJEANTS-AT-LAW or **SERVIENTES AD LEGEM** constituted the highest order of counsel at the English and Irish bar. The title is said by Coke to have been introduced into England by William the Conqueror with other titles of serjeanty (*q.v.*). However this may be, Bracton, writing *c.* 1250–58, says that the king had his serjeants-at-law in every county, and that until 19 Stephen he had no other chief officer in the city of Norwich but his serjeant, who presided in the courts there. After the Conquest the sheriffs are officers of the Crown, and we know from other sources that they were usually serjeants-at-law. They were therefore styled *servientes Regis ad legem* who as stewards of courts baron served the lords of the manor in a similar capacity, or who as counsel—*conteurs* or *narratores*—appeared for suitors in the courts. These men were styled common serjeants, a title which survives in the common serjeant of the City of London, and (a second class) king's serjeants. As it happened, both were selected from the utter-barristers. The serjeants (except king's serjeants) were created by writ of summons under the great seal, and wore a gown and scarlet hood. They had social precedence after knights bachelors and before companions of the Bath and other orders. In this they differed from king's counsel, who had simply professional as distinguished from social rank. The serjeants at the Irish bar had precedence next after law officers of the Crown. Till past the middle of the 19th century a limited number of the serjeants were called "king's (queen's) serjeants." They were appointed by patent and summoned to parliament. Until 1814 the two senior king's serjeants had precedence of the attorney-general and solicitor-general. It was the custom for serjeants, on their appointment, to give gold rings inscribed with mottoes to their colleagues. Down to 1845 the order enjoyed a very valuable monopoly of practice.

Certainly, for at least 600 years the judges of the king's bench and common pleas were always serjeants, but by the Judicature Act 1873 this qualification was abolished. The serjeants had their own Inns, one in Fleet street and one in Chancery lane. In 1758 the members of the former joined the latter. In 1877 the society was dissolved, the Inn sold to one of the members, and the proceeds divided among the existing serjeants. The order is now extinct.

See J. Manning, *Serviens ad Legem* (1840); A. Pulling, *The Order of the Coif* (1897).

SERJEANTY. Tenure by serjeanty was a form of land-holding under the feudal system, intermediate between tenure by knight-service (*q.v.*) and tenure in socage. It originated in the assignation of an estate in land on condition of the performance of a certain duty, which can hardly be described more exactly than as not being that of knight-service. Its essence, according to Pollock and Maitland, might be described as "servantship," the discharge of duties in the household of king or noble; but it ranged from service in the king's host, distinguished only by equipment from that of the knight, to petty renders scarcely distinguishable from those of the rent-paying tenant or socager. The varieties of serjeanty were afterwards increased by lawyers classing for convenience under this head such duties as those of escort service to the abbess of Barking, or of military service on the Welsh border by the men of Archenfield.

Serjeants (*servientes*) are already entered as a distinct class in Domesday Book (1086), though not in all cases differentiated from the barons, who held by knight-service. Sometimes, as in the case of three Hampshire serjeanties—those of acting as king's marshal, of finding an archer for his service, and of keeping the gaol in Winchester castle—the tenure can be definitely traced as far back as Domesday. It is probable, however, that many supposed tenures by serjeanty were not really such, although so described in returns, in inquests after death, and other records. The simplest legal test of the tenure was that serjeants, though liable to the feudal exactions of wardship, etc., were not liable to scutage; they made in place of this exaction special composition with the Crown.

The germ of the later distinction between "grand" and "petty" serjeanty is found on the Great Charter (1215), the king there renouncing the right of prerogative wardship in the case of those who held of him by the render of small articles. The legal doctrine that serjeanties were (*a*) inalienable, (*b*) impartible, led to the "arrentation," under Henry III., of serjeanties the lands of which had been partly alienated, and which were converted into socage tenures, or, in some cases, tenures by knight-service. Gradually the gulf widened, and "petty" serjeanties, consisting of renders (usually a bow, sword, dagger or other small thing belonging to war), together with serjeanties held of mesne lords, sank into socage, while "grand" serjeanties, the holders of which performed their service in person, became alone liable to wardship and marriage.

When the military tenure of knight-service was abolished at the Restoration, that of grand serjeanty was retained, it being then limited in practice to the performance of certain duties at coronations, the discharge of which as a right has always been coveted. The most conspicuous are those of champion, appurtenant to the Dymokes' manor of Scrivelsby, and of supporting the king's right arm, appurtenant to that of Worksop.

The title of serjeant as a household officer is still preserved in the king's serjeants-at-arms, etc.

The best summary of tenure by serjeanty is in Pollock and Maitland, *Hist. Eng. Law;* McKechnie's *Magna Carta* (1905) should also be consulted; and for Domesday the *Victoria History of Hampshire*, vol. i. The best list of serjeanties is in the *Red Book of the Exchequer* ("Rolls" series), but the *Testa de Nevill* (Record Commission) contains the most valuable records concerning them. (J. H. R.)

SEROW or **SARAU** (*Capricornis sumatrensis*), found from the Himalayas to Sumatra, a goat-like antelope of the size of a donkey, nearly allied to the goral (*q.v.*) but larger, and with small face-glands. The name serow may be extended to embrace all species belonging to the genus, the range of which extends from the Himalayas to Burma, the Malay Peninsula and Sumatra in one direction, and to Tibet, China, Japan and Formosa in another. Serows inhabit scrub-clad mountains, at no great elevation.

SERPA PINTO, ALEXANDRE ALBERTO DE LA ROCHA (1846–1900), Portuguese explorer in Africa, was born at the castle of Polchras, on the Douro, on April 10, 1846. Entering the army in 1864, he served in Mozambique, and in 1869 took part in an expedition against tribes in revolt on the lower Zambezi. In 1877 he and Captains Capello and Ivens of the Portuguese navy were sent on an expedition to south central Africa. They left Benguella in Nov. 1877 for the interior, but Serpa Pinto soon parted from his colleagues and went east. He crossed the Kwando in June 1878, and in August reached Lialui, the Barotse capital on the Zambezi, continued his journey down the river to the Victoria falls, whence he turned south, arriving at Pretoria on Feb. 12, 1879. He was the fourth explorer to traverse Africa from west to east, and was the first to lay down the route between Bihe and Lialui. He received the founder's medal of the Royal Geographical Society of London. The account of his travels appeared in English under the title *How I Crossed Africa* (2 vols., London, 1881). In 1884 he attempted, with less success, the exploration of regions between Mozambique and Lake Nyasa. Appointed governor of Mozambique in 1889, he organized an expedition to obtain for Portugal the Shiré highlands and neighbouring regions, but the vigorous action of the British agents (John Buchanan and H. H. Johnston) frustrated this design. (*See* AFRICA.) Shortly afterwards Serpa Pinto returned to Lisbon and was promoted to the rank of colonel. He died on Dec. 28, 1900.

SERPENT, a synonym for reptile or snake (*see* REPTILE and SNAKES), now generally used only of dangerous varieties or metaphorically. *See* also SERPENT CULTS below.

In music the serpent is an obsolete bass wind instrument derived (towards the end of the 16th century) from the old wooden cornets and the progenitor of the bass-horn, and ophicleide.

SERPENT CULTS. Common belief associated serpents, dragons and other monsters with the guardianship of treasure or wealth; comp.; *e.g.*, the golden apples of the Hesperides, and the Egyptian Osiris, and the Indian Krishna and Indra. Serpents adorned with necklaces of jewels or with crowns were familiar in old susperstition, and the serpent with a ruby in its mouth was a favourite love-token. Many stories tell of the grateful reptile which brought valuable gifts to a benefactor. According to a common Indian belief a wealthy man who dies without an heir returns to guard his wealth in the form of a serpent, and it was an Italian superstition that a serpent's skin brought luck. The serpent is often associated with metallurgy, and to serpent deities have been ascribed the working of metals, gem-cutting and indeed culture in general. The Ophites (*q.v.*) actually identified the serpent with Sophia ("Wisdom"); the old sage Garga, one of the fathers of Indian astronomy, owed his learning to the serpent-god Sesha Nāga; and the Phoenician γέρων 'Οφίων wrote the seven tablets of fate which were guarded by Harmonia (Baudissin, *Stud. z. Rel. Gesch.*, i. 255–292 [on Semitic serpent cults]). The Aztec Quetzalcoatl taught metallurgy and agriculture, gave abundance of maize, also wisdom and freedom from disease. The Babylonian Ea, who sometimes has serpent attributes, introduced—like the American serpent Votan—knowledge and culture. The half-serpent Cadmus brought knowledge of mines, agriculture, and the "Cadmean" letters, while Cecrops inculcated laws and ways of life and was the first to establish monogamy. Although the reptile is not particularly intelligent, it has become famed for shrewdness and wisdom, whether in the Garden of Eden (Gen. iii. 1; 2 Cor. xi. 3) or generally (*cf.* Matt. x. 16): "Be ye therefore wise as serpents, and harmless as doves."

Serpents in Healing.—In one form or another the healing powers of the serpent are very familiar in legend and custom. Siegfried bathed in the blood of the dragon he slew and thus became invulnerable; the blind emperor Theodosius recovered his sight when a grateful serpent laid a precious stone upon his eyes; Cadmus and his wife were turned into serpents to cure human ills. In 1899 a court in Larnaca, Cyprus, awarded £80 (Turkish) as damages for the loss of a snake's horn which had been lent to cure a certain disease. It was popularly believed that medical skill could be gained by eating some part of a serpent; the idea that its valuable qualities would thus be assimilated belongs to one of the fundamental dogmas of primitive mankind (*cf.* Porphyry, *De abst.* ii. 48). Serpents were tended in the sanctuaries of the Greek Aesculapius (Asklēpios), the famous god of healing. (*See* AESCULAPIUS.)

At Emesa in Syria, watered by the Orontes, an image, the lower part of which was a scorpion, cured the sting of scorpions and freed the city from snakes. Constantinople was similarly protected by the serpent-trophy of Delphi which Constantine removed thither; an emperor was said to have performed an enchantment over the monument well known in Greek history. In modern India a walking-stick from a species of cane in the neighbourhood of a certain serpent-shrine protects against snakebite. At Fernando Po, when there was an epidemic among children, they were brought to touch a serpent's skin which hung on a pole. The same ideas underlie the story of the Brazen Serpent which cured the Israelites of the bites of the serpents in the Wilderness (Num. xxi. 6–9). The object, however, was no temporary device; centuries later, long after the founding of the temple of Jerusalem, the Brazen Serpent was at last regarded as unorthodox by the reforming king Hezekiah, and the historian who relates its overthrow ascribes its origin to the founder of Israelite national religion (2 Kings xviii. 4).

In Wells and Lakes.—According to primitive thought, rivers, lakes, springs and wells are commonly inhabited by spirits which readily assume human or animal form. Here the serpent and its kind are frequently encountered (Frazer's notes on *Pausanias*, vol. v. pp. 44 *sqq.*). In India the serpent-godlings are very often associated with water, and, even at the digging of a well, worship is paid to the "world serpent," and the Sālagrāma (spiral ammonite), sacred to Vishnu, is solemnly wedded to the Tulasī or basil plant, representative of the garden which the pool will fertilize. It is often supposed that the Nāga (serpent) chiefs rule countries in or under the water, and in Kashmir a submarine serpent-king became a convert and built churches. Especially common are the popular stories connecting serpents with submarine palaces and treasures (Crooke i. 45); and one submarine realm in the Ganges was reputed to possess "the water of strength." In Palestine and Syria, where demoniacal beings are frequently associated with water, local opinion is sometimes uncertain whether the water is under the care of a *jinn* or of a patron-saint. Several springs are named after the serpent, and the sacred fountain of Ephca at Palmyra, whose guardian in the early Christian era was appointed by the god Yarḥibol, is still tenanted by a female serpent-demon which can impede its flow. Jerusalem had the stone Zōḥeleth (possibly "serpent," 1 Kings i. 9) and also its Dragon Well (Neh. ii. 13); and in modern times the curative Virgin's Spring or St. Mary's Well has its dragon which, when awake, swallows the intermittent flow of the water.

The Cosmic Serpent.—The serpent of the water is also the serpent of the great sea upon which the earth rested. Sometimes the reptile lives in submarine infernal regions, and as the demon of the underworld it is sometimes the earth-shaker. The Greek demon or snake Poseidon, god of sea and springs, was an earthquake god. To the great half-serpent monster Typhon were ascribed numerous springs; he was also the cause of earthquakes, and when he buried himself in the earth he formed the bed of the Syrian Orontes. This river, which was otherwise called Drakōn, Typhōn or Ophites, is known at the present day as the "river of the rebel" (*Nahr El-'Aṣi*). The waterspout, sometimes taken for a long-tailed dragon, is a huge sea-serpent, according to the Wanika of East Africa (Tylor, *Primitive Culture*, i. 292 *seq.*). In ancient Persia the rainbow was the celestial serpent; and among some African tribes it is the subterranean wealth-conferring serpent, stretching its head to the clouds, and spilling the rain in its greedy thirst. An early Indian name of the Milky Way is "the path of the serpent" (Crooke i. 25), and a great dragon or serpent is often the cause of eclipses, so that in India, on the occasion of an eclipse, its attention can be attracted by bathing in a sacred stream, or by a ritual which

includes the worship of the image of the snake-god (i. 22 *sqq.*).

Serpent and Parentage.—The folk-lore of the Old and New World contains many examples of supernatural conception, an idea which is supplemented by the actual living belief in the East that supernatural beings can be fathers (E. S. Hartland, Primitive *Paternity; cf.* his *Legend of Perseus* i. 121, etc). In Annam where water spirits may take the form of serpents or of human beings, two deified heroes were said to have been serpents born of a childless woman, who drank from a bowl of water into which a star had fallen. It was a mediaeval belief that the household snake, if not propitiated, could prevent conception, and in Bombay barrenness is sometimes attributed to a serpent which has been killed by the man or his wife in a former state of their existence. Hence the demon is laid to rest by burning the serpent-image with due funereal rites. In the sanctuary of Aesculapius at Epidaurus women were visited in their dreams by a serpent—the reputed father of the child that was born, and elsewhere Sicyon who had such a progenitor was regarded as the son of the divine healer. Similar also was the origin of Augustus in a temple of Apollo, the god who had his tame serpents in the grove on Epirus. Further, as the serpent-father of Alexander the Great came with a healing-root to cure his general Pompey (Cicero, *De div.* ii. 66), so in an Indian story the son of a king of serpents and of a virgin (or, in a variant form, a widow) was succoured in warfare by his sire (Fergusson, p. 266). In India, China and Greece the serpent origin of kings and rulers is well-known.

Relations with Clans.—There are many instances of tribes or clans named after the serpent. These are not necessarily examples of nicknames, since a relationship between the two often shows itself in custom or belief. This feature sometimes applies, also, to cases where the clan does not bear the serpent name. In accordance with universal ideas of the reality of the "name," there are tribes who will refrain from mentioning the serpent. Also there are clans like the American Apaches and Navahos who will neither kill nor eat rattlesnakes. Where the reptile is venerated or feared it is usually inviolable, and among the Brassmen of the Niger the dangerous and destructive cobra was especially protected by an article in the diplomatic treaty of 1856 for the Bight of Biafra (J. F. Maclennan, *Studies,* ii. 524). The North American Indians fear lest their venerated rattlesnake should incite its kinsfolk to avenge any injury done to it, and when the Seminole Indians begged an English traveller to rid them of one of these troublesome intruders, they scratched him—as a matter of form—in order to appease the spirit of the dead snake. The snake-tribes of the Punjab clothe and bury a dead serpent; and elsewhere in India when one is killed in the village a copper coin is placed in its mouth and the body ceremonially burned to avert evil. These snake-tribes claim to be free from snake-bite, as also the ancient Psylli of Africa and the Ophiogenes ("serpent born") of Cyprus who were supposed to be able to cure others. This power was claimed likewise by the Marsians of ancient Italy, and is still possessed by the snake-clan of Senegambia. In Kashmir the serpent-tribes became famous for medical skill in general, and they attributed this to the health-giving serpent (J. Fergusson, *Tree and Serpent Worship* [1873], p. 260). Moreover, the Psylli would test the legitimacy of their new-born by exposing them to serpents which would not harm those of pure birth, and a similar ordeal among the Ophiogenes of Asia Minor showed whether a man was really of their kin (Strabo, xiii. 1, 14). This peculiar kinship between serpent-clans and serpents can be illustrated from Senegambia, where a python is supposed to visit every child of the python-clan within eight days of birth, apparently as a sign of recognition.

Relations with Families.—A kindred belief is that which regards the household snake an agreeable guest, if not a guardian spirit. In Sweden, even in the 16th century, such snakes were virtually household gods and to hurt them was a deadly sin. Among the old Prussians they were invited to share an annual sacrificial meal, and their refusal was a bad sign. Mohammed is said to have declared that the house-dwelling snakes were a kind of *jinn;* and, certainly, the heathen Arabs regarded them as malevolent or benevolent demoniacal beings (Nöldeke, on Arab serpent-lore, *Zeit. f. Völkerpsych* i. 412 *sqq.*) Among the Romans every place had its *genius,* also in the form of a serpent—*cf.* the doubt of Aeneas (Virgil *Aen.* v. 84 *sqq.*)—and household snakes were lodged and fed in vast numbers. They were the guardian-spirits of men and families, and stories are told of the way in which human life depended upon the safety of the reptile. As a chthonic animal the serpent has often been regarded as an embodiment of the soul of the dead. Grimm's story of king Gunthram tells how, while he slept, his soul in serpent-form visited a mountain full of gold (Paulus *Diac.* iii. 34), and Porphyry relates that a snake crawled from beneath the bed of Plotinus at the moment of the philosopher's death. In Bali near Java, where the Nāga-cult flourishes, a serpent is carried at the funeral ceremonies of the Kshatriya caste and burned with the corpse. Among many African tribes the house-haunting serpents are the dead, who are therefore treated with respect and often fed with milk.

As Heroes and Local Guardians.—In Greece, however, the dead man became a chthonic *daemon,* potent for good or evil; his natural symbol as such, often figured on tombs, was the snake. "The men of old time," as Plutarch observed, "associated the snake most of all beasts with heroes," and in Photius the term "speckled hero" thus finds an explanation. At the battle of Salamis the serpent which appeared among the ships was taken to be the hero Cychreus. These heroes might become objects of cult and local divinities of healing; people would pass their tombs in awe, or resort thither for divination or for taking oaths (Jane Harrison, *Journ. of Hell. Studies* xix. 204 *sqq.*). In Egypt not only are there serpents of the houses, but each quarter in Cairo had a serpent-guardian. This is said also of the villages and districts of Armenia, and Buddhist legends affirm it for India. The Satī (Suttee) wife immolated to accompany her deceased husband often became the guardian of the village, and on the Satī shrine a snake may be represented in the act of rising out of the masonry (Crooke, i. 187 *seq.*). Athene ("the Athenian one") was primarily the guardian spirit of Athens, and at the Erechtheum her sacred serpent (apparently known to the 3rd century A.D.), was fed monthly with honey-cakes; when, during the Persian War, it left the food untouched it was taken as a sign that the protectors had forsaken the city. At Lebadeia in the shrine of Trophonios and elsewhere serpents gave oracles.

Human Sacrifice.—The control of the weather was ascribed to the nāga demi-gods and rajahs of India and to the "king of snakes" among North American Indians. It is significant that in India the widely-distributed Nagapančami-festival occurs in the rainy season. There are popular stories of springs and waters which could only be used in return for regular human sacrifices. A very rich dynasty in the Upper Niger was supposed to owe its wealth to a serpent in a well which received yearly a maiden attired as a bride; the cessation of the practice brought drought and sickness (Hartland iii. 57 *seq.*). In Mexico the half-serpent Ahuizotl dragged into its pool hapless passers-by; however, their souls were supposed to go to the terrestrial paradise, and the relatives became rich through the unhappy accident. But in India human sacrifice was actually made in the expectation of gaining hidden treasure, and doubtless we have a survival of this when snake-charmers, for a drop of blood from the finger of a first-born, will track the snakes which are guardians of treasure (Crooke ii. 135, 170 *seq.*). Indian traditions tell how reformers have persuaded the people in the past to stop their human sacrifices to serpent-spirits.

The Famous Dahomey Cult.—Conspicuous in serpent cults is the prominence of women. In India, in Behār, during August, there is a colourless festival in which women, "wives of the snake," go round begging on behalf of the Brahmans and the villages. Among the Nāyars of Malabar at the ceremonies of the Pambantullel, the household serpent-deities show their benevolence by inspiring with oracles certain women who must be of perfect purity. In Travancore a serpent-god is the property of a family, the priests of a temple; the eldest female carries the

image at the festal processions and must lead a celibate life. The cult of the Python Dañh-gbi of Whydah, after taking root in Dahomey, became the most remarkable example of a thoroughly organic serpent cult (A. B. Ellis, *Ewe-speaking Peoples of Slave Coast of W. Africa*, pp. 47 *sqq.*, 140 *sqq.*). The python-deity is god of wisdom and earthly bliss and the benefactor of man: he opened the eyes of the first human pair who were born blind. He is specially invoked on behalf of the king (the nominal head of the priesthood) and the crops, and a very close connexion was supposed to exist between the god's agency and all agricultural life. Initiated priests, after remaining silent in his temple for seven days, receive a new name and thus become ordained. They possess a knowledge of poisons and antidotes and thereby acquire considerable income. Children who touch or are touched by one of the many temple-snakes are sequestered for a year and learn the songs and dances of the cult. Women who are touched become "possessed" by the god. In addition to his ministrant priestesses, the god has numerous "wives," who form a complete organization. Neither of these classes may marry, and the latter are specially sought at the season when the crops begin to sprout. These "wives" take part in licentious rites with the priests and male worshippers, and the python is the reputed father of the offspring. Every snake of its kind receives the profound veneration of the native of Whydah, who salutes it as master, father, mother and benefactor. Such snakes must be treated with every respect, and if they are even accidentally killed, the offending native may be burned alive. Occasional human sacrifice in honour of the god is attested.

Various Developments of Cults.—In the gloomy rites of the Diasia, the Olympian Zeus, as Zeus Meilichios god of wealth, has been imposed upon a chthonic snake-deity who is propitiated by holocausts of pigs and by a ritual of purgation (Harrison, *Prol.* 12–28). In the Thesmophoria (*q.v.*), a sowing festival of immemorial antiquity performed by women, cakes and pigs were thrown to serpents kept in caves and sacred to the corn-goddess Demeter, who, like the Bona Dea, was representative of the fertility of nature. The Maenads ("mad ones") or Bacchae, the women attendants of Dionysus, with their snake-accompaniments, are only one of the various snake-features associated with the cult of a deity who was also a god of healing. The symbol of the Bacchic orgies was a consecrated serpent, and the snakes kept in the sacred cistae of the cult of Dionysus find a parallel among the sect of the Ophites where, at the sacramental rites, bread was offered to the living serpent and afterwards distributed among the worshippers. Other developments may be illustrated from the cult of Aesculapius, who seems to have been merely a deified ancestor, or the interesting Indian healer Sokha Bāba (Crooke i. 147, ii. 122) (*see* AESCULAPIUS).

Contests with Serpents.—For the retention of older cults under a new name, Mohammedanism supplies several examples, as when a forest-serpent of India receives a Mohammedan name (Oldham, p. 128). But sometimes there is a contest between the new cult and the old. Thus Apollo has to fight the oracle serpent of Gaia, and it has been observed that where Apollo prevailed in Greek religion the serpent became a monster to be slain. At Thebes—the Thebans were Serpentigenae—Apollo took the place of Cadmus, who, after killing the dragon which guarded a well and freeing the district, had ended by being turned into a serpent. This looks like the assumption of indigenous traits by a foreigner—much in the same way as Hercules has contests with serpents and dragons, becomes the patron of medicinal springs, and by marrying the serpent Echidna is the ancestor of the snake-worshipping Scythians. But an ethnological tradition appears when Phorbas killed the serpent Ophiusa, freed Rhodes of snakes and obtained supremacy, or when Cychreus slew the dragon of Salamis and took the kingdom: compare the similar view of serpent-conflicts in Persian tradition (Fergusson, p. 44 *seq.*), and the story of the colonization of Cambodia, where the new-comer marries the dragon-king's daughter. A story told by Herodotus (i. 78) admirably shows how the serpent as a child of earth was a type of indigenous peoples.

In Christianity.—It remains to observe the overthrow or supersession of the serpent in Christian lands. At Axum in Abyssinia, where worship was divided between the serpent and the Mosaic Law, it is said that the great dragon was burst asunder by the prayers of Christian saints (*c.* A.D. 340; Fergusson, p. 35). At the Phrygian Hierapolis the serpent Echidna was expelled by the Apostles Philip and John. France had traditions of the destruction of serpents by missionaries (Deane, *Serpent Worship*, p. 283 *seq.*), and memory possibly survived at Luchon in the Pyrenees, where the clergy and people celebrated the eve of St. John by burning live serpents. Christian saints have also stepped into the shoes of earlier serpent-slayers; while, in stories of the "St. George and the Dragon" type, the victory of the pious over the enemy of mankind has often been treated as a literal conflict with dragons, thus introducing a new and confusing element into the subject. At Rouen the celebration of St. Romain seems to preserve a recollection of human sacrifice to a serpent-demon which was primarily suppressed by a pagan hero, and at Metz, where St. Clement is celebrated as the conqueror of a dragon, its image (formerly kept in the cathedral) was taken round the streets at the annual festival and received offerings of food. Most remarkable of all, at Cocullo in the Abruzzi mountains on the border of the old territory of the Marsi snake-men, the serpent-deity has a lineal descendant in the shape of St. Domenico of Foligno (A.D. 950–1031). The shrine is famous for its cures, and when the saint has his serpent-festival on the first Thursday in May, Serpari or serpent-men carry coils of live reptiles in procession before his image, which in turn is hung with serpents of all sizes. The rites are a valuable testimony to the persistence of the cult among people who still claim power over serpents and immunity from their bite, and who live hard by the home of the ancient tribe which ascribed its origin to the son of Circe (M. C. Harrison, *Folklore* xviii. 187 *sqq.*). One may recall the old cult of Sabazios where men waved great red snakes over their heads as they marched in procession. Moreover, we find at Madagascar the procession of the god of fertility and healing, the patron of serpents who are the ministers of his vengeance (Frazer, *Paus.* v. 66 *seq.*). In a Bengal festival the men march entwined with serpents, while the chief man has a rock-boa or python round his neck and is carried or rides on a buffalo (Fergusson 259). (S. A. C.)

SERPENTINE, in mineralogy the name for a group of minerals of the composition $H_4(Mg,Fe)_3Si_2O_9$, probably crystallizing in the rhombic system. According to the habit and optical properties of the crystals, varieties are known under different names, the fibrous types including chrysotile, metaxite and picrolite and a platy variety is known as antigorite. The hardness is 3–4 and the density 2·5–2·7. The dominant cleavage is parallel to the fibres or plates. The colour of the minerals is usually green, but is dependent on the content of iron, colourless, red and yellow serpentines being known.

Serpentine is a common alteration product of magnesium silicates, particularly of olivine, and the rhombic and monoclinic pyroxenes. In igneous rocks it is believed to arise during a late pneumatolytic or hydrothermal stage of their consolidation. In metamorphic rocks the mineral is frequently met with as an alteration product of the olivine forsterite, less often of diopside, as in marbles and lime-silicate rocks.

The variety antigorite appears to be essentially a metamorphic

mineral, the original mineral coming from the Antigorio valley in Piedmont. Chrysotile serpentine often fills veins and seams in massive serpentine rocks and then displays a well-marked fibrous structure, with the fibres arranged transverse to the veins. The asbestos of commerce is largely chrysotile and is derived both from igneous rocks and metamorphosed dolomites.

In petrology the name serpentine is given to those rock masses which consist essentially of serpentine. The purest are derived from peridotites or dunites. In these as in other varieties the serpentine is frequently found as definite pseudomorphs after olivine, enstatite, augite or hornblende, and the mineral may show a characteristic arrangement indicative of the parent mineral. Thus serpentine derived from olivine frequently possesses a mesh structure, from monoclinic pyroxene, a knitted structure, from hornblende, a lattice structure, while the serpentine pseudomorphs of the rhombic pyroxenes are known as bastite.

Serpentines are largely used as ornamental stones. The beauty and variety of these rocks are due to the veining and mottling of the massive serpentine by talc, magnesite, iron oxide and individual crystals of schillerized pyroxenes. Serpentines of igneous origin are widely distributed. In the British Isles the largest masses occur at the Lizard in Cornwall and in the Shetland Isles. They are well developed in the Alps, Pyrenees and Urals, in North America, and occupy a large area of New Caledonia. In Australia, a linear belt of serpentine intrusions can be traced in north-eastern New South Wales over a distance of 200 miles.

The rock known as ophicalcite is an intimate mixture of calcite and serpentine, resulting from the metamorphism of an impure dolomitic limestone. The well-known "eozoon marble" of Canada and the serpentine marble of Connemara are of this character.

For serpentine in geometry *see* CURVE, SPECIAL. (C. E. T.)

SERPUKHOV, a town of Russia, in the province of Moscow, in 54° 56′ N., 37° 28′ E. Built on high cliffs on both banks of the river Nara, 3 m. above its confluence with the Oka, Serpukhov is an important manufacturing and commercial town. Pop. (1926) 43,918. It has important textile and dyeing industries, and its chintz is famous. There are also iron and copper foundries. Grain, hemp and timber, brought from the east down the Oka, are discharged at Serpukhov and sent on to Moscow and Leningrad. The cathedral (1380) was rebuilt in the 18th century; the old fortress has almost entirely disappeared.

Serpukhov is one of the oldest towns of the principality of Moscow; in 1328 it was a nearly independent principality under the protectorate of Moscow. Its fortress protected Moscow on the south and was often attacked by the Tatars; the Mongol prince Toktamish plundered it in 1382, and the Lithuanians in 1410. In 1556 the town was strongly fortified, so that fifteen years later it was able to resist the Mongols. Its commercial importance dates from the 18th century.

SERRA JUNÍPERO, MIGUEL JOSÉ (1713–1784), Spanish missionary in America, was born in the island of Majorca, on Nov. 24, 1713, entered the Franciscan order in 1729, and in 1750 arrived at Mexico City to devote his life to missionary work among the Indians. From 1750 to 1769 he laboured among the Indians of the Sierra Gorda region. In 1769 he accompanied the Gálvez expedition to the north-west, and at San Diego founded the first mission in the present State of California. In 1770 he founded the mission of San Carlos at Monterey, and in 1771 the missions of San Antonio and San Gabriel, the latter near Los Angeles. He began the mission of San Francisco in 1776 and that at Santa Clara in 1777. Many lesser missions were founded by Father Junípero or his band of 16 followers, and these became the first settlements in California. He made Monterey his headquarters, from which he frequently visited all his missions, always covering the distance between them on foot. His farewell visit was in 1783, his health rapidly declining after his return to Monterey, where he died on Aug. 28, 1784.

SERRANO, FRANCISCO, Duke de la Torre and Count of San Antonio (1810–1885), Spanish marshal and statesman, born in the island of Leon, Cadiz, on Dec. 17, 1810. A cadet in 1822, he was promoted from captain to brigadier-general in the Carlist War (1834–1839), and obtained the Cross of San Fernando and many medals. Member of the Cortes for Malaga in 1839, general of division and commander of the district of Valencia in 1840, he helped, in 1841, Espartero to overthrow the regency of Queen Cristina; in 1843 at Barcelona he made a *pronunciamiento* against Espartero. He was minister of war in the Lopez and Olozaga cabinets, senator in 1845, captain-general of Cranada in 1848: from then until 1853 he lived apart from politics. He assisted O'Donnell in the military movements of 1854 and 1856, was made marshal in 1856, and captain-general of Cuba (1859–62), being the first viceroy to advocate political and financial reforms in the colony. On his return to Spain he was made duke de la Torre, grandee of the first class and minister of foreign affairs by O'Donnell. Serrano gallantly exposed his life to help O'Donnell quell the formidable insurrection of June 22, 1866, at Madrid and was rewarded with the Golden Fleece. At the death of O'Donnell, as president of the senate, he helped Rios Rosas to draw up a petition to Queen Isabella against her Moderado ministers. Exiled, he conspired with the duke of Montpensier, Prim, and Sagasta, and was transported to the Canary Islands (July 7, 1868). On Sept. 18, Admiral Topete sent a steamer to bring him to Cadiz. On landing, he signed the manifesto of the revolution with Prim, Topete, Sagasta, and others and, taking command of the revolutionary army, routed Isabella's troops at Alcolea.

The queen fled to France, Serrano entered Madrid, convoked the Cortes Constituyentes (Feb. 1869), and was appointed regent. He respected the liberty of action of the Cortes in choosing Amadeus of Savoy, though he would have preferred Montpensier. He twice attempted to form a coalition cabinet under King Amadeus, and after his abdication (Feb. 11, 1873), he conspired against the federal republic (April 23, 1873), failed, and went to France until General Pavia recalled him on the eve of his *coup d'état* (Jan. 3, 1874). President of the executive again, Serrano tried first a coalition cabinet, in which Martos and Sagasta soon quarrelled, then formed a cabinet presided over by Sagasta, which, however, proved unable to cope with the military and political agitation that ended in the restoration of the Bourbons. During his eleven months of office, Serrano reorganized the finance, tried to renew relations with American and European powers and to suppress revolt. After the Restoration, he spent some time in France, returning to Madrid in 1876; marshal in the senate, he coquetted a little with Sagasta in 1881, and finally gave his open support to the formation of a dynastic left with a democratic programme defended by his own nephew, Gen. Lopez Dominguez. He died in Madrid on Nov. 26, 1885.

(A. E. Ho.)

SERRES, OLIVIA (1772–1834), an English impostor, who claimed the title of Princess Olive of Cumberland, was born at Warwick on April 3, 1772. She was the daughter of Robert Wilmot, a house-painter in that town, who subsequently moved to London. In 1791 she married her drawing-master, John Thomas Serres (1759–1825), marine painter to George III., but in 1804 separated from him. She claimed in 1817 to be the natural daughter of Henry Frederick, duke of Cumberland, brother of George III., and in 1820 claimed to be his legitimate daughter. Her story was that her mother had secretly married the duke in 1767, and that she had been substituted as an infant for the still-born child of Robert Wilmot. In 1823 Sir Robert Peel, then Home Secretary, speaking in parliament, declared her claims unfounded, and her husband expressly denied his belief in them in his will. Mrs. Serres died on Nov. 21, 1834, leaving two daughters. The eldest, who married Antony Ryves, a portrait painter, upheld her mother's claims and styled herself Princess Lavinia of Cumberland. In 1866 she took ner case into court, but the jury declared the signatures to the documents produced to be forgeries.

See W. J. Thoms, *Hannah Lightfoot, and Dr. Wilmot's Polish Princess* (London, 1867); *Princess of Cumberland's Statement to the English Nation; Annual Register* (1866), Case of *Ryves* v. *the Attorney-General.*

SERRI, a village in central Sardinia. To the west of it is a plateau, surrounded by rocky cliffs, which was of great importance in prehistoric times. A group of sacred buildings has been found here, notably a sanctuary containing a sacred well, of a type not infrequent in Sardinia. Two other buildings which served the purposes of worship contained numerous votive offerings in bronze; a group of three altars was also found. There were also massive fortifications forming a complicated defensive system, and the whole group, which was in use down to Roman times, is the finest example we have of an early Sardinian cult centre, especially interesting now that it is known that the cult of the double axe was practised here.

See Taramelli in *Monumenti dei Lincei,* xxiii. (1915–16) 313–436; *Year's Work in Classical Studies,* 1922–23, 114; 1923–24, 117.

SERTORIUS, QUINTUS (d. 72 B.C.) Roman statesman and general, was a native of Nursia in Sabine territory. After acquiring some reputation in Rome as a jurist and orator, he entered upon a military career. He served under Marius in 102 B.C. at Aquae Sextiae (mod. Aix). In 97 he was serving in Spain. In 91 he was quaestor in Cisalpine Gaul, and on his return to Rome he would have been elected to the tribuneship but for the opposition of Sulla. He now declared for Marius and the democratic party. On Sulla's return from the East in 83, Sertorius went to Spain, where he represented the Marian or democratic party, but without receiving any definite commission or appointment. Having been obliged to withdraw to Africa in consequence of the advance of the forces of Sulla over the Pyrenees, he carried on a campaign in Mauretania, in which he defeated one of Sulla's generals and captured Tingis (Tangier). The Lusitanian tribes then invited him (80) to head a rising. Brave and kindly, and gifted with a rough telling eloquence, Sertorius was just the man to impress them favourably, and the native militia, which he organized, spoke of him as the "new Hannibal." Many Roman refugees and deserters joined him, and with these and his Spanish volunteers he completely defeated one of Sulla's generals and drove Q. Caecilius Metellus Pius, who had been specially sent against him from Rome, out of Lusitania.

Sertorius owed much of his success to his statesmanlike ability. His object was to build up a stable government in the country with the consent and co-operation of the people, whom he wished to civilize after the Roman model. He established a senate of 300 members, drawn from Roman emigrants, with probably a sprinkling of the best Spaniards, and surrounded himself with a Spanish bodyguard. For the children of the chief native families he provided a school at Osca (Huesca), where they received a Roman education and even adopted the dress of Roman youths. Strict and severe as he was with his soldiers, he was particularly considerate to the people generally, and made their burdens as light as possible. It seems clear that he had a peculiar gift for evoking the enthusiasm of rude tribes, and we can well understand how the famous white fawn, a present from one of the natives, which was his constant companion and was supposed to communicate to him the advice of the goddess Diana, promoted his popularity.

For six years Sertorius may be said to have really ruled Spain. In 77 he was joined by M. Perperna (or Perpenna) Vento from Rome, with a following of Roman nobles, and in the same year the great Pompey (*q.v.*) was sent to conquer him. Sertorius proved himself more than a match for his adversaries, utterly defeating their united forces on one occasion near Saguntum. Pompey wrote to Rome for reinforcements, without which, he said, he and Metellus would be driven out of Spain. Sertorius was in league with the pirates in the Mediterranean, was negotiating with the formidable Mithridates, and was in communication with the insurgent slaves in Italy. But the arrival of Perperna formed a centre of disaffection, and his influence over the native tribes slipped away from him, though he won victories to the last. In 72 he was assassinated at a banquet, Perperna, it seems, being the chief instigator of the deed.

See Plutarch's lives of *Sertorius* and *Pompey;* Appian, *Bell. civ.* and *Hispanica;* the fragments of Sallust; Dio Cassius xxxvi. 25, 27, 28, xliv. 47; Vell. Pat. ii. 25, 29, 30, 90.

SERUM THERAPY. Serum therapy consists in the introduction into the patient of blood serum containing specific anti-bodies, preformed in some other animal, which will (*a*) neutralise the toxins produced by the corresponding infecting bacteria or (*b*) destroy the corresponding bacteria themselves—thus establishing a condition of "passive" immunity (*q.v.*).

Action of Microbes.—Disease-producing microbes may be divided into two broad groups (1) those secreting poisonous substances or *toxins* into the surrounding tissues or (2) those multiplying and invading areas far distant from the point at which they gained entry to the body of their host.

Again, speaking generally, natural recovery from a bacterial infection due to an organism of the first group coincides with the appearance in the blood serum of a neutralising agent known as *anti-toxin* in adequate amount; whilst when dealing with microbes of the second class, nature elaborates, also in the serum, a different anti-body—a bacteriolysin or immune body for the purpose of destroying the invading bacteria. In each instance the resulting anti-body is specific in character—that is to say, it will only act in opposition to the particular toxin in the one case or in the other to the members of that particular species of microbe whose entry into the body provoked its formation—the serum which is the vehicle of the curative substance is termed in this first instance "anti-toxic" and in the second "anti-bacterial." Thus the early and accurate recognition of the bacterium responsible for any infection it is proposed to treat determines the selection of the appropriate anti-serum.

Preparation of Anti-serum.—As these sera are nowadays employed in considerable quantities it is customary to select a large mammal, such as the horse, for immunisation. After a period of observation during which the freedom of the animal from diseases transmissible to man is established, a series of subcutaneous injections is undertaken starting with an artificially attenuated virus or a mixture of toxin and previously obtained anti-toxin as the case may be and gradually increasing the size of the dose and the potency thereof until the animal is able to withstand enormous quantities of highly poisonous material without any ill effects while maintaining perfect physical condition. From time to time small quantities of blood are withdrawn from the animal and the serum tested to ascertain the amount of anti-body that is available, and when a suitable stage has been reached the animal is bled to the extent of several pints, the serum carefully separated from the blood corpuscles and passed through a sterile porcelain filter to ensure its freedom from bacteria. Occasionally the serum is concentrated, some of its unneeded proteins removed and purified.

It is obvious that a correct appreciation of its valency is necessary for the scientific employment of any serum in the treatment of disease; but, unfortunately, bacterial poisons formed by various micro-organisms, and even by different strains of the same species, not only exhibit many variations in toxicity depending upon biological factors (not all of which are at present known) but they have, so far, proved incapable of isolation in a state of chemical purity. Consequently, it is only possible in the majority of instances to effect a comparison by observing the results of their introduction into suitable experimental animals.

Indeed only in the case of diphtheria toxin is there any universally accepted standard, for here Ehrlich prepared, many years ago, a standard diphtheria anti-toxin of constant valency which is preserved hermetically sealed in vacuo, by means of which all diphtheria toxins can be graded and the potency of the sera prepared by their means expressed in anti-toxic units.

In the case of toxins produced by other bacteria, and in the preparation of anti-bacterial sera, the plan usually adopted is to inoculate gradually decreasing doses of the virus into susceptible animals until the smallest quantity that will cause death with certainty, and within a specified time, is determined. This is termed the minimal lethal dose (M.L.D.) and forms the basis for the standardisation of the corresponding anti-serum. Varying quantities of serum are in turn mixed with a constant dose of virus—usually 100 M.L.D.—and injected into animals until that amount of serum is determined which will effectively neutralise the test dose. This quantity of serum is then regarded as containing one unit of anti-body and the serum which is in process of standardisa-

tion is stated to contain so many units per cubic centimetre.

Anti-toxin Sera.—Of the anti-toxin sera, diphtheria anti-toxin is rightly regarded as the most efficient. Its use, now almost universal, has been largely responsible for the reduction of the death-rate from diphtheria (*see* INFECTIOUS FEVERS) in a most striking manner from over 33% in pre-anti-toxin days to about 7 per cent. This latter figure includes all cases in all stages, but if treatment is instituted on the first day of disease the mortality falls to zero. Tetanus anti-toxin is also of great value, but owing chiefly to the fact that Tetanus (*q.v.*) is rarely diagnosed until the toxin has secured a firm hold upon nervous elements, it has not achieved a position as a therapeutic agent equal to that occupied by diphtheria anti-toxin. On the other hand the mass of evidence accumulated in the World War clearly demonstrates the necessity for its use in the prophylactic treatment of earth-soiled wounds. Gas gangrene, rife during the early days of the World War, led to the production of highly efficient anti-sera for the toxins of B. welchii and the vibrion septique, the necessity for which has largely passed. Another serum, for the neutralisation of the toxin of bacillus botulinus—a germ which gives rise to a particularly fatal type of food poisoning fortunately rare in the British Isles—is also prepared but there is little evidence available as to its efficiency (*see* FOOD POISONING).

Finally, Calmette has obtained an anti-toxic serum, "anti-venene," from horses which he had immunised against both colubrine and viperine venoms.

Anti-bacterial Sera.—Many varieties of anti-bacterial sera have been prepared against many of the microbes of the second group, but few of them have stood the test of time; and at the present day only anti-streptococcic, anti-meningococcic, anti-pneumococcic, anti-anthrax and anti-dysentery sera remain. These have established their positions in the therapeutic armament largely as the result of recent acquisitions to our knowledge of the biology of certain microbes but in part also to improvements in the methods of preparing anti-sera.

The recognition that numberless strains of streptococci exist which though morphologically identical are biologically diverse has resulted in the preparation of polyvalent sera which sometimes produce dramatic recoveries in apparently hopeless cases of septicaemia, although in other instances serum is employed without avail. In the case of infections by the pneumococcus too, several different types may be encountered to some of which no curative serum could be prepared. Within recent years these organisms have been classed into four different groups of which the two first were alone amenable to serum treatment—that designated Type 1 being particularly so. Similarly, and largely as the result of researches necessitated by the prevalence of the so-called "spotted fever" (*see* SPINAL MENINGITIS) during the War the meningococci have been grouped under four types and whilst multivalent sera comprising anti-bodies for all types have been made, the use of appropriate univalent sera has afforded even more successful results. The two anti-sera prepared against pathogenic bacilli, anti-anthrax and anti-dysentery, are both of very considerable value. The first has long been employed either alone or in conjunction with operative measures in the treatment of "malignant pustule," but the position of the latter depends almost entirely upon the ample demonstration of its value in the War provided it is used early in the disease. SERVAL (*Felis serval*), an African wild cat, ranging from Algeria to the Cape. It is of medium size, with long limbs, short tail, and tawny fur spotted with black. It may measure 56in., including the tail. The serval is fairly common in south Central Africa, frequenting thick bush near rivers and preying on the smaller antelopes, guinea-fowls, and francolins. The mantles made from its skin are reserved for native chiefs.

BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

THE SERVAL, A WILDCAT OF AFRICA

SERVETUS, MICHAEL [MIGUEL SERVETO] (1511–1553), Spanish physician and polemic, was born in 1511 at Tudela in Navarre, his father being Hernando Villanueva, a notary of good family in Aragon. His surname is given by himself as "Serveto" in his early works, "per Michaelem Serueto, alias Reues." Later he Latinized it "Servetus"; when writing French (1553) he signs "Michel Seruetus." The surname, Villanovanus or de Villeneufve, is derived from the home of the family, Villanueva. Servetus studied law at Toulouse, where he first became acquainted with the Bible (1528). From 1525 he had found a patron in Juan de Quintana (d. 1534), a Franciscan promoted in 1530 to be confessor to Charles V. In the train of Quintana he witnessed at Bologna the double coronation of Charles in Feb. 1530, visited Augsburg, and perhaps saw Luther at Coburg. The spectacle of the adoration of the pope at Bologna impressed him strongly in an anti-papal direction. He left Quintana, visited Lyons and Geneva, repaired to Oecolampadius at Basle, and pushed on to Bucer and Capito at Strasbourg. His first publication, *De Trinitatis erroribus* (1531, printed by John Setzer at Hagenau) is crude, but original and earnest, and shows a wide range of reading. The essay was followed in 1532 by a revised presentation of his views in dialogue form. We next find him at Lyons (1535) editing scientific works for the Trechsel firm, adopting the "Villanovanus" surname, which he constantly used till the year of his death. At Lyons he found a new patron in Dr. Symphorien Champier (Campegius) (1472–1539), and he then went (1536) to Paris to study medicine under Johann Günther, Jacques Dubois and Jean Fernel. In 1536 Calvin saw Servetus in Paris, and as he himself says, proposed to set him right on theological points. Servetus succeeded Vesalius as assistant to Günther, who extols his general culture, and notes his skill in dissection, and ranks him *vix ulli secundus* in knowledge of Galen. He graduated in arts, and claims to have graduated in medicine, published six lectures on "syrups" (the most popular of his works), lectured on geometry and "astrology" (from a medical point of view) and defended by counsel a suit brought against him (March 1538) by the medical faculty on the ground of his astrological lectures. Shortly afterwards, on the death of his master, he left Paris for Louvain, where he studied theology and Hebrew. He then practised medicine for a short time at Avignon, and for a longer period at Charlieu. In September 1540 he entered the medical school at Montpellier.

Pierre Paulmier, since 1528 archbishop of Vienne, who had attended his lectures in Paris, now invited Servetus to Vienne as his confidential physician. At Vienne he remained for 12 years (1541–53), making money by his practice, and also by renewed editorial work for the Lyons publishers. Outwardly he was a conforming Catholic; privately he pursued his theological speculations. It is probable that in 1541 he had been rebaptized (he maintained the duty of adult baptism at the age of 30). Late in 1545, or very early in 1546, he opened a fatal correspondence with Calvin, forwarding the ms. of a much-enlarged revision of his theological tracts and expressing a wish to visit Geneva. Calvin replied (Feb. 13, 1546) in a letter now lost, in which, he says, he expressed himself "plus durement que ma coustume ne porte." On the same day he wrote to Guillaume Farel, "si venerit, modo valeat mea autoritas, vivum exire nunquam patiar," and to Pierre Viret in the same terms. Evidently Servetus had warning that if he went to Geneva it was at his peril. Writing to Abel Poupin (in

or about 1547) he complains that Calvin would not return his ms., and adds, "mihi ob eam rem moriendum esse certo scio." The volume of theological tracts, again recast, was declined by two Basle publishers, Jean Frellon (at Calvin's instance) and Marrinus, but an edition of 1,000 copies was secretly printed at Vienna by Balthasar Arnollet. Ready by Jan. 3, 1553, the bulk of the impression was privately consigned to Lyons and Frankfort for the Easter market.

On Feb. 26, a letter, enclosing a sheet of the printed book, and revealing the secret of its authorship, was written from Geneva by Guillaume de Trye, formerly *échevin* of Lyons, to his cousin Antoine Arneys in that city. The letter bears no sign of dictation by Calvin (who must, however, have furnished the enclosed sheet). For a subsequent letter Calvin furnished (reluctantly, according to de Trye) samples of Servetus's handwriting, expressly to secure his conviction. The inquisitor-general at Lyons, Matthieu Ory (the "Doribus" of Rabelais) took up the case on March 12; Servetus was interrogated on March 16, arrested on April 4, and examined on the two following days. His defence was that, in correspondence with Calvin, he had assumed the character of Servetus for purposes of discussion. At 4 A.M. on April 7 he escaped from his prison, evidently by connivance. How he spent the next four months is not known. On Saturday, Aug. 6, he rode into Louyset, a village on the French side of Geneva. Next morning he walked into Geneva, put up at "the Rose," and asked for a boat to take him towards Zürich on his way to Naples. Finding he could not get the boat till next day (Monday) he attended afternoon service (he would probably have got into trouble if he had not done so), was recognized at church *par quelques frères*, and immediately arrested.

The process against Servetus (Nicholas de la Fontaine being in the first instance the nominal prosecutor) lasted from Aug. 14 to Oct. 26, when sentence to be burned alive was passed, and carried out next day at Champel (Oct. 27, 1553). Calvin would have had him beheaded. Meanwhile the civil tribunal at Vienne had ordered (June 17) that he be fined and burned alive; the sentence of the ecclesiastical tribunal at Vienne was delayed till Dec. 23. Jacques Charmier, a priest in Servetus's confidence, was condemned to three years' imprisonment in Vienne. The only likeness of Servetus is a small copperplate by C. Sichem, 1607 (often reproduced); the original is not known and the authenticity is uncertain. In 1876 a statue of Servetus was erected by Don Pedro Gonsalez de Velasco in front of his Instituto Antropologico at Madrid; in 1903 an expiatory block was erected at Champel; in 1907 a statue was erected in Paris (Place de la Mairie du XIV^{e} Arrondissement); another is at Aramnese; another was prepared (1910) for erection at Vienne.

The denial by Servetus of the tripersonality of the Godhead and the eternity of the Son, along with his anabaptism, made his system abhorrent to Catholics and Protestants alike, in spite of his intense Biblicism, his passionate devotion to the person of Christ, and his Christocentric scheme of the universe. His earliest theological writings, in which he approximates to the views of F. Socinus, are better known than his riper work. He has been classed with Arians, but he endorses in his own way the homoousian formula, and denounces Arius as "Christi gloriae incapacissimus." He has had many critics, some apologists (*e.g.*, Postel and Lincurius), few followers. The 15 condemnatory clauses, prefacing the sentence at Geneva, set forth in detail that he was guilty of heresies, blasphemously expressed, against the foundation of the Christian religion. An instance of his injurious language was found in his use of the term "trinitaires" to denote "ceux qui croyent en la Trinité." No law, current in Geneva, has ever been adduced as enacting the capital sentence. Claude Rigot, the procureur-général, put it to Servetus that his legal education must have warned him of the provisions of the code of Justinian to this effect; but in 1535 all the old laws on the subject of religion had been set aside at Geneva; the only civil penalty recognized by the edicts of 1543 being banishment. The Swiss churches, while agreeing to condemn Servetus, say nothing of capital punishment in their letters of advice. The extinct law seems to have been revived for the occasion. A controversy followed on the question of executing heretics, in which Beza (for), Mino Selsi (against), and several caustic anonymous writers (especially Castellio) took part.

His Works.—The following is a list of the writings of Servetus:

1. *De Trinitatis erroribus libri septem* (Hagenau, 1531).

2. *Dialogorum de Trinitate libri duo* (Hagenau, 1532); two reprints of 1 and 2, to pass for originals; No. 1 in Dutch version (1620), by Regnier Telle.

3. *Claudii Ptolomaei Alexandrini geographicae enarrationis libri octo; ex Bilibaldi Pirckheymeri translatione, sed ad Graeca et prisca exemplaria a Michaele Villanovano jam primum recogniti. Adjecta insuper ab eodem scholia*, etc., Lyons, Melchior and Gaspar Trechsel (1535; 2nd ed., Lyons, Hugo à Porta, 1542 *seq.;* printed by Caspar Trechsel at Vienne); on this work Tollin founds his high estimate of Servetus as a comparative geographer; the passage incriminated on his trial as attacking the verity of Moses is from Lorenz Friese; the accounts of the language and character of modern nations show original observation.

4. *In Leonardum Fuchsium apologia. Autore Michaele Villanovano* (1536, reproduced by photography, 1909).

5. *Syruporum universa ratio*, etc. (Paris, 1537); four subsequent editions; latest, Venice, 1548 (six lectures on digestion; syrups treated in fifth lecture).

6. *Michaelis Villanovani in quendam medicum apologetica disceptatio pro astrologia* (Paris, 1538; reprinted, Berlin, 1880); the medicus is Jean Tagault, who interrupted Servetus's lectures on astronomy, including meteorology.

7. *Biblia Sacra ex Santis Pagini tralatione . . . recognita et scholiis illustrata*, etc. (Lyons, Hugo à Porta, 1542, *seq.*), remarkable for its theory of prophecy, explained in the preface and illustrated in the notes.

8. D'Artigny says Servetus *fit les argumens* to a Spanish version of the *Summa* of Aquinas; this, and *divers traités de grammaire* from Latin into Spanish have not been identified.

9. *Christianismi restitutio* (1553; perfect copies in Vienna and Paris); a copy in Edinburgh university library is complete except that the missing first 16 pages are replaced by a transcript from the original draft, containing matter not in the print (this supplementary ms. was reproduced by photography, 1909); a transcript of other portions of the draft is in the Bibl. Nat., Paris; partly reprinted (London, 1723) (copies in London and Paris); reprinted (page for page) from the Vienna copy (Nuremberg, Rau, 1790); German version, by B. Spiess (Wiesbaden, 1892–95); the last section *Apologia* to Melanchthon, is given in the original Latin. The book is not strictly anonymous; the initials M.S.V. are given at the end; the name Seruetus on p. 199. The often-cited description of the pulmonary circulation (which occurs in the 1546 draft) begins p. 169; it has escaped even Sigmond that Servetus had an idea of the composition of water and of air; the hint for his researches was the dual form of the Hebrew words for blood, water, etc. Two treatises, *Desiderius* (*ante* 1542) and *De tribus impostoribus* (1598) have been wrongly ascribed to Servetus. Most of his few remaining letters are printed by Mosheim; his letter from Louvain was despatched in duplicate (to evade capture), but both were seized; one is in the Record Office (U. 140), the other in the British Museum (Cotton mss., Galba B. x.).

The literature relating to Servetus is very large; a bibliography is in A. v. d. Linde, *Michael Servet* (1891); the following are among the important pieces. Calvin's *Defensio orthodoxae fidei* (1554) (in French, *Déclaration pour maintenir*, etc., 1554), is the source of prevalent misconceptions as to Servetus's opinions, and attitude on his trial. De la Roche's *Historical Account* in *Mem. of Lit.* (1711–12) (in French, *Biblioth. Ang.* Amsterdam, 1717) was followed by *An Impartial History*, etc., 1724 (said to be by Sir Benjamin or Nathaniel Hodges). Allwoerden's *Historia*, etc. (1728) (materials furnished by Mosheim) is superseded by Mosheim's *Anderweitiger Versuch* (1748, with appendix, *Neue Nachrichten*, etc., 1750), reproducing the records of the Vienne examination (since lost) first printed by D'Artigny. *Nouveaux Mémoires d'hist.*, etc., vol. ii. (1749). Chauffepié's valuable article, *Nouv. Dict. historique*, iv. (1756) (in English, by Rev. James Yair, 1771) makes no use of Mosheim's later researches. Trechsel's *Die Prot. Antitrinitaires vor F. Socin*, bk. i. (1839), uses all available material up to date. The investigations of H. Tollin (40 separate articles in various journals, 1874 to 1885) have thrown much light, mixed with some con-

jecture. The records of the Geneva trial, first published by De la Roche, reproduced in Rilliet's *Relation* etc. (1844), and elsewhere, are best given in vol. viii. (1870) of the *Corpus reformatorum* edition of Calvin's works; Roget's *Hist. du peuple de Genève*, vol. iv. (1877), has a good account of both trials. The passage on the pulmonary circulation, first noticed by W. Wotton, *Reflections upon Anc. and Mod. Learning* (1694), has given rise to a literature of its own; *see*, especially, Tollin, *Die Entdeckung des Blutkreislaufs*, etc. (1876); Huxley, in *Fortnightly Rev.* (Feb. 1878); Tollin, *Kritische Bemerkungen über Harvey und seine Vorgänger* (1882). Other physiological speculations of Servetus are noted by G. Sigmond, *Unnoticed Theories of Servetus* (1826). The best study of Servetus as a theologian is Tollin's *Lehrsystem M. Servets* (3 vols., 1876–78); Pünyer's *De M. Serveti doctrina* (1876) is useful. From a Unitarian point of view, Servetus is treated by R. Wright, *Apology* (1807); W. H. Drummond (1848); R. Wallace, *Antitrin. Biog.* (1850); J. S. Porter, *Servetus and Calvin* (1854). E. Saisset, *Rev. des deux Mondes* (1848), treats Servetus as a pantheist; he is followed by Menendez Pelayo, *Los Heterodoxos españoles* (1880, vol. ii.), and by R. Willis, *Servetus and Calvin* (1877, *cf.* A. Gordon, *Theol. Rev.*, April and July 1878). Of Servetus's personal character the best vindication is Tollin's *Characterbild M. Servets* (1876); *see* also A. Dide, *M. Servet et Calvin* (1907); W. Osler, *Michael Servetus* (N.Y., 1909); J. van der Erde, *M. Servet* (Amsterdam, 1909); A. Gordon, *The Personality of M. Servetus* (1910), and *Servetus and the Spanish Inquisition* (1925). His story has been dramatized by Max Ring, *Die Genfer* (1850), by José Echegaray, *La Muerte en los Labios* (1880), by Albert Hamann, *Servet* (1881), and by Prof. Shields, *The Reformer of Geneva* (1897). (A. Go.; X.)

SERVICE, ROBERT WILLIAM (1874–), Canadian poet and novelist, was born at Preston, England, on Jan. 16, 1874, and educated at Hillhead public school, Glasgow. He went in 1905 to Canada and settled for a short time in Vancouver island. He entered the Canadian Bank of Commerce in Victoria, B.C., and was afterwards transferred first to White Horse in the Yukon and then to Dawson. In all he spent eight years in the Yukon and travelled widely. During his last years with the bank he wrote verse describing life in the North, notably *Songs of a Sourdough* (1907) and *Ballads of a Cheechako*. In 1910 appeared a novel *The Trail of '98* giving a vivid description of men and conditions in the Klondike. During the Balkan War of 1912–13 Service was war correspondent to *The Toronto Star* and served this paper in the same capacity during the World War, in which he spent two years as an ambulance driver in the Canadian Army Medical Corps. He described his war experiences in *Rhymes of a Red Cross Man* (1916). After the War he devoted himself to literary work in Paris. His other works include *Rhymes of a Rolling Stone* (1913); *Ballads of a Bohemian* (1920); *Poisoned Paradise*, a novel of Monte Carlo (1922); *The Roughneck* (1923).

SERVICE STRIPE: *see* STRIPE.

SERVICE TREE (*Pyrus domestica*), a native of the Mediterranean region, not infrequently planted in southern Europe for its fruit. It has been regarded as a native of England on the evidence of a single specimen, which has probably been planted, now existing in the forest of Wyre. The tree is seldom productive till it has arrived at a goodly size and age. The fruit has a peculiar acid flavour, and, like the medlar, is fit for use only when kept till it has become "bletted," *i.e.*, partially rotten. There is a pear-shaped variety, *pyriformis*, and also an apple-shaped variety, *maliformis*, both of which may be propagated by layers, and, better, by grafting on seedling plants of their own kind. The fruit is sometimes brought to market in winter. The service is nearly allied to the mountain ash, *Pyrus Aucuparia*, which it resembles in having regularly primate leaves. *P. torminalis* is the wild service, a small tree occurring in woods and hedges from Lancashire southwards; the fruit is sold in the country markets.

SERVITES or **"SERVANTS OF MARY,"** an order under the rule of St. Augustine, founded in 1233. In this year seven merchants of Florence, recently canonized as "the seven holy Founders," gave up their wealth and position, and with the bishop's sanction established themselves as a religious community on Monte Senario near Florence. They lived an austere life of penance and prayer, and being joined by others, they were in 1240 formed into an order following the Augustinian rule supplemented by constitutions borrowed from the Dominicans. Soon they were able to establish houses in various parts of Italy, France, Germany and Spain. The most illustrious member of the order and its chief propagator and organizer was St. Filippo Benizi, the fifth general, who died in 1285. The order received papal approbation in 1255; in 1424 it was recognized as a Mendicant order, and in 1567 it was ranked with the four great orders of Mendicant friars.

BIBLIOGRAPHY.—The chief work on the Servites is the *Monumenta* by Morini and Soulier, 1897, etc. Max Heimbucher, *Orden u. Kongregationen* (1907), ii. § 73; Wetzer u. Welte, *Kirchenlexicon* (2nd ed.); the *Catholic Encyclopaedia;* Herzog-Hauck, *Realencyklopädie* (3rd ed.). The most interesting part of Servite history is told by P. Soulier, *Vie de S. Philippe Benizi* (1886). (E. C. B.)

SERVITUDE, a right over the property of another. In Roman law, servitudes were classified into (1) personal and (2) praedial. (*See* ROMAN LAW.)

The term "servitude" is in use in Scots law and in other systems which have been much influenced by Roman law. For the English law, *see* EASEMENTS.

SERVIUS HONORATUS, MAURUS (or MARIUS), Roman grammarian and commentator on Virgil, flourished at the end of the 4th century A.D. He is one of the interlocutors in the *Saturnalia* of Macrobius, and allusions in that work and a letter from Symmachus to Servius show that he was a pagan. He was one of the most favourable examples of the Roman "grammatici" and the most learned man of his time. He is chiefly known for his commentary on Virgil, which has come down to us in two distinct forms. The first is a comparatively short commentary, definitely attributed to Servius in the superscription in the mss. and by other evidence. A second class of mss. (all going back to the 10th or 11th century) presents a much expanded commentary, mostly clearly of ancient origin.

The real Servian commentary practically gives the only complete extant edition of a classic author written before the destruction of the empire. It is constructed very much on the principle of a modern edition, and is partly founded on the extensive Virgilian literature of preceding times, much of which is known only from the fragments and facts preserved in the commentary. The notices of Virgil's text supply valuable information concerning the ancient recensions of Virgil. Besides the Virgilian commentary, other works of Servius are extant: a collection of notes on the grammar (*Ars*) of Aelius Donatus; a treatise on metrical endings (*De finalibus*); and a tract on the different metres (*De centum metris*).

Editions of the Virgilian commentary by G. Fabricius (1551); P. Daniel, who first published the enlarged commentary (1600); and G. Thilo and H. Hagen (1878–1902). *See* E. Thomas, *Essai sur Servius* (1880); O. Ribbeck's *Virgil* (1894–95); *Journal of Philology*, x. (1882); W. A. Baehrens, *Cornelius Labeo* (Leipzig, 1918). The smaller works are in Keil's *Grammatici Latini*, vol. iv.

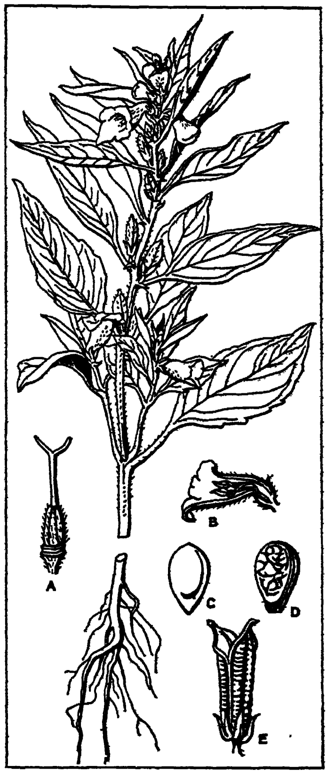
SERVIUS TULLIUS, sixth legendary king of Rome (578–534 B.C.). According to one account he was the son of the household genius (Lar) and a slave named Ocrisia, of the household of Tarquinius Priscus. He married a daughter of Tarquinius and succeeded to the throne by the contrivance of his mother-in-law, Tanaquil, who was skilled in divination and foresaw his greatness. Another legend, alluded to in a speech by the emperor Claudius (fragments of which were discovered on a bronze tablet dug up at Lyons in 1524), represented him as an Etruscan soldier of fortune named Mastarna, who attached himself to Caeles Vibenna (Caelius Vivenna), the founder of an Etruscan city on the Caelian Hill (*see* also Tacitus, *Annals*, iv. 65). An important event of his reign was the conclusion of an alliance with the Latins, whereby Rome and the cities of Latium became members of one great league. His reign of forty-four years was ended by a conspiracy headed by his son-in-law, Tarquinius Superbus.

Servius was regarded as the originator of a new classification of the people, which laid the foundation of the gradual political enfranchisement of the plebeians (for the constitutional alterations with which his name is associated, *see* ROME: *Ancient History;* for the Servian Wall, *see* ROME: *Archaeology*).

For a critical examination of the story *see* Schwegler, *Römische Geschichte*, bks. xvi., xvii.; Sir G. Cornewall Lewis, *Credibility of early Roman History*, ch. xi.; W. Ihne, *History of Rome*, i.; E. Pais, *Storia di Roma*, i. (1898); and *Ancient Legends of Roman History* (Eng. trans., 1906); C. Pascal, *Fatti e legende di Roma antica* (Florence, 1903); also O. Gilbert, *Geschichte und Topographie der Stadt Rom im Altertum* (1883–85), and J. B. Carter, *The Religion of Numa* (1906), on the reorganization of Servius.

SESAME, the most important plant of the genus *Sesamum* (family Pedalineae), is that which is used throughout India and other tropical countries for the sake of the oil expressed from its seeds. *S. indicum* is a herb 2 to 4 ft. high, with the lower leaves on long stalks, broad, coarsely toothed or lobed. The upper leaves are lanceolate, and bear in their axils curved, tubular, two-lipped flowers, each about $\frac{3}{4}$ in. long, and pinkish or yellowish in colour. The four stamens are of unequal length, with a trace of a fifth stamen, and the two-celled ovary ripens into a two-valved pod with numerous seeds. The plant has been cultivated in the tropics from time immemorial and is supposed to have been derived from the Indian archipelago, but at present it is not known with certainty in a wild state. The colour of the flower, and that of the seeds, ranges from light yellow or whitish to black. Sesame oil, otherwise known as gingili or til (not to be confounded with that derived from *Guizotia* [family Compositae], known under the same vernacular name), is very largely used for the same purposes as olive oil, and although less widely known, is commercially much more important. The seeds and leaves are used by the natives as demulcents and for other medicinal purposes. The soot obtained in burning the oil is said to constitute one of the ingredients in Indian or Chinese ink.

For further details *see* G. Watt, *Dictionary of Economical Products of India* (1893).



FROM KOEHLER, "MEDICINAL PLANTS"

SESAME (SESAMUM INDICUM)
A. Flower after removal of corolla and calyx. B. Longitudinal section of flower. C. & D. Seeds of white and black varieties. E. Ripe fruit

SESIA, a river of northern Italy, rising below Monte Rosa, passes Alagna (a favourite mountain resort) and Varallo (*q.v.*) and leaves the mountains at Romagnano; then flows past Vercelli (*q.v.*) and soon falls into the Po.

SESOSTRIS, the name of a legendary king of Egypt. According to Herodotus, Diodorus Siculus (who calls him Sesoosis) and Strabo, he conquered the whole world, even Scythia and Ethiopia, divided Egypt into administrative districts or nomes, was a great lawgiver, and introduced a system of caste and the worship of Serapis. He has been considered a compound of Seti I. and Rameses II., belonging to the XIXth Dynasty. In Manetho, however, he occupied the place of the second Senwosri (formerly read Usertesen) of the XIIth Dynasty, and his name is now usually viewed as a corruption of Senwosri. So far as is known no Egyptian king penetrated a day's journey beyond the Euphrates or into Asia Minor, or touched the continent of Europe. The kings of the XVIIIth and XIXth dynasties were the greatest conquerors that Egypt ever produced, and their records are clear on this point. Senwosri III. raided south Palestine and Ethiopia, and at Semna beyond the second cataract set up a stela of conquest that in its expressions recalls the stelae of Sesostris in Herodotus: Sesostris may, therefore, be the highly magnified portrait of this Pharaoh. Khian, the powerful but obscure Hyksos king of Egypt, whose prenomen might be pronounced Sweserenrē, is perhaps a possible prototype, for objects inscribed with his name have been found from Baghdad to Cnossus. Sesostris is evidently a mythical figure calculated to satisfy the pride of the Egyptians in their ancient achievements, after they had come into contact with the great conquerors of Assyria and Persia.

Herodotus ii. 102–111; Diod. Sic. i. 53–59; Strabo xv. p. 687; *see* also article EGYPT; and Kurt Sethe, "Sesostris," 1900, in his *Unters. z. Gesch. u. Altertumskunde Ägyptens,* tome ii.

SESSA AURUNCA, a town and episcopal see of Campania, Italy, in the province of Rome, on the south-west slope of the extinct volcano of Rocca Monfina, 27 m. by rail W.N.W. of Caserta and $20\frac{1}{2}$ m. E. of Formia by the branch railway to Sparanise, 666 ft. above sea-level. Pop. (1921) 19,202 (town), 21,488 (commune). It is situated on the site of the ancient Suessa Aurunca, on a small affluent of the Liri. The town contains many ancient remains, notably the ruins of an ancient bridge in brickwork of twenty-one arches, of substructures under the church of S. Benedetto, of a very large cryptoporticus, belonging probably to a gymnasium, and of an amphitheatre. The Romanesque cathedral is a basilica with a vaulted portico and a nave and two aisles begun in 1103, a mosaic pavement in the Cosmatesque style, a good ambo resting on columns and decorated with mosaics showing traces of Moorish influence.

The ancient chief town of the Aurunci, Aurunca or Ausona, is believed to have lain on the narrow south-western edge of the extinct crater of Rocca Monfina (3,297 ft.). Here some remains of Cyclopean masonry exist; but the area enclosed is too small for anything but a detached fort of a time prior to Roman supremacy. In 337 B.C. the town was abandoned in favour of the site of the modern Sessa. In 313 a Latin colony under the name Suessa Aurunca was founded here.

See G. Tomassino, *Sessa Aurunca e i suoi avanzi archeologici* (1925).

SESSION, the period or time that a legislature, court or council meets for business, whether for the day or for the full term. A session of the British parliament is reckoned from its assembling till prorogation; usually there is one session each year. The Congress of the United States similarly meets ordinarily once a year, the so-called long session beginning in December of the odd-numbered years and adjourning whenever Congress so decides, generally in the early summer, and the short session beginning in December of the even-numbered years and ending on the succeeding March 4. The president may call an extraordinary session at any time. The term is applied to the sittings of various judicial courts, especially criminal. The sittings of the justices of the peace or magistrates in Great Britain are "sessions of the peace," i. e. quarter sessions or "petty sessions." In the United States a court of general or special sessions is a local criminal court for lesser offences. The supreme court of Scotland is termed the "court of session." The name is also given in the Presbyterian Church to the lowest ecclesiastical court.

SESTETT, the name given to the second division of a sonnet, which must consist of an octave, of eight lines, succeeded by a sestett, of six lines. In the usual course the rhymes are arranged *abc* | *abc*, but this is not necessary. Early Italian sonnets, and in particular those of Dante, often close with the rhyme-arrangement *abc* | *cba*. In the quatorzain, there is properly speaking no sestett, but a quatrain followed by a couplet, as in the case of Shakespeare's so-called "Sonnets." Another form of sestett has only two rhymes, *ab* | *ab* | *ab;* as in Gray's sonnet "On the Death of Richard West." The sestett should mark the turn of emotion in the sonnet; as a rule it may be said that the octave having been more or less objective, in the sestett reflection should make its appearance, with a tendency to the subjective manner.

Wordsworth and Milton are both remarkable for the dignity with which they conduct the downward wave of the sestett in their sonnet. The French sonneteers of the 16th century, with Ronsard at their head, preferred the softer sound of the arrangement *aab* | *ccb* |.

SESTINA, a most elaborate form of verse, employed by the mediaeval poets of Provence and Italy, and occasionally used by modern poets. The scheme was the invention of the troubadour, Arnaut Daniel (d. 1199), who wrote many sestinas in the *lingua di sì.* Dante, a little later, wrote sestinas in Italian, above all that beginning "Al poco giorno ed al gran cerchio d' ombra." In the *Dē vulgari Eloquio,* Dante admits that he imitated Arnaut; "et nos eum secuti sumus," he says. The sestina, in its pure mediaeval form, consists of six stanzas of six lines each of blank verse: hence the name. The final words of the first stanza appear in varied order in all the others, the order laid down by the Provençals being:—*abcdef, faebdc, cfdabe, ecbfad, deacfb, bdfeca.*

On these stanzas followed a *tornada*, or *envoi*, of three lines, in which all the six key-words were repeated in the following order: —*b-e, d-c, f-a.* What symbolism, if any, this rigid form concealed, has been lost. Petrarch cultivated a slightly modified sestina, but later the form fell into disuse, until it was revived by the poets of the Pléiade, in particular by Pontus de Tyard. In the 19th century, it was assiduously cultivated by the Comte de Gramont, who, between 1830 and 1848, wrote a large number of examples, included in his *Chant du passé* (1854). The earliest sestina in English was published in 1877 by Edmund Gosse; this was in the style of Daniel. Since that time it has been frequently employed by English and American writers, particularly by Swinburne, who has composed some beautiful sestinas on the French pattern; of these, that beginning "I saw my soul at rest upon a day" is perhaps the finest specimen in English. His astonishing *tour de force*, "The Complaint of Lisa," is a double sestina of 12 verses of 12 lines each. The sestina was cultivated in Germany in the 17th century, particularly by Opitz and Weckherlin. In the 19th century an attempt was made, not without success, to compose German sestinas in dialogue, or even double sestinas.

SESTRI LEVANTE, seaport of Liguria, Italy, in the province of Genoa (anc. *Segesta Tiguliorum*), from which it is 28½ m. distant by rail, 33 ft. above sea-level. Pop. (1921) 11,333, town; 14,444, commune. It is both a summer and a winter resort, with fine views. Part of the town is situated on a promontory (230 ft.) between two bays. Here the roads for Borgotaro and Spezia turn inland. There is an important shipbuilding yard at Riva Trigoso, in a sheltered bay 3 m. to the south. From this point to Spezia (25 m.) the coast is so precipitous that the railway traverses 46 tunnels with a total length of over 18½ m.

SESTRI PONENTE, a town of Liguria, Italy, in the province of Genoa, 4 m. W. of that town on the coast. Pop. (1921) 26,026, town; 28,269, commune. It has important shipbuilding yards and iron-works, with factories for railway carriages, tanneries, etc., and, in the vicinity, alabaster quarries. A mile and a half west is Pegli, with beautiful walks and fine villas.

SETH or, more correctly, **SHETH,** was according to the "priestly" tradition the firstborn son of Adam and Eve, Genesis v. 3 (*cf.* also I. Chron. i. 1, Luke iii. 38). The main tradition of the Yahwist, on the other hand, makes Cain the firstborn son. But a secondary stratum within this tradition, Genesis iv.25, agrees with the priestly genealogy, and provides for the name an etymology. In the R.V. margin of Numbers xxiv. 17 the Moabites are called "sons of Sheth"; this may be due to confusion with the Sutu of the cuneiform records, a nomad people of the North Syrian desert. Seth is much more prominent in Jewish tradition than in the Old Testament, and many fancies gathered round the name (*see* Josephus, *Ant.* I.ii.3). Ecclesiasticus xlix.16 couples him with Shem as "glorified among men." There was an heretical Jewish sect known as the Sethites, whose doctrines were taken over by a Christian Gnostic sect similarly named.

SETH, ANDREW (ANDREW SETH PRINGLE-PATTISON) (1856–), Scottish philosopher, was born in Edinburgh and educated at Edinburgh high school and university. In 1898 he assumed the name of Pringle-Pattison when he succeeded to Haining estate. He became assistant professor of logic and metaphysics at Edinburgh university in 1880. On the foundation of the University college of Cardiff in 1883 he was appointed professor of logic and philosophy, holding a similar post at St. Andrews from 1887 to 1891, and at Edinburgh from 1891 to 1919. In 1921 he was appointed Hibbert lecturer, and from 1921 to 1923 was Gifford lecturer at Edinburgh university.

His many publications on philosophical subjects include: *The Development from Kant to Hegel* (1882); *Man's Place in the Cosmos* (1897, enlarged ed. 1902); and many lectures and essays.

SETIA (mod. *Sezze*, 44 m. by rail S. E. of Rome), an ancient town of Latium (adjectum), Italy, on the south-west edge of the Volscian mountains, overlooking the Pomptine Marshes, 1,047 ft. above sea-level, and over 900 ft. above the plain. It was an ancient Volscian town, which became a Latin colony in 382 B.C., and, owing to the strength of its position as a frontier fortress, is frequently mentioned in military history. It was captured by Sulla in 82 B.C. Under the empire it was well known for its wine, which Augustus preferred even to Falernian. Considerable remains of the city walls exist, built of large blocks of limestone in the polygonal style. This style may also be seen in several terrace walls belonging to a later date. The modern town, occupying the ancient site, has a much-restored 13th-century Gothic cathedral. Pop. (1921) 6,683, town; 12,391, commune. At the foot of the hill on which the town stands are considerable remains of Roman villas. Here is the railway station, at which the new line from Rome via Cisterna is joined by the old one via Velletri.

See H. H. Armstrong in *American Journal of Archaeology* (1915), 34. (T. A.)

SET-OFF, in law, a statutory defence to the whole or to a portion of a plaintiff's claim. It was created for mutual debts only by 2 Geo. II. ch. 22 for the relief of insolvent debtors. By the rules of the supreme court (O. XIX. r. 3) a defendant in an action may set off or set up any right or claim by way of counterclaim against the claims of a plaintiff, and such set-off or counterclaim has the same effect as a statement of claim in a cross-action. (*See* PLEADING.) The word "compensation" as used in many foreign codes has substantially the same meaning.

SETON (*Family*). The Scottish family of Seton, Seyton or Seatoun, claims descent from a Dougall Seton who lived in the reign of Alexander I. The family honours include the earldoms of Wintoun (cr. 1600) and Dunfermline; of Eglinton through marriage with the Montgomeries; and through alliance with a Gordon heiress a Seton became the ancestor of the earls and marquesses of Huntly and dukes of Gordon. The Setons were connected by marriage with the royal family of Scotland, and also with the Dunbars, Lindsays, Hays and Maitlands.

Sir Christopher Seton, son and heir of John de Seton, a Cumberland gentleman, and his wife Erminia Lascelles, was born probably in 1278, and came into his inheritance in 1299. He had married about 1301 Christian Bruce, sister of King Robert, who was possibly his second cousin. He was present at his brother-in-law's coronation at Scone in 1306, and saved his life at the battle of Methven later in the same year. According to Dugdale he shut himself up in Lochdoon Castle in Ayrshire, and on the surrender of that castle was hanged as a traitor at Dumfries by order of Edward I. He left no heirs. His widow was in March 1307 in receipt of three pence a day from Edward I. for her support at the monastery of Sixhill in Lincolnshire. She was afterwards placed in the custody of Sir Thomas de Gray. His Cumberland estates, with the exception of his mother's dower, were given to Robert de Clifford. Another Seton, John de Seton, described as having no lands or chattels, was hanged for helping in the defence of Tibbers Castle, and for aiding in the murder of John Comyn, with other prisoners of war, at Newcastle in August 1306.

Sir Alexander Seton (d. *c.* 1360) was probably the brother of Sir Christopher. He received grants of land from King Robert Bruce, and was one of the signatories of the letter addressed by the Scottish nobles to the pope to assert the independence of Scotland. He was twice sent on embassies to England, and in 1333 he defended the town of Berwick against the English. He agreed with the English to surrender the town on a certain date unless he received relief before that time, giving his eldest surviving son Thomas as a hostage. On the refusal of the Scots to surrender at the expiry of the term Thomas Seton was hanged in sight of the garrison. This incident is related by Fordun and Boece, but with inconsistencies that have rendered it suspect. An elder son, Alexander, had perished in 1332 in opposing the landing of Edward Baliol; according to some authorities the third son, William, was hanged with his brother, but he is generally said to have been drowned during the siege; his daughter Margaret married Alan de Wintoun. The tragic death of young Thomas Seton was the subject of a ballad of "Seton's Sons," printed in Sheldon's *Minstrelsy of the Scottish Border;* of a tragedy, *The Siege of Berwick* (1794, printed 1882) by Edward Jerningham, and of another by James Miller (1824).

Sir William Seton of Seton (*fl.* 1371–1393) is said to have been ennobled with the title of Lord Seton, and his heirs laid

claim that the barony of Seton was the oldest in Scotland. By his wife Catherine Sinclair he had eight children. John succeeded him; Alexander married Elizabeth, daughter and heiress of Sir Adam de Gordon, by whom he became the ancestor of the Gordons of Huntly.

Sir John of Seton (d *c.* 1441) was taken prisoner at Homildon Hill in 1402. He was hostage in England for the earl of Douglas in 1405, and again in 1423 for James I. He married Lady Janet Dunbar, daughter of the 10th earl of March. His son Sir William was killed at Verneuil, fighting on the French side, leaving as heir GEORGE (d. 1478), 1st Lord Seton, who was created a lord of parliament in 1448 as Lord Seton. By his first marriage with Margaret, daughter of John Stewart, earl of Buchan, he had a son John, who died during his father's lifetime. He was succeeded by his grandson GEORGE, 2nd Lord Seton (d. 1508), who was a scholar of St. Andrews and Paris, and in common report a necromancer. He was captured by the Flemings, and on his release fitted out and maintained a ship for the purpose of harassing Flemish travellers. His son GEORGE, 3rd Lord Seton, was killed at Flodden in 1513. He redeemed estates which his father had sacrificed to support his enterprises against the Flemings. By his marriage with Janet, daughter of Patrick Dunbar, 1st earl of Bothwell, he left a son GEORGE, 4th Lord Seton (d. 1549), who allowed Cardinal Beaton to escape from custody in 1543, and received considerable grants of land in the sequel. The castle and church of Seton were burnt by Hertford in revenge for the part he had taken against the English in 1544.

George, 5th Lord Seton (1530?–1585), was a Catholic and a firm friend of Mary, queen of Scots. He was present at her marriage with the dauphin in 1557, and three years later he was again in France. When Mary returned to Scotland he became privy councillor and master of the household, but four years later he again found it advisable to retire to France. Mary and Darnley spent their honeymoon at Seton Palace, and Mary found a retreat there after the murder of Rizzio and again after the murder of Darnley. She spent the night before Carberry Hill under Seton's roof, and he was waiting for her on her escape from Lochleven in May 1568. He took her to his castle at Niddrie, Linlithgowshire, and thence to Hamilton. A week later he was taken prisoner at Langside. He was set free after the assassination of the regent Moray, and made his way to Flanders, where he was said to have made his living as a wagoner. He was, in fact, entrusted by Mary's supporters with a mission to the duke of Alva, and sought in vain to secure for service in Scotland two regiments of Scots then in Spanish pay. He returned home in 1571, being apparently reconciled with the government, but he retained his Catholicism and his friendship for Mary, who wrote to Elizabeth in 1581 desiring a passport for Lord Seton that he might alleviate her solitude. In 1581 he was one of Morton's judges, and in 1583 he was sent as ambassador to France, where he sought interference on Queen Mary's behalf. He died soon after his return on Jan. 8, 1585. The 5th Lord Seton figures in Sir Walter Scott's *Abbot.* He was succeeded by his second and eldest surviving son, Robert, who became 6th Lord Seton and 1st earl of Wintoun. His third son, Sir John Seton of Barns, was a gentleman of the bedchamber to Philip II. of Spain. He was recalled to Scotland by James VI., and served as lord of session from 1587 to 1594.

Mary Seton, one of the "Four Maries" attendant on the queen, is supposed to have been the 5th Lord Seton's half-sister. She had been educated with Queen Mary in France, being about a year older than her mistress, with whom she returned to Scotland in 1561. She helped Mary to escape from Lochleven by assuming her clothes. Later on she joined her at Carlisle, and remained with her in her various prisons until 1583, when prison life had undermined her health and spirits. She died in poverty at the abbey of St. Pierre at Reims in 1614.

ROBERT SETON (d. 1603) succeeded his father as 6th lord in 1585, and was created earl of Wintoun in 1600. He married, about 1582, Margaret, eldest daughter of Hugh Montgomerie, 3rd earl of Eglinton. His sons Robert and George were successively earls of Wintoun; the third, Alexander, became, in right of his mother, 6th earl of Eglinton; the fourth, Thomas, was the ancestor of the Setons of Oliveston.

GEORGE, 4th earl of Wintoun (1640–1704), succeeded his grandfather, George Seton, 3rd earl, in 1650. He saw some service in the French army, and fought against the Covenanters at Pentland and at Bothwell Bridge. By his second marriage, with Christian Hepburn, he had a son George, who quarrelled with his father and is said to have been working as a journeyman blacksmith abroad when he succeeded to the title in 1704. In 1715 the 5th earl joined Kenmure with 300 men at Moffat, but it was against his advice that the Jacobite army invaded England. He was lying in the Tower under sentence of death when he succeeded in making his escape, and proceeding to the continent, he became well known in Rome, where he was grand master of the Roman lodge of freemasons. He died there in 1749. With him the earldom became extinct, but it was revived in 1840 in favour of the earls of Eglinton.

Seton, *The History of the House of Seton* (2 vols., 1896); Sir R. Douglas, *Scots Peerage,* new ed. by Sir J. B. Paul; *Calendar of Documents relating to Scotland* in the "Rolls" series; and G. E. C(okayne), *Complete Peerage.*

SETON-WATSON, ROBERT WILLIAM (1879–), English historian, was born on Aug. 20, 1879. He was educated at Winchester and at New college, Oxford, afterwards studying at Berlin, Paris and Vienna universities. He made a special study of the history of Austria-Hungary and of the Balkans, and in 1915 became lecturer in East European history at King's college, London. He made many contributions on his subject to various periodicals, and in 1916 founded the *New Europe,* of which he was joint-editor until 1920. In 1922 he was appointed Masaryk professor of Central European history in the University of London.

He has published a number of volumes dealing with European history and politics, among which may be mentioned *Maximilian I.* (1902); *The Future of Austria-Hungary* (1907); *The Southern Slav Question* (1911); *Roumania and the Great War* (1915); *The Balkans, Italy and the Adriatic* (1915); *German, Slav and Magyar* (1916); *The Rise of Nationality in the Balkans* (1917); *Europe in the Melting-pot* (1919); *The New Slovakia* (1924); *Serajēvo* (1926).

SETTEE, a long upholstered seat, usually high-backed and with arms at each end. Its ancestors were the settle and the chair—it has alternately resembled the one and the other. It is broadly distinguished from the many varieties of sofa by being intended for sitting rather than reclining—its seat is of the same height as that of a chair; its arms and much of its detail are chair-like. It dates from about the middle of the 17th century, but examples of that early period are exceedingly rare. There is a famous one at Knole, made about midway between the restoration of Charles II. and the revolution of 1688. By that time the settee had acquired the splendid upholstery and convoluted woodwork which adorned the end of the Stuart period. Early in the 18th century the conjoined double or triple chair form became fashionable. The form was artless, and the absence of upholstery, save on the seat, produced a somewhat angular effect. As the taste for carved furniture waned these sturdy settees were replaced by lighter ones, often graceful enough in outline but partaking more and more of the "stuffed-over" character. Its modern varieties are many, but in all of them the frame, once so lavishly ornamented, is almost concealed by upholstery. (*See* INTERIOR DECORATION: *English.*)

SETTEMBRINI, LUIGI (1813–1877), Italian man of letters and politician, was born in Naples. At the age of twenty-two he was appointed professor of eloquence at Catanzaro, and married Raffaela Luigia Faucitano (1835). He carried on propaganda for Italian unity, and in 1839 was arrested. Although nothing could be proved against him he was kept in prison for three years at Naples. He took part in the movements of 1848 and then once more was arrested as a suspect (June 1849) and imprisoned. After a monstrously unfair trial, he and two other "politicals" were condemned to death, and nineteen others to

varying terms of imprisonment (February 1851). The death sentences were, however, commuted to imprisonment for life, and Settembrini was sent to the dungeons of Santo Stefano. There he remained for eight years. His friends, including Antonio Panizzi, then in England, made various unsuccessful attempts to liberate him, and at last, in 1859, he was deported with sixty-five other political prisoners. Settembrini's son, Raffaello, boarded the ship as a steward at Cadiz, donned a British officer's uniform, and ordered the ship, bound for America, to London. Settembrini, after a short stay in England, joined his family at Florence in 1860. On the formation of the Italian kingdom he was appointed professor of Italian literature at the university of Naples. In 1875 he was nominated senator, but his first and last speech in the Senate, a violent attack on taxation, caused consternation. He died in 1877. His chief work is his *Lezioni di letteratura italiana.*

Bibliography.—L. Settembrini, *Ricordanze*, 2 vols., edited by F. de Sanctis (Naples, 1879–1880); *Epistolario di Luigi Settembrini*, edited by F. Fiorentino; Countess Martinengo Cesaresco, *Italian Characters* (London, 1901); and a notice in P. Villari, *Studies Historical and Critical* (Eng. ed. 1907).

SETTLE, ELKANAH (1648–1724), English poet and playwright, born at Dunstable on Jan. 1, 1648, entered Trinity College, Oxford, in 1666, but left the university without taking a degree. His first tragedy, *Cambyses, King of Persia,* was produced at Lincoln's Inn Fields in 1667. Rochester encouraged the new writer as a rival to Dryden. Through his influence Settle's *Empress of Morocco* (1671) was twice acted at Whitehall, and proved a signal success on the stage. The play was printed with a preface to the earl of Norwich, in which Settle described with scorn the effusive dedications of other dramatic poets. Dryden was obviously aimed at, and he co-operated with Crowne and Shadwell in an abusive pamphlet entitled "Notes and Observations on the Empress of Morocco" (1674), to which Settle replied in "Some Notes and Observations on the Empress of Morocco revised" (1674). In the second part of *Absalom and Achitophel,* in a passage certainly by Dryden's hand, he figures as "Doeg." Neglected by the court party he took an active share in the anti-popish agitation. When this subsided he turned round to expose Titus Oates, and with the revolution he veered towards the Whig party. But he had lost the confidence of both sides, and "recanting Settle" accordingly abandoned politics for the appointment (1691) of city poet. In his old age he kept a booth at Bartholomew Fair, where he is said to have played the part of the dragon in a green leather suit devised by himself. He became a poor brother of the Charterhouse, where he died on Feb. 12, 1724.

Settle's numerous works include, beside numerous political pamphlets and occasional poems, *Ibrahim, the Illustrious Bassa* (1676), a tragedy taken from Madeleine de Scudéry's romance; *The Female Prelate; being the History of the Life and Death of Pope Joan* (1680), a tragedy; *The Ambitious Slave: or A Generous Revenge* (1694); *The World in the Moon* (1697), an opera, of which the first scene was formed by a moon fourteen feet across; and *The Virgin Prophetess, or The Fate of Troy* (1701), an opera.

SETTLE, a market town and parish in the West Riding of Yorkshire, England, 41½ m. N.W. of Leeds, on the L.M.S. railway. Pop. (1921) 2,389. It is situated at the foot of Castleberg, a limestone cliff 300 ft. in height, in the upper portion of the Ribble valley, amid wild scenery. In this district of almost pure limestone are found the characteristic features of a Karst topography, with dry valleys, bare rock surfaces, caves and gorges well developed. The district includes Victoria cave, close to the town, where bones of animals, implements of stone and bone, and ornaments have been discovered; Clapham and Weathercote caves; Malham cove and tarn; the ravine of Gordale scar; the cliffs of Attermyre and Giggleswick scar; the chasms of Helln pot and Gaping Gill and the waterfall of Stainforth foss. In the town are cotton factories and a tannery, and sheep are reared on the pastures of the limestone hills. To the west of the town is the grammar school of Giggleswick, one of the principal public schools in the north of England, founded in 1512.

SETTLE, a wooden bench, usually with arms and a high back, long enough to accommodate three or four sitters. It is most commonly movable, but occasionally fixed as in the "boxes" of those old coffee-houses of which a few examples still remain in London, and perhaps elsewhere. Its high back was a protection from the draughts of mediaeval buildings—a protection which was sometimes increased by the addition of winged ends or a wooden canopy. It was most frequently placed near the fire in the common sitting-room. Constructed of oak, or other hard wood, it was extremely heavy, solid and durable. Few English examples of earlier date than the middle of the 16th century have come down to us; survivals from the Jacobean period are more numerous. Its vogue did not long outlast the first half of the 18th century.

SETTLEMENT, in law, a mutual arrangement between living persons for regulating the enjoyment of property, and the instrument by which such enjoyment is regulated. Settlements may be either for valuable consideration or not. The latter are usually called voluntary, the former are really contracts, and in general their validity depends upon the law of contract governing in such cases.

The elements of the modern settlement are to be found in Roman law. *Substitutio* (consisting in the appointment of successive heirs in case of the death, incapacity or refusal of the heir first nominated) may have suggested the modern mode of giving enjoyment of property in succession. Such a *substitutio* could only have been made by will, while its relation, usufruct, could be made also *inter vivos,* like the settlement of English law The *dos* or *donatio propter nuptias* corresponds to some extent with the marriage settlement. Other modes of settling property in Roman law were the life interest or *usus,* the *fidei-commissum* and the prohibition of alienation of a *legatum.* The most striking point of difference between the Roman and the English law is that under the former the children took no interest in the contributions made by the parents.

The oldest form of settlement in England was perhaps the gift in frankmarriage to the donees in frankmarriage and the heirs between them two begotten (Littleton, s. 17). This was simply a form of gift in special tail, which became up to the reign of Queen Elizabeth the most usual kind of settlement. The time at which the modern form of settlement of real estate came into use seems doubtful. The plan of granting the freehold to trustees to preserve contingent remainders is said to have been invented by Lord Keeper Sir O. Bridgeman in the 17th century, the object being to preserve the estate from forfeiture for treason during the Commonwealth. The appointment of such trustees was rendered unnecessary by acts of 1845 and 1877.

Settlement in English law is, so far as regards real property, used for two inconsistent purposes—to "make an eldest son," as it is called, and to avoid the results of the right of succession to real property of the eldest son by making provision for the younger children. The first result is generally obtained by a strict settlement, the latter by a marriage settlement, which is for valuable consideration if ante-nuptial, voluntary if post-nuptial. But these two kinds of settlement are not mutually exclusive: a marriage settlement may often take the form of a strict settlement and be in substance a resettlement of the family estate. (*See* Entail; Jointure; Trusts and Trustee.)

In Scotland a *disposition and settlement* is a mode of providing for the devolution of property after death, and so corresponds rather to the English will than to the English settlement. The English marriage settlement is represented in Scotland by the *contract of marriage,* which may be ante- or post-nuptial.

In the United States, settlements other than marriage settlements are almost unknown. These usually take the form of an ante-nuptial contract, entered into prior to the marriage, in which the parties waive any dower or other rights to the estates of the other to which they might be entitled under the law. Occasionally, married couples enter into agreements to waive their claims to each other's estates. Marriage settlements are not in common use, owing to the fact that most states long ago adopted the principles of the English Married Women's Property Acts.

SETTLEMENT, ACT OF, the name given to the act of parliament passed in June 1701, which, since that date, has regu-

lated the succession to the throne of Great Britain. Towards the end of 1700 William III. was ill and childless; his sister-in-law, the prospective queen, Anne, had just lost her only surviving child, William, duke of Gloucester; and abroad the supporters of the exiled king, James II., were numerous and active. The need for the act was obvious. It decreed that, in default of issue to either William or Anne, the crown was to pass to "the most excellent princess Sophia, electress and duchess dowager of Hanover," a grand-daughter of James I., and "the heirs of her body being Protestants." The act is thus responsible for the accession of the house of Hanover to the British throne. In addition to settling the crown, the act contained some important constitutional provisions (many of which are manifest censures on the policy of William III.), of which the following are still in force. (1) That whosoever shall hereafter come to the possession of this crown shall join in communion with the Church of England as by law established. (2) That in case the crown and imperial dignity of this realm shall hereafter come to any person not being a native of this kingdom of England, this nation be not obliged to engage in any war for the defence of any dominions or territories which do not belong to the Crown of England, without the consent of parliament. (3) That after the said limitation shall take effect as aforesaid, judges' commissions be made *quamdiu se bene gesserint* (during good behaviour), and their salaries ascertained and established; but upon the address of both Houses of Parliament it may be lawful to remove them. This clause established the independence of the judicial bench. (4) That no pardon under the great seal of England be pleadable to an impeachment by the Commons in parliament.

The act as originally passed contained four other clauses. One of these provided that "all matters properly cognizable in the Privy Council . . . shall be transacted there," and that all resolutions "shall be signed by such of the Privy Council as shall advise and consent to the same." Another declared that all office-holders and pensioners under the Crown shall be incapable of sitting in the House of Commons. The first of these clauses, which was an attempt to destroy the growing power of the Cabinet, was repealed, and the second seriously modified in 1706. Another clause, repealed in the reign of George I., forbade the sovereign to leave England, Scotland, or Ireland without the consent of parliament. Finally a clause said that "no person born out of the kingdoms of England, Scotland, or Ireland, or the dominions thereunto belonging (although he be naturalized or made a denizen), except such as are born of English parents, shall be capable to be of the Privy Council, or a member of either House of Parliament, or enjoy any office or place of trust, either civil or military, or to have any grant of lands, tenements, or hereditaments from the Crown to himself, or to any other or others in trust for him." By the Naturalization Act of 1870 this clause is virtually repealed for all persons who obtain a certificate of naturalization.

The importance of the Act of Settlement appears from the fact that, in all the regency acts, it is mentioned as one of the acts to the repeal of which the regent may not assent. To maintain or affirm the right of any person to the crown, contrary to the provisions of the act, is high treason by an act of 1707.

SETTLEMENT, SOCIAL: *see* SOCIAL SETTLEMENTS.

SETTLEMENT or **SETTLING DAY.** In stock exchange practice days of settlement are fixed officially for which bargains in stocks and shares are made. Thus, on the London Stock Exchange the settlements take place fortnightly and each occupies four days, the fourth of which is settling day, *i.e.*, that on which payments are made. For details *see* STOCK EXCHANGE.

SETUBAL, a seaport of Portugal, 18 m. S.E. of Lisbon. It was formerly called *St. Ubes* in English and *St. Yves* in French. Pop. (1911) 30,346. Setubal is built on the north shore of a deep estuary, formed by the rivers Sado, Marateca and São Martinho. There are five forts for the defence of the harbour; the castle of St. Philip, built by Philip III. of Spain (1578–1621), commands the city. Setubal exports large quantities of fine salt, oranges and muscatel grapes; it has many sardine-curing and boat-building establishments, and manufactures of fish-manure and lace. Under John II. (1481–1495) Setubal was a favourite royal residence and one of the churches dates from this period; but most of the ancient buildings were destroyed by the great earthquake of 1755. In the sandhills of a low-lying promontory in the bay opposite Setubal are the so-called ruins of "Troia," uncovered in part by heavy rains in 1814 and excavated in 1850. These ruins are those of Cetobriga, which flourished A.D. 300–400.

SEURAT, GEORGES (1859–91), French painter, of the Post-Impressionist movement. He was born in Paris on Dec. 2, 1859. At the age of 16 he entered the École des Beaux Arts and worked four years under Henry Lehmann, a pupil of Ingres. He studied the old masters at the Louvre; and, being interested in the problems and theories about colour, read the works of Chevreul, Charles Blanc, Humbert de Superville, Helmholtz and Ogden N. Rood. He carefully analysed the works of Delacroix, and, as a result of these researches, established the law of contrast by complementary colours. During his military service at Brest, he made use of every opportunity to sketch on the quays. Then, on his return to Paris, he at first devoted himself to drawing, seeking to apply to line and tone a law of contrast, analogous to that of complementary colours. In these drawings, done with black crayon on white Ingres paper, light and dark are contrasted in a harmonious scale of values, and the lines are rhythmically arranged at right angles to one another. It was his practice to paint small sketches in oil in the neighbourhood of Paris, at Asnières and on the Île de la Grande Jatte on the Seine, near Neuilly. A sketch of boys bathing in the Seine led to the first of those large canvases, six in number, which, with a few smaller pictures, constitutes his work. The "Baignade" (now at the Tate gallery) was refused at the Salon of 1884, and was shown at the Salon des Independants, which was organized that year. Here Seurat made the acquaintance of Signac, who had been working on similar lines, and through him became acquainted with the Impressionist movement, whose existence he had ignored. Henceforth he adopted their technique of broken colour (*see* IMPRESSIONISM), but systematized their method. In 1886 he exhibited "Un Dimanche à la Grande Jatte" (now in America), a carefully-organized composition, executed entirely in the "pointillist" technique, by which he attained an extraordinary luminosity. The paint was applied in detached specks, each colour and the exact space which it would occupy being planned in advance, a procedure characterized by some critics as the decline of art into scientific impersonality, while others hailed it as the rise of the artist from fumbling to exactitude. Seurat and Signac were the pioneers of Pointillism, or Neo-Impressionism, as it is sometimes called; other distinguished representatives of the movement being Charles Argrand, Henri Edmond Cross, A. Dubois-Pillet, Lucie Cousturier and Theo van Rysselberghe. Such artists as Camille Pissaro, Gauguin, van Gogh, Matisse, Derain and Metzinger experimented for a while on the same lines. But Seurat was not only a pointillist, he was also a great designer, and this quality in his art has only recently been "discovered." In a letter dated 1890 (published in English translation in Walter Pach's book) he set down his artistic creed. He affirmed that "Art is harmony," and explained how harmony is attained in tone, colour and line by the application of laws of contrast. His aim was to extricate from the manifold and confusing aspects of nature a harmonious and unified organization. His mind was intent on the abstract qualities of form and colour; and therein it anticipated the movement which some 20 years later emphasized the essentiality of artistic design. The four great pictures which followed were experiments on similar lines; "Les Poseuses" of 1888 were painted in a higher key; "La Parade" of 1889 displays an obvious geometrical composition. "Le Chahut" of the same year is distinguished for its rhythmic lines. Finally, his last work, "Le Cirque," shows his perfected style. The picture represents a scene in the circus; the design is full of swing, every detail clearly drawn and carefully considered. Soon after its exhibition in the Salon des Indépendants, Seurat died, on March 29, 1891.

SEVASTOPOL or SEBASTOPOL, a natural harbour of Russia in the Crimean S.S.R., on the south-west coast, in 44° 37′ N., 33° 35′ E., connected by rail with Moscow via Kharkov. It is available at all times for large steamers, and has a depth of 36 to 240 ft. over the whole port. The estuary, which is one of the best roadsteads in Europe and could accommodate the combined fleets of Europe, is a deep and thoroughly sheltered indentation among chalky cliffs, running east and west for nearly 4 m., with a width of three-quarters of a mile, narrowing to 930 yds. at the entrance. The main inlet has also four smaller indentations, and a small river, the Chornaya, enters the head of the inlet. Since 1890 it has been exclusively a naval arsenal and no foreign vessels call at the por unless they have machinery or coal for the Government or the State railways. Its trade has been diverted to Theodosia and Nikolayev, but it has manufactures of machinery, macaroni, flour, leather, soap and tiles. Sevastopol sustained a memorable 11 months' siege in 1854, when the English, French and Turkish troops bombarded it; it was evacuated by the Russians in September 1855, when the fortifications were blown up by the allies, and barely a dozen buildings escaped uninjured. By the treaty of Paris the Russians were bound not to restore the fortress, but during the Franco-Prussian War, in 1870, Sevastopol was again made a naval arsenal. For many years after the siege the town was practically deserted, but it is now flourishing. Pop. (1926) 67,412. It has numerous sanatoria and is a favourite sea-bathing resort. Its museum of biology and marine biological station are famous, and there are schools of navigation.

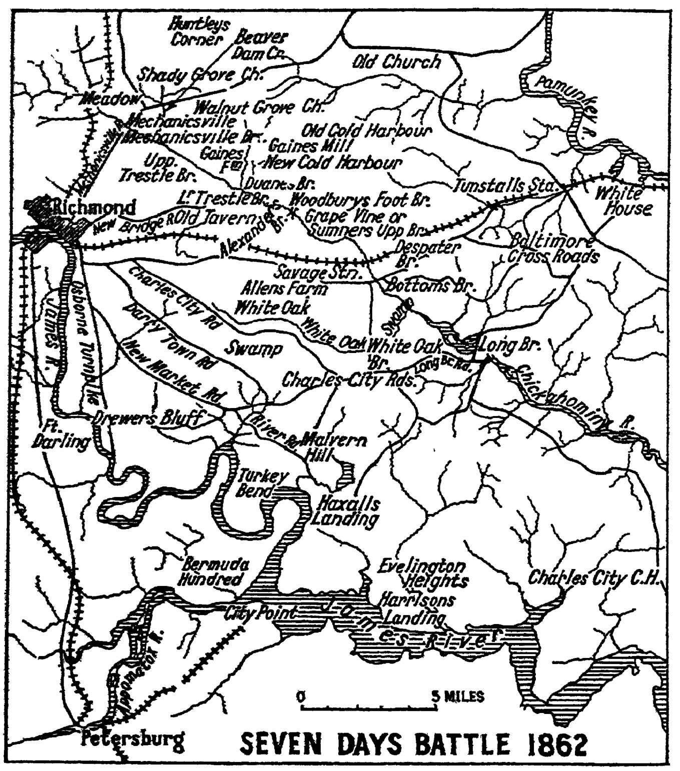
The peninsula between the Bay of Sevastopol and the Black sea was known in the 7th century as the Heracleotic Chersonese. In the 5th century B.C. a Greek colony was founded here and remained independent for three centuries, when it became part of the kingdom of the Bosporus, and subsequently tributary to Rome. Under the Byzantine empire Chersonesus was an administrative centre for its possessions in Taurida. Vladimir, prince of Kiev, conquered Chersonesus (Korsuñ) before being baptized there, and restored it to the Greeks on marrying (988) the princess Anna. Subsequently the Slavs were cut off from relations with Taurida by the Mongols, and only made occasional raids, such as that of the Lithuanian prince Olgierd. In the 16th century a new influx of colonists, the Tatars, occupied Chersonesus and founded a settlement named Akhtyar. This village, after the Russian conquest in 1783, was selected for the chief naval station of the empire in the Black sea and received its present name ("the August City"). In 1826 strong fortifications were begun. Before the Crimean war Sevastopol was a beautiful, well-built city. Some years after the siege an active period of rebuilding began. *See* also CRIMEAN WAR.

SEVČIK, OTTAKAR (b. 1852), Czech violin teacher, was born at Horazdowitz, Bohemia, on March 22, 1852. He studied under Bennewitz at Prague conservatoire until 1870, when he became Konzertmeister of the Mozarteum, Salzburg. In 1873 he accepted a similar post at Vienna, but in the following year went to Russia, where he remained at Kiev until 1892, when he was appointed professor at Prague conservatoire. His system is set forth in his *Method*, and the results which can be achieved by it have been exemplified in the playing of his many famous pupils, including Kubelik, Zimbalist, Marie Hall and many more.

SEVEN CHAMPIONS OF CHRISTENDOM, the name given in mediaeval tales to the seven national saints—of England, Scotland, Ireland, Wales, France, Spain and Italy—*i.e.*, Saints George, Andrew, Patrick, David, Denis, James and Anthony. The classical version of their achievements is that of Richard Johnson (1573–*c.* 1659), *Famous Historie of the Seaven Champions of Christendom* (3 parts, 1596, 1608, 1610).

SEVEN DAYS' BATTLE, a name given to a series of combats in the neighbourhood of Richmond, Va., during the American Civil War, June 26–July 2, 1862. The Federal Army of the Potomac, advancing up the Yorktown peninsula to White House on the Pamunkey and thence over the Chickahominy on Richmond, had come to a standstill after the battle of Seven Pines (or Fair Oaks), and Gen. Robert E. Lee, who succeeded Joseph Johnston in command of the Confederates, initiated the series of counter attacks upon it which constitute the "Seven Days."

McClellan had at his disposal 32 brigades and 67 batteries organized in five corps each of two or three divisions. His cavalry consisted of ten regiments and 22 companies. Lee's army consisted of 40 brigades and 59 batteries organized in 11 divisions and an independent brigade: four divisions were grouped under



SEVEN DAYS BATTLE 1862

Jackson—who, however, did not arrive in the district until June 26—and three under Magruder. The reserve artillery consisted of 23 batteries and Stuart's cavalry corps of 3,000 sabres. McClellan lingered north of Richmond, despite President Lincoln's constant demand that he should "strike a blow" with the force he had organized and taken to the Yorktown peninsula in April, until Gen. Lee had concentrated 73,000 infantry in his front; then the Federal commander, fearing to await the issue of a decisive battle, ended his campaign of invasion in the endeavour to "save his army"; and he so far succeeded that on July 3 he had established himself on the north bank of the James in a position to which reinforcements and supplies could be brought from the north by water without fear of molestation by the enemy. But he lost 15,000 men in the course of his seven days' retreat, and 20% of the remainder became ineffective from disease contracted in the swamps of the Chickahominy, while enormous quantities of valuable stores at White House on the Pamunkey had been burnt to avoid seizure by the enemy. McClellan described this flight to the James as a change of base, a move which, in fact, he had previously contemplated, but the actual impulse was not of his own initiative. Instead, it was the sequel to the action of Gen. Lee, who in the middle of June summoned Jackson's corps from the Shenandoah valley (*q.v.*). The news soon reached McClellan, who thereupon prepared to evacuate White House on June 25 and to move his trains southward to the James covered by his army. Jackson had preceded his troops in order personally to confer with Lee, and had then appointed the morning of June 26 for his appearance north of the Chickahominy to lead the march and attack McClellan's right wing under Gen. Fitzjohn Porter. Jackson was to be supported by the divisions of A. P. Hill, Longstreet and D. H. Hill. Lee's other divisions under Magruder, Huger and Holmes were to defend the lines which covered Richmond from the east and so prevent McClellan effecting a counterstroke. Huger had dem-

onstrated on the Williamsburg road on June 25 in order to draw McClellan's attention to his left wing, and though on June 26 Jackson had failed to appear, Gen. A. P. Hill at 3 P.M. crossed the Chickahominy and attacked the enemy's right wing at Beaver Dam creek assisted by D. H. Hill, while Longstreet crossed at Mechanicsville. Gen. Lee and President Davis were present, and witnessed the loss of 2,000 men in a frontal attack which continued till 9 P.M. Meanwhile Gen. Jackson, with Stuart's cavalry corps, "marched by the fight without giving attention, and went into camp at Hundley's Corner half a mile in rear of the enemy's position."

The Federal detachment retreated during the night to a stronger position in rear at Gaine's Mill near Cold Harbor, and on June 27 the Confederates again attacked Porter's corps. Lee's six divisions formed an échelon. D. H. Hill moving towards the enemy's right was followed by Jackson's corps (three divisions), while A. P. Hill engaged the enemy in front and Longstreet in reserve moved along the left bank of the Chickahominy. The resistance of the Federals was stubborn; at 5 P.M. Gen. Lee required Longstreet to attack the enemy's left, and at this moment he procured the assistance of some part of Jackson's corps, which had become separated from the remainder. About sunset the Federals under Porter (three divisions) yielded to the pressure of the attack at all points, and withdrew after nightfall across the Chickahominy, leaving 5,000 prisoners in the hands of Gen. Lee. That night McClellan issued orders for the movement to the James.

Lee's right wing had in the meantime demonstrated against the main body of the Federals about Fair Oaks, on the south bank of the river. On June 28 complete inactivity supervened among the Confederates north of the Chickahominy save that Stuart's cavalry and Ewell's division were advanced as far as the railway to reconnoitre, but on this day McClellan was making good his retreat southwards to the James with little interference, for Magruder was instructed to "hold his lines at all hazards," and accordingly acted on the defensive except that Jones's division opposed a Federal division under W. F. Smith near Fair Oaks. On June 29 Gen. Lee became aware of the situation and then issued orders for his six divisions to cross the Chickahominy in pursuit. Jackson's corps and D. H. Hill's division were to follow the enemy, while Longstreet and A. P. Hill were to move their divisions via New Bridge to the Darbytown or James river road to cut off McClellan from the James. Stuart was to operate at his discretion north of the Chickahominy, and it seems that he was attracted by the enemy's abandoned depot at White House more than by McClellan's retreating army. On this day Magruder with two divisions attacked superior forces about Fair Oaks and was repulsed, and again attacked at Savage station with like results. Gen. Lee, however, rebuked Magruder for slackness in pursuit. Holmes's division was moving in front of Longstreet on the James river road, but two Federal divisions were holding the route at Willis church and at Jordan's ford. On June 30 Jackson got into action with Whiting's division at White Oak Swamp, while Longstreet encountered the Federals at Frazier's farm (or Glendale). Longstreet was supported by A. P. Hill and together they lost 3,200 men; it was hoped that Jackson's corps would come up during the engagement and attack the enemy's rear, and Huger's division assail his right, but Federal artillery stopped Huger, and of Jackson's three divisions only one came into action. Magruder and Holmes were engaged to their own advantage at Turkey bridge. Longstreet and Hill were thus opposed to five Federal divisions, while Gen. McClellan was pushing his wagons forward to Malvern hill, on which strong position the Army of the Potomac was concentrated at nightfall. On July 1 Jackson's corps and D. H. Hill's division had been drawn again into the main operation and followed the Federal line of retreat to Malvern hill with Huger and Magruder on their right. The divisions of Longstreet and A. P. Hill were in support.

Gen. Lee had thus on the seventh day concentrated his army of ten divisions in the enemy's front; but Jackson's dispositions were unfortunate and Gen. Lee's plan of attack was thus upset; and while seeking a route to turn the enemy's right the Confederate commander was apprised that a battle had been improvised by the divisions in advance. In the result these troops were repulsed with a loss of 6,000 men, a circumstance hardly to be wondered at, as McClellan had entrenched eight divisions on the strongest position in the country, and was aided by his siege artillery and also by a flanking fire from his gunboats on the river near Haxall's Landing. Gen. Lee's offensive operations now ended, though Stuart's cavalry rejoined the main army at night and followed the enemy on July 2 to Evelington Heights, while Lee rested his army. Stuart discovered a position which commanded the Federal camp, and maintained his cavalry and horse artillery in this position until the afternoon of July 3, when, his ammunition being expended, he was compelled to retire before a Federal force of infantry and a battery. Longstreet and Jackson had been despatched to his support, but the former did not arrive before nightfall and the latter failed to appear until the next day (July 4). Stuart afterwards moved farther down the James, and shelled McClellan's supply vessels in the river until recalled by Gen. Lee, who on July 8 withdrew his army towards Richmond.

The operations, indecisive as was their issue, re-established the confidence of the Confederates in their army which Johnston's retreat from Yorktown had shaken, added prestige to President Davis and his Government, and rectified the popular view of Gen. Lee as a commander which had been based upon his failure to recover West Virginia in the autumn of 1861. In the north a feeling of despondency overtook Congress at the "lame and impotent conclusion" of a campaign of invasion which was expected to terminate the war by the defeat of the Confederate army, the capture of Richmond and the immediate overthrow of the Confederacy. (G. W. R.)

SEVENOAKS, a market town in the Sevenoaks parliamentary division of Kent, England, 20 m. S.E. by S. of London by the S. railway. Pop. of urban district (1931) 10,482. It is beautifully situated on high ground among the wooded undulations of the North Downs, above the valley of the river Darent. The town consists principally of two streets which converge at the south end, near which is the church of St. Nicholas, of the 13th, 14th and 15th centuries. The grammar school was founded in 1418 by Sir William Sevenoke, who also founded almshouses in connection with the school. Close to Sevenoaks is Knole park, one of the finest old residences in England, which in the time of King John was possessed by the earl of Pembroke, and at a later date by Archbishop Bourchier (d. 1486).

SEVEN SLEEPERS OF EPHESUS, THE, according to the most common form of a legend first referred to in Western literature by Gregory of Tours (*De glor. mart. c.* 95), seven Christian youths of Ephesus, who, in the Decian persecution (A.D. 250), hid themselves in a cave. Their hiding-place was discovered and its entrance blocked. The martyrs fell asleep in a mutual embrace. Nearly 200 years later a herdsman rediscovered the cave on Mount Coelian, and, letting in the light, awoke the inmates, who sent one of their number to buy food. The lad was astonished to find the cross over the gates of Ephesus, and to hear the name of Christ openly pronounced. By tendering coin of the time of Decius at a baker's shop he roused suspicion, and was taken before the authorities. He confirmed his story by leading his accusers to the cavern where his companions were found, youthful and beaming with a holy radiance. The emperor Theodosius II., hearing what had happened, hastened to the spot and heard from their lips that God had wrought this wonder to confirm his faith in the resurrection of the dead. This message delivered, they again fell asleep.

Gregory says he had the legend from the interpretation of "a certain Syrian"; in point of fact the story is common in Syriac sources. It forms the subject of a homily of Jacob of Sarug (*ob.* A.D. 521), which is given in the *Acta sanctorum*. Another Syriac version is printed in Land's *Anecdota*, iii. 87 *seq.* According to Bīrūnī (*Chronology*, trans. by Sachau, p. 285), certain undecayed corpses of monks were shown in a cave as the sleepers of Ephesus in the 9th century. The story is well told in Gibbon's *Decline and Fall of the Roman Empire*, ch. xxxiii.

SEVEN WEEKS' WAR. This name is given to the war of 1866, fought between Prussia on the one side and Austria, Bavaria,

Saxony, Hanover, and certain minor German States on the other. The issue was decided in Bohemia, where the principal Prussian armies met the main Austrian forces and the Saxon army. A Prussian detachment, known as the Army of the Main, meanwhile dealt with the forces of Bavaria and of the other German States which had sided with Austria. Simultaneously, a campaign was fought in Venetia between the Austrian army of the south and the Italians, who had made an alliance with Prussia; this campaign is described under ITALIAN WARS: *1848–70*.

THE ORIGINS AND OUTBREAK OF THE WAR

The 1866 campaign was a definite and carefully planned stage in the unification of Germany under the Hohenzollern dynasty, of which Bismarck was the principal agent. The issue was clear-cut: Prussia deliberately challenged Austria for the leadership of the Germanic Confederation. And, however unscrupulous the Prussian Government may have been in its methods of designedly provoking a war at its chosen time, Prussia did represent progress and enlightenment in comparison with Austria's intolerance and inefficiency. Prussia had thrown down the glove in 1850, but the complete failure of her mobilization in that year compelled the postponement of the conflict and the acceptance at Olmütz of the somewhat humiliating terms of Austria. Since then Prussia, with Bismarck as statesman, von Moltke as strategist, and von Roon as army organizer, had prepared methodically for a fresh challenge. The actual pretext found by Bismarck in 1866 was a dispute over the administration of Schleswig and Holstein, which Austria and Prussia had seized from Denmark in 1864, and had since held jointly. Diplomatic exchanges began in January and military preparations a little later, but hostilities did not actually break out till the middle of June. By the alliance with Italy, Bismarck contrived to divert part of the Austrian forces to the South. Not only did the majority of the other German States join Austria,

SEVEN WEEKS' WAR: THE GERMANIC CONFEDERATION IN 1866.
English Miles.
Prussian Territory shown thus

but also the war was far from popular with the people of Prussia itself, who did not understand the policy underlying it, and could see no good cause of quarrel with Austria.

The Opposing Forces Compared.—Numerically, the armies of Austria and Prussia were approximately equal. Each mobilized a total of about 550,000 men, of whom some 320,000 constituted the field armies, the remainder being reserves and garrisons. But Austria could also count on the direct support of the Saxons (25,000), and the indirect aid of the forces of Bavaria and other German States (about 150,000). This preponderance in favour of Austria was partly neutralized by the Italian intervention, which withdrew three Austrian corps from the main theatre. Von Moltke, trusting to lack of co-operation between the German States hostile to Prussia, and aware of the comparative inefficiency of their armies, detached a force of under 50,000 to deal with them. Thus in the decisive theatre there was virtually numerical equality; some 270,000 Prussians (if a Reserve Corps of 25,000 be included) opposed 245,000 Austrians and 25,000 Saxons.

Contemporary military opinion held that the Austrian army, with its longer period of active service (seven years against the Prussian three or four) and its recent experience of war, would prove greatly superior to the Prussian army, which had not been engaged in battle for over 50 years. Contemporary military opinion was quite wrong. The Prussians proved to be better trained, better organized, and better led. They had, besides, a great advantage in the possession of a breech-loading rifle. The Austrian muzzle-loading rifle, though a longer-ranging and more accurate weapon, not only had a much slower rate of fire but also could not be re-loaded without exposure of the firer. The superiority conferred by the breech-loader was not, however, recognized at the outbreak of war; and the newer and rather better pattern of gun, with which the Austrian artillery was armed, was fully expected to counterbalance the Prussian advantage of a breech-loading rifle. The Austrian cavalry was considered to be greatly superior in manoeuvre and horsemanship. Though a proportion of the cavalry on both sides was armed with a carbine, little use was made of dismounted action; shock action was held to be the principal, if not the only, rôle of cavalry on the battlefield. The Austrian infantry, also, relied on shock action rather than on fire effect: the Prussians, in spite of their lack of war experience, had arrived at a juster appreciation of the power of the rifle and the possibilities of rapid fire. Both forces were organized into army corps of 25,000 to 30,000 men, comprising four brigades of infantry. But whereas the Prussian corps was subdivided into two divisions each of two brigades, the Austrians had no divisional link, the four brigades working directly under the corps headquarters.

The Rival Commanders.—Since the leadership and strategical handling of the armies in this campaign have been much, even hotly, debated, it is worth while to devote some attention to the personality of the principal commanders on either side. The illustrious von Moltke, who as chief of the general staff to King William, was the virtual leader of the Prussian armies, came later to war than any other of the great captains of history. He was 66 years of age at the beginning of this, his first campaign. He had held the position of C.G.S. since 1857, and had been working at the problem of a war against Austria in the closest detail since 1860 (the date of No. 1 of the famous "Projects"). He was a student of war rather than a battlefield general; the soldiers who won victories under his direction can rarely have set eyes on this quiet, professor-like man, who was calm and inflexible in a crisis. But, though his reputation as a commander in the field has been much and vehemently assailed (the French have never tired of pointing out to their conquerors of 1870 what would have happened had they met the real Napoleon), no more nor greater mistakes have been proved against him than must be made by every leader of large bodies in this blindfold game of war. And, whatever the verdict on his generalship, his fame in military history is secure as the originator of scientific education for war. He was the first to insist on close study of the principles of their profession by all grades of commander.

King William, though he wisely deferred to von Moltke's views on matters of strategy, was no mere figurehead. He was a good judge of men and could make his influence felt. The two royal princes who commanded the I. and II. Prussian armies, Frederick Charles and the Crown Prince, were not great generals, but were both brave soldiers, well grounded in the profession of arms. The Prussian corps commanders and their principal staff officers had all been carefully selected.

The Austrian commander-in-chief, Benedek, was a complete contrast to von Moltke. He had fought with distinction in several campaigns, but had little military education. A Protestant in an almost fanatically Catholic country, of humble origin in an

army where birth was almost the first qualification for high command, he had risen by his personal valour and bold, energetic leadership on the battlefield. He was, in fact, an excellent Corps Commander, but he was no strategist, knew little of the theory of his profession, and had no military imagination. He was only too well aware of his limitations, knew himself unfitted for the handling of large forces, and accepted the command of the Austrian Army of the North with great reluctance, out of loyalty to his emperor. His own wish had been for the command against Italy, a smaller and less responsible task in a theatre of war which he knew well. To trust the fate of an empire to one who so mistrusted himself was obvious folly. Yet Benedek's appointment was very popular with the great mass of the Austrian army, though his relations with his aristocratic corps commanders were never cordial. He needed a really able and tactful chief of staff to supply the necessary technical knowledge and to give him the confidence he lacked.

His nominal chief of the staff was von Henikstein, amicable and rich—civil rather than military virtues—personally brave, but without any real qualification for his important post. He could bring to Benedek neither military knowledge, for he had little, nor confidence, for he was himself of a pessimistic turn of mind. In the actual conduct of operations von Henikstein seems to have been a cipher, and the virtual arbiter of Austrian strategy was Krismanić, head of the operations branch of the general staff. He had been a professor at the staff college and had made a special study of the topography of Bohemia. He was a clever, plausible man, full of self-confidence, and oozed theory of war from every finger-tip. Unfortunately his studies had led him to a conviction of the superiority of the defensive. He based the strategy of this campaign on the successful defensive campaign of the Austrians against Frederick the Great in Bohemia in 1757. He was an arm-chair strategist, a maker of war by rote and by diagram, rather than a practical soldier. The Austrian corps commanders were great nobles, who treated war as a sport and usually troubled themselves little about the theoretical or scientific side of their profession. To sum up, the Austrian army was led by amateurs, the Prussian by professionals.

Topography of the Theatre of Operations.—Bohemia, where the main campaign was fought, is, generally, a country of open rolling plains, highly cultivated. Except the rivers, there are few obstacles to the movements of troops of all arms. But on the northern marches, between Bohemia and Prussia, lies a crescent of mountains, from 2,000 to 4,000ft. in height. These mountains are known in the east, on the Silesian frontier, as the Sudeten Gebirge, in the centre as the Riesen Gebirge, and in the west, on the Saxon frontier, as the Erz Gebirge. The Riesen Gebirge are the most formidable. They constituted a definite barrier, some 36m. in length and 20 in depth, to the movement of large forces. The principal routes from Prussia into Bohemia passed round either end of the Riesen Gebirge, through the lower and less rugged Sudeten and Erz Gebirge,—a fact which had, as will be seen, an important bearing on Prussian strategy. The Sudeten and Erz Gebirge were not steep, troops of all arms could move freely off the roads (except where the country was thickly wooded) and the so-called "passes" were in no sense defiles such as those in the Alps or on the north-west frontier of India. Of the rivers, the Elbe, which rises in the Riesen Gebirge and eventually leaves Bohemia through the Erz Gebirge, is a considerable obstacle, 60 to 70 yards broad at Königgrätz. The Iser, too, is deep, swift and broad, and had some strategical and tactical significance. The other streams in the theatre of operations were unimportant, except the Bistritz, as will be seen, at the battle of Sadowa.

Mobilization and Concentration.—After a long period of diplomatic negotiation, during which both sides had made certain military preparations, Austria ordered the mobilization of her Army of the North on April 27. Prussia followed suit a week later. Mobilization arrangements had not then reached the nicety of timing that in 1914 made a delay of even a few hours dangerous and thus rendered the mobilization of a European state practically equivalent to a declaration of war. The Prussian Corps were originally concentrated in their recruiting areas, a waste of time, since they had again to be broken up for the movement to the frontier by rail, which began on May 16 and was completed by June 5 (the most considerable use of railways in war up to that time).

Much ink has been spilt in criticism and defence of von Moltke's strategical deployment of the Prussian forces for this campaign, of which space permits only the barest possible outline here. The outstanding features of a strategical problem, which von Moltke had been studying in all its bearings for six years, were firstly, the mountain belt, with the almost roadless Riesen Gebirge in the centre, which had to be crossed if an offensive campaign into Bohemia were contemplated, and secondly, the salient formed by the province of Silesia, which greatly complicated the problem of defence should the enemy obtain the initiative. Von Moltke believed that Prussia's better transport arrangements would enable her armies, in spite of their later mobilization, to forestall the Austrians in northern Bohemia, provided they were moved thither with all speed, passing through the mountains on a broad front. Thus the importance of time, which impelled him to use all available railways, motived the original detrainment on a front of 275 miles, from Halle to Neisse. Thence the corps were moved inwards, and by June 8 stood in three groups on a front of about 150 miles: Army of the Elbe (VIII. Corps, 14th Div.) centre about Torgau; I. Army (II., III., IV. Corps) under Prince Frederick Charles, Senftenburg to Gorlitz; II. Army (I., V., VI. Corps) under the Crown Prince, centre about Landshut; the Guard Corps was still at Berlin. Von Moltke would now have liked to unite the armies by a movement into Bohemia. But there followed a delay of nearly a fortnight due to the reluctance of King William to appear the aggressor in the conflict. This delay was almost fatal to the Prussian plan.

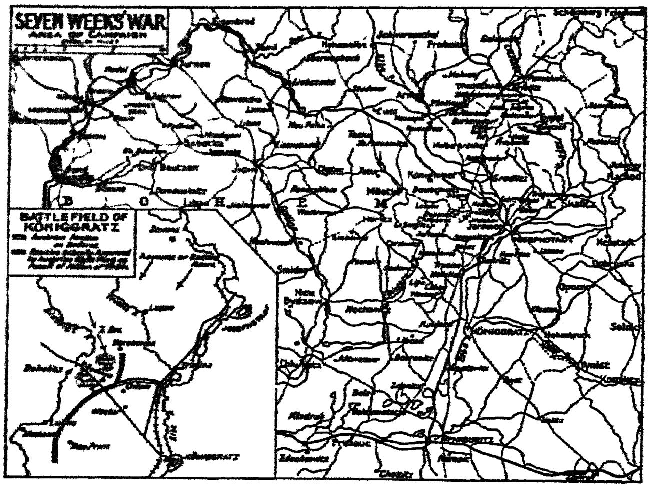
Meanwhile the Austrian army had concentrated round Olmütz in Moravia, near the Silesian frontier, with a detachment of the I. Corps and a cavalry division in northern Bohemia. The Crown Prince, the commander of the Prussian II. Army, convinced that an Austrian invasion of Silesia was imminent, proposed to move his army eastwards to about Neisse, to meet the danger, and also requested the strengthening of his army by the Guard Corps, originally allotted to the I. Army. Moltke was somewhat reluctantly compelled to agree to a move that still further separated the II. Army from the I. and exposed it to the danger of having to meet, unsupported, an attack by the Austrian main forces. This extension of front, for which von Moltke has been criticized, was probably less dangerous than it appeared. Von Moltke was sure of the tactical superiority of the Prussian infantry, with its breech-loading weapon, and could therefore count on the ability of the II. Army to delay any Austrian invasion long enough for the I. Army to intervene; he was also probably aware of the predilection of the Austrian high command for defensive strategy.

On June 15 King William relieved von Moltke of some of his anxieties by sanctioning the invasion of Saxony by the Army of the Elbe. Dresden was occupied on June 19 without fighting, the Saxon Army retiring into Bohemia. This brought the Army of the Elbe into close touch with the I. Army and it was now placed under the command of Prince Frederick Charles. There was still a wide gap between the I. and II. Armies, and a forward concentration in Bohemia was now hazardous, since Benedek had on June 17 ordered the march of the whole Austrian army from Olmütz towards Josefstadt. Nevertheless, Moltke chose the bold part, and on June 22 issued his famous order for the advance of the I. and II. Armies towards a point of junction at Gitschin. The forces of both combatants were thus hurrying towards the same area—the Austrians united, the Prussians seeking to unite.

THE ADVANCE TO KÖNIGGRÄTZ

The Prussian I. Army.—The danger threatening two separated forces which seek to unite within range of an active enemy is obvious. The one may be delayed and held fast by a detachment whilst the other is overwhelmed by the enemy's main mass. It appeared to von Moltke that the II. Army was the more

exposed and had the harder task to win a passage through the mountains; he therefore enjoined on the Commander of the I. Army a rapid advance on Gitschin in order "to shorten the crisis." Prince Frederick Charles with the I. and Elbe Armies had an unexpectedly easy task at first, since he was allowed to pass the defiles of the Erz Gebirge without opposition. The Austrian detachment on this wing (Saxon Corps, I. Corps, 1st Light Cav-



alry Division) had been ordered by Benedek to hold the line of the Iser. In the advanced guard combats of Hühnerwasser and Podol on June 26 the Prussians secured crossings over this river, and the Austrians had their first experiences of the deadliness of the breech-loader. Prince Frederick Charles spent the whole of the 27th in manoeuvring his forces into position for an enveloping battle at Münchengrätz, where he supposed the main body of the Austrian detachment to be, and practically the whole of the 28th in manoeuvring them back into line of march, when he found that the enemy had retired on Gitschin without awaiting his blow. In the battle of Gitschin on the 29th the ground favoured the Austrians, who had an opportunity of crushing the head of one of the Prussian columns before the other could reach the field of battle. But the superior weapon and skilful handling of the Prussian infantry won the day and in the end the Austrians and Saxons suffered a severe defeat. Thus by the 30th the I. and Elbe Armies had reached their original rendezvous. Their commander had, however, been guilty of several errors. Of these the most flagrant was the placing of his cavalry in the rear, with the result that he was always in ignorance of his enemy's dispositions and moves. His unjustified halt of the I. Army on June 25 before it was clear of the mountains, and his faulty dispositions at Gitschin might have been severely punished had the Austrian high command been less inept.

Engagements of the Second Army.—Meanwhile the II. Army had been fighting hard to win through the mountains and to reach the line of the Upper Elbe. The first engagements on this wing took place on June 27. The Prussian advance on that day was in three columns: on the right the I. Corps was to push through Trautenau; on the left the V. Corps was directed on Nachod; in the centre the Guard Corps was given Eipel as its destination, with the task of supporting the Corps on its right or left at need. The advanced guard of the I. Corps drove back a part of the Austrian X. Corps, and early in the afternoon secured the exits from the defile at Parschnitz. But the Prussian Commander, Bonin, thinking the action was over, neglected to hasten the deployment of the remainder of his Corps and refused the proffered assistance of a division of the Guard. Later in the afternoon the remainder of the Austrian X. Corps reached the battlefield, and counterattacked vigorously. They drove in the Prussian advanced troops and caused the I. Corps to retreat in complete disorder across the frontier. On the same day the Prussian V. Corps won an important success at Nachod against the Austrian VI. Corps. Here, as at Trautenau, the Prussian advanced guard was attacked by a greatly superior force before the main body was clear of the defile behind. But von Steinmetz, commander of the V. Corps, a veteran who had fought in the Napoleonic wars, was of more resolute mettle than Bonin, and after a hard struggle won clear of the defile and drove back his enemy. On the following day, the 28th, the Prussians continued their advance and won two successes. The Guard Corps at Soor defeated the Austrian X. Corps, the victors of Trautenau, while Steinmetz's V. Corps at Skalitz drove back the Austrian VIII. Corps, which had relieved the VI. Corps in front of him. The success of the Guard Corps opened the Trautenau defile and enabled the rallied I. Corps to resume its advance. On the 29th Steinmetz won a third success, at Schweinschadel, this time over the Austrian IV. Corps. By the evening of June 30, the II. Army had disposed of the irresolute and unco-ordinated opposition of its enemies and had established itself on the line of the upper Elbe, with its centre about Königinhof. The I. Army and Army of the Elbe, which had received orders to continue their advance beyond Gitschin in the direction of Königgrätz, were now within a day's march of the II. Army. Moltke's first strategical aim, the junction of the Prussian forces, had practically been accomplished. On the same date, the 30th, Benedek gave orders for a retreat of the Austrian Army on Königgrätz, and thus acknowledged that he had forfeited the advantage which a central position between two separated hostile forces might have given him.

Benedek's Vacillation.—Moltke's bold gambit had gone unpunished and had given him a winning strategical position. Let us turn to the Austrian side of the board, consider Benedek's handling of the pieces during these last ten days of June, and enquire whether (as most critics hold) he missed an opportunity of defeating his enemies in detail, and if so, by what false moves. In the first place, he was probably correct in his decision to advance into northern Bohemia rather than to invade Silesia, and his march of some 200,000 men from Olmutz to Josefstadt was well enough ordered. But he had already lost time—the most precious element of war, as of chess—and was always at least one move in the game behind his opponent. Thus while the Prussian armies were widely separated in a lateral direction, the Austrian army as it approached the critical point of Josefstadt was also widely dispersed—from front to rear. If Benedek was to use his central position to strike to right and left alternately, he must first gain time to close up his army. He could gain this time only by his own efforts, by so using detachments from his main force as to impose delay on the forward march of the divided armies of his opponents. This fact he never grasped, he seems hardly to have realised any especial need for haste, but to have assumed that he would be given time to assemble, and even to rest his forces before having to make up his mind and to assume the offensive. Certainly his instructions to his detachments show no sense either of a definite plan or of the importance of keeping elbow-room for manoeuvre. His western detachment (I. Corps and Saxons) properly handled, should have been able seriously to delay the Prussian I. Army in the mountains and on the line of the Iser. But Benedek's instructions were vague, and the Commander of the I. Corps, Clam Gallas, was incompetent, so that the Prussians were able to advance to Gitschin with hardly a check. On the other wing, the opportunity to delay or destroy the Crown Prince's army at the exits from the mountains was also lost through want of clear orders and energetic action.

Military writers who have commented on the campaign have satisfied themselves that Benedek should have delayed the I. Prussian Army and Army of the Elbe and have thrown his whole weight in the first instance against the Crown Prince, before the latter could extricate himself from the mountains. Benedek's own conception, so far as he had any definite plan, seems to have been the opposite—to delay the Crown Prince and to attack the armies of Prince Frederick Charles. But he never formulated a clear-cut scheme either for holding up the one enemy or for offensive action against the other. And under their relentless pressure he presently abandoned his own plans, took up a position and passively awaited attack. Much of Benedek's irresolution can probably be traced to the influence of Krismanić's defen-

sive theories, but it was rooted in his sense of having to perform a task beyond his powers. The result of his half measures had been disastrous. In the engagements between June 26 and June 30, six of the eight Austrian Corps had met defeat and had suffered severely in their massed formations against the fire of the breech-loader. The Austrian losses had been well over 30,000, while those of the Prussians were less than a quarter of that total. It was a disillusioned army that retired on Königgrätz, under a leader who was not far from being demoralized.

THE BATTLE OF KÖNIGGRÄTZ (OR SADOWA)

The Prussian Plans.—On July 1 two great hosts of nearly a quarter of a million men each (the largest forces that met on one battlefield till the World War of 1914) lay within a few miles of each other. It might have been expected that a "set-piece" battle would ensue; that the Austrian army, now thrown on the defensive, would select the most favourable position in which to await attack, and that the Prussians after due reconnaissance would assault, if unable to manoeuvre their enemies out of their selected position. Actually, on July 3, 1866, these two great armies blundered into battle on a field and in circumstances which neither commander had chosen nor foreseen. The incidents which led up to this result deserve some attention. They showed that the art of reconnaissance had been forgotten with the passing of Napoleon. Neither Prussian nor Austrian army had any other employment for its numerous cavalry than to await the opportunity for a charge on the battlefield. Hence, though only a few miles apart, they completely lost touch with each other for more than 48 hours, and made their dispositions blindfold.

To consider first the Prussian plans. Von Moltke had deliberately kept an interval of half a day's march between the I. and II. Armies, though there was no longer any bar to their close assembly. He had realized—he was the first to do so—that the union of two forces from different points *on the field of battle itself,* the one striking the enemy frontally, the other in flank, had been made possible by modern inventions and would lead to decisive results. The method by which he proposed in this instance to put his theories into practice is characteristic. He set himself a tactical problem—to select the best defensive position for the Austrian army—solved it to his own satisfaction by placing his opponents east of the Elbe with flanks on the fortified crossings of Josefstadt and Königgrätz, and issued orders to the Prussian forces accordingly, without ascertaining by reconnaissance whether or not Benedek had arrived at the same able solution of the problem. Moltke's orders for July 3 directed the I. Army and Army of the Elbe towards Königgrätz and Pardubitz, while the II. Army on the left bank of the Elbe was to reconnoitre the line of the Aupa and Mettau rivers with a view to advancing next day against the supposed right flank of the Austrians. Actually, the Austrian army was still west of the Elbe, so that had Moltke's orders been executed the I. Army would have been exposed unsupported to the whole Austrian army, and could hardly have avoided defeat. The chain of events which modified these orders and made a Prussian victory possible was as follows. On the evening of July 2 Prince Frederick Charles sent out reconnaissances and discovered that there was a large Austrian force between the Bistritz and the Elbe, though he did not yet realize that the whole Austrian army was there. He at once made preparations to attack this force on the morning of the 3rd, and sent a letter to the Crown Prince to ask for one of the latter's Corps to cover his left flank. The Crown Prince was asleep when the letter reached his H.Q. at 2 A.M. and his Chief of Staff, Blumenthal, without awakening him refused Prince Frederick Charles' request. Meanwhile, however, duplicates of the I. Army's orders had reached Moltke, who was prompt to realize the situation and instant to decide. Orders were sent forthwith from Imperial H.Q. for the Crown Prince to co-operate with his whole army. These orders did not reach him till 4 A.M. of the morning of the battle.

Austrian Dispositions.—The retreat towards Königgrätz on July 1 had been confused by bad staff work. On July 2 therefore the army halted to rest instead of crossing to the east of the Elbe, as seems to have been the original intention. Meanwhile Benedek, who had now lost all faith in his advisers and in his troops as well as in himself, telegraphed to his emperor advising the immediate conclusion of peace. The emperor's reply "Has a battle been fought?" seems to have resolved Benedek to stand and fight. The full history of his correspondence with the Emperor and of the instructions he received at this crisis has never been disclosed. Pressure was probably brought on him to give battle against his better judgment, but after the disaster he accepted his disgrace and loyally kept silence. Whether in any case he intended to fight a decisive battle west of the Elbe or on July 3 is doubtful. His orders, issued late at night on July 2, are almost incredibly bad judged as orders for a decisive battle. Bonnal, the author of *Sadowa,* says: "Except at Ulm and Sedan, no worse dispositions for an army about to accept battle have ever been made." It is, however, more likely that Benedek's dispositions were made merely with a view to providing for the safety of his army during another day's rest, after which he proposed to take up a position behind the Elbe. If so, he once again showed his disregard of the time factor. The orders provided for the army to occupy a semi-circular position between the Trotina and Bistritz streams with the centre in front of the village of Chlum, about 10 miles north-west of Königgrätz. A mile or so north of Chlum lies the Swiep Wald, in the struggle for which the issue of the battle was decided. The position might have been made a reasonably strong one, but the orders were vague and crude and did not reach some of the Austrian corps till 6 A.M., by which time the advanced troops on both sides were already in contact. Henikstein and Krismanić, as well as Clam Gallas, had been superseded, but the new Chief of Staff, Baumgarten, did not arrive till the morning of the battle.

The Battle.—The numbers engaged were: Prussians 220,000 (including 14,000 cavalry) with 780 guns, Austrians and Saxons 215,000 (including 24,000 cavalry) with 770 guns. Early in the morning (which was dull and rainy) Prince Frederick Charles advanced his force to the Bistritz, intending to hold the line of that river until the II. Army could appear on the field. But his hand was forced by the action of his left division (7th) under Fransecky, which was already across the Bistritz and advanced into the Swiep Wald, where it drew on itself the whole weight of the Austrian right wing, IV. and II. Corps, and caused these Corps to face west instead of north. It fought magnificently against heavy odds, but its danger led to the premature advance of the remainder of the I. Army across the Bistritz. Thus during the whole morning the I. Army was struggling against greatly superior Austrian forces and was hard pressed. Meanwhile the advanced guard of the Army of the Elbe was engaged on the right with the Saxon Army at Nechanitz. Shortly after noon the leading troops of the II. Army appeared on the field and soon decided the conflict. They caught the Austrian II. and IV. Corps in the act of retiring from the Swiep Wald to the positions they had originally been ordered to hold from Chlum and Nedelist to the Elbe, quickly routed them, and seized Chlum. The Austrian reserve corps then made two counter-attacks on Chlum. These failed, and by 4:30 P.M. the Austrians were in full retreat, gallantly covered by the self-sacrificing charges of their cavalry and by the steadiness of their artillery. There was great confusion at the river crossings, but the pursuit was not pressed, the victors themselves being in almost as great confusion as the vanquished owing to the lines of advance of the I. and II. Armies having converged. The Austrian losses were about 45,000, of whom 20,000 were prisoners, and 150 guns; the Prussian losses were under 10,000. The features of the battle were, on the Prussian side, the extraordinary influence of the gallant fighting of Fransecky's division in the Swiep Wald, the deadliness of the breech-loader, and the spirit which animated the swift and resolute march of the II. Army to the rescue of the I. Army. On the Austrian side, the artillery was brilliantly handled throughout the battle, and the cavalry by their devotion at the end made some amends for their failures in reconnaissance.

Benedek withdrew his army unmolested to the fortress of Olmutz to recuperate, thus placing himself on the flank of the

Prussian advance on Vienna. There is no virtue, however, in a flank position unless the troops have the power to issue offensively from it, as these had not. The Archduke Albert, who had succeeded to the chief command, ordered the army from Olmütz to Vienna, to join the two corps brought back from Italy in the direct defence of the capital. The Austrians eventually succeeded in assembling at Vienna, though an engagement with the Prussian II. Army at Tobitschau on July 15 forced the three rear corps from Olmütz to make a wide detour. Prussians and Austrians were facing each other outside Vienna when an armistice was agreed to on July 22, followed by peace on Prussia's terms.

The Campaigns in Western Germany.—Space permits only a brief reference to the operations of the Army of the Main under Gen. von Falkenstein, to whom had been given the task of dealing with the minor German States allied to Austria. The Hanoverian army on its way to join the Bavarians won a success over a Prussian column at Langensalza on June 27, but was surrounded and forced to capitulate two days later. The operations against Bavaria lasted all July and consisted of a series of small actions, as a result of which the territory of the States hostile to Prussia had mostly been over-run when an armistice was concluded early in August.

Comments.—The campaign of 1866 marks the dawn of modern war, and may be said to represent the passing of the military art from an amateur to a professional basis. The characteristic of the professional is constant and assiduous practice at all times, not only when engaged in a match. Similarly, Moltke introduced unceasing preparation in peace for every detail in war and enjoined diligent study on commanders of all grades. Moltke's theories of war (enunciated in his famous "Memorandum for the Guidance of Superior Officers,"—issued in 1868) also mark a stage in the science of strategy, which may be studied in Caemmerer's *Development of Strategical Science*. Historians a century hence may write that Clausewitz and his disciple von Moltke killed war by making it so serious, so dull and so deadly.

Bibliography.—The English translation of Bonnal's *Sadowa* (1907) contains a full bibliography of works published up to that date. Neill Malcolm, *Bohemia 1886* (1912), and translations of Moltke's *Projects* and *Correspondence* are the principal works published in English since that date. (A. P. W.)

SEVEN WISE MASTERS, THE, a cycle of stories of oriental origin. A Roman emperor causes his son to be educated away from the court in the seven liberal arts by seven wise masters. On his return to court his stepmother the empress seeks to seduce him. He is bound over to a week's silence. During this time the empress accuses him and seeks to bring about his death by seven stories which she relates to the emperor; but her narrative is each time confuted by tales of the craft of women related by the sages. Finally the prince's lips are unsealed, the truth exposed, and the wicked empress is executed.

An analogous collection of stories occurs in Sanskrit, but the Indian original is unknown. Travelling from the east by way of Arabic, Persian, Syriac and Greek, it was known as the book of Sindibâd, and was translated from Greek into Latin in the 12th century by Jean de Hauteseille, with the title of *Dolopathos* (edit. H. Oesterley, Strasbourg, 1873). This was translated into French about 1210 by a *trouvère* named Herbers as *Li Romans di Dolopathos*. The German, English, French and Spanish chapbooks of the cycle are generally based on a Latin original. Three metrical romances probably based on the French, and dating from the 14th century, exist in English. The most important of these is *The Sevyn Sages* by John Rolland of Dalkeith, edited for the Bannatyne club (1837).

The Latin romance was frequently printed in the 15th century, and Wynkyn de Worde printed an English version about 1515. *See* G. Paris, *Deux rédactions du roman des sept sages de Rome* (1876, Soc. des. anc. textes fr.); Büchner, *Historia septem sapientium* . . . (Erlangen, 1889); K. Campbell, *A Study of the Romance of the Seven Sages with special reference to the middle English versions* (Baltimore, 1898); D. Comparetti, *Researches respecting the Book of Sindibâd* (Folk-Lore Soc., 1882).

SEVEN WISE MEN OF GREECE, THE, a collective name for certain sages who flourished *c.* 620–550 B.C. The generally accepted list is Bias, Chilon, Cleobulus, Periander, Pittacus, Solon, Thales (*qq.v.*), although ancient authorities differ as to names and number.

See "Septem sapientium carmina et apophthegmata," with short biographies in F. Mullach, *Fragm. philosophorum Graec.*, i. (1860); H. Diels, *Die Fragmente der Vorsokratiker*, Bd. 2 (4th ed., 1922) and Überweg, *Grundriss der Gesch. der Philosophie*, Bd. I. (1926).

SEVEN WONDERS OF THE WORLD, the name conferred on a group of ancient works of art which had obtained pre-eminence among the sight-seers of the Alexandrian era. The earliest extant list, doubtless compiled from the numerous guide books then current in the Greek world, is that of the epigrammatist Antipater of Sidon (2nd century B.C.). A second and slightly divergent list from the hand of a Byzantine rhetorician has been incorporated in the works of Philo of Byzantium. The monuments are as follows:—(1) the pyramids of Egypt, (2) the gardens of Semiramis at Babylon, (3) the statue of Zeus at Olympia (*see* PHEIDIAS), (4) the temple of Artemis at Ephesus, (5) the Mausoleum at Halicarnassus (*see* MAUSOLEUM), (6) the Colossus at Rhodes, (7) the Pharos (lighthouse) of Alexandria, or the Walls of Babylon.

See "Philo," *De septem mundi miraculis* (ed. Hercher, Paris, 1858).

SEVEN YEARS' WAR (1756–1763), the name given to the European war which arose from the formation of a coalition between Austria, France, Russia, Sweden and Saxony against Prussia, with the object of destroying, or at least crippling, the power of Frederick the Great. Prussia was joined by England, and between England and France, as usual, a maritime and colonial war broke out at the first pretext; this war laid the foundations of the British empire, for ere the seven campaigns had been fought in Europe, the French dominion in Canada and the French influence in India, in spite of Dupleix, Lally and Montcalm, had been entirely overthrown by the victories of Clive, Amherst and Wolfe. Great as was the effect of these victories on the history of the world, however, it is at least questionable whether the steadfast resistance of Prussia, almost single-handed as she was—the resistance which laid the solid, if then unseen, foundations of modern Germany—is not as important a phenomenon, and from the technical military standpoint Rossbach and Leuthen, Zorndorf and Kunersdorf possess an interest which it would be possible perhaps to claim for Plassy and for Quebec, but not for border conflicts in Canada and India. It is not only battles, the distinct and tangible military events, that make up the story of Frederick's defence. There are countless marches and manoeuvres, devoid of interest as regards their details; but, as indications of the equilibrium of forces in 18th-century warfare, indispensable to a study of military history as a whole.

Pirna.—Learning of the existence and intentions of the coalition, Frederick determined to strike first, and he concentrated his 150,000 men as follows:—11,000 men in Pomerania to watch the Swedes, 26,000 on the Russian frontier, 37,000 men under Field Marshal Schwerin in Silesia and a main body of 70,000 in three columns ready to advance into Saxony at a moment's notice, the king being in chief command. On Aug. 29, 1756 the Saxon frontier was crossed. Dresden was occupied on Sept. 10, the Saxon army, about 14,000 strong, falling back before the invaders to the entrenched camp of Pirna, an almost inaccessible plateau parallel to the Elbe and close to the Bohemian frontier. The secret of the Prussian intentions had been so well kept that the Austrians were still widely distributed in Bohemia and Moravia. 32,000 men under Field Marshal Browne were at Kolin, and 22,000 under Piccolomini at Olmütz, when on Aug. 31 the news of the invasion arrived, and such was their unreadiness that Browne could not advance till Sept. 6, Piccolomini until Sept. 9. Meanwhile the Prussians, leaving detachments to watch the exits from Pirna, moved up the Elbe and took post at Aussig to cover the investment of the Saxons. Learning of Browne's approach on Sept. 28, the king, assuming the command of the covering force, advanced yet farther up the Elbe to meet him, and the two armies met at Lobositz (opposite Leitmeritz) on the morning of Oct. 1. The battle began in a thick fog, rendering dispositions very difficult, and victory fell to the Prussians, principally owing to the tenacity displayed by their infantry in a series of disconnected

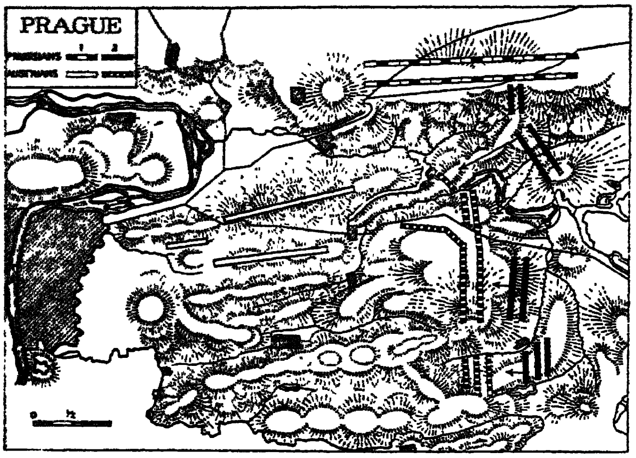
local engagements. The nature of the ground rendered pursuit impossible, and the losses on both sides were approximately equal —viz. 3,000 men—but the result sealed the fate of the Saxons, who after a few half-hearted attempts to escape from their entrenchments, surrendered on Oct. 14, and were taken over bodily into the Prussian service. Prussian administrators were appointed to govern the country, and the troops took up winter quarters.

The coalition had undertaken to provide 500,000 men against Prussia, but at the beginning of the year only 132,000 Austrians stood ready for action in northern Bohemia. Against these the king was organizing some 250,000, 45,000 of whom were paid for by British subsidies and disposed to cover Hanover from a French attack. After leaving detachments to guard his other frontiers, Frederick was able to take the field with nearly 150,000 men, but these also were scattered to guard a frontier some 200 m. in length—the left wing in Silesia under Schwerin and the duke of Brunswick-Bevern, the centre and right under the king. In April the operations began. Schwerin and Bevern crossed the mountains into Bohemia and united at Jung Bunzlau, the Austrians falling back before them and surrendering their magazines. The king marched from Pirna and Prince Maurice of Dessau from Zwickau on Prague, at which point the various Austrian commands were ordered to concentrate.

Battle of Prague.—On the morning of May 5 the whole army, except a column under Field Marshal Daun, was united here under Prince Charles of Lorraine, and the king, realizing the impossibility of storming the heights before him, left a corps under Keith and a few detachments to watch Prague and the fords across the river, and marched during the night upstream and, crossing above the Austrian right, formed his army (about 64,000) for attack at right angles to the Austrian front. The ground had not been reconnoitred, and in the morning mist many mistakes in the deployment had been made, but as Daun was known to be but 20 m. away and the Austrian army was changing its front to meet the unexpected attack, the king threw caution to the winds and sending Zieten with his cavalry by a wide détour to cover his left, he ordered the whole to advance. One of the most savage battles in history was the result. Almost immediately the Prussian infantry became entangled in a series of morasses, the battalion guns had to be left behind and the troops had to correct their alinement under the round shot fired by the Austrians, who had completed their change of front in time and now stood ready to sweep the open glacis before them. Before the storm of bullets and the grape and canister of the heavy and battalion guns the Prussian first line faltered and fell in thousands. Their attempts to prepare the way for the bayonet assault broke down. Schwerin was killed. But the second line carried the survivors on, and in the nick of time Zieten's cavalry drove the Austrian horsemen off the field and broke in on the flank and rear of their infantry. This turned the scale, and the Austrians retreated into Prague in hopeless confusion, leaving some 10,000 men (14.8%) on the ground, and 4,275 prisoners, out of about 66,000, in their enemy's hands. The Prussians lost 11,740 men killed and wounded and 1,560 prisoners, and in all 20.8% of their strength. The actual fighting seems only to have lasted about two hours, though firing did not cease till late at night; 16,000 Austrians managed in the confusion to evade capture and join Daun, who made no movement either on this or succeeding days to come to the assistance of his comrades, but began a leisurely retreat towards Vienna. The Prussians immediately began the siege of the town, and after a month's

delay Daun, now at the head of some 60,000 men, moved forward to the relief of the city. Learning of his approach, the king, taking with him all the men who could be spared from the investment and uniting all available detachments, moved to meet him with only 34,000 men, and on June 18 he found Daun strongly entrenched.

Battle of Kolin.—He immediately endeavoured to march past him and attack him on the right flank—a repetition of the Prague

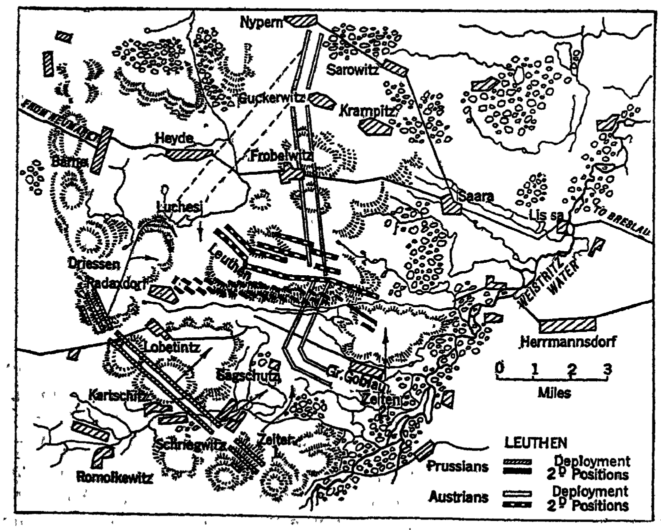


manoeuvre without its concealment—but the Austrian light troops harassed his columns so severely during the movement that without orders they wheeled to drive them off and, being thus thrown into disarray, they took three divergent objectives. Their disunited attacks all fell upon superior numbers, and after a most obstinate struggle they were badly beaten with a loss in killed and wounded of 6,710 (18·6%) and 5,380 prisoners with 45 guns. The fighting lasted 5½ hours. The Austrian loss was only 8,000 out of 53,500, or 15·2%, of whom only 1,500 were taken prisoners.

This disaster entailed raising the siege of Prague, and the Prussians fell back on Leitmeritz. The Austrians, reinforced by the 48,000 troops in Prague, followed them 100,000 strong, and, falling on Prince August Wilhelm of Prussia, who was retreating eccentrically (for commissariat reasons) on Zittau, inflicted a severe check upon him. The king was compelled to abandon Bohemia, falling back on Bautzen. Having re-formed his men and calling in Keith's 27,000 men from Pirna, he again advanced, but found the enemy so strongly posted at Burkersdorf (south of Bischofswerda) that he relinquished his purpose and retreated on Bernstadt.

Frederick in the West.—Meanwhile his enemies had been gathering around him. France had despatched 100,000 men under d'Estrées against Hanover, where Cumberland with 54,000 stood to meet him, and another 24,000 men were marching through Franconia to unite with the "Army of the Holy Roman Empire" under the prince of Saxe-Hildburghausen. Fortunately this latter army was not as formidable as its title, and totalled only some 60,000 most undisciplined and heterogeneous combatants. In the north 100,000 Russians under Apraxin were slowly advancing into East Prussia, where Lehwald with 30,000 was preparing to confront them, and 16,000 Swedes had landed in Pomerania. On June 26 Cumberland had been beaten at Hastenbeck by d'Estrées, and the French overran Hanover and Brunswick. The king, leaving Bevern with only 13,600 men in Silesia to watch the Austrians, began to march across Germany to succour Cumberland. Arrived at Leipzig on Sept. 3, he heard of Lehwald's defeat at Gross-Jägerndorf on Aug. 30, and immediately afterwards of Cumberland's convention of Kloster Seven, which gave up Hanover to the French. Fearing that the French army now set free in Hanover might unite with the Army of the Empire under Hildburghausen and with 150,000 men march direct on Berlin, Frederick, taking with him 23,000 men, marched to join Prince Ferdinand in the district about Halberstadt, hoping to strike his blow before the enemy's junction could be completed. Mobility, therefore, was the first consideration, and arrangements for supply having been made in advance along his road, his troops covered 170 m. in 12 days (September 1–13). But Hildburghausen, not having been joined by d'Estrées, refused to fight and fell back into the wooded districts of Thuringia and Franconia. Bad news now reached Frederick from Silesia; leaving Ferdinand to observe Hildburghausen, he marched with all haste to Eckersberg to support Bevern. Arrived here, he found more bad news from Berlin, which had been entered by a body of Austrian raiders under Hadik and plundered. Prince Maurice and Seydlitz were sent by forced marches to its aid, and before them Hadik retired at once (Oct. 18). Finding the Austrians for the moment quiescent and hearing that Hildburghausen was again advancing, the king now concentrated all available men on Leipzig and marched to support Prince Ferdinand. Hildburghausen took up a position about Meucheln on Nov. 2, and on the 5th moved off to repeat Frederick's manoeuvre of Prague against its inventor.

Rossbach.—The Battle of Rossbach (*q.v.*) followed. In this Seydlitz and the Prussian cavalry won imperishable renown. Aided only by the fire of 18 guns and of 7 battalions of infantry, only two of which fired more than five rounds, the Prussian squadrons swept down upon the marching columns of the Allies and in about 40 minutes the whole 64,000 were in full flight. Never was a victory more timely, for the Prussian army was almost worn out and more bad news was even then on the way. Bevern in Silesia, who had been beaten at Moys near Görlitz (Sept. 7) and in the battle of Breslau on Oct. 22, had been compelled to retire behind the Oder, leaving the fortresses of Schweidnitz and Breslau to their fate, and both had capitulated within a few days. Leaving a small reinforcement for Ferdinand, the king now moved by forced marches to Liegnitz. The distance, about 170 m. through difficult country, was covered again in 12 days, but the numbers were small, only 13,000, which shows how tremendous had been the drain upon the men of the previous six weeks' exertions. On the night of Dec. 4, having joined the beaten forces of Bevern at Parschwitz, making in all 43,000 men of very unequal fighting value, he decided to attack the 72,000 Austrians who lay across the Breslau road, their centre marked by the village of Leuthen (*q.v.*). His position appeared so desperate that he sent for all his generals, laid the facts before them, announced his decision to attack and offered to accept any man's resignation without preju-



dice to his character should he deem the risk too hazardous. Needless to say, not one accepted the offer.

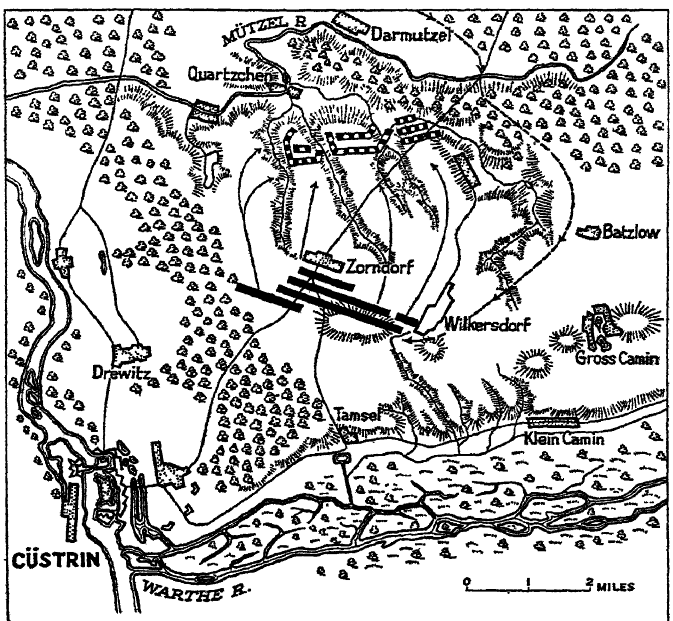
Battle of Leuthen.—Covered by the low rolling hillocks of the district, the army now moved off to its right across the Austrian front, the advance led by Zieten and half the cavalry, the rear covered by Driessen with the remaining half—some 40 weak squadrons. The infantry having gained a position sufficiently on the Austrian flank, now wheeled into line and attacked in échelon of battalions from the right. The battle soon became desperate, and the Austrian cavalry on their right wing under Luchesi,

unaware of Driessen's presence as a flank guard, issued out of their lines, wheeled to their left and swept down upon the refused flank of the Prussian infantry; but they never reached them, for Driessen, seizing his opportunity, set his squadrons in motion and attacked. The Austrians, completely surprised, were ridden down and driven back on to the front of their own infantry, and the pressure of the fugitives threw the rear of their left wing into confusion and in a short time the ruin of their army was completed. When the news of Driessen's charge was brought to the king his astonishment was expressed in the single phrase, "What, that old fool Driessen?" The fighting, however, had been desperate, and though the Austrians out of their 72,000 lost 37% including 20,000 prisoners, with 116 guns, the Prussians lost 6,200 (14%) making with the other battles of the year a total of nearly 75,000 men, and not including losses in minor skirmishes and on the march.

Campaign of 1758.—The raid upon Berlin had accomplished nothing, and the advance of the Russian main body had died out for want of resolution to seize the opportunities offered by Frederick the Great's absence. The Tsaritsa, annoyed by his slowness, recalled Apraxin and appointed Fermor in his place. Utilizing the winter snows, he collected some 31,000 men and crossed the frontiers of East Prussia (Jan. 10, 1758) and attempted to annex the province, driving out all the Prussian officials who refused to swear fealty to Elizabeth. This took time, and when the period of thaw supervened the Russians were immobilized and could not advance until approaching summer had dried the roads again. For the moment, therefore, no danger threatened Frederick from this quarter, and Rossbach had effectually tamed the French. The Swedes, too, showed little energy, the "roadless" period affecting them equally with the Russians.

Frederick therefore resolved to seize the opportunity to renew his invasion of Austria. As a beginning he recaptured Schweidnitz in April with 5,000 prisoners. The Austrian field army under Daun lay about Königgrätz, covering all the passes out of Silesia; but covered by the newly formed "Free Corps" (his answer to the semi-savage Croats, Pandours and Tolpatches of the Austrians), Frederick marched right across their front on Olmütz, whilst a special corps (30,000) under Prince Henry threatened their left from Saxony and the Elbe. He had with him about 40,000 men. But Olmütz lay 90 m. from the Prussian frontier, and the Austrian light troops swarmed in the intervening district. Ultimately a great Prussian convoy was destroyed in the action of Domstädl, and the siege of Olmütz had to be raised (July 1); but instead of marching back the way he had come Frederick led his troops through Bohemia practically in the rear of Daun's army, and on July 14 entered Daun's empty entrenchments at Königgrätz. Fermor's Russians were now again in the field and had reached Posen, burning and plundering horribly. By skilful manoeuvring the king deceived the Austrians till the roads to Silesia by Skalitz and Nachod were open and then by a rapid march passed over into Silesia, reaching Grüssau (near Landshut) on Aug. 8. Leaving Keith with half his force to hold this district, he then marched to Frankfurt-on-the-Oder, taking with him only some 15,000 men, to strengthen the wing already engaged against the Russians. Frankfurt was reached on Aug. 20. Fermor was then besieging Cüstrin with 52,000 men, and hearing of the king's approach he raised the siege and placed himself behind a formidable obstacle facing north, near Zorndorf, from which direction the king was approaching.

Battle of Zorndorf.—Seeing that the same obstacle that prevented him from attacking the Russians prevented them equally from attacking him, the king marched right round Fermor's eastern flank—the Russians gradually forming a fresh front to meet him,—so that when the Prussian attack began on the morning of Aug. 25 they stood in three irregular squares, divided from each other by marshy hollows, and thus unable to render one another support. The king made his first effort against the square on the right,—Seydlitz with his squadrons covering the movement. But the Russian troops fought with far more spirit than the Austrians had ever shown, and things were going very badly with the Prussians when Seydlitz, who in the meanwhile had succeeded in making paths across the Zaberngrund on which the Russian right rested, flung himself upon the great square, and rode over and destroyed the whole mass in a prolonged mêlée in which quarter was neither given nor asked. Relieved by this well-timed charge, the king now re-formed the infantry already engaged, and concentrated all his efforts on the south-west angle of the great centre square. Again the Russians more than held their own, issuing forth from their squares and capturing many field pieces. Some of the Prussian infantry was actually broken and in full flight when Seydlitz, with his ranks re-formed and his horses rested, returned and again threw himself upon the square exactly as on the previous occasion and with the same result—the square, as a formation, was broken, but groups still stood back to back and the most savage butchery ensued. Darkness put a stop to the slaughter. Of 36,000 Prussians 12,500 were killed or wounded, 1,000 prisoners or missing (37·5%), and of 42,000 Russians about 21,000 had fallen (50%).



PRUSSIANS ▬ RUSSIANS ▭

BATTLE OF ZORNDORF

In the night the survivors gradually rallied, and morning found the Russians in a fresh position a couple of miles to the northward, but Frederick's troops were too weary to renew the attack. Gradually the Russians withdrew towards Landsberg and Königsberg, and the king, leaving Dohna to follow them up, marched with the remainder of his forces on Sept. 2 for Saxony, covering 22 m. a day. They arrived only in the nick of time, for Daun had united with portions of the Empire Army and was threatening to crush Prince Henry under the weight of more than twofold numbers. The prince had been driven into an entrenched position above Gahmig near Dresden and Daun was about to attack, but the mere name of Frederick was enough, and learning of his arrival Daun fell back to Stolpen on Sept. 12.

The Prussian army now lay around Grossenhain, Prince Henry's force covering Dresden and the Elbe bridges. The Empire Army was at Pirna, Daun at Stolpen, and in these positions they remained until Sept. 26, the Prussians getting the rest they so urgently needed. On that date, however, the state of truce was broken and the king moved towards Bischofswerda, where Daun's subordinate Loudon was posted. The latter retired, opening the road to Bautzen. The king arrived at Bautzen on Oct. 7 and had to wait until the 10th for provisions from Dresden. He then moved forward to Hochkirch, where he found Daun strongly entrenched across his path at Kittlitz with 90,000 men, the Prussians having only 37,000. The king determined to attack the Austrian right. So confident had the Prussians become in the belief that Daun would never take the offensive himself that the most elementary precautions of safety were forgotten.

Battle of Hochkirch.—During the night of the 13th the Austrians, leaving their watchfires burning and moving silently through the woods, which covered much of the ground, formed up almost all round the Prussian camp. At 5 A.M. the attack was delivered from all quarters simultaneously and a most desperate struggle ensued. Nothing but the superb discipline of the Prussians saved the situation. Zieten with his squadrons managed to keep a way of escape open, and after a most obstinate conflict the wreck of the army succeeded in withdrawing, leaving 101 guns and 9,450 men on the ground or in their enemies' hands (25·5%). The Austrians, in spite of the advantage of a well-conceived surprise, lost 7,590 men and were too shaken for pursuit. They fell back to their old camp, where they remained for a week, thus giving Frederick time to bring up reinforcements from Dresden (6,000 men) and, starting on the 23rd, he marched right round the Austrian right and raised the siege of Neisse, the prime object with which he had set out. Daun, learning that the king had gone past him into Silesia, now laid siege to Dresden. On Nov. 15 he heard that Frederick was marching to its relief through Lusatia and incontinently gave way, retiring on Pirna. The king was in Dresden again on the 20th.

Campaign of 1759.—The drain on Frederick's resources had been prodigious. On the battlefields of the previous three years he had lost at least 75,000 men, not counting the waste of life in his marches and skirmishes; but he still managed to keep 150,000 men in the field, though for want of the old two years' training in loading, firing and manoeuvring the average efficiency had much diminished. In cavalry, too, he was relatively weaker, as there was no time to train the remounts. His enemies felt their losses far less and were beginning to understand his tactics; fortunately they remained incapable of combined action.

After minor operations on the frontiers the Russians took the field. Fermor had been superseded by Soltikov, and Dohna with his 18,000 men proved quite inadequate to arrest the Russians' progress. He was superseded by Wedell, who, on July 23, with 26,000 men boldly attacked the 70,000 Russians whilst on the march near Züllichau. He was defeated with a loss of 6,000 and fell back to Crossen bridge, 5 m. below Crossen, which Soltikov occupied next day, thence he moved down the river towards Frankfurt, keeping on the eastern bank. Daun had detached Loudon and Hadik with 35,000 men to join him, and it became vital to Frederick to prevent the combination. Leaving Prince Henry at Schmöttseifen to watch Daun, he marched with all available forces and joined Wedell on Aug. 6 at Müllrose near Frankfurt, after vainly searching for the Hadik-Loudon force. Here he was joined on the 10th by Finck with 10,000 men, bringing his whole force up to 50,000 against the Russian and Austrian 90,000, who lay entrenched in the sandhills about Kunersdorf.

Battle of Kunersdorf.—On the 11th he crossed his whole force over the Oder at Reitwein and on the 12th marched forward, intending to envelop the Russians on both flanks; but his columns lost their way in the woods and their attacks were delivered successively. In spite of their usual disciplined gallantry, the Prussians were completely beaten, even Seydlitz and his squadrons failed to achieve the impossible, and the night closed down on the greatest calamity Frederick had ever experienced. Of 43,000 men 20,720 (48·2%) were left on the ground and 178 guns fell into the hands of the enemy; and the allied Austro-Russian force only lost 15,700. The battle had only lasted six hours. In the depression following this terrible day he wrote to Schmettau, commanding at Dresden, telling him to expect no help, and on Sept. 4 Dresden fell.

As usual Frederick was saved by the sluggishness of his enemies, who attempted no pursuit, and being reinforced the day after the battle by 23,000 men, and having ordered up Kleist (who had been watching the Swedes), he was again at the head of an army. Week after week went by, during which he countered all attempts of Daun and Soltikov to combine, and ultimately the Russians, having consumed all the food and forage in the districts they occupied, were compelled to fall back on their own frontiers. Then, uniting with Prince Henry, the king turned to fall upon Daun; but his contempt for his adversary proved his own undoing.

Battle of Maxen.—He sent a detachment of 12,000 men under Finck to work round the Austrians' flank by Dippoldiswald to Maxen, but the latter, learning of the movement and calling up a wing of the Empire Army to their assistance, fell upon Finck with 42,000 men and compelled him to surrender after two days' hard fighting. The combination having failed, the two armies stood facing one another till far into the winter. But for Prince Ferdinand's glorious victory at Minden on Aug. 1, the year would have been one catalogue of disaster to the Prussian arms, and these operations must now be mentioned.

In the early part of 1758 Prince Ferdinand with 30,000 men had advanced from Lüneburg and was joined by Prince Henry with 8,600 from Halberstadt. The approach of the latter threatened the right wing of the French army under Clermont, which was posted along the Aller, and the whole line gave way and retreated without making any serious stand behind the Rhine. Prince Ferdinand followed and defeated them on June 23 at Crefeld. Clermont was relieved by Contades and at the same time Soubise, who had at last reorganized his command, shattered by the disaster of Rossbach, moved forward through Hesse and compelled Prince Ferdinand to withdraw from his very advanced position. No engagement followed; Soubise fell back upon Frankfurt and Prince Ferdinand held a line through Münster, Paderborn and Cassel during the winter.

Fortunately events in Canada and the glory of his victories had made Frederick's cause thoroughly popular in Great Britain, and at last it became possible to detach a considerable force of British troops to Prince Ferdinand's assistance, whose conduct turned the scale in the critical moment of the campaign. During the winter the French had organized their forces in two columns—based on Frankfurt and Wesel respectively. Broglie was now in command of the former; Contades still led the latter.

In April Prince Ferdinand advanced to drive the French out of Hesse and Frankfurt, and actually reached Bergen, a village some 10 m. to the north, but here he was defeated by Broglie (April 13) and forced to retreat the way he had come, the French following along their whole front and by sheer weight of numbers manoeuvring him successively out of each position he assumed. On July 10 Broglie surprised Minden, thus securing a bridge over the Weser and free access into Hanover, and light troops overran the south of the electorate. On the 16th Contades with the left column joined Broglie and the French now had some 60,000 men against the 45,000 Ferdinand could muster. The latter's position was extremely difficult, for the French had only to continue in possession of the bridges at Minden to ruin the whole country by their exactions, and the position they held was too well protected on the flanks and too strong in front for direct attack. Nevertheless Prince Ferdinand drew up before it and met the French plundering raids by a threat on their communication with Cassel, and as a further inducement to tempt Contades to attack him, he detached a column under Wangenheim, which entrenched itself across the only outlet by which the right of the French army could debouch from behind the marshes which lie in the angle between the Weser and the Bastau. The bait took, and during the early hours of Aug. 1 the French army moved out to attack Wangenheim.

Battle of Minden.—But Ferdinand's troops had been lying in instant readiness for action, and as soon as the outposts gave the alarm they were in motion in eight columns, *i.e.*, practically deployed for action to meet the French as they emerged from their positions. Unfortunately the outpost reports were delayed by about two hours, owing to the heavy gale and storm that was prevailing, and the French had made far greater progress with their deployment than Ferdinand had reckoned on. An almost front-to-front engagement ensued. Things were going badly with the Prussians when, through a mistake in the delivery of an order, the British brigade (12th, 20th, 23rd, 25th, 37th, 51st regiments), followed by some Hanoverian battalions, began to advance straight upon the masses of French cavalry who stood protected by the crossfire of several batteries. Once launched, neither fire nor

shock could check their progress; halting for a moment to pour volleys into the charging squadrons hastily thrown against them, they swiftly resumed their advance. French infantry too were hurled against them, but were swept away by fire and bayonet, and presently they had pierced right through the French line of battle. Now came the moment when cavalry should have been at hand to complete the victory, and this cavalry, the Blues, the 1st and 3rd Dragoons, Scots Greys and 10th Dragoons under Lord George (afterwards Viscount) Sackville (*q.v.*) stood ready, waiting only the order to advance. This Sackville refused to give, though called on three times by the prince; no satisfactory explanation of his conduct has ever been discovered, but he was tried by a general court-martial and cashiered. Nevertheless, so brilliant had been the conduct of all the troops engaged, especially of the infantry brigade that the victory was won even in spite of this failure of the cavalry, and before evening the French were retreating as a demoralized mass towards Cassel, leaving some 10,000 men and 45 guns in the hands of the victors, who on their side out of 43,000 had lost 2,600 killed and wounded. Of the six British regiments that went into action 4,434 strong, 1,330 (30%) had fallen, but their feat is not to be measured only by the losses victoriously borne—these were not unusual in the period—but by the astounding discipline they maintained throughout the advance, resuming their march after beating off cavalry charges with the cool precision of a review in peace-time. Ferdinand followed up his victory by a pursuit which was vigorous for three days and had all but reached the Rhine when his movement was stayed by the necessity of detaching 12,000 men to the king to make good the losses of Kunersdorf.

Campaign of 1760.—The year opened gloomily for Frederick. His embarrassment both for men and money was extreme, and his enemies had at last agreed on a combined plan against him. They purposed to advance in three columns concentrically upon him: Daun with 100,000 men in Saxony, Loudon with 50,000 from Silesia, Soltikov's Russians from East Prussia; and, against whichever column the king turned, the others were to continue towards Berlin. Only in Hanover were the conditions more favourable, for Ferdinand had 70,000 (20,000 British) against the 125,000 of the French.

Early in April the king stood with 40,000 men, west of the Elbe near Meissen facing Daun, Prince Henry with 34,000 in Silesia from Crossen to Landeshut, 15,000 under Forcade and Jung-Stutterheim in Pomerania facing the Swedes and Russians. Towards the end of May Loudon moved to besiege Glatz, and Fouqué, who commanded at Landeshut, marched with 13,000 to cover Breslau. Loudon at once seized Landeshut, and Fouqué, returning in response to urgent orders from the king, was attacked by Loudon with 31,000 men and almost destroyed. Meanwhile, Prince Henry had moved to Landsberg against the Russians, but failed to seize his opportunities and thus Silesia lay open to the Austrians. Frederick decided to march with his main body against Loudon and attack him if unsupported, but, if his movement induced Daun to move to Loudon's support, then to double back and besiege Dresden. For this purpose a siege train was held in readiness at Magdeburg. He marched rapidly on Bautzen, then hearing that Daun was approaching to support Loudon he returned and besieged Dresden (July 12). The town was bombarded, there being no time for regular siege approaches, but it held out, and by the 28th of July Daun's army returning had almost surrounded Frederick. The siege had to be raised, and during the night of July 29 the Prussians slipped away to Meissen. On the same day Frederick learnt that Glatz, the key to Southern Silesia, had fallen into the hands of the Austrians, but as a set-off the news shortly afterwards arrived of Prince Ferdinand's brilliant victory at Warburg, in which the British cavalry led by the marquis of Granby amply wiped out the disgrace incurred by Sackville.

On Aug. 1 Frederick began his march into Silesia, summoning Prince Henry from Landsberg to join him, which he did by a splendid march of some 90 m. in three days. The king's march was almost as remarkable, for the roads were very bad and the Austrians had freely obstructed them; nevertheless in five days he reached Bautzen, having marched more than 100 m. from his starting-point, and crossed five considerable rivers on his way. Thence he continued more easily to Bunzlau. Daun was in front of him and Lacy with clouds of light troops on his right, the Russians under Czernicheff with Loudon not far away to his left front, 114,000 men in all to his 30,000, but he held to his decision to reach Schweidnitz. With this purpose in view he moved south-east on Jauer, marching 25 m. on Aug. 9, but the enemy was still in front of him and hovering on his flanks. On the 10th he tried the Liegnitz road with the same result, and his position became desperate as his food was almost exhausted. He had already covered 15 m. that day, but at 11 P.M. he called on his men for a night march and formed up again on his old position next morning, Aug. 11. He appeared to be completely surrounded, and things looked so desperate that Mitchell, the British ambassador, burnt his papers and cipher key. At sunset on the 12th, however, Frederick again broke camp and by a night march evaded the enemy's scouts and reached Liegnitz at noon on the 13th, the Austrians appearing a couple of hours later. The troops rested during the 13th and 14th, but at nightfall, leaving their watch-fires burning, marched off by the Glogau road, and the only way of escape still open. The Austrians, however, had planned a night attack, and Loudon's columns were moving to close this last loophole of escape. Fortunately for the Prussians they arrived just a few minutes too late, and in the combat that ensued 15,000 Prussians inflicted a loss of 10,000 men and 82 guns upon their assailants, afterwards resuming their march undisturbed.

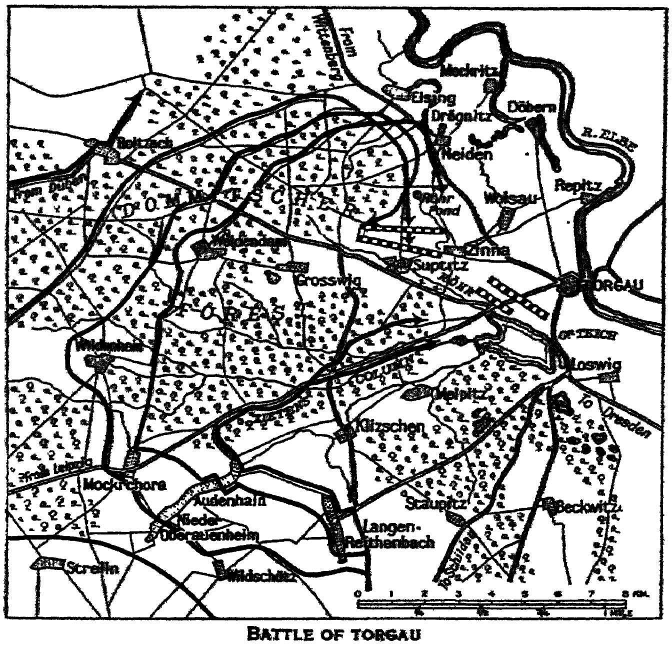
But the danger was not yet over. Czernicheff was known to be in the immediate vicinity; so as to get him out of the way, Frederick gave to a peasant a despatch addressed to Prince Henry containing the words: "Austrians totally defeated to-day, now for the Russians. Do what we agreed upon." The peasant was to take care to be captured by the Russians and only give up the paper to save his life. The plan worked as he had anticipated, the paper duly reached Czernicheff's hands and he immediately evacuated the dangerous neighbourhood. Elated with his success the king now abandoned his retreat on Glogau and determined to press on at all hazards to Breslau, which in spite of many anxious moments he reached on Aug. 17.

The Russians now abandoned the campaign in the open field and besieged Colberg on the Baltic coast. Frederick in Silesia manoeuvred for some weeks between Breslau, Schweidnitz and Glatz, but was suddenly recalled by the news of the capture of Berlin on Oct. 9 by Cossacks and portions of the Empire Army and Austrians from Saxony. On Oct. 11 the king was in full march, but the news of his approach was enough and the enemy dispersed, the Austrians and Empire Army making for Torgau. Daun, relieved of Frederick's pressure, now also moved to Torgau, leaving Loudon in Silesia, and had concentrated over 64,000 men at and around Torgau before Frederick had collected an attacking force of 45,000.

Battle of Torgau.—The position held by the Austrians was an entrenched camp fronting in all directions, but it was too cramped for their numbers and difficult to leave for a counter-stroke. Frederick determined to attack it both front and rear, and leaving Zieten to act against the former, he marched off at 6.30 on Nov. 3 to attack it as soon as Zieten should have thoroughly attracted the enemy's attention. But for once Zieten failed; he allowed himself to be drawn off by the Austrian light troops, and Frederick, in ignorance of the real state of affairs, launched his grenadiers against a thoroughly intact enemy, strongly entrenched, with, it is said, 400 guns in position to sweep the approaches. The grenadiers were simply swept away by grape and case—only 600 out of 6,000 remained, and Prussian batteries hurrying up to their support were destroyed before they had time to load. The attack was, however, renewed by fresh brigades as they came to hand, and the Prussian artillery did something to diminish the intensity of the Austrian case fire. The action began at 2 P.M. At 4.30, as the sun was setting, the king's last reserve of horse and foot at last succeeded in breaking the Austrian line and in the darkness there ensued a confused slaughter as at Zorndorf. The result was still in the balance when at length Zieten reached the field

and attacked at once. For an hour or so the struggle still raged, but the Austrians were by now completely spent and withdrew gradually into the fortress and then across the river. Out of 44,000 the Prussians had lost 13,120 men (30%), out of 65,000 the Austrians only 11,260 (17·3%), but of these over 7,000 were prisoners. Both sides, however, were completely paralysed by the struggle, and the year ended without further serious fighting.

On the western theatre of war Prince Ferdinand after the victory of Warburg had pressed the French back to the Rhine and



BATTLE OF TORGAU

besieged Wesel, but was compelled to raise the siege after suffering the defeat of Kloster-Kamp (Oct. 16) and to withdraw to Lippstadt and Warburg.

Campaign of 1761.—Torgau proved to be Frederick's last great battle. All parties were now so completely exhausted that they no longer were able to face the risks of a decision on the field. In the west Prince Ferdinand was first in the field, and in February and March he drove the French southward as far as Fulda, but an attempt to capture Marburg failed and the gradual pressure of French numerical superiority, together with the reduction of the British contingent on the death of George II., compelled him to retreat gradually until by the beginning of October both Brunswick and Wolfenbüttel fell into their hands. In the east the king had barely 100,000 men against 300,000 Austrians and Russians. Leaving Prince Henry to observe Daun in Saxony he marched to join von der Goltz, who with 23,000 stood about Schweidnitz. The Russians (50,000) under Buturlin were approaching from Posen, and Loudon with 72,000 men starting from Glatz manoeuvred to join them. After two months' skirmishing and marching the Allies effected their junction between Liegnitz and Jauer, having completely severed Frederick's communications with Prussia. But Frederick depended for his food and immediate supplies on Southern Silesia, and not caring to risk a battle with odds of three to one against him he withdrew into the entrenched camp of Bunzelwitz, where the Allies did not dare to attack him. Ultimately, as usual, the Russian commissariat broke down, and in September Buturlin withdrew the way he had come. Relieved of this antagonist, Frederick manoeuvred to draw Loudon out of his positions and compel him to fight in the open, but Loudon refused the challenge and after an attempt to surprise Schweidnitz, which failed, withdrew into winter quarters. Prince Henry in Saxony held his own against Daun.

England now threatened to withdraw her subsidies, and as the Prussian armies had dwindled to 60,000 men the end seemed very near. But a turn of fortune was already at hand. On Jan. 5, 1762, the tsaritsa died, and her successor, Peter III., at once offered peace. On March 16 an armistice was agreed to, and shortly afterwards the treaty of St. Petersburg was signed, by which Pomerania was given back to Prussia and a contingent of 18,000 men placed at Frederick's disposal. The withdrawal of the Russians led in turn to the withdrawal of the Swedes, and thus only France and Austria remained—the former bled white by the strain of her colonial disasters, the latter too weary to make further great exertions. Though the war dragged on for some months, and Prince Henry, assisted by Seydlitz, won the victory of Freiberg over the Empire Army (Oct. 29, 1762), no great battle was attempted, and although a revolution at St. Petersburg deprived Frederick of Russian assistance, in the autumn Ferdinand drove the French back over the Rhine, and thereupon an armistice was agreed upon by all. Final terms of peace were adjusted on *status quo ante* basis at Hubertusburg on Feb. 15, 1763. (F. N. M.)

BIBLIOGRAPHY.—The three principal works on the "Third Silesian" part of the war are the Prussian General Staff, *Der siebenjährige Krieg* (Berlin, 1901); Austrian Official "Kriegsarchiv," *Kriege der Kaiserin Maria Theresia* (in progress), and Carlyle's *Frederick the Great*. *See* also C. B. Kriege* (Berlin, 1893). The main authorities for Ferdinand's Campaign are Westphalen, *Feldzüge des Herzogs Ferdinand von Braunschweig,* and J. W. Fortescue, *Hist. British Army,* vol. ii.

NAVAL OPERATIONS

When the Seven Years' War broke out, with the Prussian invasion of Saxony on Aug. 29, 1756, eight years had elapsed since the Peace of Aix-la-Chapelle, 1748, which concluded the War of the Austrian Succession. During the years 1754 and 1755 the French performed a number of hostile acts against the British on land and sea in various parts of the world to which the British retaliated, especially in the Mediterranean and along the frontier between French Canada and British America. Thus there existed during those two years a state of affairs which can be best described as an unofficial war of outposts between the British and French. Although no part of the Seven Years' War, it is convenient to review briefly the naval operations of those three years.

In June 1755 a British squadron under Boscawen was sent into the Straits of Belle Isle to intercept French ships carrying soldiers and stores. On June 8 Boscawen seized two French line-of-battle ships fitted as transports, the "Alcide" and the "Lys." Hawke was sent to sea with the Western Squadron and a general seizure of French merchant ships followed. The Government of Louis XV. did not reply by a declaration of war, but prepared to retaliate by a surprise invasion of the British Isles, which soon degenerated into a threat, which was, however, kept up as a feint to cover an expedition against Minorca.

A squadron of 12 sail of the line was prepared at Toulon under La Galissonière. It escorted transports carrying 15,000 troops under the duc de Richelieu. The danger to Minorca, where the garrison had been allowed to fall below its due strength, was well known to the British ministers. On March 11 they appointed Admiral John Byng to command a squadron which was to carry reinforcements. He had ten sail of the line, and reached Gibraltar on May 2. The French invasion of Minorca had been carried out on April 19. The governor of Gibraltar, Gen. Fowke, refused to part with any of his soldiers to reinforce Minorca, though under orders to do so, and on May 8 Byng sailed, and was off Minorca on the 19th. Before the officers of the garrison, whom he carried, could be landed, the French fleet came in sight. Byng had been joined by three ships of the line at Gibraltar, and had therefore 13 ships to 12. On the morning of May 20 he gained the weather-gauge, and then bore down on the enemy at an angle, the van of the English steering for the van of the French. The sixth ship in his line, the "Intrepid" (74), having lost her foretopmast, became unmanageable and threw the vessels behind her out of order. Thus the six in front were exposed to the fire of all the French, who were with difficulty repulsed. Being now much dis-

turbed by the crippled state of the ships in his van, Byng made no effort either to land the soldiers he had on board or to renew the action; and after holding a council of war on May 24, which confirmed his own desire to retreat, he sailed for Gibraltar, and Minorca surrendered in June, which gave the French a great advantage in the Mediterranean.

In 1757 the naval war began to be pushed with considerable vigour. The elder Pitt became the effective head of the Government, and was able to set about ruining the French power at sea. He sent out, during the last months of 1757 and the whole of 1758, a series of combined expeditions against the French coast which, though costly and for the most part unsuccessful, forced the French to divert large bodies of troops from the Rhine frontier. In the East Indies, the squadron under Vice-admiral Watson, with the assistance of the Company's troops under Clive, recaptured Calcutta in Jan. 1757 and Chandernagore in March. On Watson's death, Rear-admiral George Pocock succeeded to the command, and fought an indecisive action with the French squadron under M. d'Aché on April 29, 1758, off Cuddalore, and again on Aug. 3 off Negapatam, after which M. d'Aché retired to Mauritius. Meanwhile the French were so occupied on their eastern frontier and their Atlantic ports were so well watched, that they were unable to send sufficient reinforcements to their Colonists in Canada. Consequently, Boscawen and Gen. Amherst were able to undertake a combined operation against Louisburg, which capitulated on July 26, 1758, thus giving England control of the whole of Cape Breton island and the mouth of the St. Lawrence.

On the West Coast of Africa, Commodore Henry Marsh captured Senegal in May 1758, and Commodore Augustus Keppel captured Gorée in December. In 1759 the French made a last effort to retrieve their naval position. In European waters they again made plans for an invasion of the British Isles; but the attempted concentration of the Toulon fleet under de la Clue at Brest was defeated by Boscawen in a running fight ending in Lagos bay in August. On Nov. 20 Hawke, in Quiberon bay, defeated the Brest fleet under Conflans, which had slipped out while Hawke had had to withdraw the blockading forces owing to bad weather. Hawke and Boscawen's watch on the French Atlantic and Mediterranean ports had been so close that few ships of the line had been able to leave them during the year, and French colonial possessions had become completely isolated.

Throughout the summer Vice-admiral Charles Saunders conducted operations in the St. Lawrence, which resulted in his enabling General James Wolfe to surprise the French above Quebec, and defeat them on the heights of Abraham. This led to the immediate capitulation of Quebec on Sept. 18 and later to the capture of Montreal and the whole of French Canada. In the East Indies M. d'Aché fought one more action with Pocock, on Sept. 8, and then retired to Pondicherry, which fell in Jan. 1761. In the West Indies Commodore John Moore failed to capture the important French island of Martinique, but took Guadeloupe on May 1, 1759, after which many other islands fell into his hands.

During 1760 and 1761 the French fleet made no attempt to keep the sea. The British navy went on with the work of conquering French possessions. During 1760 it co-operated on the Lakes and on the St. Lawrence in the final conquest of Canada. Between April and June of 1761 it captured the island of Belle-Ile on the French coast, which both strengthened its means for maintaining blockade and gave the British Government a valuable pledge to be used for extorting concessions when the time for making peace arrived. The complete ruin of French merchant shipping and the collapse of the navy left the maritime population free to seek a livelihood in the privateers. Commerce-destroying was carried on by them with considerable success. The number of British merchant ships taken has been put as high as one-tenth of the whole. This was the price paid for the advantage gained by the ruin of the French as commercial rivals.

By the close of 1761 the maritime war was revived for a few months by the intervention of Spain. A close alliance, known as "the family compact," had been cemented with France earlier in the year. The secret was divulged, and Pitt would have made war on Spain at once. He was overruled and resigned. So soon, however, as the treasure ships from America had reached Spain, the Spanish Government declared war. Its navy was incapable of offering a serious resistance to the British, nor did it even attempt to operate at sea. The British Government was left unopposed to carry out the plans which Pitt had already prepared. The only aggressive movement undertaken by the Spanish Government was an attack on Portugal, which was the close ally of Great Britain and gave her the free use of Portuguese ports. Great Britain supported her ally, with a small force, and the Spaniard eventually retired. But the most effective blows against Spain were directed at her colonies. The British troops, left free by the recent success against the French in America, were employed firstly in a combined attack on Martinique under Rear-admiral G. B. Rodney, who captured the whole island by Feb. 1762. This was quickly followed by the capitulation of Grenada and St. Lucia. A powerful fleet left England in March 1762 bringing still more troops, with Pocock, who had recently returned from the East Indies, in supreme command. The expedition was ordered to attack Havana, and was off Cuba by June. The worst losses of the besiegers were due to the climate of Cuba, aided by bad sanitary arrangements. Of the 10,000 troops landed, three-fourths are said to have suffered from fever or dysentery, and the majority of the sick died. Yet the Moro was taken on Sept. 30, and Havana, which could have made a longer resistance, surrendered on Oct. 10. In the East Indies, where the surrender of Pondicherry had left other forces free, a combined expedition under Rear-admiral Cornish and Col. Draper captured Manila in Sept. 1761. The blockade of the French ports, and the defeat of their main battle fleets, had ruined all their hopes of invading the British Isles, and left their colonial possessions completely isolated. These were now practically all lost, and they could only set against them the capture of Minorca. The preliminaries of the peace of Paris were signed on Nov. 3, 1762.

See Sir Julian Corbett, *England in the Seven Years' War* (1918); Sir W. L. Clowes, *The Royal Navy*, vol. iii. (1898); M. Burrows, *Life of Admiral Lord Hawke* (1896). (G. A. R. C.; W. C. B. T.)

SEVERIANA, VIA, an ancient highroad of Italy, running south-east from Ostia to Terracina, 73 m. along the coast, taking its name from the restoration of an existing road by Septimius Severus. It ran along the shore at first, just behind the line of villas which fronted upon the sea, and are now half a mile inland. Further on, the ancient and modern coastlines coincide, and the road ran on the outside of the lagoons which lie to the north of the Circeian promontory.

SEVERING, WILHELM KARL (1875–), German statesman, was born at Herford, Westphalia on June 1, 1875, the son of a cigar-sorter. He worked for ten years in Bielefeld, Barmen and Zürich, as a locksmith, and after acting as secretary to the metal workers' union in Bielefeld (1902–10), obtained a post on the staff of a Socialist newspaper. He was appointed Commissioner for the Rhineland and Westphalia, and was responsible for the negotiations with the workmen who revolted in the Ruhr. He held office as Prussian minister of the interior from 1920 to 1925 (with one short interval), and was a staunch upholder of republican principles, being largely instrumental in suppressing the reactionary disturbances of 1923. The Republican Police force owes its organization chiefly to him. He was again minister of the interior in the Müller cabinet of 1927.

SEVERINUS, pope in 640, successor of Honorius. He occupied the papal chair only three months after his consecration, having had to wait a year and a half for its ratification by the emperor. During this long vacancy the exarch of Ravenna, supported by the military body of Rome (*exercitus Romanus*), occupied the Lateran and seized the treasure of the Church.

SEVERN, JOSEPH (1793–1879), English portrait and subject painter, was born at Hoxton on the 7th of December 1793, the son of a musician, who belonged to an old Gloucestershire family. During his earlier years he practised portraiture as a miniaturist; and, having studied in the schools of the Royal Academy, in 1818 he gained the gold medal for his "Una and the Red Cross Knight in the Cave of Despair." He was an intimate friend of Keats, whom he accompanied to Italy in 1820 and

nursed till his death in 1821. In 1861 he was appointed British consul at Rome, a post which he held till 1872, and during a great part of the time he also acted as Italian consul. His most remarkable work is the "Spectre Ship" from the *Ancient Mariner*. His portraits include several of Keats. He died at Rome on Aug. 3, 1879.

See the *Life and Letters*, by William Sharp (1892).

SEVERN (Welsh, *Hafren*, Roman, *Sabrina*), a river of Wales and England. It rises on the north-east side of Plynlimmon, on the south-west border of Montgomeryshire, and flows with a nearly semicircular course of about 210 m. to the Bristol channel. Its course is at first in a south-east direction, and for the first 15 m. it flows over a rough precipitous bed. At Llanidloes it bends north-east, passing Newtown and Welshpool; this part of the valley bearing the name of the Vale of Powys. It receives the Vyrnwy near Melverley, and forms a mile of the Welsh border, and then turning eastward enters Shropshire and waters the broad plain of Shrewsbury, after which it bends southward past Ironbridge and Bridgnorth to Bewdley in Worcestershire. In Shropshire it receives a number of tributaries, the chief of which is the Tern. In Worcestershire it passes Stourport, where it receives the Stour (left), and Worcester, shortly after which it receives the Teme (right). It enters Gloucestershire close to Tewkesbury, where it receives the Upper Avon (left), after which, bending south-west, it passes Gloucester, below which it becomes estuarine and tidal. A high bore, for which the Severn is notorious, may reverse the flow as high up as Tewkesbury Lock (13½ m. above Gloucester), and has sometimes caused great destruction. The estuary merges into the Bristol Channel at the point where it receives the Lower or Bristol Avon (left) and the Wye (right).

Like the Yorkshire Ouse, the river Severn collects on its right bank a number of streams which have remarkably parallel courses. Of these the Upper Severn, Teme, Wye and Usk flow in a direction a little south of east, whilst the Ebbw, Rhymney and Taff flow generally southward. The whole system drains over a half of Wales. It is assumed by Dr. A. Strahan (*Geology in the Field*, p. 856) that the system originated on a land surface of Upper Cretaceous and Tertiary strata, of which however nothing remains in the area. The eastward flowing streams, which may probably at one time have formed part of the Thames system, were captured one by one and diverted southward into the Bristol channel. The river had reached its base level when, in Pliocene times, the district, along with a much more extensive area, was affected by an uplift of from 400 to 600 feet. The effect of this uplift is seen in the incised meanders of the Wye and the occurrence of rock-steps in most of the valleys themselves. Above these steps the streams present all the characteristics of mature rivers. One such step occurs at the Ironbridge gorge which was considered by Prof. Lapworth (*op. cit.*, p. 768) to be due to river capture during the glacial period. The present Upper Severn and the Vyrnwy he considered were affluents of a river which, flowing northwards, was dammed by ice coming down from north Wales so that the water was ponded back and overflowed at Ironbridge into the Severn. This overflow channel was deepened sufficiently to bring about the permanent diversion of the streams when the ice retreated.

The upper part of Severn estuary is difficult of navigation, and therefore the Gloucester and Berkeley ship canal (16¾ m. long) was constructed, admitting vessels of 350 tons to Gloucester from the docks at Sharpness on the estuary. The navigation extends up to Arley, above Bewdley, 47 m. from Gloucester, and Stourport (43 m.), where the Staffordshire and Worcestershire canal gives access to the Wolverhampton and the Trent and Mersey navigation. There is connection with the Thames by the Stroudwater canal from Framilode, joining the Thames and Severn canal near Stroud. The Wye is in part navigable; the Bristol Avon gives access to the great port of Bristol, and the Upper Avon is in part navigable. The Severn is a good salmon river, and is famous for its lampreys, while many of the tributaries afford fine trout-fishing, such as the Teme and the Vyrnwy.

The Severn tunnel, carrying the G.W. railway under the estuary, forms the direct route between the south of England and south Wales. In order to relieve the pressure of traffic, the G.W. railway sought powers in 1924 to construct a bridge across the estuary. The scheme has been postponed until fuller enquiry can be made into the effects of such a construction upon tidal currents, etc. Another important project which has been postponed indefinitely is the "Severn barrage scheme" to utilize the high tides of the river to generate electrical power.

SEVERUS, LUCIUS SEPTIMIUS (A.D. 146–211), Roman emperor, was born of an equestrian family, on April 11, 146, at Leptis Magna on the coast of Africa. He had to learn Latin as a foreign language, and kept an African pronunciation all his life. Some time between 164 and 170 he came to Rome and studied law under Q. Cervidius Scaevola; he had Papinian as a fellow-pupil. Marcus Aurelius gave him the *latus clavus*, and at the age of 26 he went as *quaestor militaris* to Baetica, in Spain. While he was away in Africa, in consequence of his father's death, the emperor took over Baetica from the Senate, and gave them Sardinia, of which Severus became quaestor. In 174 or 175 he was legate to the proconsul of Africa, and then was tribune of the plebs, an office of dignity rather than importance. In that year he married Marcia, his first wife. In 178 or 179 he was praetor, and went to *Hispania Citerior* as *legatus iuridicus;* after that he commanded a legion in Syria. After the death of Marcus Aurelius he was unemployed for some time, and studied at Athens. He was governor of *Gallia Lugdunensis* in 186, and during his governorship occurred the revolt of Maternus. Niger, with whom he was afterwards to dispute the succession, was sent by Commodus to deal with it, and a letter from Severus to Commodus records his admiration for his future rival. At this period also, probably in 187, he married Iulia Domna, daughter of a priest of Baal at Emesa, and his son Caracalla was probably born on April 4, 188. He was proconsul of Sicily in 189, and *consul suffectus* in 190. Next year he went to Pannonia as governor. Here, in a province recently upset by the wars of the Antonines, he was in command of three legions, with his headquarters at Carnuntum. On the last day of 192 Commodus was murdered; Septimius' complicity is doubtful. His successor Pertinax, appointed by the senate, was murdered on March 28, 193, and another senator, Iulianus, bought the support of the praetorians. But it was not the guard but the legions that had the disposal of the throne. As soon as the news of the death of Pertinax reached him Severus gathered his troops, received their acclamation as emperor, and set out at once for Rome, having already indicated his role of avenger of Pertinax by adopting his name. Meanwhile two other governors had taken the same steps, but they were not his equals in speed, in strength, or in the important factor of proximity to Rome. Roughly, the continent of Europe was his, the legions of Britain had proclaimed for Albinus, and Syria for Niger. Albinus for the moment accepted the offer of the title of Caesar, which made him heir-apparent. Severus' march on Rome was desperately swift; no soldier took off his breastplate between Carnuntum and Rome, according to Dio, and his first success was the surrender of the fleet and town of Ravenna. Iulianus was quite inadequate, and when the praetorians deserted the Senate went over too.

Iulianus was murdered and Severus was immediately proclaimed emperor. Before entering the city he disbanded the guard and exiled them 100 miles from Rome; the new guard he formed was open to soldiers from all provinces of the empire. He then made a magnificent entry, performed funeral and deificatory rites over Pertinax, and before the end of July left for the East. The contest between Severus and Niger was practically decided by two or three engagements fought by Severus' officers. The last battle, at Issus, ended in the defeat and death of Niger (194). After this the emperor spent two years in successful attacks on the peoples bordering on Syria, particularly in Adiabene and Osrhoene. Byzantium, the first to be attacked, was the last to fall, after a glorious defence.

Late in 196 Severus turned westward, to reckon with Albinus, leaving affairs in the East by no means settled. As Severus was nearing Italy he received the news that Albinus had been declared emperor by his soldiers. The first counter-stroke of Severus was to affiliate himself and his elder son to the Antonines by a spurious

and posthumous adoption. Bassianus, the elder son of Severus, thereafter known as Aurelius Antoninus, was named Caesar in place of Albinus, and was thus marked out as successor to his father. Without interrupting the march of his forces, Severus contrived to make an excursion to Rome. Here he availed himself with much subtlety of the sympathy many senators were known to have felt for Niger. Though he was so far faithful to the decree passed by his own advice that he put no senator to death, yet he banished and impoverished many whose presence or influence seemed dangerous or inconvenient to his prospects.

The collision between the forces of Severus and Albinus was the most violent that had taken place between Roman troops since the contest at Philippi. The decisive engagement was fought on February 19 of the year 197 on the plain between the Rhône and the Saône, to the north of Lyons, and resulted in a complete victory for Severus.

Thus, released from all need for disguise, he "poured forth on the civil population all the wrath which he had been storing up for a long time" (Dio). He frightened the senate by calling himself the son of Marcus and brother of Commodus, whom he deified. He read a speech in which he declared that the severity and cruelty of Sulla, Marius and Augustus had proved to be safer policy than the clemency of Pompey and Julius Caesar, which had wrought their ruin. Over 60 senators were arrested on a charge of having adhered to Albinus, and half were put to death.

The next years (197–202) were devoted to war against the Parthians, who had invaded Mesopotamia, and Severus recovered and annexed Mesopotamia, and spent some time in what seems to have been a rather unsuccessful punitive expedition. On his return journey he visited Egypt; Dio observes that he was not the man to leave anything, human or divine, uninvestigated. He returned to a triumph, commemorated still by the arch that bears his name. For the next six years (202–208) Severus lived at Rome. Nothing of great importance happened except the fall of Plautianus, praefect of the guard, an African like his master, who exercised a more complete dominance than any favourite since Seianus. He was thoroughly hated by both Iulia and Caracalla, and Caracalla invented a plot against the emperor's life in which Plautianus was supposed to be implicated, and had him put to death in 205. Severus spent the last three years of his life (208–211) in Britain, which had been unsettled for some time. He seems to have welcomed military service as a chance of healing the strife between his sons Caracalla and Geta, and getting them away from Rome. He died at York on Feb. 4, 211.

Administration.—In military history his reign is important, marking the beginning of the admittedly military despotisms. His main work in this sphere was the throwing open of the praetorian guard to the empire, the establishment of a centralised force in Italy (a long step towards the complete assimilation of Italy to the provinces), and a series of improvements in the conditions and rewards of service, including permission to the soldiers to have their wives with them, and the opening of the equestrian civil service career to the veterans.

In his home administration the chief feature is the further reduction in the importance of the senate, combined with an increase in the powers and duties of the equites, and especially of their chief members, the *praefecti praetorio.*

The Legal Praefect becomes the most important subject in the empire, with administrative as well as judicial powers; the *praefectus annonae* disappears in this reign, and his duties are absorbed by Papinian, the first and most distinguished of a long line of judicial *praefecti.* They repaid their advancement by working the theory of absolutism into Roman law. Severus' laws show a growing humanitarian tendency, and a renewed attempt to carry out the social policy of the *Lex Iulia de adulteriis.* His financial policy is marked by the growth of a new treasury, the *res privata,* the emperor's personal property, distinct from the Crown property.

As a result of his own troubles with the holders of big provincial commands he tended to split up the largest, *e.g.,* Britain, Syria and Africa, into divided commands. On the whole the reign of Severus was one of peace and prosperity in the provinces.

The foregoing account, though mainly confined to undisputed facts, implies a favourable estimate of Severus' administration, and is based on Platnauer (see *inf.*). Mention must be made, however, of the view of Rostovtzev (*infra*), who bases on the same facts a wholly different interpretation, in which Severus appears as responsible for the demoralisation and, if not the barbarisation, yet at least the "democratisation and provincialisation" of the army, as responsible for the abandonment of the policy of the Antonines in favour of a dynasty supported by the army, and as having sacrificed the upper classes of the empire to the peasants, from whom the army was now drawn. Where they differ flatly is in their estimate of the condition of the provinces during the reign.

In literature and philosophy the reign is undistinguished, but interesting on account of Iulia Domna, the philosophic Empress, and her circle, which included Diogenes Laertius, Galen, Aelian, the lawyers Papinian and Ulpian, and Philostratus, the author of that abortive gospel, the *Life of Apollonius of Tyana.* Severus himself was markedly superstitious, but there is nothing to connect him with the surge of Eastern mysticism that his wife fostered. What we have of his is a definite edict against conversion to Christianity.

SEVERUS, MARCUS AURELIUS ALEXANDER: *see* Alexander Severus; Marcus Aurelius.

SEVERUS, SULPICIUS (*c.* 363–*c.* 425), Christian writer, was a native of Aquitania. He was imbued with the culture of his time and of his country, which was then the only true home of Latin letters and learning. Almost all that we know of Severus' life comes from a few allusions in his own writings, and some passages in the letters of his friend Paulinus, bishop of Nola. In his early days he was famous as a pleader, and his knowledge of Roman law is reflected in parts of his writings. He married a wealthy lady belonging to a consular family, who died young, leaving him no children. At this time Severus came under the powerful influence of St. Martin, bishop of Tours, by whom he was led to devote his wealth to the Christian poor, and his own powers to a life of good works and meditation.

The chief work of Severus is the *Chronica* (*c.* 403), a summary of sacred history from the beginning of the world to his own times, with the omission of the events recorded in the Gospels and the Acts, "lest the form of his brief work should detract from the honour due to those events." The book was a text-book, and was used as such in the schools of Europe for about a century and a half after the *editio princeps* was published by Flacius Illyricus in 1556. As a historian of the past Severus has little value. The real interest of his work lies, first, in the incidental glimpses it affords all through of the history of his own time; and in the information he has preserved concerning the struggle over the Priscillianist heresy, which disorganized and degraded the churches of Spain and Gaul, and particularly affected Aquitaine. The sympathies here betrayed by Severus are wholly those of St. Martin. Severus loses no opportunity for laying stress on the crimes and follies of rulers, and on their cruelty, though he once declares that, cruel as rulers could be, priests could be crueller still. This last statement has reference to the bishops who had left Maximus no peace till he had stained his hands with the blood of Priscillian and his followers. Martin, too, had denounced the worldliness and greed of the Gaulish bishops and clergy. Severus also fully sympathized with the action of St. Martin touching Priscillianism.

After the *Chronica* the chief work of Severus is his *Life of Martin*, a catalogue of miracles, told in all the simplicity of absolute belief. Two *Dialogues* and the *Epistles* on the death of Martin complete the list of Severus' genuine works.

Authorities.—The text of the *Chronica* rests on a single 11th century ms., one of the Palatine collection now in the Vatican; of the other works mss. are abundant, the best being one of the 6th century at Verona. The complete works of Severus were edited by Halm (forming vol. i. of the *Corpus scriptorum ecclesiasticorum Latinorum*, Vienna, 1866).

SEVIER, JOHN (1745–1815), American frontiersman, and first governor of Tennessee, was born in Rockingham county, Va., Sept. 23, 1745. He settled on the Watauga river west of the Alleghanies. When this territory was annexed to Tennessee in 1776, Sevier was elected as its representative to the provincial congress which drew up the first state constitution. He served as captain in Lord Dunmore's War in 1774. He took an active part in the battle of King's Mountains in 1780, and in the following year he served under General Francis Marion against the British in the Carolinas and Georgia. In 1780 he defeated the Cherokees at Boyd's Creek. When North Carolina ceded her western lands to the Federal government in 1784, Sevier took part in the revolt against the parent state which resulted in the formation of the separate state of Franklin and was elected its first governor. By 1786 the Conservative party had regained control, and Sevier was tried for high treason and convicted, but was subsequently pardoned. In 1789 he was a member of the North Carolina Senate, and in 1790–91 of the National House of Representatives. After the final cession of its western territory by North Carolina to the United States in 1790 he was appointed brigadier-general of militia for the eastern district of the "Territory South of the Ohio"; and when Tennessee was admitted into the Union as a state, Sevier became its first governor (1796–1801) and was governor again in 1803–09. He was a member of the National House of Representatives in 1811–15, and then was commissioner to determine the boundary of Creek lands in Georgia. He died near Fort Decatur (Ga.), Sept. 24, 1815.

See J. R. Gilmore, *The Rear-Guard of the Revolution* (New York, 1896), and *John Sevier as a Commonwealth Builder* (New York, 1887); errors in Gilmore's books are pointed out in Theodore Roosevelt's *The Winning of the West* (New York, 1894–96).

SÉVIGNÉ, MARIE DE RABUTIN-CHANTAL, Marquise de (1626–1696), French letter-writer, was born at Paris on Feb. 5, 1626. The family of Rabutin (if not so illustrious as Bussy, Madame de Sévigné's notorious cousin, affected to consider it) was one of great age and distinction in Burgundy. Marie's father, Celse Bénigne de Rabutin, Baron de Chantal, was killed during the English descent on the Isle of Rhé in July 1627. His wife did not long survive him many years, and Marie was left an orphan at the age of seven. At the age of ten she passed into the guardianship of her uncle Christophe de Coulanges, abbé de Livry. Readers of his niece's letters know how well "Le Bien Bon" fulfilled the trust. Long after his nominal duties were ended he was in all matters of business the good angel of the family, while for half a century his abbacy of Livry was the favourite residence both of his niece and her daughter. Coulanges provided his niece with an admirable education. Jean Chapelain and Gilles Ménage are specially mentioned as her tutors, and Ménage at least fell in love with her. Another literary friend of her youth was the poet Denis Sanguin de Saint-Pavin. She was intimate with all the coterie of the Hôtel Rambouillet, and her special ally was Mademoiselle de la Vergne, afterwards Madame de la Fayette. In person she was extremely attractive, though the minute critics of the time objected to her divers deviations from regular beauty. Her long minority, under so careful a guardian as Coulanges, had also raised her fortune to the amount of 100,000 crowns. She married (1644) Henri, marquis de Sévigné, a Breton gentleman of good family, allied to the oldest houses of that province, but of no great estate. They settled at Sévigné's manor-house of Les Rochers, near Vitré. It may be suspected that the happiest days of Madame de Sévigné's brief married life were spent there. For there at any rate her husband had less opportunity than in Paris of neglecting her, and of wasting her money and his own. Henri de Sévigne was one of the innumerable lovers of Ninon de l'Enclos, and made himself even more conspicuous with a certain Madame de Gondran, known in the nickname slang of the time as "La Belle Lolo." He was wildly extravagant. That his wife loved him and that he did not love her was generally admitted. He quarrelled with the Chevalier d'Albret about Madame de Gondran, fought with him and was mortally wounded on Feb. 4, 1651.

There is no reasonable doubt that his wife regretted him a great deal more than he deserved. Though only five and twenty, and more beautiful than ever, she never married again. For the rest of her life she gave herself up to her two children, Françoise Marguerite (b. 1646), and Charles (1648). To Charles Madame de Sévigné was an indulgent, a generous (though not altogether just) and in a way an affectionate mother. Her daughter, the future Madame de Grignan, she worshipped with an almost insane affection. For nearly ten years she lived an uneventful life at Paris in a house she occupied in the Place Royale (not as yet in the famous Hôtel Carnavalet), at Les Rochers, at Livry or at her own estate of Bourbilly in the Mâconnais. She had, however, in 1658, a quarrel with her cousin Bussy over a loan. He gives a malicious portrait of her in his *Histoire amoureuse*. The quarrel was never quite healed, though after Bussy's disgrace in 1666 correspondence was renewed.

In 1661, at the downfall of the Superintendent Fouquet, it was announced on indubitable authority that communications from Madame de Sévigné had been found in the coffer where Fouquet kept his love letters. Bussy obtained from Le Tellier, who as minister had examined the letters, a corroboration of her protest that the letters were merely those of a friend. Nevertheless, there have always been those who held that Madame de Sévigné regarded Fouquet with at least a very warm kind of friendship. During these earlier years Madame de Sévigné had a great affection for the establishment of Port Royal.

Madame de Grignan.—The bulk of Madame de Sévigné's letters are addressed to her daughter, who married in 1668 François d'Adhémar, comte de Grignan, a Provençal, of one of the noblest families of France. He had been twice married, and his great estates were heavily encumbered. Neither did the large dowry (300,000 livres) which Madame de Sévigné, somewhat unfairly to her son, bestowed upon her daughter, suffice to clear encumbrances. In 1669 M. de Grignan, who had previously been lieutenant-governor of Languedoc, was transferred to Provence. The governor-in-chief was the young duke of Vendôme. But at this time he was a boy, and he never really took up the government, so that Grignan for more than forty years was in effect viceroy of this important province. His wife liked the part of vice-queen; but their peculiar situation threw on them the expenses without the emoluments of the office, so that the Grignan money affairs hold a larger place in Madame de Sévigné's letters than might perhaps be wished.

1671–1691.—Madame de Sévigné lived in Paris from 1677 onwards in the Hôtel de Carnavalet, but she spent part of the year usually on her estate at Les Rochers. She was there when the estates of Brittany were convoked at Vitré in 1671, and she was there in 1675 when the province was being punished for its resistance to illegal taxation. Occasionally she was able to enjoy her daughter's society. She spent a year with the de Grignans in Provence in 1672–3, and the whole Grignan family paid a long visit to the Hôtel de Carnavalet in 1677. Between 1680 and 1688 the Grignans were in Paris for a great part of their time. The bulk of the letters from Madame de Sévigné to her daughter therefore belong to the period before 1677.

In 1679 Madame de Sévigné lost La Rochefoucauld, the most eminent and one of the most intimate of her close personal friends and constant associates. In 1684 Charles de Sévigné married a young Breton lady, Jeanne Marguerite de Mauron, who had a considerable fortune. In the arrangements for this marriage Madame de Sévigné practically divided all her fortune between her children (Madame de Grignan of course receiving an unduly large share), and reserved only part of the life interest. In 1687 the Abbé de Coulanges died. In the same year Madame de Sévigné was present at the Saint-Cyr performance of *Esther*,

and some of her most amusing descriptions of court ceremonies and experiences date from this time. 1689 and 1690 were almost entirely spent by her at Les Rochers with her son; and on leaving him she went across France to Provence. 1691 was passed at Grignan and other places in the south, but at the end of it Madame de Sévigné returned to Paris, bringing the Grignans with her; and her daughter stayed with her till 1694.

Last Years.—The year 1693 saw the loss of two of her oldest friends—Bussy Rabutin, her faithless and troublesome but in his own way affectionate cousin, and Madame de la Fayette, her life-long companion, and on the whole perhaps her best and wisest friend. Another friend almost as intimate, Madame de Lavardin, followed in 1694. Madame de Sévigné spent but a few months of this latter year alone, and followed her daughter to Provence. She never revisited Brittany after 1691.

During an illness of her daughter Madame de Sévigné herself was attacked by smallpox in April 1696, and she died on the 17th of that month at Grignan, and was buried there. Her idolized daughter was not present during her illness. But in her will Madame de Sévigné still showed her preference for this not too grateful child. Charles de Sévigné died on March 26, 1713. His widow survived him twenty years. Madame de Grignan had died on August 16, 1705, at a country-house near Marseilles, of the very disease which she had tried to escape by not visiting her dying mother. Her son, who had fought at Blenheim, had died of the same malady at Thionville the year before. Marie Blanche, her eldest daughter, was in a convent, and, as all the comte de Grignan's brothers had either entered the church or died unmarried, the family, already bankrupt in fortune, was extinguished in the male line by Grignan's own death in 1714, at a great age.

The Letters.—Madame de Sévigné was a member of the strong and original group of writers—Retz, La Rochefoucauld, Corneille, Pascal, Saint-Evremond, Descartes and the rest—who escaped the influence of the later 17th century, while they profited by the reforms of the earlier. According to the strictest standard of the Academy her phraseology is sometimes incorrect, and it occasionally shows traces of the quaint and affected style of the *Précieuses;* but these things only add to its savour and piquancy. In lively narration few writers have excelled her, and in the natural expression of domestic and maternal affection none. She had an all-observant eye for trifles and the keenest possible appreciation of the ludicrous, together with a hearty relish for all sorts of amusements, pageants and diversions, and a deep though not voluble or over-sensitive sense of the beauties of nature. But with all this she had an understanding as solid as her temper was gay.

Unlike her daughter, she was not a professed blue-stocking. But she had a strong affection for theology, in which she inclined (like the great majority of the religious and intelligent laity of her time in France) to the Jansenist side. Her favourite author in this class was Nicole. She has been reproached for her fondness for the romances of Mlle. de Scudéry and the rest of her school. But probably many persons who make that reproach have themselves never read the works they despise, and are ignorant of how much merit there is in them. In purely literary criticism Madame de Sévigné was no mean expert. Her preference for Corneille over Racine has much more in it than the fact that the elder poet had been her favourite before the younger began to write; and her remarks on La Fontaine and some other authors are both judicious and independent. Nor is she wanting in original reflections of no ordinary merit. But to enjoy her work in its most enjoyable point—the combination of fluent and easy style with quaint archaisms and tricks of phrase—it must be read as she wrote it, and not in the trimmed and corrected version of Perrin and Madame de Simiane.

BIBLIOGRAPHY.—Madame de Sévigné's correspondence with Bussy Rabutin appeared in his *Memoirs and Correspondence,* partly in the year of her death, partly next year. The remainder was not printed in any form for 30 years. The number of unauthorized editions of the letters which appeared, taken from copies of letters privately circulated caused Madame de Simiane (d. 1737), the daughter of Madame de Grignan, to give an authorized version. This appeared under the care of the Chevalier de Perrin in 6 vols. (1734–37). It contained only the letters to Madame de Grignan, and these were subjected to editing rather more careful than conscientious, the results of which were never thoroughly removed until recently. Madame de Simiane, who possessed her mother's replies, is said to have burnt the whole of these from religious motives; this phrase is explained by Madame de Grignan's Cartesianism, which is supposed to have led her to expressions alarming to orthodoxy. There were numerous omissions and alterations of style and language. Perrin followed up this edition in 1751 with a volume of supplementary letters to other persons, and in 1754 published his last edition of the whole, which was long the standard (8 vols., Paris). During the last half of the 18th century numerous editions of the whole or parts appeared with important additions, such as that of 1756, giving for the first time the letters to Pomponne on the Fouquet trial; that of 1773, giving letters to Moulceau; that of 1775, giving for the first time the Bussy letters separate from his memoirs, etc. An important collected edition of all these fragments, by the Abbé de Vauxcelles, appeared in 1801 (Paris, An. IX.) in 10 vols.; five years later Gouvelle (Paris, 1806, 8 vols.) introduced the improvement of chronological order; this was reprinted in 12 vols. (Paris, 1819) with some more unpublished letters which had separately appeared meanwhile. In the same year appeared the first edition of M. de Monmerqué. From that date continual additions of unpublished letters were made, in great part by the same editor, and at last the whole was remodelled on MS. copies (the originals unfortunately are available for but few) in the edition called *Des Grands Écrivains,* which M. de Monmerqué began, but which owing to his death had to be finished by MM. Regnier, Paul Mesnard and Sommer (1862–68). This, which supersedes all others (even a handsome edition published during its appearance by M. Silvestre de Sacy), consists of 12 volumes of text, notes, etc., two volumes of lexicon and an album of plates. It contains all the published letters to and from Madame de Sévigné, with the replies where they exist, with all those letters to and from Madame de Simiane (many of which had been added to the main body) that contain any interest. To it must be added two volumes (printed uniformly) of *Lettres inédites,* published by M. Ch. Capmas in 1876 and containing numerous variants and additions from a ms. copy discovered in an old curiosity shop at Dijon. Of less elaborate and costly editions that in the collection Didot (6 vols., v.d.) is the best, though, it contains an adulterated text. There are many English translations of the Letters. One of the early English translations, was reprinted, with additions, and with a preface by Madame Ducloux in 1928 (10 vols.). Another edition, with introduction by A. E. Newton (7 vols.) also appeared in 1928.

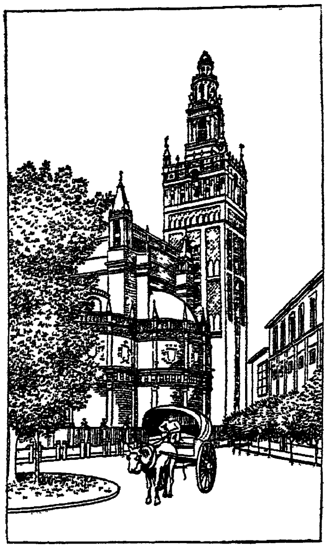
Works on Madame de Sévigné are innumerable. Besides essays by nearly all the great French critics from Sainte-Beuve (*Portraits de femmes*) to M. Brunetière (*Études critiques*), the work of F. Combes, *Madame de Sévigné, historien* (1885), and G. Boissier's volume in the *Grands Écrivains Français* (1881), should be consulted. The biography by Paul Mesnard is nearly exhaustive, but the most elaborate biographical book is that of Walckenaer (3rd ed., Paris, 1856, 5 vols.), to which should be added the remarkable *Histoire de Mme. de Sévigné* of Aubenas (Paris and St. Petersburg, 1842). In English an excellent little book by Miss Thackeray (Lady Ritchie) (1881) may be recommended, and also Janet Aldis's *Mme de Sévigné: The Queen of Letter-writers* (1907). Most of the editions have portraits.

See also E. Angot, *Dames du grand Siècle* (1919); E. Fitzgerald, *Dictionary of Madame de Sévigné* (2 vols. 1914); H. Hallays, *Madame de Sévigné* (1921).

SEVILLE, an inland province of southern Spain, one of the eight provinces into which Andalusia was divided in 1833; bounded on the north by Badajoz, north-east by Cordova, south by Málaga and Cadiz and west by Huelva. Pop. (1920) 703,747; area 5,428 sq. miles. The province is bisected by the navigable river Guadalquivir (*q.v.*), which here receives the Genil and Guadaira on the left, and the Guadalimar on the right. West of the Guadalquivir the surface is broken by low mountain ranges forming part of the Sierra Morena; the eastern districts are comparatively flat and very fertile, except along the frontiers of Cadiz and Málaga, where rise the Sierras of Gibalbin and Algodonales; and there are extensive marshes near the Guadalquivir estuary. Coal, copper, iron ore, silicate of alumina, marble and chalk are the chief mineral products; the province is famous for its oranges, and also exports wheat, barley, oats, maize, olives, oil, wine and chick-peas. Seville is the capital and chief riverport. Other important towns of the province are Écija—pop. 1920—(29,934), Carmona (22,095), Utrera (21,316), Moron de la Frontera (18,758), Osuna (16,374), Marchena (5,309), Lebrija (12,012).

SEVILLE, the capital of the Spanish province of Seville, and the chief city of Andalusia, on the left bank of the river Guadalquivir, 54 m. from the Atlantic Ocean, and 355 m. by rail S.S.W. of Madrid. Pop. (1900) 148,315. Seville is an archiepiscopal

see, a port with many thriving industries, and in size the fourth city in the kingdom, ranking after Madrid, Barcelona and Valencia. Its history and its treasures of art and architecture render it one of the most interesting places in Europe. Few parts of the city are more than 30 feet above sea level and, owing to the frequency of floods, an elaborate system of defences against the Guadalquivir and its affluents the Guadaira, Tamarguillo and Tagarete, was undertaken in 1904. This entailed the construction (spread over many years) of dykes, walls and surface drains, the raising of certain streets and railway embankments and the diversion of the lower Tagarete along a new channel leading into the Tamarguillo. The climate is pleasant at all seasons except in summer, when the heat is excessive.



SEVILLE CATHEDRAL, THE SECOND LARGEST CHURCH IN THE WORLD
Once a mosque, the Giralda, or campanile, for which this church is distinguished, was built by the Moors, A.D. 1196

The townsfolk, and the peasants who have come to town for bull-fights, fairs or carnivals, have preserved many of the curious old customs which tend to die out in the other large cities of Spain; they continue to wear the vivid costumes which suit the sunny climate of Andalusia; and their own gaiety, wit and grace of manner are proverbial. Nowhere else in Spain are great church festivals celebrated with so much splendour. Easter at Seville is especially famous, and at this season the city is usually crowded with foreigners.

Principal Buildings.—The Cathedral, dedicated to Santa Maria de la Sede, is one of the largest churches in the world, being 414 ft. long, 271 ft. wide and 100 ft. high to the roof of the nave. Building began in 1402 and was finished in 1519, so that the one style of Spanish Gothic is fairly preserved throughout the interior, however much the exterior is spoiled by later additions. The interior forms a parallelogram containing a nave and four aisles, a centre dome 121 ft. high, and at the east end a royal sepulchral chapel, which was an addition of the 16th century. The thirty-two immense clustered columns, the marble floor (1787–1795) and the seventy-four windows filled with painted glass, mostly by Flemish artists of the 16th century, produce an unsurpassed effect of magnificence. The reredos is an enormous Gothic work containing forty-four panels of gilt and coloured wood carvings begun by the Fleming Dancart in 1479 and completed by Spanish artists in 1526; the silver statue of the Virgin is by Francisco Alfaro (1596). The Cathedral contains many treasures of 16th century craftsmanship; the tomb of St. Ferdinand of Castile (1200–1252) and a curious life size image of the Virgin, which was presented to St. Ferdinand by St. Louis of France in the 13th century. It is carved wood with movable arms, seated on a silver throne and with hair of spun gold. The chief pictures in the cathedral are the "Guardian Angel," the "St. Anthony," and other works of Murillo; the "Holy Family" of Alphonso Miguel de Tobar (1678–1738); the "Nativity" and "La Generacion" of Luis de Vargas; Valdés Leal's "Marriage of the Virgin," and Guadalupe's "Descent from the Cross." In the Sacristia Alta are three fine paintings of Alexo Fernandez, and in the Sala Capitular are a "Conception" by Murillo and a "St. Ferdinand" by Francesco Pacheco. The organs (1777 and 1827) are among the largest in the world. A curious and unique ritual is observed by the choir boys on the festivals of Corpus Christi and the Immaculate Conception—a solemn dance with castanets being performed by ten of them before the altar; the custom is an old one but its origin is obscure. The Sagrario (1618–1662) on the north of the cathedral, a Baroque addition by Miguel de Zumarraga and Fernandez de Inglesias, which is the parish church. At the north-east corner of the cathedral stands the Giralda, a bell tower of Moorish origin, 295 ft. in height. The lower part of the tower, or about 185 ft., was built in the latter half of the 12th century by Yusuf I.; the upper part of the belfry, which is surmounted by a vane formed of a bronze figure 14 ft. high representing faith, were added (1568) by Fernando Ruiz in the Renaissance style. The ascent is made by a series of inclined planes. The exterior is encrusted with delicate Moorish detail, and the tower is altogether the finest specimen of its kind in Europe. At the base lies the Court of Oranges, of which only two sides now remain; the original Moorish fountain however, is preserved.

On the whole, the chief relic of the Arab dominion in Seville is the Alcazar, a palace comparable in interest and beauty only with the Alhambra of Granada. It was begun in 1181 during the best period of the Almohades, and was surrounded by walls and towers of which the Torre del Oro, a decagonal tower on the river side, is now the principal survival. The Torre del Oro (1220) has an 18th century superstructure. Among other Moorish remains in Seville may be mentioned the Minaret of San Marcos, the Casa de Pilatos, the 15th century Casa de los Pinelos (Casa de Abades) and the 15th century palace of the dukes of Alva (Palacio de las Duenas or de las Pinedas).

The churches of Seville are enriched by paintings or sculptures of Pacheco, Montanes, Alonso Cano, Valdes Leal, Roelas, Campana, Morales, Vargas and Zurbaran. The church of La Caridad has six admirable Murillos. The museum was formerly the church and convent of La Merced. It now contains priceless examples of the Seville school of painting, which flourished during the 16th and 17th centuries. Among the masters represented are Velazquez and Murillo (both natives of Seville), Zurbaran, Roelas, Herrera the Elder, Pacheco, Juan de Castillo, Alonso Cano, Cespedes, Bocanefra, Valdes Leal, Goya and Martin de Vos.

The school founded in 1256 by Alfonso X, became a university in 1502; its present buildings were originally a Jesuit college built in 1567 from designs either by Herrera or by the Jesuit Bartolomé de Bustamente. The Lonja or exchange was designed by Herrera and completed in 1598; a brown and red marble staircase leads to the Achivo de Indias, which contains 30,000 volumes relating to the voyage of Spanish discoverers, many of which are still unexamined. The archbishop's palace dates from 1697; the most notable features are the Churrigueresque doorway and staircase. The palace of San Telmo was formerly the seat of a naval college founded by Ferdinand Columbus. Other noteworthy buildings are the Mudejar palaces of the duke of Osuna and the count of Penaflor; the house occupied by Murillo at the time of his death (1682); the civil hospital built in 1559 and enlarged in 1842; the foundling hospital (1558); the bull-ring with room for 14,000 spectators; and fragments of the city walls, which once had a circumference of more than 10 m., with 12 gateways and 166 towers.

Commerce and Industries.—The port of Seville, in 37° 10′ N. and 5° 10′ W. has always been one of the chief outlets of the wealth of Spain. It is the terminus of three railways to Madrid, and of other lines to Cadiz, Almorchon, Ciudad Real, Huelva, Badajoz and Lisbon. Three of these lines have branches down to the water-side of the quays. The quay on the left bank 4,500 ft. long is provided with powerful cranes, and sheds for merchandise. Navigation up the Guadalquivir from its mouth to Seville (where the river is still tidal) is less dangerous for steamers than for sailing vessels, but is nevertheless uncertain. The construction of a ship-canal 4 m. long from the Punta de los Remedios to the Punta de los Verde—two points between which the windings of the river make navigation especially difficult—was first proposed in 1859 and was undertaken in 1907. Dredging operations were begun at the same time, so that on completion of the canal vessels drawing 25 ft. (instead of 16 ft.) could come up to Seville. The principal exports are Manzanilla, Amontillado and other wines, oranges and lemons, iron and lead ores, mercury, olives, oil, cork and wool. The royal artillery works and iron foundries and the porcelain and earthenware factory in the Carthusian convent are important. Pottery has been the characteristic industry of the Triana from time immemorial; the patron saints of Seville, Justa

and Rufina, are said by tradition to have been potters here. Equally important is the great tobacco and cigar factory.

History.—Seville appears originally to have been an Iberian town. Under the Romans the city was made the capital of Baetica in the second century B.C., and became a favourite resort for wealthy Romans. It was captured in 45 B.C. by Julius Caesar who gave it the name of Colonia Julia Romula, and made it one of the conventus juridici. The emperors Hadrian, Trajan and Theodosius were born in the neighbourhood at Italica (now Santiponce), where are the remains of a considerable amphitheatre. The chief existing monument of the Romans in Seville itself is the remains of an aqueduct, on four hundred and ten arches, by which water from Alcala de Guadaira was supplied to the town. At the beginning of the 5th century the Silingian Vandals made Seville the seat of their empire, until it passed in 531 under the Visigoths, who chose Toledo for their capital. After the defeat of Don Roderick at Guadalete in 712 the Moors took possession of the city after a siege of some months. Under the Moors Seville continued to flourish. Idrisi speaks in particular of its great export trade in the oil of Aljarafe. The district was in great part occupied by Syrian Arabs from Emesa, part of the troops that entered Spain with Balj in 741 at the time of the revolt of the Berbers. It was a scion of one of these Emesan families, Abū 'l-Kāsim Mohammed, cadi of Seville, who on the fall of the Spanish caliphate headed the revolt of his townsmen against their Berber masters (1023) and became the founder of the Abbadid dynasty, of which Seville was capital, and which lasted under his son Mo'tadid (1042–1069) and grandson Mo'tamid (1069–1091) till the city was taken by the Almoravides. The later years of the Almoravide rule were very oppressive to the Muslims of Spain; in 1133 the people of Seville were prepared to welcome the victorious arms of Alphonso VII., and eleven years later Andalusia broke out in general rebellion. Almohade troops now passed over into Spain and took Seville in 1147. Under the Almohades Seville was the seat of government and enjoyed great prosperity; the great mosque (now destroyed) was commenced by Yusuf I. and completed by his son Almanazor. In the decline of the dynasty between 1228 and 1248 Seville underwent various revolutions, and ultimately acknowledged the Hafsite prince, but Ferdinand III. restored it to Christendom in 1248. Ferdinand brought temporary ruin on the city, for it is said that 400,000 of the inhabitants went into voluntary exile. But the position of Seville was too favourable for trade for it to fall into permanent decay, and by the 15th century it was again in a position to derive full benefit from the discovery of America. After the reign of Philip II., its prosperity waned with that of the rest of the Peninsula; yet even in 1700 its silk factories gave employment to thousands of workpeople; their numbers however by the end of the 18th century had fallen to four hundred. In 1800 an outbreak of yellow fever carried off 30,000 of the inhabitants and in 1810 the city suffered severely from the French under Soult, who pillaged to the extent of six millions sterling. Politically Seville has always had the reputation of peculiar loyalty to the throne from the time when, on the death of Ferdinand III., it was the only city which remained faithful to his son Alphonso the Wise. It was consequently favoured by the monarchs, and frequently a seat of the court. For its loyalty during the revolt of the Comuneros it received from Charles V., the motto *Ab Hercule et Caesare nobilitas; a se ipsa fidelitas.* In 1729 the treaty between England, France and Spain was signed in the city; in 1808 the central junta was formed here and removed in 1810 to Cadiz; in 1823 the Cortes brought the king with them from Madrid; and in 1848 Seville combined with Malaga and Granada against Espartero, who bombarded the city but fled on the return of Queen Maria Cristina to Madrid.

Guichot y Parodi, *Historia del Ayuntamiento de la ciudad de Sevilla* (3 vols., Seville 1896–98); J. Cascales y Munoz, *Sevilla intellectual* (Madrid 1896); W. M. Gallichan, *The Story of Seville* (1903).

SÈVRES, a town of northern France, in the department of Seine-et-Oise, on the left bank of the Seine, midway between Paris and Versailles, about 3 m. from the fortifications of the former. Pop. (1926) 14,171. The town owes its celebrity to the porcelain manufactory established there in 1756 and taken over by the State three years later. The works museum has a general collection of pottery and the whole series of models employed at Sèvres from the beginning of the manufacture, for an account of which *see* POTTERIES AND PORCELAINS. A technical school of ceramics is attached to the factory.

SÈVRES, TREATY OF, the treaty of peace concluded between the Allied and Associated Powers and Turkey on Aug. 10 1920. It was not ratified and was later superseded by the Treaty of Lausanne which was signed on July 24 1923. The principal arrangements of the Treaty of Sèvres were as follows:—

The king of Hejāz was recognized as independent. The boundaries of Turkey were so drawn as to exclude her from control of any other Arabian states or of Syria, Palestine and Mesopotamia, and Turkey renounced in favour of the principal Allied Powers rights over territory outside Europe that lay outside her new frontiers (Egypt, Sudan, Libya [Tripoli], Morocco and Tunis). Palestine was to be entrusted to a Mandatory Power, Syria and Mesopotamia "provisionally recognized as independent states to be advised by Mandatory Powers." Smyrna and the Ionian hinterland were placed under Greek administration for five years, when further arrangements would be made. The Dodecanese islands were ceded to Italy, Imbros and Tenedos to Greece, and Turkey recognized Greece's sovereignty in Lemnos, Samothrace, Mitylene, Chios, Samos, and Nikaria. The zone of the Straits from Constantinople and Scutari to the Dardanelles, and a zone on the Asiatic mainland were handed over to an international commission to be internationalized and demilitarized. Western Thrace, which had already been ceded to the Allies as a whole, was ceded by them to Greece by separate treaty. Turkey ceded to Greece Eastern Thrace, to the Chatalja lines. Turkey agreed to recognize Armenia as "a free and independent state" while Kurdistan was to receive local autonomy. The Turkish army was to be reduced to 50,000, all Turkish aircraft was to be surrendered and all the fleet except a few ships and torpedo boats.

The financial clauses charged Turkey with loss, with damage and with war guilt, but admitted that, as her resources were unequal to payment, such claims should be waived. But immense powers were conferred on a financial commission of British, French and Italian representatives with a Turkish representative in a consultative capacity, which was practically empowered to control the budget and the financial laws and regulations of Turkey. The Council of the Ottoman Public Debt was to be similarly formed and to have complete powers over its administration. The Capitulations were to be re-established for the Allies but not for enemy Powers, and the separate postal system of the Allies was also re-erected. Various Turkish ports, Constantinople, Smyrna, Alexandretta, etc., and the river Maritsa, were to be placed under international control. *See* H. W. V. Temperley, ed. *Hist. of the Peace Conference at Paris,* vol. vi. (1924). For the reversal of some of the terms of this treaty *see* LAUSANNE, CONFERENCE OF.

SEWAGE DISPOSAL. The following methods are utilized for the ultimate disposal of sewage:— (*a*) direct discharge into the sea or tidal estuary, (*b*) treatment on land, (*c*) treatment on artificial beds, (*d*) aeration and agitation, (*e*) tank treatment. Methods (*b*), (*c*), (*d*) and (*e*) are used inland and are necessary before discharge into a stream. Since the term sewage will include trades wastes, any treatment will have to allow for their presence, and this always increases the difficulties of the problem. The quantity received at a disposal works will vary considerably throughout the day, but is very different in different towns. Rainwater and infiltration water will also increase the supply at irregular intervals.

Disposal at Sea.—This method is obviously cheap, simple and complete. No treatment should be required, the dilution being so great as to render the sewage harmless. Care must be taken, however, to choose the site of the outfall so that no sewage is brought back onto the shore and there is no possibility of the pollution

of shell fisheries. The sewage should be carried rapidly out to sea at all states of the tide and no nuisance created by the solids being left on islands or mud flats. Such a method of disposal will probably include the rainwater, and the outfall sewer may have to become a tank at flood tide. If possible, this should be avoided, as otherwise the open end will have to be fitted with a flap valve or penstock to prevent the entrance of sea water. The outlet should, if possible, be always below low water level.

Land Treatment.—Inland towns are compelled in Great Britain to adopt some form of purification as the Rivers Pollution Act forbids the entrance of raw sewage into streams. Purely chemical methods are now obsolete, reliance being to a great extent placed on bacteria. Such organisms live habitually in the upper portion of the soil, and require air for their purifying processes, and hence the first of the modern methods was to turn the screened sewage onto or under suitable land. Clayey and heavy soils are quite unsuitable, the best for the purpose being of a light loamy character. As soils vary very much in their suitability, the proposed site of disposal must be carefully chosen, and must afterwards be given frequent periods of rest for a duration of four or five weeks at least to prevent "sewage-sickness." The process of "broad-irrigation," *i.e.,* flooding the land with sewage at intervals, may now be considered obsolete. "Surface irrigation" is often quite suitable for small rural communities and isolated institutions or houses. The sewage is distributed by carriers which are often only furrows in the ground at anything up to 30 feet apart, and the liquid overflows into the land or soaks through the sides and bottoms of the channels. The quantity treated varies considerably, being from 2,000 to 8,000 gallons per acre *per diem,* according to the quality of the sewage and the suitability of the land. The effluent is either naturally absorbed by the land, or under drains may be installed for the purpose. Evaporation will play a considerable part in this means of disposal, a dry hot climate much increasing the amount treated per acre. Certain crops such as rye-grass, may be grown with profit.

"Fill-and-draw" and Continuous Filters.—The purifying process, due to bacterial action in the upper layer of the soil, can be much more successfully and rapidly accomplished with greater economy of space, by utilizing artificial filters, working either intermittently or constantly. The first type used were on the intermittent contact or "fill-and-draw" principle, *i.e.,* the filter beds were filled with the liquid, after suitable screening and sedimentation, so as to remove, as far as possible, the solid constituents. On common forms of screens will be caught paper, rags, orange peel and similar matter. A screening chamber will also remove large quantities of the mineral grit, which is, however, much less than formerly owing to the decreasing popularity of water-bound macadam roads. It is usual to allow a capacity in detritus chambers of at least $\frac{1}{100}$ of the dry weather flow and there should be at least two to allow of cleaning. If this cannot be done, some form of dredger or worm conveyor should be provided. Disposal works are not designed to deal with more than three times the dry weather flow, the remainder of the flow, up to six times, being treated in storm-water tanks.

The royal commission on sewage disposal, however, states that it is generally only necessary to provide filter capacity up to $1\frac{1}{2}$ times that required for dry weather flow, hence it publishes a table for three strengths of sewage, giving areas desirable for "sprinkling" filters and "contact" or "fill-and draw" filters. (Par. 293, p. 209 of *Report.*) Sewage may be roughly classified by the amount of oxygen absorbed in parts per 100,000 from permanganate of potash at 80° F after four hours. From 7 to 8 parts may be considered weak, from 10 to 13 average, and 17 and over "strong" sewage. Any flow over the six times may generally be passed direct to the streams which must be done before reaching the works.

Sedimentation Tanks.—These are usually on the continuous principle and consist of at least two tanks, the total capacity being not less than 10 to 15 hours dry weather flow. Fig. 1 shows a common type of rectangular tank, of width about one-third to one-fourth the length. The speed of travel through the tank should be slow, not more than one inch a minute, and so that the "detention period" is just sufficient to remove all solid matter possible. The tanks are usually emptied by a "floating arm" (*see* fig. 1) so as to draw the water from the surface, and the sludge is either removed by hand when the tank is emptied or passes to some form of pump. Vertical tanks may be used, where space is valuable or land very expensive. They have the disadvantage of entailing considerable excavation and greater cost of construction. The liquid may be allowed to then pass to filters as it should contain little more than colloidal matter. These filter beds consist of shallow tanks filled with suitable rough material such as slag, coke, clinker, etc. Hard stones such as granite are too liable to polish and so form an unsuitable medium for bacterial culture. The beds are worked in cycles, each cycle consisting of about 1 hour filling and the same time emptying, 2 hours standing full and 4 hours rest, the bulk of the purifying action taking place during the rest period. The beds are usually about 3 feet deep to ensure internal aeration and are never more than 6 feet. About 50 per cent of the space is available initially for the liquid, but this rapidly reduces to about 30 per cent after use. The filling and emptying may be done by hand with penstocks or automatically by syphons or the liquid may be distributed by surface channels, and it is usually considered that the economical limit in size is one acre. The usual size of the broken material is about 2 in. cube, but may be larger or smaller.

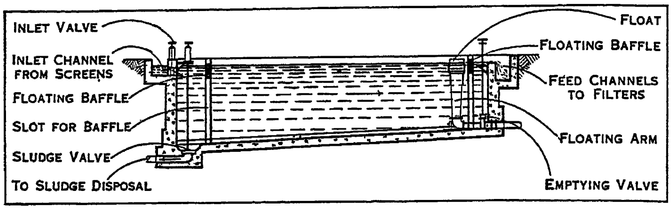


Fig. 1.—Sedimentation Tank

The continuous type of sprinkling or percolating filter is now more common, being more economical in space and time but needing some form of distributor. The commonest form is the rotary shown in fig. 2, the beds being then circular or hexagonal. If the beds are above ground the walls are frequently omitted and consist of large, uncemented blocks of the clinker. In the type shown the effluent leaves the bed by a false floor of tiles or pipes connecting to a drain, but in the elevated type the effluent is generally collected in an open channel surrounding the bed.

Such filters are usually 6 feet in depth and the material is usually not larger than 3 in. cube. It is said that they will treat at least 300,000 gallons per acre when 5 feet deep, but the amount depends on the size of the medium and the amount of the suspended solids. Various other ingenious methods of distribution are in use, but fixed sprinklers with nozzles are now obsolete in Great Britain.

Before the treated liquid can be finally discharged to a stream, it is generally necessary to further pass it through what are known as "humus" tanks or filters. This will be due to the effluent still containing organic matter which has escaped the purifying action of the bacteria on the previous filters, and there will also be a proportion of the filtering medium broken down by the passage of the liquid. These tanks are usually merely repetitions of the sedimentation tanks on a smaller scale, having a capacity equivalent to 4 hours dry weather flow. Shallow sand filters about 12 in. deep have also been used and are considered to be able to deal with not more than 500 gallons per sq.yd. per day. These

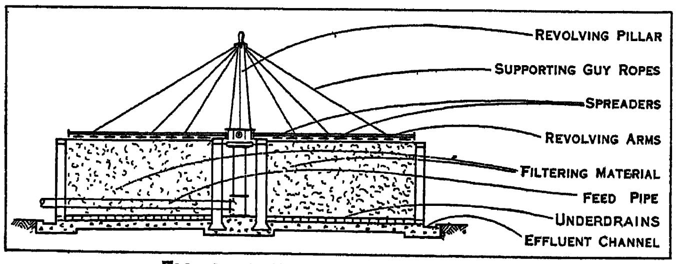

Fig. 2.—Rotary Sprinkling Filter

latter will, however, need constant attention.

The latest methods of treatment utilize the power of air and agitation to increase the bacterial action, it having been also discovered that sludge once treated by air can be utilized to inoculate the untreated sewage after settlement, and to much accelerate the purification. Fig. 3 shows in diagrammatic form the essential feature of the "activated sludge" process, the sewage passing along channels fitted with porous "air diffusers" in the bottom or at the side, and also often being given some form of spiral motion to utilize any surface aeration. Many experts consider that much of the purification is due to the mechanical agitation on the surface by the bursting of the air bubbles, and hence systems causing surface agitation are in growing use. In this method a horizontal agitator draws up sewage by the central tube and throws it to the sides of the tank, thus aerating and agitating at the same time, the liquid finally escaping after several revolutions. In the Sheffield system of "bio-aeration" the liquid travels a long length of narrow channel, being agitated at regular intervals of about 260 feet by skeleton paddle wheels as shown in fig. 4. In these aeration and agitation methods a final settling tank or tanks is required before the liquid is ultimately discharged to the stream. The amount of air used for diffusion is about 1 cu.ft. of free air per gallon of sewage, but this includes air used in the air-lift pumps, which are often utilized to return a portion of "activated" sludge to the commencement of the process. The area of the diffusers varies from $\frac{1}{5}$ to $\frac{1}{17}$ that of the channel floor. The air pressure is usually between 5 and 10 lb. per square inch, specially designed air-compressors being now manufactured. The diffuser area will be smallest for purely domestic sewage and largest for strong sewage with a large proportion of trade waste. The detention period in the channels varies from about 3 hours at least for purely domestic sewage, to as high as 20 for sewage with much trade wastes, the latter being very liable to injure the process. The diffusers are of fine concrete or silica sand and are contained in metal or preferably concrete boxes.

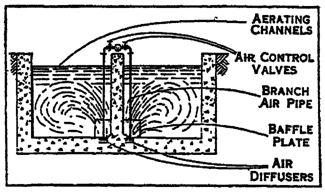

FIG. 3.—ACTIVATED SLUDGE CHANNEL

Sludge Disposal.—This is still the greatest problem connected with sewage treatment, the difficulties of which have been rather increased than diminished by the modern aeration processes, owing to the greater diffusion of the sludge particles by agitation. Formerly it was the custom to either spread the sludge on the land or dig it in, but the great area of land necessary for successful operation has forced this method out of use for large towns. The chief difficulty arises from the fact that the sludge is very retentive of the water, which forms by far the greatest proportion of the mixture, the proportion being greater with the modern aeration processes.

These remarks do not apply to the sludge from detritus tanks, which can be easily handled and hence removed, and which only comprises about one-twelfth of the whole. A further amount will be removed in the sedimentation tanks. Chemical precipitation is successful for clarification purposes but greatly increases the amount of sludge, and has been largely abandoned for that reason, but is once more being tried on improved lines. Pressing the sludge into cake is still in use but is costly and often unsatisfactory. The cake is not appreciated as manure and still contains much moisture. It is usually impracticable to mix the sludge with dry house refuse or street sweepings, as the supply of these is insufficient. Drying by heat is usually too expensive, and removal of the water by vacuum filters has not passed the experimental stage. Centrifugal machines have so far not been successful, and chemical flotation methods do not appear to have come into common use. The most popular method is still the spreading of the sludge on cinder beds termed lagoons, the water passing away into underdrains and being conveyed back by pipes to the sedimentation tanks. Such lagoons may be merely depressions in the ground, the excavated material forming the banks. The sludge should not be more than 9 inches deep and about 10 gallons per square yard can be treated in this manner. The amount is, however, very variable owing to the varying humidity of the atmosphere, and the sludge may take anything from one day to several months before it is dry enough to be lifted by a spade and carted away.

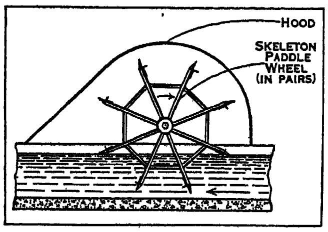

FIG. 4.—BIO-AERATION

Large towns like Manchester, Glasgow and London pump their excess sludge into specially designed steamers of about 1,000 tons capacity and carry it out to sea, where it is dumped.

Attempts have also been successfully made to separate out the sludge by "digestive" methods. Of these, those processes in use on the Ruhr in Germany and at Birmingham are the most noteworthy. At Essen Dr. Imhoff has developed a tank in which the liquid travels continuously through an upper tank at a velocity of from 30 to 1,000 ft. an hour, and the solids fall through slots into a lower quiescent tank where digestion takes place. This sludge is afterwards forced up by the static pressure and spread over cinder drying beds. The water is said to evaporate rapidly and the sludge left to be quite innocuous. The methan gas evolved is now collected and forms a valuable by-product for light and power purposes. Similar gas collection is now in operation at Birmingham. At this latter town the sludge is pumped to separate shallow tanks, the digestion being accomplished in two stages to encourage fomentation. The pumping main is inoculated with digested sludge to encourage bacterial action and heat has also been utilized, and the effluent is returned to the percolating filters. The sludge, originally 18 in. thick, dries down to 6 in. on ash beds, and is then removed by wagons to sheds, spread in thin sheets, air-dried, ground and finally mixed with chemicals to form a fertilizer. The process eliminates grease, preserves the nitrogen and is effective.

Storm Water Treatment.—Storm water to an extent ranging from 3 to 6 times the average dry weather flow, must be treated in special plant after being screened. The total capacity of such plant is usually taken at one quarter the dry weather flow, and there should be at least two units provided for, such units usually consisting of tanks or roughing filters. In dry periods they should be empty, but when full they should act as continuous flow tanks. They are often merely extra sedimentation tanks in which the sludge is dealt with in the usual manner. The roughing filters may be used where much sediment is expected, but cleaning is thus made more difficult. If suitable land is available the screened liquid may be passed on to it and then discharged direct to the stream, after passing through separate detritus tanks.

When sufficient and suitable land is available and nuisance cannot be caused, the Royal Commission's Report suggests that the area of filtration may be half $1\frac{1}{2}$ times the dry weather flow, but that the remainder must be treated on land at a rate of between 3,000 and 30,000 gallons per acre per 24 hours according to the character of the soil.

(G. S. Co.)

SEWALL, SAMUEL (1652–1730), American jurist, was born at Bishopstoke, England, on March 28, 1652. He was taken to Newbury in New England in 1661; graduated at Harvard in 1671, receiving his master's degree three years later; studied divinity; and was resident fellow of Harvard in 1673–74, and keeper of the college library in 1674. He had apparently intended to enter the ministry, but his marriage to Judith Hull in 1678 caused him, like his father-in-law, to embark upon a mercantile and public career. In 1683 he was deputy to the general court for Westfield; from 1681 to 1684 he managed the only licensed printing press in Boston; and in 1688 he went to England on business connected with land titles. He was a member of the New England Council in 1692–1725, and in 1692 he was made one of the special commissioners to try persons accused of witchcraft in Suffolk,

Essex, and Middlesex counties (Mass.). This court condemned 19.

Sewall in Jan. 1697 stood in meeting while a bill was read in which he took "the blame and shame" of the "guilt contracted upon the opening of the late commission of oyer and terminer at Salem," and asked pardon; and till the end of his life he annually set apart a day of fasting, meditation and prayer in token of his offence. Later he was judge of probate for Suffolk county and a judge of the superior court, being its chief justice in 1718–28. He died in Boston, Jan. 1, 1730. Of his works the one which appeals most to modern readers, however, is his naïve and delightful diary. The unconscious humour of such parts as the courting, the intimate revelation of a man of distinguished ability and sterling character, and the minutely detailed record of the political, civic and social life of the time make it one of the most valuable and interesting documents left from colonial days.

The diary, like the letter-book of Sewall, was published by the Massachusetts Historical Society in its *Collections*. Selections from it have been edited by Mark Van Doren (1927). *See* also G. E. Ellis, *An Address on the Life and Character of Chief Justice Samuel Sewall* (1885); N. H. Chamberlain, *Samuel Sewall and The World He Lived In* (1885); and articles in J. L. Sibley's *Biographical Sketches of Graduates of Harvard University*, vol. ii. p. 345–371 (1881) and by C. H. C. Howard in *Essex Institute Historical Collections*, vol. xxxvii. (1901).

SEWANEE, a village of Franklin county, Tennessee, U.S.A., on the Dixie highway and served by the Nashville, Chattanooga and St. Louis Railway. Sewanee is the seat of the University of the South (Protestant Episcopal), which was founded in 1857, largely through the efforts of Bishop Leonidas Polk of Louisiana. The tower on the library is modelled after that of Magdalen college, Oxford.

SEWARD, ANNA (1747–1809), English writer, often called the "Swan of Lichfield," was the elder daughter of Thomas Seward (1708–1790), prebendary of Lichfield and of Salisbury, and author. Born at Eyam in Derbyshire, she passed nearly all her life in Lichfield, beginning at an early age to write poetry partly at the instigation of Dr. Erasmus Darwin. Her verses include elegies and sonnets, and she also wrote a poetical novel, *Louisa*, of which five editions were published.

Sir Walter Scott edited her *Poetical Works* in three volumes (Edinburgh, 1810); to these he prefixed a memoir of the authoress, adding extracts from her literary correspondence. *See* also *Letters of Anna Seward 1784–1807* (Edinburgh, 6 vols., 1811). Miss Seward also wrote *Memoirs of the Life of Dr. Darwin* (1804). *See* E. V. Lucas, *A Swan and her Friends* (1907); and S. Martin, *Anna Seward and Classic Lichfield* (1909).

SEWARD, WILLIAM HENRY (1801–1872), American statesman, was born on May 16, 1801, in the village of Florida, New York. He graduated from Union college in 1820, was admitted to the bar at Utica, N.Y., in 1822, and in the following year began the practice of law at Auburn, N.Y., which was his home for the rest of his life. He soon attained distinction in his profession, but drifted into politics, for which he had a greater liking, and early became associated with Thurlow Weed. He was at first an adherent of Daniel D. Tompkins in State, and a National Republican in national politics. After 1828 he became allied with the Anti-Masonic party, attending the national conventions of 1830 and 1831, and as a member of the organization he served four years (1830–34) in the State senate. By 1833 the Anti-Masonic movement had run its course, and Seward allied himself with the other opponents of the Jackson Democrats, becoming a Whig. In 1834 he received the Whig nomination for governor, but was defeated by William L. Marcy. Four years later he was renominated, was elected, was re-elected in 1840, and served from 1839 until 1843. As governor, Seward favoured a continuance of works of internal improvement at public expense. His administration was disturbed by the anti-rent agitation and by the M'Leod incident growing out of the Canadian rebellion of 1837. During this period he attracted much attention by his liberal and humane policy, promoting prison reform, and proposing to admit Roman Catholic and foreign teachers into the public schools of the State. Laws were passed during his term putting obstacles in the way of recovering fugitive slaves. Seward soon became recognized as the leader of the anti-slavery Whigs. He was one of the earliest political opponents of slavery, as distinguished from the radical Abolitionists, or the followers of William Lloyd Garrison, who devoted themselves to a moral agitation.

When the Whigs secured a momentary control of the State legislature in 1849 they sent Seward to the United States Senate. The antagonism between free labour and slave labour became the theme of many of his speeches. In his first set speech in the Senate, on March 11, 1850, in opposing the pending compromise measures, he attracted the attention of the whole country by his assertion that "there is a higher law than the constitution" regulating "our authority over the domain" (*i.e.*, the Territories). When the Democrats, however, declared such language incendiary he tried to explain it away, and by so doing offended his friends without appeasing his opponents. In a speech at Rochester, N.Y., in 1858 he made the famous statement that there was "an irrepressible conflict between opposing and enduring forces, and it means that the United States must and will, sooner or later, become either entirely a slave-holding nation or entirely a free-labour nation." Although this idea had often been expressed by others, and by Seward himself in his speech of 1848, yet he was severely criticized, and four days later he sought to render this statement innocuous also.

In the election of 1852 Seward supported Gen. Winfield Scott, but not his party platform, because it declared the Compromise of 1850 a finality. He naturally opposed the Kansas-Nebraska bill of 1854, which repealed the Missouri Compromise and established the principle of popular sovereignty in the Territories. Subsequently he actively supported in the Senate the free-state cause in Kansas. In 1854–55, when it became evident that the Whig party in the North was moribund, Seward helped to lead its scattered remnants into the Republican fold. As the recognized leader of the new party, his nomination by the Republicans for the presidency in 1856 and in 1860 was regarded as certain; but in each instance he was put aside for another. The heterogeneous elements of the new organization could not be made to unite on a man who for so many years had devoted his energies to purely Whig measures, and he was considered less "available" than Frémont in 1856 and than Lincoln in 1860. After Lincoln was elected in 1860 he chose Seward for his secretary of state. The new president was a man comparatively little known outside the state of Illinois, and many of his supporters, doubtful of his ability to deal with the difficult problems of 1861, looked to Seward as the most experienced man of the administration and the one who should direct its policy. Seward himself, apparently sharing these views, although not out of vanity, at first possessed an unbounded confidence in his ability to influence the president and his cabinet. He believed that the Union could be saved without a war, and that a policy of delay would prevent the secession of the border States, which in turn would gradually coax their more southern neighbours back into their proper relations with the Federal Government. In informal conferences with commissioners from the seceded States he assured them that Fort Sumter should be speedily evacuated. Finding himself overruled by the war party in the cabinet, on April 1, 1861, Seward suggested a war of all America against most of Europe, with himself as the director of the enterprise. Dangers from abroad would destroy the centrifugal forces at home, and the Union would be saved. When this proposal was quietly put aside by the president, and Seward perceived in Lincoln a chief executive in fact as well as in name, he dropped into his proper place, and as secretary of state rendered services of inestimable value to the nation. To prevent foreign states from giving official recognition to the Confederacy was the task of the hour, and in this he was successful. While he did not succeed in preventing the French occupation of Mexico or the escape of the Confederate cruiser "Alabama" from England, his diplomacy prepared the way for a future adjustment satisfactory to the United States of the difficulties with these powers. While his treaty with Lord Lyons in 1862 for the suppression of the slave trade conceded to England the right of search to a limited extent in African and Cuban waters, he secured a similar concession for American war vessels from the British Government, and by his course in the Trent affair he virtually committed Great Britain to the Ameri-

can attitude with regard to this right.

On April 5, 1865, Seward was thrown from his carriage and severely injured. Nine days later, while lying ill at his home at Washington, he was attacked by one Lewis Powell, alias Payne, a fellow-conspirator of John Wilkes Booth, at the same time that Lincoln was assassinated. The secretary's son, Frederick W. Seward, and three other persons who came to his assistance, were also wounded by the assailant. Seward's wife, an invalid, received such a shock that she died within two months, and his only daughter, who witnessed the assault, never recovered from the effects of the scene and died within the year. Seward gradually regained his health, and remained in the cabinet of President Johnson until the expiration of his term in 1869. In the struggle between the Executive and Congress over the method of reconstructing the Southern States, Seward sided with Johnson and thus shared some of the obloquy bestowed upon that unfortunate president. His greatest work in this period was the purchase of Alaska from Russia, in 1867. After returning to private life, Seward spent two years in travel and died at Auburn on Oct. 10, 1872.

His son, FREDERICK WILLIAM SEWARD (1830–1915), was born in Auburn, N.Y., on July 8, 1830, graduated at Union college in 1849 and was admitted to the bar at Rochester, N.Y., in 1851. From 1851 to 1861 he was one of the editors and owners of the Albany *Evening Journal,* and during his father's term at the head of the State Department he was assistant secretary of state. He served in the New York Assembly in 1875, and from 1877 to 1881 was again assistant secretary of state. After 1881 he devoted his time to the practice of his profession and to lecturing and writing. He died at Montrose-on-Hudson, N.Y., on April 26, 1915.

The best biography of Seward is that by Frederic Bancroft, *The Life of William H. Seward* (1900); *see* also, *The Life and Works of William H. Seward* (Boston, 1883), edited by George E. Baker; *William H. Seward: an Autobiography from 1801 to 1834, with a Memoir of his Life and Selections from his Letters* (1891), by his son, Frederick W. Seward; *William H. Seward's Travels around the World* (1873), by his adopted daughter, Olive R. Seward; *Lincoln and Seward* (1874), by Gideon Welles; *William Henry Seward* (Boston, 1899), by T. K. Lothrop, in the "American Statesmen Series"; *Seward and the Declaration of Paris,* by Charles Francis Adams (1912); "Union Portraits: William H. Seward," *Atlantic Monthly,* vol. cxvi., pp. 322–334 (1915); *Recollections of a War-Time Statesman and Diplomat,* by Frederick W. Seward (1916); and "Seward's Far Eastern Policy," in *American History Review,* vol. xxviii., pp. 45–62 (1922).

SEWARD, a town of Alaska, latitude 60° 6′ N., longitude 149° 27′ W., is situated at the head of Resurrection bay, about 1,800 miles north-west from Seattle, 60° 6′ N. and 149° 27′ W. It was founded as the terminus of the Alaska Central railway. This project soon changed hands and at the same time the designation of the road was changed to the Alaska Northern. Under the new organization, considerable construction work was done but the company later fell into the hands of a receiver. The Government railway, Seward to Fairbanks, took over the section which had been constructed, and incorporated it in the main line, with Seward as the ocean terminus. The town is a centre for business in the lower part of Cook inlet and to the westward along the Alaska peninsula and the Aleutian islands. Its population in 1930 was 835.

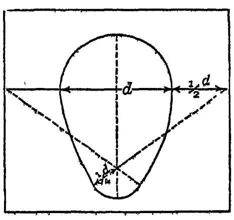

FIG. 1.—EGG-SHAPED SEWER

SEWER CONSTRUCTION. The underground channels provided by the local authority for removing liquid wastes from buildings are termed sewers, and are usually situated in the public thoroughfares. The smaller sizes up to 24in. diameter may be formed of glazed stoneware, but over this size it is more convenient to use brick or concrete. Pipes of artificial stone are also being used. The two commonest forms of cross-section for large sewers are circular and "eggshaped," the latter of the relative dimensions shown in fig. 1. The idea of the "eggshape" is to concentrate low flows and so retain the scouring action of the water. It is, however, much weaker against external pressure than the circular shape. When bricks are used they are made wedge shaped for the smaller sizes so as to lessen the thickness of the joints, and consist usually of at least two rings. The mortar should be made of one part of Portland cement to one part of clean sand. As the invert of eggshaped sewers may be of a sharp curve the "invert block" shown in fig. 2 is often provided. Such sewers are rarely made more than 7 feet in height. With very large sewers, such as those used for intercepting purposes or for outfalls, reinforced concrete is coming into use. For these, semi-elliptical, "horse-shoe," semi-circular and other forms of cross section are common.

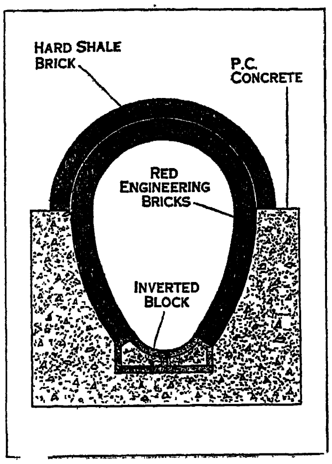

FIG. 2.—EGG-SHAPED SEWER WITH INVERT BLOCK

Gradients.—The sewers should be laid at such gradients that they are self-cleansing at all rates of discharge, and that, on the other hand, the velocity is not so great as to cause erosion of the lining. Sediment is usually deposited at velocities less than 2 feet per second, but the speed is usually limited to about 4 feet per second.

Rainfall Run-off.—Where "combined" sewers are used the channel must be large enough to take the rainwater received as well as house wastes, even if the former liquid is soon afterwards overflowed to a stream. It is now customary to calculate the rainfall run-off from such a formula as:—

$$Q=60{\cdot}5\ Ap\nu$$

where Q is run-off in cubic feet per minute, A is the area drained in acres, p is the coefficient of impermeability, dependent on the

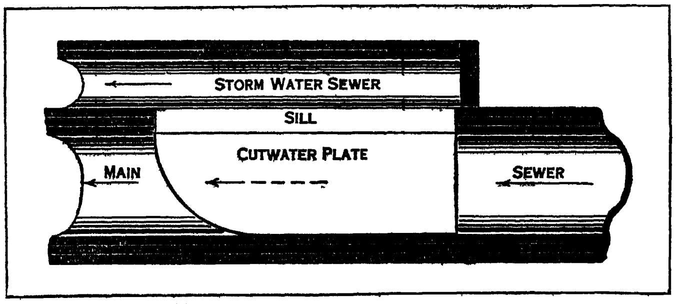

FIG. 3.—STORM WATER OVERFLOW

nature of the ground surface, and ν is the rate of rainfall in inches per hour, and is obtained from a chart plotted from automatic records if possible, and will be of higher value the shorter the storm. It is customary to consider that all combined discharge, diluted more than six times the normal dry weather flow,

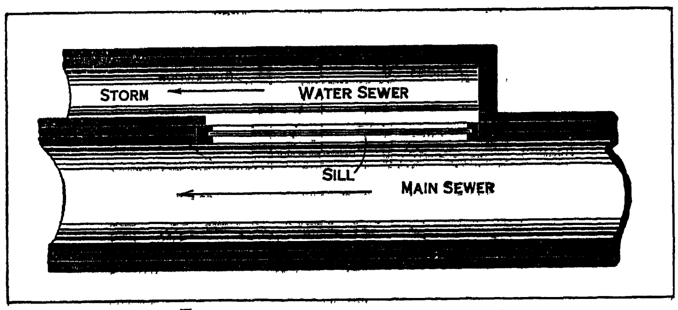

FIG. 4.—STORM WATER OVERFLOW

may be overflowed to a stream, but there is no rule, as the sewage may vary so much in quality. The duration of the storm is assumed equal to the time of travel in the sewer from the highest point in the area to the point of discharge from the area A; p is frequently assumed as the ratio between the unbuilt-up and total areas. The flow of actual sewage is usually taken as equal to the water supply, but the rate at which it is received by the sewer will vary, being often double the mean at maximum periods. It is

customary to calculate the maximum discharging capacity of sewers to be when they are running three-quarters or seven-eighths full and hence never under pressure, and the formula

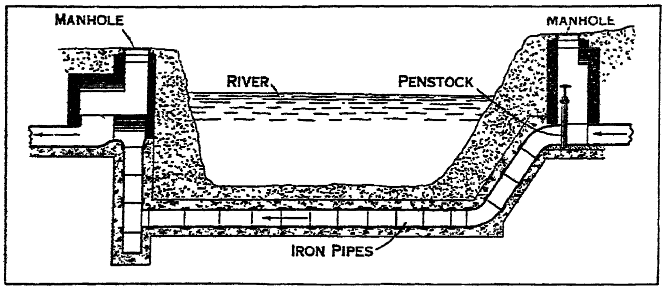

FIG. 5.—INVERTED SYPHON

for the mean velocity is of the type:—

$$v = c\sqrt{mi} \text{ feet per second,}$$

where m is the "hydraulic mean depth" and i is the "hydraulic gradient," c is a constant dependent on the material of the sewer lining and on its condition. (*See* HYDRAULICS.)

Storm-Overflows.—Two types of these are shown in figs. 3 and 4. In fig. 3 the water is intercepted above a predetermined

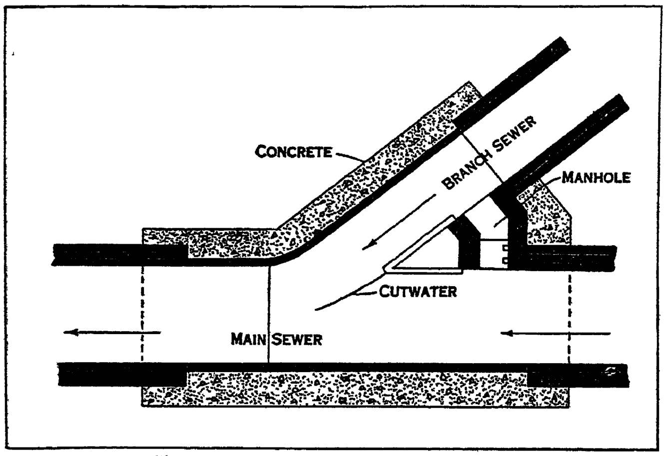

FIG. 6.—BRANCH SEWER CONNECTION

height and turned into a parallel storm-water sewer. In fig. 4 the main sewer has a weir placed on one or both sides and the water above weir level falls into the storm-water sewer alongside. The

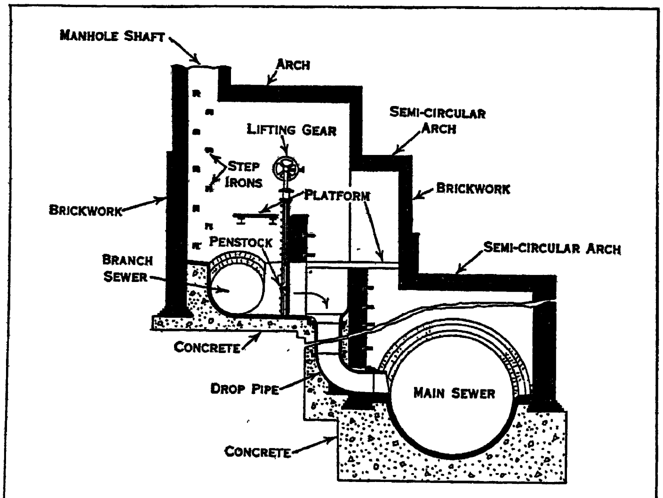

FIG. 7.—SEWER CONNECTIONS ON DIFFERENT LEVELS

latter type has the disadvantage of requiring a great length of sill, and even then a large amount of water escapes into the downstream portion of the main sewer.

Inverted Syphons.—A typical river crossing is shown in fig. 5. There should be at least two pipes in case either becomes blocked, and they are generally of cast iron or steel, and are on the small side so as to ensure scour. Access is necessary at both ends, and the downstream leg is usually vertical and provided with a sump. They may be cleaned by dragging balls or brushes to and fro, attached to chains fastened in the manholes.

Valves are usually penstocks, the leaf working in gun-metal guides. The smaller ones are worked by hand and the larger by power. They require balancing to reduce the effort of lifting and are better placed so that the water forces them against their seats. Hinged flap-valves are common at the ends of sewers, to open when the water presses against the inside.

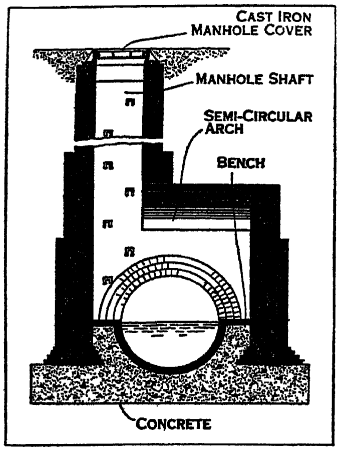

FIG. 8.—MANHOLE

Sewer Connections and Ventilation.—Fig. 6 shows the connection of two large circular sewers at about the same level, with access to either from the surface. Where there is great difference in level a "drop-pipe," fig. 7, or a ramp, may be used, tumbling bays or stairs being unsatisfactory on account of the agitation.

Unless there are objections, it is usual to ventilate the sewer through gratings in the cast-iron cover of the manholes, which latter are usually not more that 150 yards apart. Otherwise, connections are made to shafts on the roadside, such shafts being about 30 feet high. Mechanical and other methods have been tried, but the effect is very local.

Manholes.—Fig. 8 shows a typical form of manhole. The shaft is usually about 2 feet square and provided with step-irons. The floor may be concrete or brick or stone paved. The central channel should carry the maximum rate of dry-weather flow, so that the "benches" are normally free from water and deposits.

Sewers should never be at such a flat gradient as to require flushing to remove sediment, but if this is impossible, such flushing may be accomplished by perambulating water-tanks fitted with a hose, or by underground tanks designed to automatically discharge at regular intervals by means of a syphon. In either case a very large quantity of water is required. *Pumping* should be avoided whenever possible on account of the expense, but if found inevitable, either special types of pumps, or ejectors working by compressed air may be used.

SEWING: *see* HOME SEWING.

SEWING MACHINES. The basic invention in machine-sewing was the double-pointed needle, with the eye in the centre, patented by Charles F. Weisenthal in 1755, with the object of avoiding the necessity for inverting the needle in sewing or embroidering. Many of the features of the sewing machine are distinctly specified in a patent secured in England by Thomas Saint in 1790, in which he, *inter alia,* described a machine for stitching, quilting or sewing. Saint's machine, which appears to have been intended principally for leather work, was fitted with an awl which, working vertically, pierced a hole for the thread. A spindle and projection laid the thread over this hole, and a descending forked needle pressed a loop of thread through it. The loop was caught on the under side by a reciprocating hook; a feed moved the work forward the extent of one stitch; and a second loop was formed by the same motions as the first. It, however, descended within the first, which was thrown off by the hook as it caught the second, and being thus secured and tightened up an ordinary tambour or chain stitch was formed. Had Saint hit on the idea of the eye-pointed needle his machine would have been a complete anticipation of the modern chain stitch machine.

Thimmonier's Sewing Machine.—The inventor who first devised a real working machine was a poor tailor, Barthélemy Thimmonier, of St. Étienne, who obtained letters patent in France in 1830. Though the machine was clumsy, made chiefly of wood, about eighty were being worked in Paris in 1841, making army clothing, when an ignorant and furious crowd wrecked the establishment and nearly murdered the unfortunate inventor. Thimmonier, however, was not discouraged, for in 1845 he twice patented improvements on it, and in 1848 he obtained both in England and the United States patents for further improvements. The machine was then made entirely of metal, and vastly improved on the first model. But the troubles of 1848 blasted the prospects of the resolute inventor. His patent rights for Great Britain were sold; a machine shown in the Great Exhibition of 1851 attracted no attention, and he died in 1857 unfriended and unrewarded.

The most important ideas of an eye-pointed needle and a double thread or lock-stitch are strictly of American origin, and that combination was first conceived by Walter Hunt of New York about 1832–34. Hunt constructed a machine having a vibrating arm, at the extremity of which he fixed a curved needle with an eye near its point. By this needle a loop of thread was formed under the cloth to be sewn, and through that loop a thread carried in an oscillating shuttle was passed, thus making the lock-stitch of all ordinary two-thread machines. Hunt's invention was purchased by a blacksmith named Arrowsmith, but no patent was sought, nor was any serious attempt made to draw attention to the invention. After the success of machines based on his two devices was fully established, Hunt in 1853 applied for a patent; but his claim was disallowed on the ground of abandonment. The most important feature in Hunt's invention—the eye-pointed needle—was first patented in the United Kingdom by Newton and Archbold in 1841, in connection with glove-stitching.

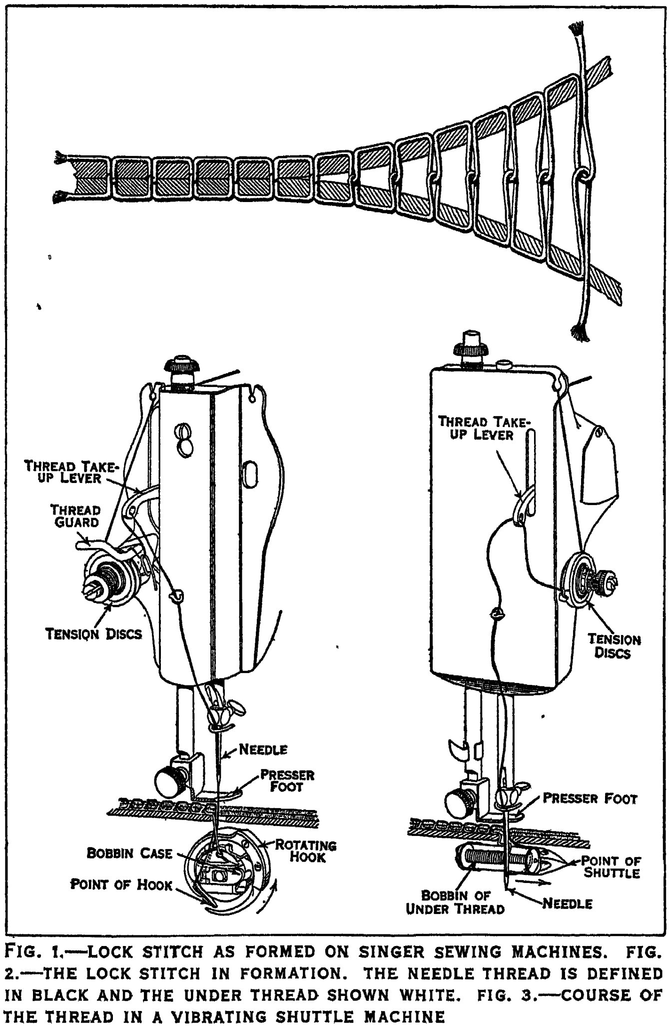

FIG. 1.—LOCK STITCH AS FORMED ON SINGER SEWING MACHINES. FIG. 2.—THE LOCK STITCH IN FORMATION. THE NEEDLE THREAD IS DEFINED IN BLACK AND THE UNDER THREAD SHOWN WHITE. FIG. 3.—COURSE OF THE THREAD IN A VIBRATING SHUTTLE MACHINE

Apparently unaware of Hunt's invention Elias Howe, a native of Spencer, Mass., directed his attention to machine-sewing about 1843. In 1844 he completed a rough model, and in 1846 patented his sewing machine (fig. 1). Howe was thus the first to patent a lock-stitch machine, but his invention had the two essential features—the curved eye-pointed needle and the under-thread shuttle—invented by Hunt twelve years previously. Howe's invention was sold in England to William F. Thomas of Cheapside, London, a corset manufacturer, for £250. Thomas secured in Dec. 1846 the English patent in his own name, and engaged Howe on weekly wages to adapt the machine for his manufacturing purposes. The career of the inventor in London was unsuccessful; and, having pawned his American patent rights in England, he returned in 1849 in poverty to America. There in the meantime the sewing machine was beginning to excite public curiosity, and various persons were making machines which Howe found to trench on his patent rights. The most prominent of the manufacturers, if not of inventors, ultimately appeared in Isaac Merritt Singer (1811–75), who in 1851 secured a patent for his machine. Elias Howe now became alert to vindicate his rights, and, after regaining possession of his pawned patent, he instituted suits against the infringers. An enormous amount of litigation ensued, but ultimately all makers became tributary to Elias Howe.

Allan B. Wilson also worked without knowledge of previous efforts. In 1849 he devised the rotary hook and bobbin combination, forming the special feature of the Wheeler and Wilson machine. Wilson obtained a patent for his machine, which included the important and effective four-motion feed for moving the work after every stitch, in Nov. 1850. In Feb. 1851 William O. Grover, a tailor, of Boston, patented his double chain-stitch action, which formed the basis of the Grover and Baker machine. In 1856 James A. E. Gibbs (1829–1902), a Virginia farmer, devised the chain-stitch machine, improved subsequently by J. Willcox and now known as the Willcox and Gibbs. These together —all American inventions—form the types of the various machines now in common use. Thousands of patents have been issued in the United States and Europe, covering improvements in the sewing machine; but, although its efficiency and usefulness have been greatly increased by numerous accessories and attachments, the main principles have not been affected thereby.

Chain Stitch.—In machine sewing three varieties of stitch are made—(1) the simple chain or tambour stitch, (2) the double chain stitch and (3) the lock stitch. In the first the machine works with a single thread, the other forms use two, an upper and an under.

The Modern Lock Stitch.—The lock stitch is that made by all ordinary two-thread sewing machines, and is a stitch peculiar to machine sewing. It consists of an upper or needle thread and an under thread locked together in the material which is being stitched; the lock being formed by passing the upper around the lower thread and tightening them together in the middle of the fabric, as shown in fig. 1. In fig. 2 the needle thread is shown as a thick black line and the under thread white, the fabric being stippled in order that each may be readily recognized. It shows the head of a lock stitch machine, rotary hook. The loop of needle thread has been taken by the point of the hook and is being passed round the bobbin case containing the bobbin of under thread, sufficient enlargement of the loop having been permitted by the descent of the thread take-up lever.

In fig. 3 is shown the head of a vibrating shuttle machine. The shuttle, containing the bobbin of under thread, has fully entered the loop of needle thread, sufficient enlargement of the loop having been permitted by the descent of the thread take-up lever. The shuttle travels to and fro in a carrier to which it is not fastened, but by which it is held in position. During the forward movement of the shuttle, the loop of needle thread slips between the shuttle and the carrier, then passes out between the heel of the shuttle and the rear part of the carrier. The shuttle thread is thus enclosed in the loop of needle thread and both threads are then drawn up by the action of the thread take-up lever.

There are over 2,000 varieties of modern sewing machines

designed for stitching processes in the great sewing industries making up clothing, boots and shoes, corsets, hats, hosiery, etc. There are machines specially designed for sewing regular or fancy shank buttons on shoes; for sewing sweat leathers into stiff felt, soft felt or straw hats; for trimming, scalloping and over-edging lace curtains; for sewing silk initials, monograms or floral designs upon material at one operation. There is a seven needle machine for making seven parallel rows of fine double chain stitching simultaneously. This machine is fitted with seven needles and seven loopers, and its capacity is over 20,000 stitches per minute.

The increasing use of electricity for domestic purposes has had its effect on the sewing machines. To adapt existing machines to electric operation, small motors are provided. There are also available sewing machines of various types with the motor incorporated in the body of the machine. Foot control or knee control is used. A small electric lamp directly over the work is often furnished.

SEX. Among the higher animals each individual is either male or female. In them maleness is the state associated with the production of spermatozoa; femaleness that associated with the elaboration of ova. A male is an individual that is efficiently equipped for the elaboration of functional spermatozoa and for the conveyance of these towards the site of fertilisation; a female one efficiently equipped for the elaboration of functional ova, for the conveyance of these to the site of fertilisation, and often, as in the mammals, for the prenatal care of the embryo and foetus and for the nurture of the offspring. In certain groups maleness and femaleness are exhibited by one and the same individual either concurrently or in succession: such groups are hermaphrodites.

Where the sexes are distinct, male is to be distinguished from female by differences in (1) the form and structure of the *gonads* or reproductive organs, those of the male being *testes*, those of the female, *ovaries;* (2) the accessory sexual apparatus of ducts and associated glands concerned with the transit of the products of the gonads; (3) the external organs of reproduction, and (4) certain skeletal, cutaneous and other less definite physiological, biochemical and psychological characters.

Sex-differentiation.—It is now established that the sex of the individual is decided at the time of the union of ovum and spermatozoon, *i.e.*, at the time of fertilisation; and the mechanism which determines sex has been disclosed. At the beginning of this century it was generally accepted that at the time of fertilisation the egg was sexually neutral and that the sex of the new individual was determined by the conditions incident to its development. But certain facts are now known which point directly to the conclusion that sex in higher animals at least is predetermined at fertilisation. Identical twins are derived from a single fertilised ovum and are always of the same sex, whereas fraternal twins, originating in two distinct fertilised ova, may or may not be both of the same sex. There is no reason why, if purely environmental factors are at work in determining the sex of the offspring, those produced from one egg should always be of the same sex whereas offspring produced by separate ova may include both males and females.

In all higher bisexual animals so far as is known, and in certain plants, the sexes are to be distinguished by differences in the chromosomal content of the nuclei of the cells of which the body is built. (*See* CYTOLOGY.) In certain forms there is in one sex an unpaired chromosome in place of the equal pair in the case of the other sex. This difference is symbolised thus:—the sex with the unpaired chromosome is the XO; the other the XX. In other forms the number of chromosomes is the same in both sexes, but while in one sex, the XX, the members of one pair are identical in size and shape, in the other, the XY, the single X has an unequal mate, the Y-chromosome. (In still other forms the X-chromosome is represented not by one chromosome but by a group of from 2 to 8 which act together as a compound X-element.) These chromosomes, the X and the Y, since in respect of them the sexes differ, are known as the *sex-chromosomes*.

Into each ripe germ-cell, ovum and spermatozoon, there passes one or other member of each pair of chromosomes. If, as is the case in man, the female is XX, all ova will be alike in that each will contain an X-chromosome, but there will be two kinds of sperm elaborated by the XY male, one carrying the X-chromosome, the other the Y. The female in these groups is *monogametic*, elaborating but one kind of *gamete* (marrying-cell) in respect of chromosome content, the male, *digametic*. When egg and sperm unite, into the fertilised egg there will pass, by way of the sperm, one member of each pair of chromosomes, and, by way of the egg, the other member of each pair. There will thus be two kinds of fertilised ova, one that received an X-chromosome from each parent, to become an XX individual, *i.e.*, a female; the other, which received an X-chromosome from the mother and a Y from the father, to become an XY individual, *i.e.*, a male. This chromosomal difference between the sexes provides a simple yet sufficient mechanism for sex-determination. Similar reasoning will apply to those species in which the X-chromosome in one sex has no mate, and also to those in which the X-element is compound.

In mammals and in most insects the male has the single X; in the butterflies, moths and birds, on the other hand, it is the female that is digametic.

SEX-LINKAGE

In those forms in which the male is digametic, being XO or XY in sex-chromosome constitution, a son receives his single X from his mother, whereas a daughter gets one X from each parent. If on the X-chromosome of the father is borne the hereditary factor for a recessive character (*see* HEREDITY and MENDELISM) the track of the chromosome in inheritance can be followed, provided that in the Y-chromosome there are no factors which affect the action of those borne upon the X. Moreover if the sex-chromosomes are elements of the sex-determining mechanism and if factors for hereditary characters are borne upon them it will be seen that the mechanism that is determining whether the individual shall be male or female is also determining whether or not the individuals shall also exhibit some particular character—the character in its transmission from generation to generation will exhibit a *sex-linked* mode of inheritance.

For example, consider the inheritance of haemophilia (tendency to excessive bleeding). This appears to be a sex-linked recessive character; the interpretation which best fits the facts is as follows. Haemophilia is an hereditary character, the factor for which is X-borne. The male therefore, possessing but one X-chromosome, is either haemophilic or else is normal: the female on the other hand can be normal, a carrier (*i.e.*, with the factor on one of her X's only), or haemophilic (*i.e.*, with the factor on each of her X's). Let an italicised *X* indicate that on this particular X the factor for this recessive sex-linked character is borne. The following matings and results are possible:—

The marriage of a haemophilic man (*X*Y) with a haemophilic woman (*XX*) can yield only haemophilic sons (*X*Y) and haemophilic daughters (*XX*).

The marriage of a haemophilic man (*X*Y) with a carrier woman (X*X*) can yield normal sons (XY): haemophilic sons (*X*Y): carrier daughters (X*X*): haemophilic daughters (*XX*).

The marriage of a haemophilic man (*X*Y) with a normal woman (XX) can yield normal sons (XY) and carrier daughters (*X*X).

The marriage of a normal man (XY) with a haemophilic woman (*XX*) can yield haemophilic sons (*X*Y) and carrier daughters (X*X*).

The marriage of a normal man (XY) with a carrier woman (X*X*) can yield normal sons (XY): haemophilic sons (*X*Y): normal daughters (XX): carrier daughters (X*X*).

On the other hand the facts concerning the inheritance of certain characters in butterflies, moths and birds require that here the female shall be digametic. These facts can be illustrated by reference to the fowl. A black (non-barred) cock mated with barred hens will throw barred sons and black (non-barred) daughters. A barred cock mated with black hens will throw barred sons and daughters and if these are interbred they will in their turn produce barred and black offspring, but every black indi-

vidual in this generation will be a male. These facts can only be explained on the assumptions that sex in this form is decided by the simplex or duplex condition of some element which when present in duplicate leads to the establishment of maleness and that the factors for the sex-linked characters are borne upon the X-chromosomes.

Non-disjunction.—So far the evidence derived from breeding experiments and also from microscopical examination of the cell is in entire agreement: it is exceedingly strong but it is indirect. But direct proof of the chromosomal determination of sex and of the location of the hereditary factors in the chromosomes is available, for it has been shown by Bridges (1916) that certain exceptions to the normal course of sex-linked inheritance in *Drosophila* depend upon abnormality in the distribution of the X-chromosomes.

In *Drosophila melanogaster* white eye-colour is a sex-linked recessive character. Using the symbols w for the factor for this and W for the alternative dominant normal red eye and writing these as affixes to the X-chromosomes, the result of a cross between a red-eyed male and a white-eyed female can be shown.

Red-eyed male .	(WX)Y	x (wX) (wX)	white-eyed female
Spermatozoa .	WX.Y	: wX . wX	ova
Red-eyed daughters .	(WX)(wX) .	(wX)Y	white-eyed sons.

It is to be noted that during the process of the formation of the ova and spermatozoa the members of the pair of sex-chromosomes (as do all the rest) disjoin so that only one passes into each gamete.

In a particular sex-linked experiment Bridges got unexpected results: there were some red-eyed sons and white-eyed daughters. On cytological examination of such exceptional white-eyed females Bridges found that their cells displayed a Y-chromosome in addition to the normal pair of X's. This is what would occur if, during the maturation of the egg in which such an individual had had its origin, the X-chromosomes had failed to disjoin so that instead of coming to possess but one X it would contain two and if this non-disjunctional egg had then been fertilised by a spermatozoon bearing a Y-chromosome. If a non-disjunctional female is used in experiments involving a sex-linked character such as white-eye, the mode of inheritance of such characters will be obscured, as can be shown in the following scheme. She will elaborate four sorts of eggs instead of one. These can be fertilised either by the (WX)-bearing or by the Y-bearing spermatozoon of the red-eyed male.

The exceptional white-eyed daughters are white-eyed because they do not get one of their X-chromosomes from their red-eyed

Non-disjunctional white-eyed female

(WX)Y — Y — YY
red male exceptional — dies
Y Sperm

father: the exceptional red-eyed males are red-eyed because each gets his Y-chromosome from his mother and his X from his father.

The aberration in the chromosome distribution can explain the entire series of exceptional results. The evidence derived from breeding and from cytological investigation turned what seemed to be a direct contradiction of the chromosomal interpretation of sex-linked inheritance into a spectacular confirmation. The evidence confirms the conclusion that sex-linked characters are associated with the sex-determining mechanism because their factors are located in the sex-chromosomes and that sex is determined at the time of fertilisation by the XX-XY mechanism. In *Drosophila* certainly the Y-chromosome has no influence upon sex-determination, XXY and even XXYY individuals develop into females of normal appearance whilst X individuals lacking the Y develop into unexceptional looking males (but are sterile). XXX individuals either die or else grow up into sterile females and Y individuals without an X never appear—they must be non-viable.

Gynandromorphism.—Another line of argument pointing to the same conclusion has been derived by Morgan and his associates from the study of gynandromorphism in *Drosophila*. A gynandromorph is an individual of a bisexual species which exhibits a mosaic of male and female characters. Most specimens are lateral gynandromorphs, male on one side of the mid-line of the body, female on the other, with a sharp demarcation between the two kinds of tissue. In other instances one-quarter of the body is male, the other three-quarters female; in yet others the head is female and the rest of the body male. Morgan and Bridges (1919) have shown that if in the mating, which produces the gynandromorphs, sex-linked characters are involved and if the sex-linked characters of the two parents are dissimilar, then the sex-linked characters of the male parts are those either of the father or of the mother, whereas the sex-linked characters of the female parts are a combination of those of both parents. These facts point to the conclusion that gynandromorphism results from aberration in the distribution of the X-chromosomes. If it is assumed that the gynandromorph starts life as a female, XX in constitution, and that at some stage during the early divisions of the fertilised egg a daughter X-chromosome fails to enter one of the daughter cells, then this cell, unlike its sister, will contain one X instead of two, becoming XO instead of XX. It thus will come to possess the sex-chromosome constitution of male tissue. If the X-chromosome of paternal origin is lost the sex-linked characterisation of the male part of the gynandromorph will be like the mother's.

BALANCE OF SEX-DETERMINING FACTORS

Since the difference in sex-chromosome content is the only apparent difference in the constitution of the sexes it follows that the X or something lodged in it is female-determining (in cases similar to man or *Drosophila*), whilst male-determination is an affair of the rest of the chromosomes (exclusive of the Y) or *autosomes*. If the female-determining factor in the X be symbolised as F and the sum of the male-determining factors in one set of autosomes as M, then whilst both male and female possess 2M, the females possess 2F, the males 1F. Thus 2F must be $>2M$ and 1F must be $<2M$.

Triploid Forms.—Bridges found a strain of *Drosophila* which was *triploid, i.e.*, which possessed some or all of its chromosomes in triplicate instead of the normal duplicate. In the individuals produced by the triploid strain, three sets of autosomes (3A containing 3M) were in some individuals associated with 1X, in others with 2Xs, in others with 3Xs. Investigation revealed the following sex types. By representing the efficiency of the female-determining factors (X-borne) as 100 and that of the male-determining factor complex as 80, a series of sex-indices can be made.

Chromosome relation	Sex types	Numerical ratio X(100) A(80)	Sex index	Interval %	X=−6 A=+2
3X:2A	Super-female (triple-X) .	1·5:1	1·88	50	−14
4X:4A	4N female (N=the number of chromosomes in the gamete) . . .	1:1	1·25	..	−16
3X:3A	3N female	1:1	1·25	..	−12
2X:2A	2N female (normal constitution) . . .	1:1	1·25	..	−8
1X:1A	1N female . . .	1:1	1·25	50	−4
2X:3A	Intersex, female type .	1:1·5	·083	..	−6
2X:3A (−IV)	Intersex, male type .	1:>1·5	·083	33	−6
1X:2A	Male (normal constitution)	1:2	0·63	50	−2
1X:3A	Super-male (triple-A) .	1:3	0·42	..	0

Thus sex-determination cannot be the function of sex-chromosomes alone; on the contrary, sex must be determined by the interaction of factors borne upon sex-chromosomes and autosomes. The addition of more autosomal factors to the usual 2X:2A balance so disturbs this that femaleness is transformed into intersexuality. The difference in the sexual characters of individuals possessing 2X chromosomes associated with 3 of each autosome (2X:3A) and of those which have but two IV chromosomes instead of three (2X:3A—IV) is to be regarded as an indication that the IV chromosome carries, like the X-chromosome, a net balance of female-determining factors. Sex-determination is thus a matter of the correct quantitative balance between the amount of male and of female determining factors of the fertilised egg and if one does not exceed the other by a certain amount intersexual forms result.

The monogametic female is a female because she has the constitution (FX)(FX)MM and because $2F>2M$, whilst a male is a male because he has the constitution (FX)Y MM and because $1F<2M$. In forms with digametic female the male-determining factors must be borne upon the X-chromosomes. Then a male is a male because his constitution is (MX)(MX)FF and because $2M>2F$, a female is a female because her constitution is (MX)YFF and because $1M<2F$. In either case when $M=F$, intersexuality will result. Of course, these formulae must not be taken too literally: they are but convenient symbolism. But it is clear that in *Drosophila* the effective factor in the establishment of maleness, femaleness and intersexuality is the numerical ratio of X-chromosomes to autosomes.

The end-result of the interaction of male and female differentiating substances is the establishment of a particular physiological state, maleness or else femaleness, within the developing fertilised egg and in this or that internal environment the development of the individual proceeds. In *Drosophila* an individual is a male and develops the attributes of the male because in its beginning it had a chromosome constitution symbolised as XY; because in this XY individual the relation of male and female determining factors was such that an internal environment of maleness became established within the developing egg; because in this environment the structures pertaining to the XY sex equipment developed; and because the impress of the external environment did not or could not affect the developing individual so as to override the action of the sex-determining mechanism. For similar reasons the XX individual becomes possessed of typical female characterisation.

Developmental Physiology.—So far this discussion has concerned itself with the location of sex-determining factors within the chromosomes and with their correlation with the adult sex-characters. It is necessary to consider the methods by which the one becomes translated into the other during development.

In the vertebrates the initial sexuality, the expression of the hereditary constitution of the individual, is strongly reinforced when the reproductive organs become differentiated. The first trace of sexual differentiation in the mammal is to be seen in the sex-gland which appears early in embryonic life and when once the testes or the ovaries have developed they, through their physiological activities, control the differentiation of the accessory sexual apparatus and of much else besides. The results of castration and of implantation of sex-gland tissues have clearly demonstrated the intimate relation that exists between the type and degree of sexual differentiation and the functional activity and structure of the sex-glands and have proved that for complete differentiation and maintenance of the sex characters functional sex-gland is essential.

But among insects this is not so. All the sex characters of the insect are the direct expressions of the action of the chromosomes and owe nothing to the physiological activity of the sex-gland. The differentiation of each cell is pursued under the control of its own set of chromosome-borne factors: in mammals, though each cell of the female body is chromosomally, genetically different from each cell of the male body, this chromosomal difference does not bring about the whole differentiation of sex-characters locally, within the individual cell, but, once the sex-glands have become differentiated, the testes and the ovaries take charge.

Goldschmidt it was who made the first serious attempt to demonstrate the method by which the sex-determining factors in their action lead to the production of the sex-characters of the adult. He started from the fact, long known to entomologists, that when species or even geographical races of moths are crossed, sexual abnormalities are commonly found among the hybrid offspring. For his material he chose the gypsy moth, *Lymantria dispar*, which has a wide distribution and is very variable. If European specimens of this forest pest are bred among themselves the offspring are unremarkable in every way. The same is true of the Japanese variety, *Lymantria japonica*. But if a Japanese male is mated with a European female, normal male offspring and females which show a number of modifications in the direction of the male type are produced. When such female *intersexes* are mated with their brothers, of the females of the generation thus produced half are normal, half are intersexual. The reciprocal cross, European male Japanese female, produces normal females and males in the first hybrid generation, but if the individuals of this are then interbred they produce a certain proportion of males with female characters.

Further investigation demonstrated that there were many different sub-races of European and of Japanese gypsy moths that were quite distinct in respect of intersexuality, in that the degree or grade of intersexuality was definite and typical for a particular mating. Goldschmidt classified strains as relatively "strong" or "weak." For example, a "strong" male mated to a "weak" female gives 50 per cent. normal males and 50 per cent. intersexual females. A "very strong" male mated to a "weak" female would give offspring all male. A mated to B gave a low grade of intersexuality, C×D a high grade, E×F a grade intermediate between these, and so on. If strong race A gave moderate sexuality with weak race P, whilst with race Q it gave strong intersexuality, and if strong race B gave moderate intersexuality with Q, then it could be predicted that B with P would give only a slight grade. Similar males from one culture mated with females from different cultures gave intersexes that could be arranged in a series according to the degree of their abnormality and so on. It was possible, by calling on experience, to produce every stage from an almost complete male to an almost complete female intersex at will by making the appropriate mating. In fact, it was as possible to turn the "determined" females into fully equipped males as to ensure the regular production of normal males and females.

Influences of Intersexuality.—It was noticed that the condition of intersexuality did not affect all the structures of the sexual organisation equally. Further investigation demonstrated that the different structures could be arranged in a definite series as regards degree of intersexuality in characterisation and that this series was exactly the opposite of the order of the embryonic differentiation of these structures. Those organs which are first developed and differentiated are the last to be modified; those that appear last are the first to be changed. From these considerations there arose the Time-Law of Intersexuality. An intersex is an individual that has developed as a male (or female) up to a certain point in its life-history and thereafter has continued its development as a female (or male). The degree of intersexuality is determined by the time at which this switch-over occurs.

Intersexual females start their development as females and then at a certain point in development change their differentiation and finish as males, and since the hard parts of an insect are external and composed of chitin any of them that have hardened before the switch-over remain unaltered by it. From an examination of the parts which are sexually dimorphic, it is possible to decide in the case of any particular individual exactly when the change-over took place. These intersexes are sex-mosaics in time.

From these facts Goldschmidt deduced the following conclusions:

(1) Each sex possesses the potentialities of the other since either can become intersexual.

(2) The type of sexual differentiation that the fertilised egg will pursue is determined at the time of, and by the mechanism

of, fertilisation. If the constituents of intersexuality are in the fertilised egg, then the individual will inevitably become an intersexual form.

(3) The normal determination of sex is bound up with the X:2X mechanism. But as this does not prevent the occurrence of intersexuality and sex-reversal, it cannot be the mere presence of these chromosomes or the factors contained within them that counts, but rather their quantitative effect during development.

(4) The mode of inheritance of this intersexuality shows that since the female in *Lymantria* is XY, and since her single X-chromosome is received from her father, the male-determining factors in sex-determination are transmitted in the X-chromosome.

(5) Other factors concerned in sex-determination in *Lymantria* are purely maternal in inheritance, being resident in the Y-chromosome. A daughter receives her Y-chromosome from her mother. But since a male has no Y-chromosome, the factors in the Y-chromosome must have exerted their action on the unripe egg when this contained both X- and Y-chromosomes. If all eggs are to be alike in respect of the Y-borne genes, these must have acted and their products must have specifically affected the cytoplasm before the X and Y became disjoined.

(6) The fact that the females of similar constitution give different results when mated with males of dissimilar constitution shows that the sex-determining genes in the X-chromosome differ quantitatively in the different races. The fact that males of similar constitution give different results when mated with females of dissimilar constitution shows also that the sex-determining factors resident in the Y-chromosome can be different quantitatively.

It will be seen that if both X-borne and Y-borne sex-determining genes can so vary quantitatively among themselves, an infinite variety of different combinations can be made, deliberately or by chance.

Goldschmidt infers with reason that the sexual characterisation of any particular organ of the sex-equipment depends on whether one or the other type of sex-differentiating substance is effectively in excess at the time when the organ arises in development. He interprets the mosaic character of the intersex on the assumption that the amount of sex-differentiating substances produced in virtue of the presence of the corresponding sex-determining factors is not constant throughout life: that at one time the male-differentiating substance is in excess, at another the female. In the male of the moth M>F and the male-differentiating substance is effectively in excess until the period of development is complete. In the female M<F and the female-differentiating substance is effectively in excess during development. But if it should so happen that the sex-differentiating substances are produced at different rates, and if some genes possess the property of producing more sex-differentiating substance in a given time than others, then there exists the possibility that sex-mosaics in time will be produced.

A male of a race whose sex-determining genes work at a faster rate is crossed with a female of a race in which these factors work slower. The female-determining factor F is always inherited through the mother and in all the offspring there will be this factor F and the female-differentiating substance will be produced in all at the same rate. But the male offspring will receive one M from their mother, and the other, the quick-acting M, from their father, so that in a given time the male-differentiating substance will be effectively in excess during development. The female offspring will have only the paternal M, and therefore the amount of male-differentiating substance will increase relatively to the amount of the female-differentiating substance, overtake it, and finally supplant it, and from this point onwards any sex characters which still have to develop will be male. The individual will be a female intersex. It is not the absolute but the relative rates of production of male- and female-differentiating substances that control the modelling of the sex-equipment. Sex-reversal in these cases is due to genetic causes—the fertilised egg contains inevitably within itself the seed of its eventual transformation in the form of a quantitative disharmony of the sex-determining factors.

This work of Goldschmidt shows definitely that intersexuality in *Lymantria* depends upon variations in the relative rate of production of definite instances and that this again is correlated with differences in the sex-determining factors that can be interpreted in Mendelian terms. (*See* HEREDITY.)

In the case of the sexually abnormal types of *Drosophila* it is seen that the abnormality is the result of a disharmony in the *distribution* of the elements of the hereditary constitution of the individual. In the case of *Lymantria* intersexuality and sex-reversal are due to a disharmony in the *composition* of the hereditary constitution. The sexually abnormal individuals of *Drosophila* are spatial intersexes; those of *Lymantria* and of the frog and of the small Crustacean *Gammarus* (Sexton and Huxley, 1927), are consecutive intersexes, sex-mosaics in time.

No spatial intersex is possible in mammals since the control of sex-differentiation lies not in the cells but is relegated to the sex-hormone. No *certain* case of consecutive intersexuality is known in mammals although there is no theoretical objection to its occurrence. But intersexuality, though its causes may not yet be exactly recognised, does exist quite commonly.

One form of sexual abnormality possibly results from delayed hormone-production. In man and in most domesticated mammals a peculiar type of sex abnormality is sometimes encountered. Examination shows (1) that testes only are present but often occupy the position of ovaries or are at least abdominal; (2) that both male and female sets of internal accessory sexual organs are present; (3) that the external organs of reproduction are mainly female in type; (4) that male secondary sex-characters and instincts develop at puberty. Crew (1923) has adduced reasons for regarding these abnormal forms as males in which, for some reason, the testis has not been secreting its controlling hormone during embryonic life or at least until the main internal and external accessory sexual organs have been laid down. This interpretation presupposes that the differentiation of the accessory organs occurs during a limited period of embryonic life and that the process is more or less irreversible. In the absence of testicular hormone both male and female accessory organs can become differentiated up to a point and thus a neutral type results. The various accessory organs have slightly different periods of differentiation and according to this and to the degree of delay in the production of testicular hormone the individual will be intermediate or predominantly male. Such individuals owing to the appearance of the external organs of reproduction are usually classified as females at birth but prove to be males at puberty. The condition is hereditary.

THE BOVINE FREE-MARTIN

The part played by the sex-hormones in mammalian intersexuality is best illustrated by the bovine free-martin, a genetic female (XX) co-twin to a normal male, the reproductive system of which becomes abnormal during the period of sexual differentiation as a result of the action of the sex-hormone of a male co-twin *in utero*. Twins in cattle may consist of two normal males, two normal females, one male and one female each normal, or one male and the other an individual with an abnormal reproductive system and known as a "free-martin." In all save one of 126 cases of twins in cattle thoroughly examined by Lillie, two *corpora lutea* (yellow scars on the surface of the ovaries at the points at which ova have been extruded) were found. This shows that twins are almost invariably binovular (fraternal) in this animal.

The two fertilised ova pass into the bicornuate uterus and become attached. As the zygotes increase in size, the embryonic membranes of the two foetuses meet and in many cases fuse. If so, an intermingling of their blood vessels can result. In the case of twinning involving one normal male and one normal female it is found that fusion of the blood systems does not occur.

Thus the sex-hormone of each developing individual is at liberty to pass into the tissues of its co-twin. The sex-hormone is the instrument which models the sex-organisation. The internal

secretions of other organs can also pass from each individual to the other, but these are mainly concerned in the general and not in the special development of the individual and will be alike in both twins. But if the twins are bisexual and if vascular intercommunication becomes established (as it does in seven cases out of eight), the sex-differentiation of both individuals will be directed by that sex-hormone which is more potent or formed earlier. The testis becomes differentiated earlier than the ovary, and so the male sex-hormone is liberated before the female. The female twin will pursue her sex-differentiation under the direction of the male sex-hormone of her co-twin and will therefore come to possess more or less completely a male organisation. The assumption of the male characters in the case of the foetuses examined is imperfect; the external genitalia are of female pattern, the internal organs more or less completely male. The male sex-hormone is liberated before the embryonic gonads of the female have undergone differentiation into ovaries; such differentiation is prevented and so there is no question of a competitive action between male and female sex-hormones. Hartman (1920) has produced evidence which may mean that the reverse type of hormonic intersex—a male rendered abnormal by the sex-hormone of the female—may occur in the opossum and in man.

THE CASE OF BONELLIA

The marine worm, *Bonellia viridis,* displays a remarkable degree of sex-dimorphism. The female has a body about the size of a plum. The male is a microscopic pigmy whose internal organs, save those concerned with reproduction, are degenerate and who lives as a parasite within the body of the female. The fertilised eggs hatch out as free-swimming larvae. If a larva settles down upon the sea bottom, it becomes, with few exceptions, and after a short neuter period, a female; but if it settles upon the proboscis of a female it becomes a male. Baltzer (1914) took larvae at various periods after they had settled upon a female but before they had become completely male and forced them to lead an independent life, and as a result he obtained intersexes, the degree of intersexuality varying with the length of time the larva had been upon the female's proboscis. It has been shown that the larvae absorb material from the proboscis and that this is responsible for the arrest of growth and the direction of the sexual differentiation. The arrested pigmy male passes from the proboscis of the female into her mouth and then emerges and ensconces himself in her reproductive duct.

An ingenious hypothesis has been advanced to cover the observed facts concerning the case of Bonellia. Goldschmidt (1923) supposes that in all the individuals there is at first an excess of male-differentiating substance, but that the production of female-differentiating substance after a time overtakes this. Further, he supposes that the secretion of the proboscis of the female of *Bonellia* has the effect of accelerating the processes of differentiation as opposed to the processes of growth, antedating, as it were, the period during development when sexual differentiation occurs. When differentiation is rapid, the sex-organisation matures under the influence of the male-differentiating substance; when it is not accelerated, under that of the female-differentiating substance. The mode of sex-differentiation is determined by a varying physiological state in connection with varying environment and secretions from other individuals.

Baltzer (1925) agrees in principle with this physiological interpretation of the case of *Bonellia* but holds that the cause of the intersexuality cannot be an acceleration of the rate of development but is rather a retardation. He points out that in experimental cultures of *Bonellia* there first appear normal females, then females with sperm, and lastly intersexes and males; and that the male organisation, compared with that of the female, is to be regarded as a lower grade of development, being characterised by the absence of various organs.

THE EFFECTS OF PARASITISM

Giard (1887) and later Smith (1906) have described in detail the changes that occur in crabs parasitised by *Sacculina* and other parasitic crustacea. Sacculina, an internal parasite, is a cirripede crustacean, and part of its body projects to the exterior under the abdomen of its host, while root-like processes ramify to all parts of the crab's body, avoiding the vital organs and absorbing nourishment chiefly from the blood. It attacks males and females and in both causes atrophy of the sex-glands and consequent sterility. The only effect of this in females is an acceleration in assumption of adult sex-characters. Parasitised males, however, gradually take on more and more of the female characters, their great claws become relatively smaller, the abdomen broader, the swimmerets enlarge and become fringed with the hairs to which, in females, the eggs are attached. Most of the affected crabs die, but in a few the parasite disappears and the reproductive organs are regenerated. In a female a normal ovary develops, in a slightly feminised male, a normal testis, but in some males a sex-gland is regenerated, in which both ova and sperm are found; real male hermaphroditism is produced.

Geoffrey Smith (1906) who investigated this problem found that the blood of the normal female crab differs in chemical constitution from that of the male. It contains fatty substances which are used in the production of the yolk of the egg. These fatty substances form an important part of the food of the parasite *Sacculina.* That which *Sacculina* absorbs cannot be used in yolk formation, and as the eggs cannot develop, the ovary degenerates. In the male these fatty substances are present in but small quantities. The parasite demands more and the whole physiology of the male crab is altered to meet this demand; the male thus assumes the female type of metabolism, and consequently female characters.

The interest of this case is that it permitted Smith to question the validity of the conception that in all forms the gonads functioned as organs of internal secretion, contributing a peculiar product to the blood streams. Smith argued that the gonad, far from adding anything to the blood stream, removed something from it.

Sex-reversal.—It is somewhat difficult, when one first approaches this subject of the transformation of sex, to grant that reversal is possible in the higher forms in which the sexual differences, morphological, physiological, and mental, are so sharply emphasized. But when one remembers that what is rare and exceptional in one form can be facultative in others, and that all forms have much in common, the difficulty vanishes. It is readily conceded that the oyster, for example, may regularly change its sex. The native oyster begins its life as a male and then, when one or two years old, may and indeed commonly does, become a female. But that is not all, for Orton (1921) has shown that such an oyster, after becoming "white sick," *i.e.,* after shedding its ova into the mantle cavity, and whilst still carrying its own embryos, can, within the space of a month, become equipped as a male once more. That which is usual in the oyster may be, under certain conditions, not rare in the more highly organised forms. Similar instances of facultative sex-transformation are those furnished by *Crepidula plana,* parasitized Cymotheids and Epicarids, the starfish, *Asterina gibbosa,* and the slug *Limax maximus.* In all these cases the direction of the transformation is male $\rightarrow$ hermaphrodite $\rightarrow$ female.

SEX-REVERSAL AS DIRECT EXPRESSION OF GENETIC ACTION

If the genetic components of sex-reversal are present in the hereditary constitution of an individual, if the physiological equilibrium of the embryo established by the action of the hereditary factors is not profoundly modified by the physiological influence of the glands of internal secretion during development, and if the impress of external agencies upon the embryo does not or cannot override the hereditary constitution, *i.e.,* does not or cannot profoundly alter the physiological state established by the hereditary factors, then sex-transformation will occur as development and differentiation proceed.

Thus in the case of the moth, *Lymantria,* and similarly constituted forms, the same general forces which lead to intersexuality lead also to sex-reversal. Intersexuality is in such cases merely incomplete reversal. Complete reversal will occur when in a male

the quantitative disharmony between the male and the female sex-differentiating reactions is such that the female reactions are in excess throughout the whole of the period of differentiation, or in the case of a female when the male reactions are in efficient excess throughout this time.

In the *Lepidoptera* Goldschmidt (1910, 1923), Harrison, (1919), and others, have obtained species hybrid broods that were largely or entirely of one sex. Harrison was able to show that in one of his cases the mortality was not sufficiently high to account for the results obtained; it was not a case of a sexually selective prenatal mortality, and both Goldschmidt and Harrison have presented evidence which strongly indicates that the results are due to a sex-transformation of half the individuals concerned.

Essenberg (1925) records that sex-reversal occurs in the viviparous teleost fish, *Xiphophorus helleri*, (the sword-tailed minnow), and that many instances of this have been reported by fish breeders and fanciers. In Essenberg's cases two females ceased to produce young when about three years old, and during the course of several weeks took on the sex-characters of the male. Cytological examination revealed the presence of ripe sperm in all parts of the gonad which, however, was juvenile in relation to the size and age of the fish. Essenberg was able to show that there is a type of development in the female which readily provides a morphological basis for the change-over. He also shows that there is a complete reversal of the sex-ratio in a population, males being rare among the immature and plentiful among the old. It would seem from Essenberg's observations that sex-reversal is extremely common in this fish and that it is genetic in origin, there being a form which through genetic action is destined merely to pass through a female phase and later to proceed to a male type of sex-differentiation.

Harms (1926) also has observed the transformation of females of *Xiphophorus* into males at different ages, especially among old sterile females. He records that during this process of sex-reversal the female when mated still produces young, though when the process is completed, the individual is a functional male, larger than the normal male, broader and heavier. Harms observed that the older the animal is at the time of the change-over, the more female the general body build remains. The process occupies about 3–4 months and in the case of old females may remain incomplete. The cause of the transformation is regarded by Harms as being a physiological exhaustion of the ovary with a consequent alteration in the general metabolism which invokes the differentiation of testicular tissue.

Harms bred from transformed females when they were functioning as males and got none but females, as would be expected if the female of the fish is monogametic (XX).

SEX-REVERSAL AND HEREDITARY CONSTITUTION

Sex-reversal can be the result of the overriding of the hereditary constitution by agencies which sufficiently disturb the general physiological conditions of the zygote at some stage or other of its development. It can result from a disturbance of the physiological condition within the ovum before fertilisation. The work of Hertwig, Kushakevitch and Witschi has shown that delayed fertilization and also the exposure of frogs' eggs before fertilization to high temperature (27° C) lead to a profound disturbance of sex-ratio. A male frog was permitted to fertilise half the eggs of a female and then was removed, to be replaced after an interval to fertilise the remainder. After an interval of 89 hours none but male offspring were obtained. This result is not due to selective fertilisation, to a sexually selective mortality among the embryos, or to the abnormal extrusion of an X-chromosome during the maturation of the eggs. The correct interpretation of the results would seem to be that some 50 per cent of the eggs were fertilised by X-chromosome-bearing spermatozoa, females (XX) being produced, but that the conditions of the experiment were such as to transform these into functional males, the sex-chromosome constitution of the zygote being overridden by the effects of delayed fertilisation upon the metabolism of the egg. The results obtained by Mrsić on the effect of over-ripeness upon trout eggs are probably to be explained in a similar fashion.

The observations of Adler (1920), who has shown that the thyroids of individuals from these late fertilised eggs are markedly hypertrophied, would seem to be of significance. Adler suggests that in these individuals the thyroid comes into action earlier than does the gonad and so affects the internal environment that the gonads, when they do differentiate, become testes.

These observations are closely in line with those of Whitman (1919) and of Riddle, (1912, 1916) upon the pigeon. It was found by Whitman that the matings of birds belonging to the *Columbidae* with species of two distinct zoological families of birds resulted in the production of male offspring only, and that females alone were obtained from the eggs of doves which had been forced to lay excessively and at an abnormally rapid rate. Riddle carried these observations further and was able to show that the eggs that yield males can be distinguished from those which yield females, that maleness is associated with eggs of smaller size, higher water content, and less stored energy, and that the production of all males or of all females was associated with the production of eggs of one or of the other type. He was able to dismiss the possibility of selective fertilisation and of differential maturation, and was driven to the conclusion that the conditions of the experiments were such as to induce sex-reversal in the egg itself (1914, 1919).

It is a simple matter to interpret these results in terms of a metabolic theory of sex as elaborated by Riddle. Delayed fertilisation implies an increased metabolic rate in the egg and a high metabolic rate implies maleness. Desiccation implies a decreased metabolic rate and femaleness. The hypertrophy of the thyroid implies an increased metabolism and an internal environment of maleness. The production of offspring all of one sex by matings of wide crosses is to be interpreted as the result of the pooling of hereditary factors which in their action lead to the establishment of one kind or the other of metabolic level in the zygote.

In this connection it should be noted that Guyer's (1909) data on species hybrids among birds show that there is a decided excess of males in the F_1 generation. Riddle (1916) recorded an excess of females in the cross *Streptopelia risoria* × *S. alba* (doves) under certain conditions and concluded that this excess was the result of a transformation of some of the males. It has been shown, however, that this conclusion is not justified, for the cross involved a sex-linked character and of the hybrids the males are dark, the females white in colour, and examination of the date for sex and also for colour shows that the only possible explanation of the excess of females is that which postulates that the conditions of the experiment were such as to cause the X-chromosome to pass into a polar body at the time of the reduction divisions more often than to remain in the egg.

Sex-reversal can result from a disturbance of the general physiology of the individual during embryonic life.

Burns (1925) joined young embryos of *Amblystoma* in the tailbud stage in parabiosis and instead of getting the expected chance combinations of the sexes, 1♂♂, 1♂♀, 1♀♂, 1♀♀, he obtained exclusively one sexed pairs. He suggested that the reason for this 44 ♂♂ : 36 ♀♀ or 1 : 1 ratio was that in one-half of the original ♂♀ and ♀♂ associations the males became transformed into females, whereas in the other half the females became transformed into males.

Witschi (1927), using four different species of frogs, joined embryos 50–70 hours old, and shortly after the closure of the medullary tube, in parabiosis. The controls exhibited the first signs of sex-differentiation during the third week of development; in the case of the parabiotic twins it was somewhat delayed. The twins were preserved at intervals during the larval period and the stage of metamorphosis. The sex-ratio among the controls was 96♂♂ : 100 ♀♀ or 1 : 1. Among the 56 twins there would be expected the following sex-combinations: 14♂♂, 14♂♀, 14♀♀. There was found on examination 16♂♂, 17♂♀ (with 7 of the ♀♀ exhibiting some stage in sex-reversal), 10♀♂ (with 4 of the ♀♀ undergoing sex-reversal), 13♀♀.[1] The combination of a female with a male twin undergoing sex-reversal was not encountered.

Witschi therefore concluded that the male sex-differentiating agencies predominated and that sex-reversal did not take place before the time of sex-differentiation.

Disharmonies in the development time-relationships of sex-differentiation may provide opportunity for sex-reversal. For example, in *Myxine* (Schreiner, 1904), growth would seem to proceed undirected to the stage when the individual is hermaphroditic, before the processes of sex-differentiation set in to convert the individual either into a functional male or else into a functional female. In the young males of the Stone-fly *Perla* both ovarian and testicular tissues are to be found but the ovarian tissue undergoes atrophy, so that in the adult none but testicular remains (Junker, 1923). In such circumstances as these the morphological basis of a possible sex-reversal is revealed and it becomes entirely conceivable how physiological disturbances during embryonic and early post-embryonic life can change the course of differentiation and lead to the conversion of a genetic male into a functional female, and *vice versa.*

Sex-reversal can result from a disturbance of the general physiology of the post-embryonic individual. The conditions necessary for such sex-transformation are (1) there must be a switch-over from one type of metabolism to the other, from the female to the male, or *vice versa;* (2) the component structures of the sex-equipment must be capable of transformation or replacement, one kind of sex-gland tissue must be replaced by the other, ovary must become or be replaced by testis, or *vice versa,* the accessory sexual apparatus, the external organ of reproduction, the rest of the secondary sex characters must be remodelled or replaced.

Complete sex-reversal therefore cannot occur in any individual or form in which the internal and external organs of reproduction, being fashioned early in embryonic life, thereafter lose their plasticity and become unresponsive to any stimulus which, had it been exhibited at the time of their differentiation, would have controlled these processes. Nor can it occur in those cases in which the differences between male and female sex-equipments are based upon the differential development of two different sets of structures, one of which, in either sex, undergoes complete atrophy. No more can it take place in those forms in which sex-dimorphism involves a differential mode of development of one and the same set of structures, for if one plan of differentiation is pursued, the steps cannot be retraced and the alternative route then followed.

Harms (1923) and Guyènot and Ponse (1923, 1925) have shown that if young castrated male toads are fed on a diet containing an excess of fat, lipoids, and lecithin for a considerable period of time, the hind portion of Bidder's organ becomes differentiated as an ovary and the fore portion as a new organ of Bidder, and that oviducts and uteri are developed while the pointed head becomes transformed into the blunted characteristic of the female. Ponse (1925) succeeded in rearing 9 metamorphosed offspring of one such transformed male functioning as a female and of these 6 were males and 3 females. Harms raised 184 such offspring and of the 161 the sex of which could be identified there were 104 males and 57 females. If in the toad the male is digametic, and if the YY zygote is non-viable, the expected sex-ratio is 2♂♂ :1♀.

Champy (1921) records that when a male triton (*T. alpestris*) was fed intensively after the winter's starvation period, he assumed the external characters of a female, and that within the pre-existing testicular tissue there were to be found immature, but unquestionable ova. He had previously shown that the annual process of spermatogenesis in tritons could be inhibited by starvation and that in the absence of spermatogenesis there was no development of external sexual characters, the animal exhibiting the "neuter" state characteristic of winter. In this "neuter" state there are to be found in the testes primitive gonocytes and spermatogonia. In animals killed in the spring, following starvation, the testis was represented by a longitudinal strip of fat. Two of these starved "neuter" tritons, when fed intensively, lost the dark blue coloration of the back and assumed a greenish shade mottled with distinct blue marks, as in the female, whilst the yellow dorsal line became more and more attenuated. One of these animals was killed in January and there was found the expected strip of fat with a few spermatogonia. The other was kept alive and in February was female in appearance. It was kept until April when post-mortem examination revealed within each of the strips of fat an elongated organ of granular appearance resembling an ovary, together with an oviduct.

In addition to these experimental studies in sex-reversal, the following cases have been observed. In the case of one of the frogs resulting from the "egg-overripeness" experiments, Witschi (1923) was able to show that indeed it was a transformed female, for when mated with a normal female it sired only female offspring. This is as would be expected, if in its fundamental chromosome constitution it still remained XX, for then all its spermatozoa would be X-chromosome-bearing and on fertilising X-bearing eggs would yield none but XX zygotes. Crew (1921) had previously encountered a similar case in the frog.

Riddle observed a case of complete sex-reversal in the ring-dove (*Streptopelia risoria*) an adult female laid eleven eggs between January 17 and April 15, 1914. During the six months following she and a male mated three times, began sitting on a nest without producing eggs, and raised young of other parents. During the following nineteen months her sex-behaviour and mode of growing changed to that of a male, frequently forcing her male mate to act as a female in copulation. At twenty-two and a half months after producing her last egg, this bird and mate were transferred to a pen with a few other spent inactive doves. The male of this pair died three and a half months later, and weights and dimensions of testes were obtained. Twenty-one months after transfer, the bird died, showing advanced abdominal tuberculosis. Two testes were found, removed and weighed. If any residue of the original ovary remained it was wholly included in a tuberculous mass, involving spleen and liver. At the time of autopsy this bird was supposed to be the original male of the pair, and therefore the testes were not saved for demonstration. The bird had lived forty-four and a half months after producing the last egg, became tuberculous, assumed male behaviour, the curve for the body weight during the three years undergoing a remarkable change, and at death it possessed two unmistakable testes. Riddle interprets this transformation as the result of the increased metabolism which followed the destruction of the ovarian tissue and the presence of tuberculosis.

Crew (1923) described the case of a Buff Orpington hen, the reputed mother of many chickens, which when three years old was attacked by tuberculosis and developed male characters, to become a fecund male and the father of two chickens. Post-mortem examination revealed the presence of two functional testes and a highly degenerate mass of ovarian tissue destroyed by tubercular disease. This case alone could not be regarded as providing conclusive proof of sex-reversal in the fowl, for during the earlier part of its life this bird had been in the possession of a private breeder concerning whose integrity there is no doubt but whose powers of critical observation can, of course, be held up to question. However, Crew (1923) and Fell (1923) examined a series of sexually abnormal fowls and were able to demonstrate that the condition found in these could logically be interpreted as stages in the process of transformation from a female type of sex-organisation to a complete male type.

In the mammal complete sex-reversal cannot occur in post-embryonic life, because of the differential mode of development of the internal and external sex organs.

A consideration of these instances of sex-reversal will show that in the egg stage and in the post-embryonic stage of Amphibia and in the case of fish also, if Huxley's interpretation of Boulenger's results is correct, reversal can occur in either direction, female to male, and *vice versa,* whereas in the post-embryonic stage of birds it has thus far been demonstrated in one direction only, from digametic sex to monogametic. In this connection it is of interest to note that in the instances of intersexuality in *Lebistes* observed by Winge (1927) the change occurred in old females which assumed male characters though still breeding as normal females. That this is so is provocative of thought. It is possible that the balance between male and female sex-differ-

entiating reactions is more easily disturbed in the case of the sex which possesses but a single X-chromosome, a suggestion which is in line with the observation of Haldane (1921) that in the case of specific and wide varietal crosses if among the offspring one sex is absent, rare or sterile, that sex is the digametic.

In the case of Amphibia, fishes and birds, the conditions required for complete sex-reversal are readily met. In the Amphibians and birds it has been shown that it is possible experimentally to masculinise a female and to feminise a male by appropriate sex-gland implantation. Male and female accessory sexual apparatuses and external sex-organs are very similar, the sexual differences commonly being nothing more than differences in the degree of development of common structures, or, in the case of such as are developed from different rudiments, the set appropriate to the alternative sex becoming completely atrophied. All that is required is that one kind of sex-gland tissue shall be replaced by the alternative kind. In the case of the Amphibia if, as seems the case, at the end of the breeding season the sex-glands are physiologically exhausted, if the differentiated tissues undergo complete involution so that a new proliferation of germinal epithelium is required for the provision of gametes for the following breeding season, or if only a portion of the primordial germ cells develop each year, then the mode of differentiation of each season's crop can be determined by the impress of varying environmental agencies, if these are of such a nature as to disturb sufficiently the general metabolism of the individual. Such would appear to be the explanation of Champy's results. Surgical removal of the gonad will lead to the same result if following gonadectomy the general metabolism of the individual is influenced by special feeding (Harms, 1923).

It is to be emphasised that, although the processes of sex-differentiation are reversible, the chromosome constitution of an individual is not thereby affected. The form and function of the gamete are not determined by its chromosome content: they are determined by the structure and function of the gonad in which the gamete is elaborated. In forms in which sex-reversal is usual it seems that the physiological state established by the hereditary constitution is readily overridden through the environment. Reversal is an adaptive response to a changing environment—the individual is a female when it may be and a male when it must.

THE SEX-RATIO

The sex-ratio is the numerical proportion of the sexes within a group. In biological literature it is commonly recorded as the number of males per hundred females: in biometrical papers it is expressed as the percentage of males in the data examined. A third and somewhat elaborate method is one that shows the proportion of males as a decimal of unity. In any bisexual species there must be a sex-ratio at all times after the sex-determining mechanism has operated. For purposes of discussion it is convenient to take conception, birth, and maturity as the three salient points in the life-history of the individual at which to compute the sex-ratio of the species, and the proportions which obtain at these three stages are known as the primary, the secondary, and the tertiary sex-ratio respectively. Of these the secondary sex-ratio has received most attention. In most animals only the tertiary sex-ratio is known.

The Tertiary Sex-ratio.—The tertiary sex-ratio will be identical with the secondary unless during the period birth–maturity sex-reversal commonly occurs or unless a sexually selective mortality has been operating. Any difference between the secondary and tertiary ratios can simply be the result of a selective postnatal mortality and can serve as an indication of the relative postnatal survival value of the sexes.

The only material available for examination is the human. The returns of the Registrar-General for 1913 reveal the following facts. In the age groups 0–5 years the sex-ratio of infantile mortality is 113·4; in the 5–10 group it is 100·7; in the 10–15 group it is 93·3. This period, 10–15, is, in fact, the only one during which more females than males die, and this is held to be the result of the exhaustion of puberty in the female and the incidence of tuberculosis (Schultz, 1918, and Stewart, 1910–1911). From 15 years on the sex-ratio of mortality rises steadily to the age of 50, when a slight decline sets in. This excess of male mortality is probably mainly due to occupational stress. The effect of this selective mortality is seen in the swing of the sex-ratio of the population; 104:100 at birth, it is reduced to 102:100 at the end of the first year, and to 101·5:100 at the end of the second. In the third to fifth years it falls to 101·3:100. From 5–10 it becomes 99·9:100; from 10–15 it becomes 94·2:100. During the 15–20 age period there is a rise following upon the increased mortality of females during the 10–15 age group. From this point on there is a continuous drop, with the exception of a slight rise between 40 and 50 during which period there is an increased mortality of females from reproductive disorders during the period 40–45 years. In old age (85 years) the sex-ratio is only 55·2:100.

It is impossible as yet to define the causes of this postnatal sexually selective mortality. The action of semi-lethal factors (*see* on), differences in occupational risks, and such like, cannot explain all the facts, and all that can be said at present is that for reasons as yet unknown the male exhibits an inherently inferior resistance to the stresses of the acts of living.

The Secondary Sex-ratio.—The secondary sex-ratio in a group will be the same as the primary unless during the period conception–birth (hatching) sex-reversal is common, or else a sexually selective mortality among male and female embryos operates. Any differences between primary and secondary ratio will suggest that the sexes possess different prenatal survival values.

It is known that while the secondary sex-ratio of a species is fairly constant and not far from equality it is distinctly variable. It varies with the species.

It is possible by selection to obtain strains differing widely in respect of their secondary sex-ratios. King (1918) has found that in the case of the albino rat it was possible, starting with two pairs of rats from the same litter, to found two strains, one of which produced a high proportion of males, the other a preponderance of females. The progeny of one pair (pair A) were bred brother to sister without selection for six generations in order to build up a homozygous and uniform race. After this, selection was practised, the brothers and sisters being chosen from litters which showed a preponderance of males. In line B the selection after the sixth generation was made from litters showing a preponderance of females. After fifteen generations of such inbreeding and selection, the sex-ratio at birth in line A was 125:100, in line B 83:100. The habitual production of an unusual sex-ratio can be the expression of the hereditary constitution of a stock. It is possible to breed for a preponderance of one sex. If this process can be developed successfully in the case of domestic animals, breeding for sex preponderance will assume economic importance.

It varies with the seasons of the year. It is not improbable that the breeding season is one in which the general physiological condition of the individual is above the average, and it is of interest therefore to compare the secondary sex-ratio following conception during the breeding season with that following conception at other times. The human birth-rate actually shows a slight variation in spite of the fact that nearly all traces of the primitive breeding season have been obliterated by social habits. It is found that the sex-ratio is low for births resulting from conceptions at the seasons of greatest fertility and high at the time of lowest birth-rate. In the case of the fowl there is evidence to show that there is a swing in the secondary sex-ratio with the chronological order of the egg. Jull (1923), using a sex-linked cross in order to preclude errors, recorded the sex of the chickens hatched from eggs of 45 hens during their first year of production. The observations were repeated for three years and the secondary sex-ratio was found to be 48·41 expressed as a percentage. Analysis of the figures gave the following table:

Eggs	Secondary sex-ratio
0 to 20	62·91 ± 1·44
11 „ 40	57·46
41 „ 60	45·00
61 „ 80	44·61
81 „ 100	37·65
101 „ 120	32·53 ± 1·15

The secondary sex-ratio is profoundly disturbed as a result of interspecific and intervarietal crosses. Haldane (1922) has pointed out that in any such cross the sex that is absent, rare, or sterile is the digametic sex.

The effects of hybridisation upon the sex-ratio is a subject of considerable anthropological interest. Three types of hybridisation are possible: (1) between white races, (2) between coloured races, and (3) between white and coloured races. As a result of an investigation of the effect of hybridisation, Little (1920) concluded that a higher preponderance of males resulted from hybrid white matings than from pure white matings, and that hybrid coloured matings gave a higher preponderance of females than did pure coloured matings. This is in agreement with Lewis' results in the Argentine (1906). Powers (1877) states that, in the case of black and white hybrids, there is a large excess of girls among half-breeds in California and Kohl (1859) notes that in the northern parts of the United States females preponderate in the progeny of French men with Indian women. Starkweather (1883) found in the mulatto a 12 to 15 per cent. excess of females, while in the whole population males were in excess. An excess of females is reported by Görtz and Waitz among the offspring of Dutch men and Malay women in Java (1859). Jastrzebski states that for the years 1910-1915 the ratios of males to 100 females in New York were: whites, 104·0; negroes, 99·9; and mulattoes, 97·9. Bugnion (1910) states that in a hybrid race formed by settlers in a colony of negroes there was a marked preponderance of females. It seems therefore possible to conclude (1) that crosses between white races produce an ex-

cess of males over pure white matings; (2) that hybridisation between coloured races produces an excess of females above pure coloured matings; and (3) that hybrids of white and coloured races show an excess of females above the pure matings of either race.

The secondary sex-ratio varies with the parity, *i.e.,* the chronological number of the pregnancy. In the case of the human, the dog, and the mouse, it has many times been noted that there is a continuous drop in the sex-ratio at each succeeding pregnancy (Wilckens, Punnett, Bidder, Copeman and Parsons). King and Stotsenburg found that the same rule obtained in the rat.

Parkes points out, however, that most of the second and higher births occurred at the end of the breeding season when the sex-ratio is at its highest, and that too much must not be inferred from his figures until the experiment has been repeated.

It has been suggested that the sex-ratio varies with the time relation of successive conceptions. Rumley Dawson (1921), for instance, maintained that in the case of the female producing one young at a time the right ovary elaborated only male-producing ova, the left only female-producing, and that the ovaries function alternately, ovulation occurring in one ovary at one oestrous period, in the other at the next. This view cannot be brought into harmony with established facts, and therefore cannot be accepted on its present-day evidence. The theory is supported by a collection of selected statistical data applied without proper statistical treatment, and those cases which do not fit into the scheme are airily dismissed, whilst the great body of established facts which supports other theories and cannot support this particular one is neglected. Variations of this theory are numerous, and like it are based upon the conception that in the human, horse, and cattle, the female is digametic. Many believe that offspring of either sex can be obtained at will by persuading the semen of the male to flow to the right or the left of the body of the female, towards the left ovary or to the right, that is. This is ensured by the female lying on one side or the other after coitus, or standing on a slope. The matter has been tested experimentally and found wanting. Doncaster and Marshall (1910) have shown that unilateral ovariotomy in the rat does not result in the production of offspring of one sex only, and the cogency of these experimental results cannot be dismissed by the statement that it is too far a cry from the rat to the human female. If the breeder really desires to have this theory tested, the way is simple, for it can readily be shown that unilateral ovariotomy in the horse or in the cow is not followed by the production of offspring of one sex only, and that the production of both male and female progeny is not to be explained by any regeneration of the imperfectly removed ovary.

Statistical evidence has been presented, sometimes supporting, at other times contradicting, the suggestion that the sex-ratio is affected by the relative ages of the parents, the offspring being mostly of the same sex (or of the opposite sex) as the older (or as the younger) parent. Hofacker (1828) and Sadler's (1830) law—that the sex of the offspring is that of the older parent—finds no support in the result of critical inquiry: it is contradicted by the work of Schultze (1903) on mice, for example. According to some data, the age of the mother has a relation to the sex of the offspring, younger mothers producing a preponderance of males (or of females). In the majority of cases the data upon which these theories are based have not been collected by biometrical experts, nor can their genuineness be absolutely guaranteed. Other data seem to suggest that the sex of the offspring tends to be that of the more (or the less) vigorous parent. For example, the theory of Starkweather (1883) suggested that the "superior" parent tended to beget offspring of the opposite sex, but since it is impossible as yet to define "vigour" and "superiority" in accurate physiological terms, such theories are not suitable for scientific discussion. There is no experimental basis for such conceptions.

It has been suggested that the sex-ratio varies with the time of service during the oestrous period. This is not supported by the elaborate data of Pearl (1917).

It has often been stated that as a result of war more males are born. Savorgnan (1921) and others have supported this contention. (*See* SEX-RATIO AT BIRTH AND DEATH.)

Causes of Inequality of Secondary Sex-ratio.—The secondary sex-ratio is probably always above 100, whereas the tertiary is almost invariably below 100. If the sex-ratio of still-births is examined it will be found to be higher than that of live births. If the sex-ratio of abortions is next examined it will be found to be considerably higher than that of still-births. The empirical data only extend back to about the third month of pregnancy, but it is well established that the relative male mortality increases the nearer conception is approached so that the primary sex-ratio must be considerably higher than that encountered in the latter part of pregnancy. Gunther (1923) has calculated that the early wastage of males must be very considerable indeed.

It is seen, then, that there exists a very considerable prenatal sexually selective mortality. Far more males than females are conceived in those forms *in which the male is the digametic sex,* and far more males than females perish prenatally so that the secondary sex-ratio approaches equality.

It is highly probable that much of this sexually selective mortality is due to the action of hereditary sex-linked factors, lethal or semi-lethal in their effects in that they lead to the development of characters which render the further development or the continued existence of the individual impossible. Since the male is digametic any recessive factors borne in the X-chromosome will take effect in all males carrying them whereas in females both X-chromosomes must carry the factor before the corresponding character can appear. It is well known that many recessive characters in animals are harmful to their exhibitors: when markedly so they may not permit the organism to live; when slightly so they may yield but a slight reduction in viability. If such recessive characters are sex-linked then the male embryo and foetus will suffer far more often than will the female. It is reasonable to assume that such recessive sex-linked factors should in man, as in other forms, frequently reduced viability. If so, a complete formal explanation of the excess of male infant mortality is provided.

This selective elimination is also affected by favourable and unfavourable conditions during pregnancy. Savorgnan concluded from an examination of his data concerning the sex-ratio and the war that it was not privation but absence of husbands which determined the rise in the sex-ratio. He explains the relatively low sex-ratio of still-births by suggesting that long absences of husbands imply less frequent pregnancies and therefore healthier mothers. It is not improbable that the lower male ratio in still-births and the increase in still-births are but reflections of privation during the latter part of pregnancy.

The same explanation can be applied to the fact that the secondary sex-ratio among illegitimate children is lower than that among legitimate—the lack of prenatal care and hygiene resulting in an intensification of the forces that always make it relatively difficult for the mammal to beget male offspring and for the bird to produce as many females as males. The secondary sex-ratio is highest among those people and those herds in which the highest degree of prenatal hygiene is practised. It is probable that amongst the coloured people there is a higher prenatal mortality and that this is the case also among the hybrids of coloured races and of white and coloured, whereas the mortality of hybrids of two white races is relatively very low in consequence of the hybrid vigour or heterosis that results from such a mating.

The Primary Sex-ratio.—If the two forms of gametes elaborated by the digametic sex are produced in equal numbers, if the two forms are equally viable and functional and if fertilisation is at random, then the primary sex-ratio will be equality.

But in certain forms the two forms of gamete elaborated by the digametic sex are not produced in equal numbers. In the case of bird and moth the egg contains the X- and Y-chromosomes in conjugation before the polar bodies are formed. Into the first polar body goes either the X or the Y. If it is but a matter of chance which way this chromosome pair lies on the spindle,

then equal numbers of X-bearing and Y-bearing eggs will result. But if in a particular line this pair should habitually be so orientated on the spindle that the X passes into the polar body more often than the Y, then in this line a preponderance of female offspring (XY) would be observed. Such a differential production can be obtained experimentally, as is shown by the work of Seiler (1920) on the Psychid *Talaeporia tubulosa* in which the female is the heterogametic sex. Seiler was able to show that the ratio of the eggs in which the X-chromosome passed into the polar body to those in which it remained in the egg, was exactly the same as the sex-ratio. Moreover, since in the course of these observations it was possible to detect the moment of the disjunction of the sex-chromosomes, it became possible to attempt to influence this disjunction experimentally and so to disturb the sex-ratio. Seiler by varying the temperature during the period of maturation division obtained the following highly interesting and significant results:

Temperature	X-chromosome remained in the egg	X-chromosome passed into the polar-body	Sex-ratio
18 C . .	61	45	136:100
35–37 C . .	52	84	62:100
3·5 C . .	48	31	155:100

The fact that there is competition between sperm is illustrated in the results of an experiment by Cole and Davies (1914). A rabbit was served by two bucks, and it was found that the majority of the offspring claimed one of these bucks as their sire. In repeated matings this was always so. But when the sperm of this buck was alcoholised it could not compete with that of the other buck, though it was shown that when employed alone it could and did fertilise ova. It is reasonable to assume that if differences in the size of the sperm are associated with differences in motility, activity or resistance to unfavourable conditions within the genital passages of the female, then chance would favour fertilisation by one rather than by the other kind of sperm.

Sex in Plants.—In the case of plants two sexual forms are recognised, the dioecious (bisexual) and the hermaphroditic. In the former the whole plant generally bears flowers of one kind only, either staminate or pistillate, and these are often referred to as male and female respectively (*e.g.*, hemp, hops). In the hermaphrodite plants staminate and pistillate parts may be borne in the same flower to give the "perfect" flower (*e.g.*, the rose) or they may be borne in different clusters on the same plant (the condition of monoecism) *e.g.*, maize, begonia. It has been argued that monoecism represents a somatic segregation of maleness and femaleness (Bond 1922) but most authorities agree with Emerson (1924) that both the perfect-flowered and the monoecious plants are alike in that the individual plant is hermaphroditic, the difference being merely one of time at which differentiation occurs.

Early genetical study of the dioecious forms showed that in certain of these the "male" is the heterozygous sex (Correns–*Bryonia dioica* 1907; Shull–*Lychnis dioica* 1910–11). In 1924 cytological evidence was presented showing that in several species of dioecious plants the male is digametic, *i.e.*, that the sex-determining mechanism is of the X–2X type. (Winge and also Blackburn—*Lychnis*, Kihara and Ono—*Rumex acetosa;* Santos—*Elodea canadensis;* Winge—*Vallisneria spiralis, Humulus Lupulus, Humulus japonica.*) In no case thus far has the female proved to be digametic.

There is one type of sex-determining mechanism in plants which is not known in animals. In the liverworts and kindred forms the gametophyte generation is the important and conspicuous one. Allen (1917) found in *Sphaerocarpus* that the male gametophyte has a Y-chromosome, the female gametophyte an X, whereas the sporophyte has the 2N number of chromosomes including the very unequal XY pair.

Two sex-linked characters have been identified (Shull, 1914), a narrow rosette leaf in *Lychnis* and (Winge, 1928) and a chlorophyll deficiency in the same plant. Winge considers that the gene for this character is Y-borne.

Sex-reversal has been reported frequently in dioecious plants (Schaffner, 1918–23). The transformation is conditioned by age, nutrition, length of day, etc.

Correns (1918–22) has investigated aberrant sex-ratios in *Lychnis dioica* and explained the excess of females on the basis of a more rapid growth of the pollen-tubes from grains bearing the X-chromosome.

Emerson (1924) has adduced evidence showing that in maize, as in *Drosophila*, it is the genic balance which is the effective factor in sex-determination. He suggests that in most dioecious plants this balance is decisive in the usual environments so that the individual is either a male or else a female whilst in the hermaphrodite it is so delicate that the characters of both sexes are expressed.

Chemical Tests and Sex-identification.—A chemical test for the identification of sex was introduced by Manoiloff (1922–23). The method is based upon the assumption that there are specifically different chemical substances in the blood of male and female. Subsequent work by others has seemed to show that different concentrations of serum proteins in the blood can explain the Manoiloff reaction. Schratz (1926) concludes that the reaction does not show a greater accumulation of oxides in female blood and that the reaction of Bernatzki (1924) is of greater value. Galwialo and others (1926) are of opinion that the test is not specific but is dependent entirely upon the protein content of the substance investigated. Luttge and v. Mertz (1926) describe a technique for the serological identification of sex, which, judging on the basis of early investigations, apparently gives satisfactory results.

SEXAGESIMAL FRACTION: *see* Fraction.

SEXBY, EDWARD (d. 1658), English soldier, "leveller" and conspirator. About 1657 he wrote the apology for tyrannicide entitled "Killing No Murder," under the pseudonym William Allen. In July 1657 he was arrested and he died in the Tower of London on Jan. 13, 1658.

SEXPARTITE VAULT, six part vault, in architecture, a type of vault used in late Romanesque and early Gothic structures, in which each bay of the vault is divided by ribs into six portions. The form was one of many attempts to solve the problem of vaulting a church nave without too great difference in the heights of the cross, diagonal and wall ribs. This was accomplished by making two bays of the aisle equal to one bay of the nave, thus creating an almost square bay which was given the normal cross and diagonal ribs. Then an additional cross rib was carried across the nave at the intermediate piers, crossing the diagonal ribs at their intersection. The wall ribs over the clerestorey windows were only as wide as the side aisle bay, thus giving two on each side, and the ridges of the cross vaults, instead of running at right angles to the main ridge, ran at an angle from the apex of the wall arches to the common intersection of the diagonals and the central cross rib. The sexpartite vault appears in an awkward and transitional form in the Abbaye aux Hommes at Caen (nave vaulting 12th century) and in another experimental form with one semi-circular wall arch on each side, the intermediate cross rib merely carrying web walls up to its ridge, in the Abbaye aux Dames at Caen (same period). In a fully developed form it is found in the cathedrals of Senlis (1150–65), Sens (1143–68), Noyon (1150–1200), Laon (1160–1205), Notre Dame at Paris (1177–1223), Bourges (begun *c.* 1200) and in England in that portion of Canterbury cathedral begun by William of Sens, 1174–80. (*See* Gothic Architecture; Vault.)

SEX-RATIO AT BIRTH AND DEATH. The fact that, so far as statistical evidence is forthcoming, there is a preponderance of males at birth throughout the human race, has given rise to endless theories as to its cause. The further fact that this preponderance is not equally spread, there being a considerable variation in its amount, has multiplied the attempts to explain this seeming anomaly.

Some interesting figures are given below. The first and probably the most important of the factors affecting the sex-ratio at birth is that of race. This term is used in its proper sense and not as a synonym to nationality, as a physical and not a political distinction. In that congerie of peoples making up the former empire of Austria were to be found political divisions inhabited by populations of which the great majority had more or less clearly differentiated racial characteristics. An investigation into the births for the three years 1904, 1907 and 1910 showed that among the Jews inhabiting the whole of the empire there were 1,091 males born to 1,000 females. In Dalmatia, with a preponderating Serbo-Croat population the male plurality was only 1,037. Bohemia and Moravia (Czechs) had a ratio of 1,056; Galicia (Poles) one of 1,060 and the coast-lands (Italians) one of 1,065.

These figures relate to racial rather than political divisions, to populations living under strictly comparable conditions, and they show a well marked variation in masculinity at birth. A similar investigation into the births recorded in the Indian empire for the years 1912–14, showed that in the Central Provinces, Berar and Madras with a preponderance of the Dravidian element, the ratio of males to females at birth was 1,045–6; in Assam (predominantly Mongoloid) it was 1,070; in the Punjab (mainly Indo-Aryan) it was 1,097. Here again we are dealing with racial types, and the result is similar to that shown for Europe. Again in the Japanese empire, the recent sex-ratios have been (1921–24), in Japan proper 1,041 males to 1,000 females; in Formosa 1,053; in Corea 1,124. Figures for the negro peoples are as yet somewhat exiguous, but they point to a much lower relative masculinity. In the Cape Colony the ratios were: whites 1,054, blacks 1,026. In New York the white ratio was 1,045, the black 1,016; in New Orleans whites 1,020, blacks 982. These figures, drawn from a very wide area may be said to prove conclusively that race is an important factor in affecting masculinity at birth.

Urbanization.—It appears that urbanization lowers masculinity, the ratios in rural areas being generally higher than those for urban areas in the same countries. The following table gives a selection from different parts of the world:

Births by Sex—Urban and Rural Areas

Country.	Period.	Number of births.	Males to 1,000 females.	
			Urban.	Rural.
England & Wales	1911–15	4,300,000	1,038	1,043
Ireland	1906–14	600,000	1,048	1,052
Austria	1904–7–10	2,800,000	1,057	1,062
Netherlands	1911–15	850,000	1,045	1,055
U.S.A.	1915	800,000	1,054	1,058
Uruguay	1912–16	170,000	1,044	1,068
South Africa (Wh.)	1912–16	200,000	1,037	1,075
Cape Colony (Bl.)	1906–08	100,000	1,023	1,033

There is reason to expect, it is suggested, a slightly higher male ratio among first than subsequently born children. The figures for Australia and also for the city of Budapest, which are reliable, give a male ratio for the first born of 1,052 and 1,051 respectively as against 1,050 and 1,049 for the subsequently born.

Influence of War.—The question as to whether a state of war did or did not raise masculinity at birth was one over which controversy raged furiously. Neither supporters of the contention that it did nor opponents had much sound material on which to draw. (*See* also the previous article on SEX and the observations of Savorgnan.) The following table has been specially prepared to show the effect of the World War on eight of the belligerent and four of the non-belligerent countries of Europe:

Sex-Ratio at Birth

Period.	England and Wales.	Scotland.	Belgium	Bulgaria.	Finland.	France.
1876–1905	1,035	1,050	1,045	1,075	1,053	1,044
1906–14	1,039	1,042	1,042	1,054	1,061	1,045
1915–19	1,048	1,053	1,054	1,072	1,061	1,054
1921–25	1,047	1,051	1,049	1,062	1,063	1,049

Period.	Germany.	Italy.	Netherlands.	Norway.	Sweden.	Switzerland.
1876–1905	1,053	1,059	1,053	1,060	1,055	1,048
1906–14	1,055	1,056	1,051	1,060	1,061	1,036
1915–19	1,068	1,056*	1,059	1,059	1,058	1,049
1921–25	1,068	1,053	1,056	1,055	1,059	1,048

*1916–19.

It will be seen that the war-period was marked by substantial increases of masculinity in Great Britain, Belgium, France, Germany and in the two non-belligerent countries most closely affected, viz., the Netherlands and Switzerland, both of which had large bodies of troops under arms. Finland was less affected by the war in every way, and Italy is the only other belligerent showing no increase. It appears abundantly proved that, for some unknown reason, a war on such a scale does increase masculinity at birth. Moreover, the effect is seen in the last period shown, where all the countries showing a higher war-time masculinity have a ratio higher than they had in the pre-war decade.

Other Factors.—Many other factors have been alleged to exercise an influence, greater or less, on masculinity at birth, among them being cross-breeding and illegitimacy. In each of these, the position must be held to be not proven. In 1915 in the United States birth registration area the children of mixed parentage showed a much lower masculinity than those of native or foreign parentage—while in New York the births for five years showed a higher masculinity for children of mixed parentage. In British Guiana, the masculinity of children of mixed parentage for the decade 1903–12 was lower than that of the East Indians or blacks, while in Rio de Janeiro from 1910–15 the ratios were whites 1,049, mulattos 979, blacks 999. It is probable that the effects of cross-breeding are determined by the nature of the cross. As for illegitimacy the evidence is also conflicting, but in the majority of countries the legitimate births show a greater ratio of males. To be of real value, however, the figures should relate not to the numbers born out of wedlock, but to those resulting from casual unions. Some proportion (often a considerable one) of the births classed as illegitimate is the result of unions which, though not recognized by the law or the Church, are, from the physiological point of view, marriages.

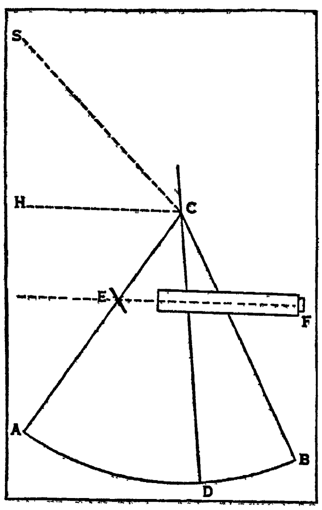
Sex-ratio at Death.—As at birth, it is a pretty general rule that the ratio of males at death is higher than that of females; indeed, the disparity in mortality is much more marked than in natality. In this case, however, the causes are by no means so obscure and doubtful as when dealing with masculinity at birth. Those of primary importance are the more persistent vitality of the female and the fact that the specially dangerous pursuits are mainly in the hands of males. A very simple proof of the former is the very marked disparity in deaths of males and females in the first few days of life, of the latter the disproportionate number of male deaths from external or violent causes. The ratio of male to female deaths is not spread equally over the whole of life; it is, generally speaking, very high in the first year and much lower at ages 1 to 5, while at ages 5 to 15 the ratio of female mortality is in most countries higher than that of males. As age advances the female advantage becomes more and more marked. It differs considerably from country to country. The following table gives the male and female death rates and the ratio of male deaths to 1,000 deaths of females in a number of countries for the triennium 1920–22, the years being those around the last census taken, when the respective numbers of the sexes had been definitely ascertained. (*Note:* The data given is confined to eleven countries in which white predominate.)

Country.	Death-rate 1920–22.		Ratio of male deaths to 1,000 female deaths.
	Males.	Females.	
England & Wales	13·3	11·6	1,146
Scotland	14·8	13·6	1,088
Belgium	14·6	13·5	1,082
Denmark	11·8	11·8	1,000
Finland	15·7	14·2	1,106
Germany	15·4	14·0	1,100
Italy	17·6	16·6	1,060
Netherlands	11·7	11·5	1,017
Norway	12·4	11·8	1,051
Sweden	12·8	12·9	992
Switzerland	13·7	13·5	1,015

It will be seen that in Sweden alone the deaths among an equal number of males and females show a slight advantage on the male side, that in Denmark the sex mortality was equal, while in all the other countries the male mortality showed excess in varying degree. In England and Wales, Finland and Germany the excess is very heavy indeed. Going outside Europe, it may be mentioned that in Chile the ratio of male to female deaths in equal numbers for the same period was 1,060, in Japan 978, in British India 1,082. In the United States for the year 1924 the ratio was 1,144, a figure almost identical with that shown for England and Wales in the foregoing table. It may be as well to say that the rates and ratios given in this section of this article are calculated on the census populations of the census taken at the end of 1920 or early in 1921. (S. de J.)

SEXTANT, a sixth part of a circle. The name is applied especially to an optical instrument for measuring angular distances, invented by John Hadley in 1731. Hadley's original instrument was, strictly, an octant, employing a graduated arc of one-eighth of a circle. The arc was enlarged to one-sixth, to meet the needs of navigation, by Capt. Campbell in 1757.

The instrument is mainly used at sea, and the angle that is measured is the altitude of the sun (or a star) above the horizon (*see* Navigation). A familiar sight on an ocean steamer is the officer on the bridge "shooting the sun" at noon, in order to determine his latitude. The officer is looking through a small telescope straight at the sea horizon; but he sees also an image of the sun (dimmed by an interposed dark glass) which has been reflected into his field of view by an arrangement of mirrors described below. He is slowly moving an arm which turns one of the mirrors until the solar image appears just to touch the sea-horizon.



The figure shows the construction of the sextant. ABC is a light framework of brass in the shape of a sector of 60°, the limb AB having a graduated arc of silver inlaid. It is held in the hand by a small handle at the back, either vertically in a position in front of the eye to measure the altitude of an object, or in the plane passing through two objects the angular distance of which is to be found. It may also be mounted on a stand. CD is a radius movable round C, where a small plane mirror of silvered plate-glass (called the "index glass") is fixed perpendicular to the plane of the sextant and in the line CD. At D is a vernier read through a microscope, also a clamp and a tangent screw for giving the arm CD a slow motion. At E is another mirror "the horizon glass," also perpendicular to the plane of the sextant and parallel to CB. F is a small telescope fixed across CB, and pointed to the mirror E. As only the lower half of E is silvered, the observer can see the horizon in the telescope through the unsilvered half, while the light from the sun or a star S may be reflected from the index glass C to the silvered half of E and thence through F to the observer's eye. If CD has been moved so as to make the image of a star or of the limb of the sun coincide with that of the horizon, it is seen that the angle SCH (the altitude of the star or solar limb) equals twice the angle BCD. The limb AB is graduated so as to avoid the necessity of doubling the measured angle, a space marked as a degree on AB being in reality only 30′.

If the sextant is used on land an "artificial horizon" is required instead of the sea-horizon. This consists of a trough containing a shallow layer of mercury, which gives a truly horizontal reflecting surface. The telescope F is now pointed downwards so as to view the sun's image reflected in the mercury trough; an image of the sun reflected by the sextant mirrors appears as before, and the two images are made to touch. The reading now gives the angle between the sun and its image in the mercury trough, which is double the angle between the sun and the horizon. In the air, however, the visible horizon is of no use, since its "dip" (below the truly horizontal direction) is large and unknown. The mercury trough is obviously unsuitable for use in an aeroplane. Hence some form of "bubble sextant" (*see* Aerial Navigation) is used, in which a spirit level is reflected into the field of view in such a way that the centre of the bubble indicates the true horizon.

SEXUAL SELECTION: *see* Selection: *Sexual Selection.*

SEYCHELLES (sā-shĕl), an archipelago in the Indian ocean, islands and islets—situated between 3° 38′ and 5° 45′ S., and 52° 55′ and 53° 50′ E. Together with the Amirantes, Cosmoledo, Aldabra and other islands they form the British colony of Seychelles. The outlying islands lie south-west of the Seychelles group and between that archipelago and Madagascar. The islands under the Seychelles government have a total area of 156 sq.m. There are in addition 40,000 to 50,000 sq.m. of coral banks within the bounds of the colony.

The Seychelles lie, with two exceptions, towards the centre of a large submarine bank and are all within the 50 fathoms line. Mahé, the largest and most central island, is 600 m. north-east of the northernmost point of Madagascar. The other chief islands form two principal groups: (i.) Praslin, with La Digue, Félicité, East Silver, West Silver, Curieuse and Aride; (ii.) Silhouette, and North Island. The most easterly island is Frigate, the most southerly Platte; on the northern edge of the reef are Bird and Denis islands.

Mahé is 17 m. long, and from 4 to 7 broad and of highly irregular shape. There are small areas of lowlands, chiefly at the mouths of the rivers but most of the island is mountainous, and in general the hills rise abruptly from the sea. The highest peaks are Morne Seychellois, 2,993 ft., and Trois Frères, 2,390 ft. The main ridge runs north and south and from the heights descend many torrents, the whole island being well watered. The principal harbour, Port Victoria, is on the north-east coast and is approached by a deep channel through the coral reef which fringes the entire eastern side of the island. Of the small islands close to Mahé the chief are St. Anne and Cerf, off the east, and Conception and Thérèse off the west coast.

Praslin island is 8 m. long and from 1 to 3 m. broad and its highest point is 1,260 ft.; La Digue covers 4 sq.m., and its greatest height is 1,175 ft.; Silhouette, roughly circular, covers 8 sq.m. and culminates in Mon Plaisir, 2,473 ft. None of the other islands exceeds $1\frac{1}{2}$ sq.m.

Geology.—Most of the islands are of granite (hornblende or hornblende-biotite variety) in places fringed by coral reefs; Silhouette and Long islands are of typical syenite whilst there are dykes and sheets of a younger vogesite, dolerite, porphyrite suite. Bird and Denis islands are of coral limestones while the basement rocks are represented by clay slates on Silhouette island and hornstones on Stag's island. The group is probably a detached and partially submerged portion of Gondwanaland. Inland cliffs indicate a recent uplift of about 200 ft.

Climate.—The climate is healthy and equable, and the temperature varies on the coast from about 68° to 88° F, falling at

night in the higher regions to 60° or 55° F. The mean coast temperature exceeds 79° F. The south-east monsoon blows from May to October, which is the dry season, and the west-north-west monsoon from December to March. During April and November the winds are variable. The average annual rainfall on the coast is 100·8 in.; it increases to about 120 in. at a height of 600 ft. and at heights exceeding 2,000 ft. is about 150 in. The Seychelles lie outside the track of the hurricanes which occasionally devastate Réunion and Mauritius. The public health is good.

Flora and Fauna.—Both flora and fauna include species and genera peculiar to the Seychelles. Of these the best known is the *Lodoicea sechellarum,* a palm tree indigenous only in Praslin island, but since introduced into Curieuse—noted for its fruit, the so-called Maldive double coco-nut or *coco de mer.* Another tree found only in the islands is the capucin (*Northea sechellarum*), now ravaged by an introduced green beetle. Characteristic of the forests of the coastal belt are the mangrove and *Pandanus,* and, a little inland, the banyan (*Ficus*), *Pisonia* and *Hernandia.* The coco-nut is a characteristic feature of the coast. The forests of the granitic land have the characteristics of a tropical moist region, palms, shrubs, climbing and tree ferns growing luxuriantly, the trees on the mountain sides, such as the *Pandanus sechellarum* sending down roots over the rocks and boulders from 70 to 100 ft. Of timber trees the bois gayac has disappeared, but bois de fer (*Stadtmannia sideroxylon*) and bois de natte (*Maba sechellarum*) still flourish on Silhouette Island. Besides cutting for building, the jungle was largely cleared for the plantation of vanilla; while a multitude of other tropical plants have been introduced. The most important of the trees introduced since 1900 are various kinds of rubber, including Para (*Hevea Brasiliensis*), which grows well. For other introduced plants *see* below, *Industries.*

The indigenous fauna resembles that of Madagascar. The only varieties of mammals are the rat and bat. The dugong, which formerly frequented the waters of the islands, does so no longer. The reptiles include certain lizards and snakes; the crocodile, once common, has been exterminated. Land tortoises have also disappeared; a freshwater tortoise (*Sternothaerus sinuatus*) is still found. The giant tortoise, *Testudo elephantina,* is found only in the Aldabra Islands; and the adjacent seas contain many turtles. Three coecilians, three batrachians (including a mountain-frequenting frog) and three fresh-water crustaceans are also indigenous, and about twenty-six species of land shells. The islands are the home of a large number of birds, including terns, gannets and white egrets.

Inhabitants.—The Seychelles were uninhabited when first visited by Europeans. The islands were colonized by Mauritian and Bourbon creoles; the white element, still prevailingly French, has been strengthened by British families. The first planters introduced slaves from Mauritius, and the negro element has been increased by the introduction of freed slaves from East Africa. There has been also an immigration of Chinese and, in larger numbers, of Indians (mainly from the Malabar coast). An official report issued in 1910 stated that the greater part of the valuable town property had passed into the hands of Indians, and that Indians and Chinese had the bulk of the retail trade. A rude creole patois, based on French but with a large admixture of Indian, Bantu and English words, is in general use. The Seychellois are excellent sailors. On Dec. 31st 1925 the population was officially estimated at 26,185. The pure white population is less than 1,000. About two-thirds of the inhabitants are Roman Catholics.

Agriculture, Industries, Towns and Communications.—The most important occupations are fishing and agriculture. Before 1850 the islands produced spices, cotton, coffee, tobacco, sugar, maize, rice, bananas, yams, coco-nut oil, timber, fish and fish oil and tortoise-shell. Whaling is carried on, chiefly by Americans and French, in the neighbouring seas. Subsequently cocoa was cultivated extensively, and from about 1890 vanilla largely superseded the other crops. Owing to increased competition, and to careless harvesting, the Seychellois, though still producing vanilla in large quantities, pay greater attention to the products of the coco-nut palm—copra, soap, coco-nut oil and coco-nuts—the mangrove bark industry, the collection of guano, the cultivation of rubber trees, the preparation of banana flour, the growing of sugar canes, and the distillation of rum and essential oils. The tortoise-shell and calipee fisheries and the export of salt fish are important industries. Minor exports are cocoa, coco-de-mer and bêche-de-mer. From the leaves of the coco-de-mer are made baskets and hats.

The imports consist chiefly of cotton goods and hardware, rice, sugar, flour, boots and shoes, wines and beer, tobacco, machinery. The imports in 1925 were £129,541 and exports £167,169. The bulk of the trade is with the countries of the British Empire. The medium of exchange is the Indian rupee (=16d.), with the subsidiary coinage of Mauritius.

The only town of any size is the capital, Port Victoria (or Mahé), picturesquely situated at the head of an excellent harbour. Many of the houses are built of massive coral, *Porites gaimardi,* hewn into square building blocks which at a distance glisten like white marble. The port is a coaling station of the British navy and is connected by telegraphic cables with Zanzibar and Mauritius. All the islands are well provided with metalled roads. The government employ steam vessels for passenger and mail services between the islands and there are large numbers of sailing craft belonging to the islanders; there is communication with Great Britain, France, India and South Africa.

Government and Revenue.—Seychelles is a crown colony administered by a governor, assisted by nominated executive and legislative councils. In 1925 revenue was £51,384, expenditure £43,801 and debt of £6,886. Education is free but not compulsory.

History.—The Seychelles are marked on Portuguese charts dated 1502. The first recorded visit to the islands was made in 1609 by an English ship. The second recorded visit, in 1742, was made by Captain Lazare Picault, who, returning two years later, formally annexed the islands to France. Picault, who acted as agent of Mahé de la Bourdonnais, governor of Mauritius, named the principal island Mahé and the group Îles de la Bourdonnais, a style changed in 1756, when the islands were renamed after Moreau de Séchelles, at that time *contrôleur des finances* under Louis XV. The first permanent settlement was made about 1768, when the town of Mahé was founded. Soon afterwards Pierre Poivre, intendant of Île de France, seeing the freedom of the Seychelles archipelago from hurricanes, caused spice plantations to be made there, with the object of wresting from the Dutch the monopoly of the spice trade they then enjoyed. The existence of these plantations was kept secret, and it was with that object that they were destroyed by fire by the French on the appearance in the harbour in 1778 of a vessel flying the British flag. The ship, however, proved to be a French slaver which had hoisted the Union Jack fearing to find the British in possession. The islands were occupied in 1810 by the British, to whom they were ceded by the treaty of Paris in 1814. J. B. Quéau de Quincy (1748–1827), governor under the Monarchy, the Republic and the Empire, was appointed by the British agent-civil. In all he governed the islands 38 years, dying in 1827. The over-dependence placed on vanilla caused waves of depression to alternate with waves of prosperity, and the depression following the fall in the price of vanilla was aggravated by periods of drought, "agricultural sloth and careless extravagance."[1] But during 1905–10 successful efforts were made to broaden the economic resources of the colony. Since that date direct telegraphic communication with Mauritius, Zanzibar, Aden, and Colombo has been installed and a Government wireless telephone service was opened in 1926 between Victoria and the Praslin islands.

Dependencies.—The outlying islands forming part of the colony of Seychelles consist of several widely scattered groups. The Amirante archipelago is situated on a submarine bank west and south-west of the Seychelles, the nearest island being about 120m. from Mahé. The archipelago consists of a number of coral islets and atolls comprising the African islands (4), the St. Joseph group (8), the Poivre islands (9) and the Alphonso group (3). Farther south and within 170m. of Madagascar is

[1] *Colonial Reports . . . Seychelles* (1907).

the Providence group (3) formed by the piling up of sand on a surface reef which is of crescent shape. The Farquhar islands lie to the south of these. The Cosmoledo islands, which are 12 in number, lie some 210m. W. of Providence island, while 70m. farther west are the Aldabra islands (*q.v.*). Assumption island lies to the south of the Aldabra. The chief island in the Cosmoledo group is 9m. long by 6m. broad. South of this group of islands lies Astove. Coetivy (transferred from Mauritius to the Seychelles in 1908) lies about 100m. S.S.E. of Platte. The majority of the outlying islands are extremely fertile, coco-nut trees and maize growing luxuriantly. Several of the islands contain valuable deposits of guano and phosphate of lime, and their waters are frequented by edible and shell turtle. Like the Amirantes, all the other islands named are of coral formation.

See A. A. Fauvel, *Unpublished Documents on the History of the Seychelles Islands Anterior to 1810,* with a bibliography (Mahé 1909); *Ancient Maps of Seychelles Archipelago* (Mahé 1909). *See* also the annual reports on the Seychelles issued by the Colonial Office. For the dependencies *see* R. Dupont, *Report on a Visit of Investigation to St. Pierre, Astove, Cosmoledo, Assumption and the Aldabra Group of the Seychelles Islands* (Seychelles, 1907).

SEYDLITZ, FRIEDRICH WILHELM, Freiherr von (1721–1773), Prussian soldier, one of the greatest cavalry generals of history, was born on Feb. 3, 1721 at Calcar, in the duchy of Cleve. At the age of thirteen he went as a page to the court of the margrave of Schwedt, who had been his father's colonel. Here he acquired a superb mastery of horsemanship, and many stories are told of his feats, the best known of which was his riding between the sails of a wind-mill in full swing. In 1740 he was commissioned a cornet in the margrave's regiment of Prussian cuirassiers. He served through the first and second Silesian wars, and in 1753 became lieutenant-colonel of the 8th cuirassiers. Under his hands this regiment soon became a pattern to the rest of the army. The Seven Years' War gave Seydlitz his opportunity. . In 1757, regardless of the custom of keeping back the heavy cavalry in reserve, he took his regiment to join the advanced guard; at Prague he nearly lost his life in attempting to ride through a marshy pool, and at Kolin, at the head of a cavalry brigade, he distinguished himself in checking the Austrian pursuit by a brilliant charge. Two days later the king made him major-general and gave him the order *pour le mérite.* In reply to Zieten's congratulations he said: "It was high time, Excellency, if they wanted more work out of me. I am already thirty-six." Four times in the dismal weeks that followed the disaster of Kolin, Seydlitz asserted his energy and spirit in cavalry encounters, and on the morning of Rossbach Frederick, superseding two senior generals, placed Seydlitz in command of the whole of his cavalry. The result of the battle was the complete rout and disorganization of the enemy, and in achieving that result only seven battalions of Frederick's army had fired a shot. The rest was the work of Seydlitz and his 38 squadrons. The same night the king gave him the order of the Black Eagle, and promoted him lieutenant-general. Seydlitz was wounded, but rejoined the king in 1758, and at the battle of Zorndorf his cavalry again won the victory. At Hochkirch with 108 squadrons he covered the Prussian retreat, and in the great disaster of Kunersdorf he was severely wounded in a hopeless attempt to storm a hill held by the Russians. During his convalescence he married Countess Albertine Hacke. In 1761 he reappeared at the front. He now commanded a wing of Prince Henry's army, composed of troops of all arms, and many doubts were expressed as to his fitness for this command, as his service had hitherto been with the cavalry exclusively. But he answered his critics by his conduct at the battle of Freyburg (Oct. 29, 1762), in which, leading his infantry and his cavalry in turn, he decided the day. After the peace of Hubertusburg he was made inspector-general of the cavalry in Silesia, where eleven regiments were permanently stationed and whither Frederick sent all his most promising officers to be trained by him. In 1767 he was made a general of cavalry. But his later years were clouded by domestic unhappiness. His wife was unfaithful to him, and his two daughters, each several times married, were both divorced, the elder once and the younger twice. His formerly close friendship with the king was brought to an end by some misunderstanding, and it was only a few weeks before his death that they met again. Seydlitz died at Ohlau on Aug. 27, 1773.

See Varnhagen von Ense, *Das Leben des Generals von Seydlitz* (Berlin, 1834); and Bismarck, *Die kgl. preussische Reiterei unter Friedrich dem Grossen* (Karlsruhe, 1837).

SEYMOUR or St. Maur, the name of an English family in which several titles of nobility have from time to time been created, and of which the duke of Somerset is the head. *See* Hertford, Earls and Marquesses of; and Somerset, Earls and Dukes of.

SEYMOUR, HORATIO (1810–1886), American statesman, was born in Pompey, Onondaga county (N.Y.), on May 31, 1810. He studied at Geneva academy (afterwards Hobart college) and at a military school in Middletown (Conn.), and was admitted to the bar in 1832. He was military secretary to Governor W. L. Marcy in 1833–39, was a member of the New York Assembly in 1842, in 1844, and in 1845, and was speaker in 1845; mayor of Utica in 1843, and in 1852 was elected governor of New York State. He vetoed in 1854 a bill prohibiting the sale of intoxicating liquors, which was declared unconstitutional almost immediately after its re-enactment in 1855, and in consequence he was defeated in 1854 for re-election as governor. Seymour was a Conservative on national issues, and supported the administrations of Pierce and Buchanan; he advocated compromise to avoid secession in 1860–61; but when war started he supported the Union. In 1863–65 he was again governor of New York State.

His opposition to President Lincoln's policy was mainly in respect to emancipation, military arrests and conscription. Although he responded immediately to the call for militia in June, he thought the Conscription Act unnecessary and unconstitutional and urged the President to postpone the draft until its legality could be tested. During the draft riots in July he proclaimed the city and county of New York in a state of insurrection, but in a speech to the rioters adopted a tone of conciliation—a political error which injured his career. He was defeated as Democratic candidate for governor in 1864. In 1868 he was nominated presidential candidate by the Democratic national convention, but carried only eight States (including New York, New Jersey, and Oregon), and received only 80 electoral votes to 214 for Grant. He died on Feb. 12, 1886, in Utica.

The Public Record of Horatio Seymour (1868) includes his speeches and official papers between 1856 and 1868.

SEYMOUR, a city of Jackson county, Indiana, U.S.A., 60 m. S. by E. of Indianapolis, near the East Fork of the White river; on Federal highways 31 and 50, and served by the Baltimore and Ohio, the Chicago, Milwaukee, St. Paul and Pacific, the Pennsylvania and electric railways, and by motor-bus lines in all directions. The population was 7,348 in 1920 (97% native white) and was 7,508 in 1930 by the Federal census. Seymour was laid out about 1850, incorporated as a town in 1864, and chartered as a city in 1867.

SEYMOUR OF SUDELEY, THOMAS SEYMOUR, Baron (*c.* 1508–1549), lord high admiral of England, was fourth son of Sir John Seymour of Wolf Hall, Wiltshire, and younger brother of the Protector Edward Seymour, 1st duke of Somerset. His sister Jane Seymour became the third wife of Henry VIII. in 1536, and another sister, Elizabeth, married Thomas Cromwell's son. Seymour was employed in the royal household and on diplomatic missions abroad. He was for a short time in command of the English army in the Netherlands. In 1544 he received the post of master of the ordnance for life, becoming admiral of the fleet a few months later, in which capacity he was charged with guarding the Channel against French invasion. In 1547 he was created Baron Seymour of Sudeley and appointed lord high admiral. From this time forward he was mainly occupied in intrigue against his brother the Protector; and he aimed at procuring for himself the position of guardian of the young king, Edward VI. The lord high admiral tried to secure the princess (afterwards queen) Elizabeth in marriage; and when this project was frustrated he secretly married the late king's widow, Catherine Parr. He ingratiated himself with Edward, and proposed a marriage between the king and the Lady Jane Grey. He

entered into relations with pirates on the western coasts, whom it was his duty as lord high admiral to suppress, with a view to securing their support; and when the Protector invaded Scotland in the summer of 1547 Seymour fomented opposition to his authority in his absence. On the death of his wife in September of the next year he made renewed attempts to marry the princess Elizabeth. Somerset strove ineffectually to save his brother from ruin, and in January 1549 Seymour was arrested and sent to the Tower; he was convicted of treason, and executed on March 20, 1549.

Hume (London, 1889); *Literary Remains of Edward VI.*, with notes and memoir by J. G. Nichols (2 vols., London, 1857); Mary A. E. Green, *Letters of Royal and Illustrious Ladies of Great Britain to the Close of the Reign of Mary* (3 vols., London, 1846). *See* also SOMERSET, EDWARD SEYMOUR, 1st DUKE OF, and the authorities there cited.

SEYNE SUR MER or **LA SEYENE,** industrial suburb of Toulon, France, south-west of that port, connected with it by rail and steamer. Pop. (1926) 18,339. It has a large shipbuilding trade with fine shipbuilding yards.

SFAX, a city of Tunisia, 78 m. due S. of Susa, on the Gulf of Qabes (Syrtis Minor) opposite the Kerkenna islands, in 34° 43′ N., 10° 46′ E. The town consists of a European quarter, with streets regularly laid out and fine houses, and the Arab town, with its kasba or citadel, and tower-flanked walls pierced by three gates. Many of the private houses, mosques and *zawias* are good specimens of native art of the 17th and 18th centuries. Sfax is the market for the phosphates of the Qafsa region, with which it is connected by a railway; other railways and good roads link it also with Susa and Tunis on the one hand and with Qabes on the other. Olive oil is manufactured, and the fisheries are important, notably those of sponges and of octopuses (exported to Greece). The prosperity of the town is largely due to the export trade in phosphates, esparto grass, oil, almonds, pistachio nuts, sponges, wool, etc. There is, in the Gulf of Qabes, a rise and fall of 5 ft. at spring tides, which is rare in the Mediterranean. A harbour, to which a channel, 3 km. long and 22 metres wide, gives access, was built 1895–97, and has since been deepened at different times. The phosphates company of Qafsa has built huge stores there; the loading of ships is effected by apparatus with endless chains worked by electricity. Sfax has the greatest tonnage of any Tunisian port; its trade exceeds two million tons (especially phosphates). It is also an important fishing port. The population of the town itself is 27,723, of whom 17,574 are Muslims, 3,265 Jews and 6,884 Europeans (3,237 French and 2,590 Italians). One must add 44,000 natives, who live in the outskirts and in the gardens in the neighbourhood of Sfax, which brings the total population of Sfax to more than 70,000. The local museum contains mosaics and other antiquities from Thaenae (mod. Thyra, marked by a lofty lighthouse), 8 m. south-west.

Sfax is on the site of a Roman settlement called *Taparura,* of which few traces remain. Many of its Arab inhabitants claim descent from Mohammed. The Sicilians under Roger the Norman took it in the 12th century, and in the 16th the Spaniards occupied it for a brief period. The bombardment of the town in 1881 was one of the principal events of the French conquest of Tunisia.

SFORZA, the name of a famous Italian family. They were descended from a peasant condottiere, Giacomo or Muzio (sometimes abbreviated into Giacomuzzo) Attendolo, who was born at Cotignola in the Romagna on June 10, 1369, gained command of a band of adventurers by whom he had been kidnapped, took the name of Sforza in the field, became constable of Naples under Joanna II., fought bravely against the Spaniards, served Pope Martin V., by whom he was created a Roman count, and was drowned on Jan. 4, 1424 in the Pescara near Aquila while engaged in a military expedition. His natural son FRANCESCO (1401–1466) served the Visconti against the Venetians and then the Venetians against the Visconti; he attacked the pope, deprived him of the Romagna, and later defended him; he married in 1441 Bianca, the only daughter of Filippo Maria Visconti, duke of Milan, and received Pontremoli and Cremona as dowry and the promise of succession to the duchy of Milan. The short-lived Ambrosian republic, which was established by the Milanese on the death of Visconti (1447), was overthrown by Francesco, who made his triumphal entry as duke of Milan on March 25, 1450. His court, filled with Italian scholars and Greek exiles, speedily became one of the most splendid in Italy. His daughter Ippolita was renowned for her Latin discourses.

Francesco left several sons, among whom were Galeazzo Maria, Lodovico, and Ascagnio, who became a cardinal.

GALEAZZO MARIA, who succeeded to the duchy, was born in 1444, and was a lover of art, eloquent in speech, but dissolute and cruel. He was assassinated at the porch of the cathedral on Dec. 26, 1476 by three young Milanese noblemen desirous of imitating Brutus and Cassius. His daughter Caterina is separately noticed. GIAN GALEAZZO (1469–1494), son of Galeazzo, succeeded to the duchy under the regency of his mother, Bona of Savoy, who was supplanted in her power (1481) by the boy's uncle, Lodovico the Moor. Gian Galeazzo married Isabella of Aragon, granddaughter of the king of Naples, and his sudden death was attributed by some to poiscn administered by the regent. His daughter, BONA SFORZA (1493–1557), married King Sigismund of Poland in 1518. On the death of her husband she returned to Italy and was poisoned (1557) by her paramour Pappacoda.

LODOVICO THE MOOR [Lodovico il Moro] (1451–1508), who is famed as patron of Leonardo da Vinci and other artists, had summoned Charles VIII. of France to his aid (1494) and received the ducal crown from the Milanese nobles on Oct. 22, in the same year, but finding his own position endangered by the French policy, he joined the league against Charles VIII., giving his niece Bianca in marriage to Maximilian I. and receiving in return imperial investiture of the duchy. Lodovico was driven from Milan by Louis XII. in 1499, and although reinstated for a short time by the Swiss he was eventually delivered over by them to the French (April 1500) and died a prisoner in the castle of Loches. FRANCESCO, the son of Gian Galeazzo, was also taken to France by Louis XII., became abbot of Marmoutiers, and died in 1511.

The two sons of Lodovico, MASSIMILIANO and FRANCESCO MARIA, took refuge in Germany; the former was restored to the duchy of Milan by the Swiss in 1512, but after the overwhelming defeat of his allies at Marignano (1515) he abandoned his rights to Francis I., and died at Paris in 1530; the latter was put in possession of Milan after the defeat of the French at La Bicocca in 1522. His death (Oct. 24, 1535) marked the extinction of the direct male line of the Sforza. The duchy went to Charles V.

The dukes of Sforza-Cesarini and the counts of Santa Fiora are descended from collateral branches of the Sforza family.

See A. Segre, "Lodovico Sforza, duca di Milano," in *R. Accad. d. Sci. Atti,* vol. 36 (Turin, 1901); G. Clausse, *Les Sforza et les arts en Milanais, 1450–1530* (1909); F. Malaguzzi Valeri, *La corte di Lodovico il Moro* (2 vols., 1913–15). There is a critical bibliography by Otto von Schleinitz in *Zeitschrift für Bücherfreunde,* vol. v. (Bielefeld, 1901).

SFORZA, COUNT CARLO (1872–), Italian statesman, knight of the Annunziata, was born at Lucca. He entered the diplomatic service, was secretary of embassy in London, then minister at Peking (1911), at Belgrade (1916), Italian high commissioner in Turkey (1918), and under secretary for foreign affairs (1919). In that year he was created senator. He became minister of foreign affairs in the Giolitti cabinet of June 16, 1920, was present at Spa (July, 1920), and negotiated the treaty of Rapallo between Italy and Yugoslavia (Nov. 12, 1920). He remained foreign minister until the formation of the Giolitti cabinet on July 4, 1921, and in February, 1922 was appointed ambassador in Paris. On Mussolini's accession to power he resigned, and became one of the chief leaders of the anti-Fascist opposition in the senate. He is a member of the Order of the Annunziata.

SFORZA, CATERINA (1463–1509), countess of Forlì, was an illegitimate daughter of Galeazzo Maria Sforza. (*See* above.) In 1473 she was betrothed to Girolamo Riario, a son of Pope Sixtus IV., who was thus able to regain possession of Imola, that city being made a fief of the Riario family. After a triumphal entry into Imola in 1477 Caterina Sforza went to Rome with her

husband, who, with the help of the pope, wrested the lordship of Forlì from the Ordelaffi. Riario, by means of many crimes, for which his wife seems to have blamed him, succeeded in accumulating great wealth, and on the death of Sixtus in August 1484, he sent Caterina to Rome to occupy the castle of St. Angelo, which she defended gallantly until, on Oct. 25, she surrendered it by his order to the Sacred College. They then returned to their fiefs of Imola and Forlì, where they tried in vain to win the favour of the people. Riario's enemies conspired against him with a view to making Franceschetto Cybò, nephew of Pope Innocent VIII., lord of Imola and Forlì in his stead. Riario thereupon instituted a system of persecution, in which Caterina was implicated, against all whom he suspected of treachery. In 1488 he was murdered by three conspirators, his palace was sacked, and his wife and children were taken prisoners. The castle of Forlì, however, held out in Caterina's interest, and every inducement and threat to make her order its surrender proved useless; having managed to escape from her captors she penetrated into the castle, whence she threatened to bombard the city, refusing to come to terms even when the besiegers threatened to murder her children. With the assistance of Lodovico il Moro she regained possession of all her dominions; she wreaked vengeance on those who had opposed her and re-established her power. She had several lovers, and by one of them, Giacomo Feo, whom she afterwards married, she had a son. Feo, who made himself hated for his cruelty and insolence, was murdered before the eyes of his wife in August 1495; Caterina had all the conspirators and their families, including the women and children, massacred. She established friendly relations with the new pope, Alexander VI., and with the Florentines, whose ambassador, Giovanni de' Medici, she secretly married in 1496. Giovanni died in 1498, but Caterina managed with the aid of Lodovico il Moro and of the Florentines to save her dominions from the attacks of the Venetians.

Alexander VI., however, angered at her refusal to agree to a union between his daughter Lucrezia Borgia and her son Ottaviano, and coveting her territories as well as the rest of Romagna for his son Cesare, issued a bull on March 9, 1499, declaring that the house of Riario had forfeited the lordship of Imola and Forlì and conferring those fiefs on Cesare Borgia. Cesare attacked her with his whole army, reinforced by 14,000 French troops and by Louis XII. Caterina placed her children in safety and took strenuous measures for defence. The castle of Imola surrendered (December 1499) with the honours of war. Caterina absolved the citizens of Forlì from their oath of fealty, and defended herself in the citadel. Finally when the situation had become untenable and having in vain given orders for the magazine to be blown up, she surrendered to Antoine Bissey, *bailli* of Dijon, entrusting herself to the honour of France (January 12, 1500). She was afterwards taken to Rome and held a prisoner for a year in the castle of St. Angelo, whence she was liberated by the same *bailli* of Dijon to whom she had surrendered at Forlì. She took refuge in Florence until the death of Alexander VI. in 1503, when she attempted without success to regain possession of her dominions. She died in the convent of Annalena on May 20, 1509.

See Buriel, *Vita di Caterina Sforza-Riario* (Bologna, 1785); F. Oliva, *Vita di C. Sforza, signora di Forlì* (Forlì, 1821); Pietro Desiderio Pesolini Dall' Onda, *Caterina Sforza* (Rome, 1893); English translation by P. Sylvester (1898).

SGAMBATI, GIOVANNI (1843–1914), Italian composer, was born in Rome on May 28, 1843, of an Italian father and an English mother. In 1860 he took up the work of winning acceptance for the best German music, which was at that time neglected in Italy. His compositions of this period (1864–1865) included a quartet, two piano quintets, an octet, and an overture. He conducted Liszt's *Dante* symphony in 1866, and made the acquaintance of Wagner's music for the first time at Munich, whither he travelled in Liszt's company. His first symphony and a piano concerto were performed in the course of his first visit to England in 1882; and at his second visit, in 1891, his *Sinfonia epitalamio* was given at the Philharmonic. His largest work, a Requiem Mass, was performed in Rome 1901. His influence on Italian musical taste has been perhaps greater than the merits of his compositions, which, though poetical and generally effective, are often slight in style. He died at Rome on Dec. 15, 1914.

SGRAFFITO. A form of ornamental plastering, originating in Italy, *sgraffito* being Italian for scratched. The essence of the method lies in applying two coats of plaster of different colours laid one upon the other, and then scratching through the outer coat to reveal the inner coat and thus producing a design.

A first rough coat is applied to give a fair surface in the ordinary way. Then follows the colour coat, the plaster being coloured with pigments such as umber, ochre, bone-black or Indian red. This colour coat may be in bands or patches to suit the designer. The final coat, which may be white or cream or coloured, is then thinly applied. The design is then transferred by pricking. By working upon this outline, the outer coat is scratched away to reveal the inner coloured coat. The effects obtained are often very beautiful, and it is perhaps surprising that the method has not found more favour outside Italy. Some of the examples found in Lombardy are very fine. The method is successfully used for both internal plastering and outdoor stucco.

SHACKLETON, SIR ERNEST HENRY (1874–1922), British explorer, was born in Kilkee, Ireland, on Feb. 15, 1874. Educated at Dulwich college, he entered the mercantile marine service. In Scott's Antarctic expedition of 1901–04 Shackleton acted as lieutenant, but had to return home on account of illness. On Jan. 1, 1908 he sailed from New Zealand in the "Nimrod" in command of an expedition which reached a point about 97 m. from the South Pole (*see* ANTARCTIC REGIONS). On his return in 1909 he was knighted and received the C.V.O. On Aug. 1, 1914, he sailed from England on "Endurance" in command of the expedition of 1914–17 with its unfortunate outcome. Finally, in Sept. 1921 he set out a third time, in the "Quest." On Jan. 5, 1922, off South Georgia island, he succumbed to an attack of angina pectoris following influenza. He was buried on South Georgia island. Shackleton gave an account of the 1907–09 expedition in *Heart of the Antarctic* (1909); and of the 1914–17 expedition in *South* (1919).

See H. R. Mill, *The Life of Sir Ernest Shackleton* (1923, new ed. 1924).

SHAD (*Alosa*), the name of a genus of fishes of the herring family, with the upper jaw notched in front, found in the Mediterranean and on both sides of the north Atlantic. They enter rivers to breed, generally from April to June, and the fry live for a year or two in fresh water. The Allis shad, *A. alosa*, of the coasts of Europe has very numerous, long and slender gill-rakers; it attains a length of 30 in. and a weight of 8 lb. The twaite shad (*A. finta*) is smaller, and has the gill-rakers much fewer and shorter; the Mediterranean form (*A. f. nilotica*) is distinct from that of the Atlantic, and the species also includes some well-marked forms permanently resident in fresh water, one from Killarney, two from lakes in northern Italy. The American shad (*A. sapidissima*) is a valued food-fish, and has been successfully introduced on the Pacific coast. The shad of the Black and Caspian seas (*Caspialosa*) have teeth on the vomer, like the herring. Another important related genus of anadromous fishes is *Hilsa*, with six species, ranging from east Africa to China.

SHADDOCK (*Citrus maxima, C. decumana*, or *C. grandis*), a tree, 20–40 ft. in height, allied to the orange and the lemon, presumably native to the Malay and Polynesian islands. The leaves are like those of the orange, but downy on the under surface, as are also the young shoots. The flowers are large and white, and are succeeded by very large globose fruits like oranges, but paler in colour, and with a more pungent flavour. The name "shaddock" is asserted to be that of a captain who introduced the tree to the West Indies. The fruit is also known under the name of pommelo. *See* also GRAPEFRUIT.

For further details, *see* R. Hume, *Florida Agric. Expt. Stat. Bull.* (1901), and *Citrus Fruits and their Culture* (1918); S. Coit, *Citrus Fruits* (1915).

SHADOW. When an opaque body is placed between a screen and a luminous source, it casts a "shadow" on the screen. If the source be a point, the outline of the shadow is to be found by drawing straight lines from the luminous point so as to

envelop the opaque body. These lines form a cone. The points of contact form a line on the opaque body separating the illuminated from the non-illuminated portion of its surface. Similarly, when these lines are produced to meet the screen, their points of intersection with it form a line which separates the illuminated from the non-illuminated parts of the screen. This line is called the boundary of the *geometrical shadow*, and its construction is based on the assumption that light travels (in homogeneous media) in straight lines and suffers no deviation on meeting an obstacle. But a deviation, termed *diffraction*, does occur, and consequently the complete theory of shadows involves considerations based on the nature of the rays themselves; this aspect is treated in LIGHT.

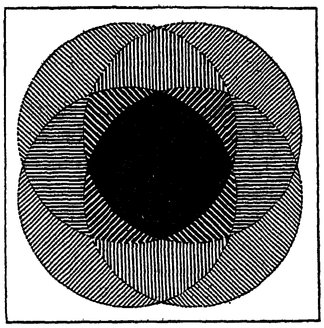


FIG. 1.—SHADOW OF DISC CAST BY FOUR EQUALLY LUMINOUS POINTS ARRANGED AS CORNERS OF A SQUARE

When there are more luminous points than one, we have only to draw separately the geometrical shadows due to each of the sources, and then superpose them. A new consideration now comes in. There will be, in general, portions of all the separate geometrical shadows which overlap one another in some particular regions of the screen. In such regions we still have full shadow; but around them there will be other regions, some illuminated by one of the sources alone, some by two, etc., until finally we come to the parts of the screen which are illuminated directly by all the sources. There will still be a definite boundary of the parts wholly unilluminated, *i.e.*, the true shadow or *umbra*, and also a definite boundary of the parts wholly illuminated. The region between these boundaries—*i.e.*, the partially illumined portion—is called the *penumbra*.

Fig. 1 represents the shadow of a circular disk cast by four equal luminous points arranged as the corners of a square—the disk being large enough to admit of a free overlapping of the separate shadows. The amount of want of illumination in each portion of the penumbra is roughly indicated by the shading. The separate shadows are circular, if the disk is parallel to the screen. If we suppose the number of sources to increase indefinitely, so as finally to give the appearance of a luminous surface as the source of light, it is obvious that the degrees of darkness at different portions of the penumbra will also increase indefinitely; *i.e.*, there will be a gradual increase of brightness in the penumbra from total darkness at the edge next the geometrical shadow to full illumination at the outer edge.

Thus we see at once why the shadows cast by the sun or moon are in general so much less sharp than those cast by the electric arc. For, practically, at moderate distances the arc appears as a mere luminous point. But if we place a body at a distance of a foot or two only from the arc, the shadow cast will have as much of penumbra as if the sun had been the source. The breadth of the penumbra when the source and screen are nearly equidistant from the opaque body is equal to the diameter of the luminous source. The notions of the penumbra and umbra are important in considering eclipses (*q.v.*). When the eclipse is total, there is a real geometrical shadow—very small compared with the penumbra (for the apparent diameters of the sun and moon are nearly equal, but their distances are as 370:1); when the eclipse is annular, the shadow is all penumbra. In a lunar eclipse the earth is the shadow-casting body, and the moon is the screen, and we observe things according to our first point of view.

Suppose, next, that the body which casts the shadow is a large one, such as a wall, with a hole in it. If we were to plug the hole, the whole screen would be in geometrical shadow. Hence the illumination of the screen by the light passing through the hole is precisely what would be cut off by a disk which fits the hole, and the complement of fig. 1, in which the light and shade are interchanged, would give therefore the effect of four equal sources of light shining on a wall through a circular hole. The umbra in the former case becomes the fully illuminated portion, and vice versa. The penumbra remains the penumbra, but it is now darkest where before it was brightest, and vice versa.

Thus we see how, when a small hole is cut in the window-shutter of a dark room, a picture of the sun, and bright clouds about it, is formed on the opposite wall. The smaller the hole (so far at least as geometrical optics is concerned) the less confused will the picture be. As the hole is made larger the illuminated portions from different sources gradually overlap; and when the hole becomes a window we have no indications of such a picture except from a body (like the sun) much brighter than the other external objects. Here the picture has ceased to be one of the sun, it is now a picture of the window. But if the wall could be placed 100 m. off, the picture would be one of the sun. To prevent this overlapping of images, and yet to admit a good deal of light, is one main object of the lens which usually forms part of the camera. (*See* PHOTOGRAPHY: *Apparatus*.)

The formation of pictures of the sun in this way is well seen on a calm sunny day under trees, where the sunlight penetrating through small chinks forms elliptic spots on the ground. During a partial eclipse of the sun, the images formed by such chinks, or by truly plane spots on a glass window pane (which act as chinks) take the form of crescents that are images of the partly obscured disc of the sun. (*See* also *Nature*, 89, 1912, p. 216.)

Another curious phenomenon may fitly be referred to in this connection, viz., the phantoms which are seen when we look at two parallel sets of palisades or railings, one behind the other, or look through two parallel sides of a meat-safe formed of perforated zinc. The appearance presented is that of a magnified set of bars or apertures which appear to move rapidly as we slowly walk past. Their origin is the fact that where the bars appear nearly to coincide the apparent gaps bear the greatest ratio to the dark spaces; *i.e.*, these parts of the field are the most highly illuminated. The exact determination of the appearances in any given case is a mere problem of convergents to a continued fraction. But the fact that the apparent rapidity of motion of this phantom may exceed in any ratio that of the spectator is of importance—enabling us to see how velocities, apparently of impossible magnitude, may be accounted for by the mere running along of the condition of visibility among a group of objects no one of which is moving at an extravagant rate.

SHADWELL, THOMAS (*c.* 1642–1692) English playwright and miscellaneous writer, was born about 1642, at Santon Hall, Norfolk, according to his son's account. He was educated at Bury St. Edmund's School, and at Caius College, Cambridge, where he was entered in 1656. He then joined the Middle Temple. Shadwell's best plays are *Epsom Wells* (1672), for which Sir Charles Sedley wrote a prologue, and the *Squire of Alsatia* (1688). For fourteen years from the production of his first comedy to his memorable encounter with Dryden, Shadwell produced a play nearly every year. These productions display a genuine hatred of shams, and a rough but honest moral purpose. They are disfigured by indecencies, but present a vivid picture of contemporary manners.

Shadwell is chiefly remembered—rather unjustly—as the unfortunate Mac Flecknoe of Dryden's satire, the "last great prophet of tautology," and the literary son and heir of Richard Flecknoe:—

> The rest to some faint meaning make pretence,
> But Shadwell never deviates into sense.

Dryden had furnished Shadwell with a prologue to his *True Widow* (1679), and in spite of momentary differences, the two had been apparently on friendly terms. But when Dryden joined the court party, and produced *Absalom and Achitophel* and *The Medal*, Shadwell became the champion of the true-blue Protestants, and made a scurrilous attack on the poet in *The Medal of John Bayes: a Satire against Folly and Knavery* (1682). Dryden immediately retorted in *Mac Flecknoe, or a Satire on the True Blue Protestant Poet, T.S.* (1682), in which Shadwell's personalities were returned with interest. A month later he contributed to Nahum Tate's continuation of *Absalom and Achitophel* satirical portraits of Elkanah Settle as Doeg and of Shadwell as Og. In

1687 Shadwell attempted to answer these attacks in a version of the tenth satire of Juvenal. At the Whig triumph in 1688 he superseded his enemy as poet laureate and historiographer royal. He died at Chelsea on Nov. 19, 1692.

A complete edition of Shadwell's works was published by his son Sir John Shadwell in 1720. But *see* the modern critical edition, *The Complete Works of Thomas Shadwell* (5 vols., 1928), edited by Montague Summers.

SHAFI'I [Mahommed ibn Idrīs ash-Shāfi'ī] (767–820), the founder of the Shāfi'ite school of canon law, was born in A.H. 150 (A.D. 767) of a Koreishite (Quraishite) family at Gaza or Ascalon, and was brought up by his mother in poor circumstances at Mecca. There, and especially in intercourse with the desert tribe of Hudhail, he gained a knowledge of classical Arabic and old Arabian poetry for which he was afterwards famous. About 170 he went to Medina and studied canon law (*fiqh*) under Malik ibn Anas. After the death of Malik in 179 legend takes him to Yemen, where he is involved in an 'Alid conspiracy, carried prisoner to Baghdad, but pardoned by Hārūn al-Rashīd. He was certainly pursuing his studies, and he seems to have come to Baghdad in some such way as this and then to have studied under Ḥanifite teachers. He had not yet formulated his own system. After a journey to Egypt, however, we find him in Baghdad again, as a teacher, between 195 and 198. There he had great success and turned the tide against the Ḥanifite school. His method was to restore the sources of canon law which Abū Ḥanīfa had destroyed by inclining too much to speculative deduction. Instead, he laid equal emphasis upon the four—Koran, tradition, analogy, and agreement. *See* further, under MOHAMMEDAN LAW. In 198 he went to Egypt in the train of a new governor, and this time was received as the leading orthodox authority in law of his time. There he developed and somewhat changed the details of his system, and died in 204 (A.D. 820). He was buried to the southeast of what is now Cairo, and a great dome (erected *c.* A.D. 1240) is conspicuous over his tomb.

SHAFT. In architecture shaft is the part of a column between the base and the capital (*q.v.*). The word is also used of any long, slender, cylindrical or polygonal form of generally columnar shape, as in the expression vaulting shaft for a colonnette or moulding attached or applied to a pier in a mediaeval church to carry, or give the appearance of carrying, a vaulting rib. In the classic and Byzantine styles the shafts are usually tapered with a curved taper known as entasis (*q.v.*) and may also be fluted with concave channels. (*See* FLUTE.) Occasional late Roman examples are spiralled. Romanesque shafts are usually cylindrical and without taper, but occasional polygonal examples are found and in certain late Romanesque styles, especially the English Norman, and the Italian Romanesque, the shafts are decorated with grooves or even richly moulded. Particularly rich are the 13th century Italian Romanesque shafts, spirally fluted and moulded, with geometric glass mosaics of the type known as Cosmati work (*see* MOSAIC) inlaid in the flutes; *e.g.,* the cloisters of S. John Lateran in Rome (in the early 13th century).

(T. F. H.)

SHAFT, DRIVING, is a bar of steel revolving in bearings and part of a mechanical power transmission system. It drives a machine or a set of machines, and is distinguished from a spindle which is incorporated in the machine itself (*e.g.,* a drill-spindle) to carry some tool or appliance, and from an axle, which carries road wheels. The shaft is necessary to transmit power from a hand drive, or a power unit, and may be located overhead in a factory, or on the ground or below it. Some machines have several shafts incorporated in the construction, conveying power by means of belts, couplings, clutches or gears. Overhead shafting is usually chosen as a matter of convenience for driving several machines by means of belts. Two essentials apply to all shafts: (1) sufficient rigidity to withstand twisting and bending under load, and (2) running with the minimum of friction. The first requirement is a matter of sufficient diameter and suitable material, generally a good class of steel, and bearings placed close enough together, especially where there is a heavy lateral pull. The frictional difficulty is not troublesome with only two bearings located close together, but when a shaft is long, and the bearings are numerous, alinement is not always easy to ensure or maintain. Settlements in buildings and foundations cause bearings to alter their position. Wedges or other adjusting devices are therefore necessary, while a swivel fitting with ball-and-socket action allows the bearings to float and automatically adjust themselves to the shaft.

The three classes of shaft bearings (*q.v.*) are the *journal,* or peripheral, the *thrust* or end pressure type, and the *footstep,* which sustains the bottom end of a vertical shaft, such as that of a water turbine. When it is necessary to drive a spindle at different heights, as with the rolling-mills, the shaft connection must be made with a universal coupling, permitting the varying angular positions. Much greater flexibility occurs in the small *flexible* shafts, which are so constructed that they will bend freely in any direction and transmit the power. These are utilized for driving portable tools for drilling, reaming, grinding, polishing, boiler-tube expanding and so on.

Special machinery is laid down for the manufacturing of shafting, which may be rolled, drawn or finished accurately, by turning or grinding. To make up lengths as required from stock sizes couplings are used, or if frequent disconnection should be desired a clutch is fitted instead. To a considerable extent shafting has been eliminated in many factories, machines being driven by self-contained electric motors, so that overhead lighting is improved, and costs for installations and the frictional losses are reduced.

(F. H.)

SHAFTESBURY, ANTHONY ASHLEY COOPER, 1ST EARL OF (1621–1683), son of Sir John Cooper and Anne, the daughter of Sir Anthony Ashley, Bart., was born at Wimborne St. Giles, Dorset, on July 22, 1621. His parents died before he was ten years of age, and he inherited extensive estates in Hampshire, Wiltshire, Dorsetshire and Somersetshire, much reduced, however, by litigation in Chancery. He married Margaret, daughter of Lord Coventry, with whom he and his wife lived at Durham House in the Strand and at Canonbury House in Islington. Though still a minor, he was elected for Tewkesbury in 1640, but he took no part in parliamentary proceedings. In 1640 Lord Coventry died, and Cooper then lived with his brother-in-law at Dorchester House in Covent Garden. For the Long Parliament, which met on Nov. 3, 1640, he was elected for Downton, Wiltshire, but the return being disputed, he did not take his seat until the last days of the Rump. He was present as a spectator at Nottingham on Aug. 25, 1642; and in 1643 he appeared openly on Charles's side in Dorsetshire, where he raised at his own expense a regiment of foot and a troop of horse, of both of which he took command. He was also appointed governor of Weymouth, sheriff of Dorsetshire for the king and president of the king's council of war in the county. In January 1644, however, he resigned his governorship and commissions and went over to the parliament, because, as he explained to a committee of the two Houses, he saw danger to the Protestant religion in the king's service. In July 1644 he went to Dorsetshire on military service, and on Aug. 3, received a commission as field-marshal general. He assisted at the taking of Wareham, and shortly afterwards compounded for his estates by a fine of £500 from which he was afterwards relieved by Cromwell. On Oct. 25, he was made commander-in-chief in Dorsetshire; in November he took Abbotsbury, the house of Sir John Strangways; and in December he relieved Taunton. His military service terminated at the time of the Self-denying Ordinance in 1645; and as he had associated himself with the Presbyterian faction, he was not included in the New Model. For the next seven or eight years he lived in comparative privacy, only carrying out his duties as high sheriff of Wiltshire (1646–48). Upon the execution of Charles, Cooper took the Engagement, and was a commissioner to administer it in Dorsetshire. In 1652 he was named on the commission for law reform, of which Hale was the chief and on March 17, 1653, he

was pardoned of all delinquency and thus at last made capable of sitting in parliament. He sat for Wiltshire in the Barebones Parliament, where he supported Cromwell against the extreme section, was appointed on the council of thirty, and on the resignation of this parliament he became a member of the council of state named in the "Instrument." In 1654 he left the privy council, and henceforward is found with the Presbyterians and Republicans in opposition to Cromwell.

Cooper was again elected for Wiltshire in 1656, but Cromwell refused to allow him, with many others of his opponents, to sit. In the parliament of 1658, however, he took his seat, and was active in opposition to the new constitution of the two Houses. He also led the opposition in Richard Cromwell's parliament, especially on the matter of the limitation of the power of the protector, and against the House of Lords.

In 1659 Cooper was arrested on a charge of corresponding with the leader of the Cheshire rising, but he was unanimously acquitted by the Council. In the disputes between Lambert at the head of the military party and the Rump in union with the council of State, he supported the latter, and upon the temporary supremacy of Lambert's party worked indefatigably to restore the Rump. He co-operated with Monk, whom he assisted to the post of commander-in-chief of the forces, was instrumental in securing the Tower for the parliament, and in obtaining the adhesion of Admiral Lawson and the fleet. On the restoration of the parliament Cooper was one of the commissioners to command the army, and was made one of the new council of State. On Jan. 7, 1660, he took his seat on his election for Downton in 1640, and was made colonel of Fleetwood's regiment of horse. He secured the admission of the secluded members, was again one of the fresh council of State, consisting entirely of friends of the Restoration, and accepted from Monk a commission to be governor of the Isle of Wight and captain of a company of foot. He now steadily pursued the design of the Restoration, and was one of the 12 commissioners who went to Charles at Breda to invite him to return. In the Convention Parliament he sat for Wiltshire.

Cooper was at once placed on the privy council, receiving also a formal pardon for former delinquencies. In the discussions regarding the Bill of Indemnity he was instrumental in saving the life of Haselrig, and opposed the clause compelling all officers who had served under Cromwell to refund their salaries. He was one of the commissioners for conducting the trials of the regicides, but was himself attacked by Prynne for having acted with Cromwell. He was named on the council of plantations and on that of trade. At the coronation in April 1661 Cooper had been made a peer, as Baron Ashley of Wimborne St. Giles, in recognition of his services at the Restoration; and on the meeting of the new parliament in May he was appointed chancellor of the exchequer and under-treasurer. He opposed the persecuting acts now passed —the Corporation Act, the Uniformity Bill, against which he is said to have spoken three hundred times, and the Militia Act. He is stated also to have influenced the king in issuing his dispensing declaration of Dec. 26, 1662, and he zealously supported a bill for the purpose of confirming the declaration. He was himself the author of a treatise on tolerance. He was now recognized as one of the chief opponents of Clarendon and the High Anglican policy. On the outbreak of the Dutch War in 1664 he was made treasurer of the prizes, being accountable to the king alone for all sums received or spent. He was also one of the grantees of the province of Carolina and took a leading part in its management. On the death of Southampton, Ashley was placed on the commission of the treasury, Clifford and William Coventry being his principal colleagues. He appears to have taken no part in the attempt to impeach Clarendon on a general charge of treason.

The new administration was headed by Buckingham, whose toleration and comprehension principles Ashley shared to the full. An able paper written by him to the king in support of these principles, on the ground of their advantage to trade, has been preserved. He excepts, however, from toleration Roman Catholics and Fifth Monarchy men. His attention to all trade questions was close and constant; he was a member of the council of trade and plantations appointed in 1670, and was its president from 1672–76; he also co-operated in the design of legitimizing Monmouth as a rival to James. In the intrigues which led to the infamous treaty of Dover he had no part, for as a Protestant he could not be trusted with the knowledge of the clause binding Charles to declare himself a Catholic. In order to blind the Protestant members of the Cabal a sham treaty was arranged in which this clause did not appear, and under this misunderstanding he signed the sham Dover treaty on Dec. 31, 1670. This treaty, however, was kept from public knowledge. He opposed the "Stop of the Exchequer," the responsibility for which rests with Clifford, but in the other great measure of the Cabal ministry, Charles's Declaration of Indulgence, he concurred. He was rewarded by being made earl of Shaftesbury and Baron Cooper of Pawlett by a patent dated April 23, 1672. It is stated too that he was offered, but refused, the lord treasurership. On Nov. 17, 1672, however, he became lord chancellor, in which position he offended the House of Commons by issuing writs to fill the vacant seats. This, though grounded on precedent, was regarded as an attempt to fortify Charles. The writs were cancelled, and the principle was established that the issuing of writs rested with the House itself. It was at the opening of parliament that Shaftesbury made his celebrated "delenda est Carthago" speech against Holland, in which he urged the Second Dutch War, on the ground of the necessity of destroying so formidable a commercial rival to England, excused the Stop of the Exchequer which he had opposed, and vindicated the Declaration of Indulgence. On March 8, he announced to parliament that the declaration had been cancelled, and for affixing the great seal to this declaration he was threatened with impeachment by the Commons. The Test Act was now brought forward, and Shaftesbury, who appears to have heard how he had been duped in 1670, supported it, with the object probably of getting rid of Clifford. He now began to be regarded as the chief upholder of Protestantism in the ministry; he lost favour with Charles, and on Sept. 9, 1673, was dismissed from the chancellorship. Among the reasons for this dismissal is probably the fact that he opposed grants to the king's mistresses.

Charles soon regretted the loss of Shaftesbury, and endeavoured, unsuccessfully, as did also Louis, to induce him to return. He now became the popular leader against the measures of the court, and may be regarded as the intellectual chief of the opposition. At the meeting of parliament on Jan. 8, 1674, he carried a motion for a proclamation banishing Catholics to a distance of 10 m. from London. During the session he organized and directed the opposition in their attacks on the king's ministers. On May 19 he was dismissed from the privy council and retired to Wimborne, where he continued to urge the necessity of a new parliament. He was in the House of Lords, however, in 1675, when Danby brought forward his famous Non-resisting Test Bill, and headed the opposition during this session with ability, supporting the right of the Lords to hear appeal cases, even where the defendant was a member of the Lower House. Parliament was prorogued for 15 months until Feb. 15, 1677, but the opposition maintained that a prorogation for more than a year was illegal. In reply Shaftesbury, with three others, was sent to the Tower. In June Shaftesbury applied for a writ of *habeas corpus,* but was only released on Feb. 26, 1678, after his letter and three petitions to the king. Being brought before the bar of the House of Lords he made submission as to his conduct in declaring parliament dissolved by the prorogation, and in violating the Lords' privileges by bringing a *habeas corpus* in the King's Bench.

The outbreak of the Popish Terror in 1678 provided an opportunity for Shaftesbury to attack the government by fanning the popular frenzy. Under his advice the opposition made an alliance with Louis whereby the French king promised to help them to ruin Danby on condition that they would compel Charles, by stopping the supplies, to make peace with France, doing thus a grave injury to Protestantism abroad for the sake of a temporary party advantage at home. Upon the refusal in November of the Lords to concur in the address of the Commons requesting the removal of the queen from court, he joined in a protest and was foremost in all the violent acts of the session. He urged on the bill by which

Catholics were prohibited from sitting in either House of Parliament, and was bitter in his expressions of disappointment when the Commons passed a proviso excepting James, against whom the bill was especially aimed, from its operation. A new parliament met on March 6, 1679. Shaftesbury had meanwhile warned the king that unless he followed his advice there would be no peace with the people. On March 25, he made a striking speech upon the state of the nation, especially upon the dangers to Protestantism and the misgovernment of Scotland and Ireland. He was suspected, too, of fostering a revolt in Scotland. By the advice of Temple, Charles now tried the experiment of forming a new privy council in which the chief members of the opposition were included, and Shaftesbury was made president, being also a member of the committee for foreign affairs. He did not, however, change his opinions or his action, and opposed the compelling of Protestant Nonconformists to take the oath required of Roman Catholics. The question of the succession was now again prominent, and Shaftesbury hastened his fall by putting forward Monmouth as his nominee, thus alienating a large number of his supporters. He pressed on the Exclusion Bill, and, when that and the inquiry into the payments for secret service and the trial of the five peers were brought to an end by a sudden prorogation, he is reported to have declared aloud that he would have the heads of those who were the king's advisers to this course. Before the prorogation, however, he saw the invaluable Act of Habeas Corpus, which he had carried through parliament, receive the royal assent. In pursuance of his patronage of Monmouth, Shaftesbury now secured for him the command of the army sent to suppress the insurrection in Scotland. In October 1679, Shaftesbury was dismissed from the presidency and from the privy council, and when applied to by Sunderland to return to office he made as conditions the divorce of the queen and the exclusion of James.

With other peers he presented a petition to the king in November, praying for the meeting of parliament, of which Charles took no notice. In April, upon the king's declaration that he was resolved to send for James from Scotland, Shaftesbury advised the popular leaders to leave the council, and they followed his advice. In March we find him unscrupulously eager in the prosecution of the alleged Irish Catholic plot. On June 26, accompanied by fourteen others, he presented to the grand jury of Westminster an indictment of the duke of York as a Popish recusant. The Exclusion Bill, having passed the Commons, was brought up to the Lords, and an historic debate took place, on Nov. 15, in which Halifax and Shaftesbury were the leaders on opposite sides. The bill was thrown out, and Shaftesbury signed the protest against its rejection. The next day he urged upon the House the divorce of the queen, and on Dec. 7, he voted for the condemnation of Lord Stafford. He continued to advocate exclusion but all opposition was checked by the dissolution of parliament. A new parliament was called to meet at Oxford, to avoid the influences of the city of London, where Shaftesbury was popular. Shaftesbury, with fifteen other peers, petitioned the king that it might as usual be held in the capital. At this parliament, which lasted but a few days, he again made a personal appeal to Charles, which was rejected, to permit the legitimizing of Monmouth. The king's advisers now urged him to arrest Shaftesbury; he was seized on July 2, 1681, and committed to the Tower, the judges refusing his petition to be tried or admitted to bail. This refusal was twice repeated in September and October, the court hoping to obtain evidence sufficient to ensure his ruin. In October he wrote offering to retire to Carolina if he were released. On Nov. 24, he was indicted for high treason at the Old Bailey, but was released on bail on Dec. 1. In 1682, however, Charles secured the appointment of Tory sheriffs for London; and, as the juries were chosen by the sheriffs, Shaftesbury felt that he was no longer safe from the vengeance of the court. Failing health and the disappointment of his political plans led him into violent courses. He appears to have entered into treasonable consultation with Monmouth and others, and after lying concealed in London, he fled to Harwich, and reached Amsterdam in the beginning of December. Here he was made a citizen of Amsterdam, but died there on Jan. 21, 1683. His body was sent in February to Poole, in Dorset, and was buried at Wimborne St. Giles.

Few politicians have been so abused as Shaftesbury. Dryden satirised him, Macaulay condemned him, but Christie did much to rehabilitate him. Christie's *Life* (1871), however, should be read with caution. Finally, in his monograph (1886) in the series of "English Worthies," H. D. Traill professes to hold the scales equally. He makes an interesting addition to our conception of Shaftesbury's place in English politics, by insisting on his position as the first great party leader in the modern sense, and as the founder of modern parliamentary oratory.

SHAFTESBURY, ANTHONY ASHLEY COOPER, 3RD EARL OF (1671–1713), was born at Exeter House, London, on Feb. 26, 1671. He was grandson of the first earl (the friend of Locke), and son of the second earl. His mother was Lady Dorothy Manners, daughter of John, earl of Rutland. At the age of three the boy was made over to the formal guardianship of his grandfather, and Locke was entrusted with the superintendence of his education. This was conducted according to the principles enunciated in Locke's *Thoughts concerning Education.* In 1683 his father entered him at Winchester as a warden's boarder. Being shy and constantly taunted with the opinions and fate of his grandfather, he appears to have been miserable, and to have left Winchester in 1686 for a course of foreign travel.

In 1689, the year after the Revolution, Ashley returned to England, and for nearly five years led a studious life. In 1695 he entered parliament as M.P. for Poole. Though a Whig by descent, by education and by conviction, Ashley could by no means be depended on to give a party vote; he supported any proposals which appeared to promote the liberty of the subject and the independence of parliament. On the dissolution of July 1698, ill health compelled his retirement from parliamentary life. He spent a year in Holland, where he met Le Clerc, Bayle, Benjamin Furly, the English Quaker merchant, at whose house Locke had resided during his stay at Rotterdam, and probably Limborch and the rest of the literary circle of which Locke had been an honoured member nine or ten years before. To the period of this sojourn must probably be referred the surreptitious publication, by Toland, of an edition of the *Inquiry concerning Virtue,* from a rough draught, sketched when he was 20 years of age.

Ashley succeeded his father as earl of Shaftesbury in 1699. He took an active part, on the Whig side, in the general election of 1700–01, and again, with more success, in that of the autumn of 1701. William III. offered him a secretaryship of state, which he declined for reasons of health. After the accession of Anne, Shaftesbury, who had been deprived of the vice-admiralty of Dorset, returned to his retired life, but retained a keen interest in politics. In 1703 he again went to Rotterdam for a year, living as he says in a letter to his steward Wheelock, at the rate of less than £200 a year, and yet having much "to dispose of and spend beyond convenient living." From this time forward he was engaged in writing or revising the treatises afterwards included in the *Characteristics.* In 1709 he married Jane Ewer. His only child and heir, the fourth earl, to whose manuscript accounts we are indebted for the details of his father's life, was born on Feb. 9, 1711.

With the exception of a *Preface to the Sermons of Dr. Whichcote,* the Cambridge Platonist, published in 1698, Shaftesbury printed nothing till 1708. About this time repressive measures were proposed against the French Camisards (*q.v.*). Shaftesbury maintained that fanaticism was best encountered by "raillery" and "good-humour"; he wrote a letter *Concerning Enthusiasm* (anon. 1708) to Lord Somers, dated Sept. 1707, which provoked several replies. In May 1709 he returned to the subject in *Sensus Communis, an Essay on the Freedom of Wit and Humour.* In the same year appeared *The Moralists, a Philosophical Rhapsody;* in 1710, *Soliloquy, or Advice to an Author,* and in 1711 *Characteristics of Men, Manners, Opinions, Times* (3 vols.), all published anonymously. These volumes contain in addition to the four treatises already mentioned, *Miscellaneous Reflections,* now first printed, and the *Inquiry concerning Virtue or Merit,* described as "printed first in the year 1699."

In July 1711 Shaftesbury set out for Italy in search of health. He spent a year in Naples, where he prepared a second edition (1713) of the *Characteristics,* the little treatise (afterwards

included in the *Characteristics*) entitled *A Notion of the Historical Draught or Tablature of the Judgment of Hercules*, and the letter concerning *Design*. "Medals, and pictures, and antiquities," he writes to Furly, "are our chief entertainments here." His conversation was with men of art and science, "the virtuosi of this place." Shaftesbury died on Feb. 4, 1713 and was buried at St. Giles's, the family seat in Dorsetshire.

Shaftesbury's philosophical importance is due mainly to his ethical speculations, in which his motive was primarily the refutation of Hobbes' egoistic doctrine. He continually laid stress on the importance of beauty and harmony in the daily life of the individual and of society, and declared virtue to be the subordination of the self-regarding to the social affections. Just as there is a faculty which apprehends beauty in the sphere of art, so there is in the sphere of ethics a faculty which apprehends the beauty or deformity of actions. This faculty he described (for the first time in English thought) as the Moral Sense (*see* HUTCHESON, FRANCIS) or Conscience (*see* BUTLER, JOSEPH). In its essence, it is primarily emotional and non-reflective; in process of development it becomes rationalized by education and use. The emotional and the rational elements in the "moral sense" Shaftesbury did not fully analyse (*see* HUME, DAVID).

From this principle, it follows (1) that the distinction between right and wrong is part of the constitution of human nature; (2) that morality stands apart from theology, and the moral qualities of actions neither depend upon the arbitrary will of God nor upon custom, fancy or will; (3) that the ultimate test of an action is its tendency to promote the general harmony or welfare; (4) that appetite and reason concur in the determination of action; and (5) that the moralist is not concerned to solve the problem of freewill and determinism. From these results we see that Shaftesbury, opposed to Hobbes and Locke, is in close agreement with Hutcheson, and that he is ultimately a deeply religious thinker, inasmuch as he discards the moral sanction of public opinion, the terrors of future punishment, the authority of the civil authority, as the main incentives to goodness, and substitutes the voice of conscience and the love of God. These two alone move men to aim at perfect harmony for its own sake in the man and in the universe.

The main object of the *Moralists* is to propound a system of natural theology, and to vindicate, so far as natural religion is concerned, the ways of God to man. His scheme of natural religion was popularized in Pope's *Essay on Man,* several lines of which, especially of the first epistle, are simply statements from the *Moralists* done into verse. Whether, however, these were taken immediately by Pope from Shaftesbury, or whether they came to him through the papers which Bolingbroke had prepared for his use is uncertain. Shaftesbury's ethical system was reproduced, though in a more precise and philosophical form, by Hutcheson, and from him descended, with certain variations, to Hume and Adam Smith. Nor was it without effect even on Butler. Of the so-called deists Shaftesbury was probably the most important, as he was certainly the most plausible. No sooner had the *Characteristics* appeared than they were welcomed by Le Clerc and Leibnitz. In 1745 Diderot adapted the *Inquiry concerning Virtue* in what was afterwards known as his *Essai sur le Mérite et la Vertu.* In 1769 a French translation of the whole of Shaftesbury's works, including the *Letters,* was published at Geneva; in 1776–79 there appeared a complete German translation of the *Characteristics.* Hermann Hettner says that not only Leibnitz, Voltaire and Diderot, but Lessing, Mendelssohn, Wieland and Herder, drew the most stimulating nutriment from Shaftesbury. Herder, in the *Adrastea,* pronounces the *Moralists* to be in form well-nigh worthy of Grecian antiquity, and in content almost superior to it.

Most of Shaftesbury's writings have been already mentioned. In addition, fourteen letters from Shaftesbury to Molesworth were edited by Toland in 1721; some letters to Benjamin Furly, his sons and his clerk Harry Wilkinson, included in *Original Letters of Locke, Sidney and Shaftesbury,* were published by Mr. T. Forster in 1830 and 1847; three letters to Stringer, Lord Oxford and Lord Godolphin appeared, for the first time, in the *General Dictionary;* and lastly a letter to Le Clerc, in his recollections of Locke, was first published in *Notes and Queries,* Feb. 8, 1851. The *Letters to a Young Man at the University* (Michael Ainsworth), already mentioned, were first published in 1716. The Letter on Design was first published in the 1732 edition of the *Characteristics.* Besides the published writings, there are the Shaftesbury papers in the Record Office.

BIBLIOGRAPHY.—The edition of the *Characteristics of Men, Manners, Opinions, Times,* by J. M. Robertson (2 vols., 1900), includes practically the whole of Shaftesbury's writings. *See* also L. Stephen, *Essays on Freethinking,* etc. (1873); B. Rand, *The Life (by his son), unpublished letters and philosophical regimen of Shaftesbury* (1900); J. J. Martin, *Shaftesburys und Hutchesons Verhältnis in Hume* (Halle, 1905); C. F. Weiser, *Shaftesbury und das deutsche Geistesleben* (1916); V. Schönfeld, *Die Ethik Shaftesburys* (Budapest, 1920).

SHAFTESBURY, ANTHONY ASHLEY COOPER, 7TH EARL OF (1801–1885), son of Cropley, 6th earl (a younger brother of the 5th earl; succeeded 1811), and Anne, daughter of the 3rd duke of Marlborough, was born on April 28, 1801. He was educated at Harrow and Christ Church, Oxford, and entered parliament in 1826. He succeeded his father as earl in 1851. Although giving a general support to the Conservatives, his parliamentary conduct was greatly modified by his intense interest in the improvement of the social condition of the working classes, his efforts in behalf of whom have made his name a household word. He opposed the Reform Bill of 1832, but was a supporter of Catholic emancipation, and his objection to the continuance of resistance to the abolition of the Corn Laws led him to resign his seat for Dorset in 1846. In parliament his name, more than any other, is associated with the new factory legislation. He was a lord of the admiralty under Sir Robert Peel (1834–35), but on being invited to join Peel's administration in 1841 refused, having been unable to obtain Peel's support for the Ten Hours' bill. Chiefly by his persistent efforts a Ten Hours' bill was carried in 1847, but its operation was impeded by legal difficulties, which were only removed by successive acts, instigated chiefly by him, until the law was consolidated by the Factory Act of 1874.

The part which Shaftesbury took in the legislation bearing on coal mines was equally prominent. In 1846, after the resignation of his seat for Dorset, he explored the slums of the metropolis, and not only gave a new impulse to the movement for the establishment of ragged schools, but was able to make it more widely beneficial. For 40 years he was president of the Ragged School Union. He was also one of the principal founders of reformatory and refuge unions, young men's Christian associations and working men's institutes. He took an active interest in foreign missions, and was president of several of the most important philanthropic and religious societies of London. He died on Oct. 1, 1885. By his marriage (1830) to Lady Emily (d. 1872), daughter of the 5th earl Cowper, he left a large family, and was succeeded by his eldest son Anthony, who committed suicide in 1886, his son (b. 1869) becoming 9th earl.

See J. L. and B. Hammond, *Lord Shaftesbury* (1923); and J. W. Bready, *Lord Shaftesbury and Industrial Progress* (1926).

SHAFTESBURY, a market town and municipal borough in the northern parliamentary division of Dorsetshire, England, 103 m. W.S.W. from London by the S. railway (Semley station). Pop. (1931) 2,366. It lies high on a hill above a rich agricultural district. Although there are traces of both British and Roman occupation in the immediate neighbourhood, the site of Shaftesbury (Caer Palladur, Caer Septon, Seaftonia, Sceafstesbyrig, Shafton) was probably first occupied in Saxon times; Matthew Paris speaks of its foundation by the mythical king Rudhudibras, while Asser ascribes it to Alfred, who made his daughter Ethelgeofu the first abbess. It is probable that a small religious house had existed here before the time of Alfred, and that it and the town were destroyed by the Danes, being both rebuilt about 888. The site of the Saxon abbey and nunnery was excavated between 1907 and 1910. In 980 Dunstan brought St. Edward's body here from Wareham for burial, and here Canute died in 1035.

In 1252 the burgesses received their first charter from Henry III. There is no evidence that Elizabeth granted Shaftesbury a charter as has been asserted, but she confiscated the common lands in 1585, the town only recovering them by purchase. This probably led to the granting of a new charter by James I. in 1604. Yet another charter was granted to the town in 1684. Shaftesbury returned two members to parliament from 1294 to 1832,

when the representation was reduced to one, and it was lost in 1885.

See Charles Hubert Mayo, *The Municipal Records of the Borough of Shaftesbury* (Sherborne, 1889); Victoria County History of Dorset II. pp. 72 to 79.

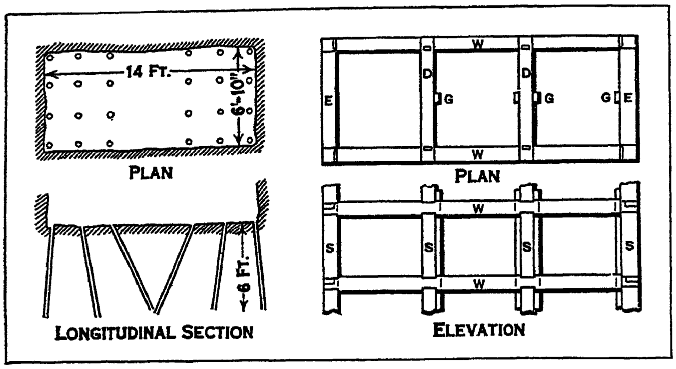
SHAFT-SINKING is an important mining operation for reaching and working mineral deposits situated at a depth below the surface, whenever the topography does not admit of driving adits or tunnels (*q.v.*). Shafts are also often sunk in connection with certain civil engineering works, *e.g.*, at intervals along the line of a railway tunnel for starting intermediate headings, thus securing more points of attack than if the entire work were carried on from the end headings only. Sundry modifications of shaft-sinking are adopted in excavating for deep foundations of heavy buildings, bridge piers and other engineering structures. If in solid rock carrying but little water, shaft-sinking is a comparatively simple operation. But when the formation penetrated comprises unstable, watery strata, special forms of lining are necessary and the work is slow and expensive. Mine shafts are often very deep, notably in the Witwatersrand, South Africa; at Bendigo, Australia; and in some of the coal fields of Europe. Several inclined shafts in Michigan approximate 8,600 ft. at an inclination of 39° to the horizontal.

Shape of Shafts.—Vertical shafts may be either rectangular or cylindrical; when inclined they are always rectangular. In Europe shafts are generally cylindrical, sometimes of elliptical cross-section, lined with masonry, concrete, cast iron or steel. In the United States and elsewhere rectangular sections are the rule for sinking in rock, the shaft walls being supported by timbering, occasionally by steel framing. For sinking in loose, water-bearing soils, the cross-section is almost invariably circular to resist crushing or caving of the shaft walls. The cheaper timber or steel-lined, rectangular shaft, however, is generally appropriate in rocky strata, in view of the temporary character of mining operations. Rectangular shafts are usually divided longitudinally into compartments; one or more of these are for the cages or skips, which run in guides bolted to the shaft timbering or by wire ropes stretched from top to bottom (*see* MINING, METALLIFEROUS); another is provided for a ladder- and pipe-way and for ventilation. When much water is encountered a separate pump compartment is desirable. Cylindrical shafts may be similarly divided.

The cross-sectional area of shafts depends mainly on the size of the cages or skips. Rectangular shafts of one or two compartments measure, inside of timbers, say 4 by 6 ft. to 7 by 12 ft.; larger shafts of three compartments, from 5 by 12 ft. to 8 or 10 ft. by 20 ft. Shafts of four to seven compartments, as in the deep-level mines of the Witwatersrand, range from 6 by 20 ft. to 6 or 8 by 30 ft., and for some of the Pennsylvania colliery shafts, up to 13 by 52 ft. Cylindrical shafts rarely have more than two hoisting compartments and vary from 10 to 21 ft. diameter.

Sinking in Rock.—If the rock be overlaid by loose soil carrying little water, excavation is begun by pick and shovel, and after the rock is reached is continued by drilling and blasting. The plant usually comprises a small hoist and boiler, several buckets or a skip, one or more sinking pumps according to the quantity of water, occasionally a ventilating fan and a timber derrick or head-frame over the shaft mouth. In some cases a portion of the permanent hoisting plant is erected for sinking. For very hard rock or for rapid work, machine drilling is advisable, a compressor and additional boiler capacity being then required. Many shafts in South Africa and the United States have been sunk at a speed of from 200 to 250 ft. per month. Inclined shafts when nearly vertical can be sunk about as fast as vertical shafts; but for inclinations between 75° and 30° to the horizontal, inclines are generally slower, due to the greater inconvenience of carrying on excavation and timbering. Very flat shafts can be sunk faster, unless there is much water. The highest speed on record for a flat incline (10°) is 267 ft. in one month (Howard shaft, South Africa). The speed of sinking depends mainly on the time required to hoist out the broken rock and therefore generally diminishes with increase of depth. Furthermore, omitting shafts of small area, the cost per foot of depth does not increase proportionately to the cross-sectional dimensions. For the same rock the rate of advance in wet formations is always much slower than in dry and the cost greater.

A round of holes is drilled, usually 3 to 4 ft. deep if by hand, or 5 to 8 ft. if by machine (*see* BLASTING). A common mode of placing machine drill holes in shown in fig. 1. The holes are charged with dynamite and fired preferably by electricity, as the



FIGS. 1 AND 2

men may have to be hoisted a long distance to a place of safety. After the smoke has cleared away, hastened by sprays or by compressed air if available, the broken rock is hoisted out and drilling resumed. In rectangular shafts not over 6 or 8 ft. wide, machine drills are usually mounted on horizontal bars stretching across from wall to wall; in wider or cylindrical shafts, on tripods or special sinking-frames. Small quantities of water are bailed but when the inflow is large, a sinking pump is employed (*see* MINING, METALLIFEROUS).

Shaft Lining.—For rectangular vertical shafts under normal conditions the excavation through surface soil is commonly lined with cribbing, inside of which a concrete curb is sometimes built to dam out surface water. After reaching rock the lining is generally of horizontal sets of 8 by 8 in. to 12 by 12 in. squared timber, wedged against the walls by smaller pieces, with lagging, put behind the sets. In firm rock lagging may be omitted. Each set (fig. 2) consists of two long timbers (wall-plates) W, W, two shorter pieces (end-plates) E, E, and one or more cross pieces (dividers or buntons) D, D, to form the compartments, strengthen the sets and support the cage guides, G, G. The sets are 4 to 6 ft. apart, with vertical posts (studdles) S, S, between them. At intervals of 80 to 120 ft., longer timbers (bearers) are notched into the walls under a set to prevent displacement of the lining. A series of shaft sets, with their posts, are either built up from a bearing-set, or suspended from the latter by hanger-bolts. In firm rock, a considerable depth of shaft may be sunk and then timbered; generally it is safer to put in a few sets at a time as sinking advances. Inclined shafts in solid ground are often timbered as described above, though sometimes longitudinal rows of posts support the roof and divide the shaft into compartments.

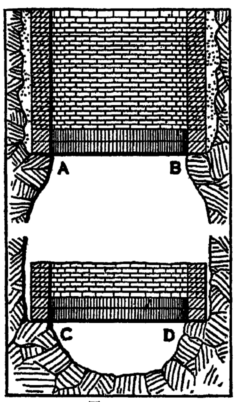


FIG. 3

A cylindrical shaft of any importance is lined with masonry, concrete or cast-iron "tubbing." Linings are generally built in sections, as sinking advances, each section being based on a walling-crib AB, CD (fig. 3). The thickness of the walling depends on the pressure anticipated; it is usually from 13 in. to 2 ft. Such linings shut out much of the water present in the surrounding rock. Iron tubbing is employed when the inflow of water is large. It consists of cast-iron flanged rings, cast in segments bolted together. To permit the rings to adjust themselves to the pressure, the horizontal joints are rarely bolted; they are best packed with sheet-lead or thin strips of dry pine, any leaks appearing subsequently being stopped with wedges. The space

between the tubbing and the rock is filled with concrete or cement grouting. The lowermost tubbing ring is based upon a "wedging-crib." This is a heavy ring of cast-iron segments bolted together, and set on a projecting shelf of rock, carefully dressed. The space behind the crib is driven full of wooden wedges, which expand on becoming water-soaked and make a water-tight joint. By using this method very little pumping is necessary, so the cost is materially reduced.

Cost of Shaft Sinking.—In rock the cost varies greatly with the size and depth of the shaft, inflow of water and character of rock. Under favourable conditions, in 1927, small, shallow shafts cost £12 to £20 per ft.; larger, deep shafts, £25 to £40. Under unfavourable conditions costs may range from £50 per ft. up. Costs in soft, watery soil are always relatively higher.

The **Kind-Chaudron process** of sinking in rock, introduced in 1852, has been confined to Europe. Many shafts have been sunk thus, some to depths of 1,000 ft. or more, without one instance of failure. It is applicable only to firm rock and was devised for cases where the quantity of water is too great to be pumped out while excavation is in progress; that is, for inflows greater than 1,000 or 1,200 gal. per min. This system is most successful when the water-bearing rocks rest on an impervious stratum, overlying the mineral deposit. The entire excavation is carried on under water. Instead of ordinary tools, massive trepans are employed, consisting of a heavy iron frame, in the lower edge of which are set a number of separate cutters. Shafts not exceeding about 8 ft. diameter are bored in one operation; for larger diameters an advance bore is usually made with a small trepan and afterwards enlarged to full size; or the small and large trepans may be used alternately, the advance being kept 30 to 60 ft. ahead of enlargement. An 8-ft. trepan weighs about 12 tons; those of 14 or 15 ft., 25 to 30 tons. The trepan is attached to a heavy rod, suspended from a walking-beam operated by an engine on the surface. A derrick is erected over the shaft, with a hoisting engine for raising and lowering the tools. Average rock is bored at a speed of about 1½ ft. per 24 hours. The advance bore is cleaned of debris at intervals by a bailer similar to that used for boreholes (*q.v.*). The enlarging trepan is so shaped that the cuttings, assisted by the agitation of the water, run into the advance bore. Owing to the difficulty of bailing, the advance bore is sometimes omitted even for large shafts, the debris being removed by a special dredger. For rather loose rock another somewhat similar system of drilling, the Pattberg, has been satisfactorily employed (see *Coll. Guardian*, Nov. 14, 1902). When the shaft has passed through the watery strata the cast-iron lining (*cc, dd*) is bolted together at the shaft mouth and lowered through the water (fig. 4). Sometimes, the first two rings (*aa, bb*) are designed to telescope together with dry moss packed between their flanges. When the lowermost ring reaches the bottom, the weight of the lining compresses the moss and forces it against the surrounding rock, making a tight joint. The lining is suspended from the surface by threaded rods, and to reduce its weight while it is being lowered the bottom may be closed by a diaphragm (*ff*), in the centre of which is an open pipe (*g*). This pipe is provided with cocks for admitting enough water to overcome buoyancy. Finally, concrete is filled in behind the lining, the diaphragm removed and the completed shaft pumped out. The moss-box is now usually omitted, the concreting being relied on to make the lining water-tight. The cost of this method (generally £50 to £80 per ft.), as well as the speed, compares favourably with results obtainable under the same conditions by other means; in many cases it is the only practicable method.

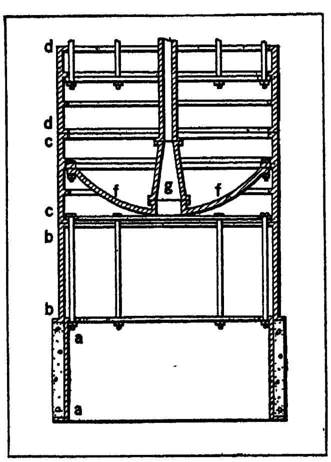

FIG. 4

Sinking in Unstable Soils.—Unstable or watery soils often cause serious engineering difficulties. Shaft sinking is then accomplished by: (1) spiling, vertical or inclined; (2) drop-shaft; (3) caisson and compressed air; (4) the freezing process. Vertical spiling consists in driving series of spiles around the sides of the excavation, each series supported by horizontal timber cribs. When the first spiles have been driven, and the enclosed soil removed, a second set follows inside, and so on. Steel sheet spiling is also used for small depths in silt, quicksand and other very watery soil. Inclined spiling (fig. 5) is limited to small depths. Cribs are put in every few feet; around them, driven ahead of the excavation, are short planks, sharpened to a chisel edge. The spiles incline outward, being driven inside of one crib and outside of that next below. The shaft bottom also may have to be sheathed with planking, which is braced against the lowest crib and advanced to new positions as sinking of the shaft progresses.

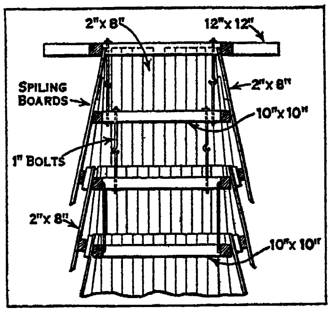

FIG. 5

Drop-shafts have been used for depths of nearly 500 ft. A heavy timber, iron or concrete lining (usually cylindrical) is sunk through the soil, new sections being successively added at the surface, while excavation goes on inside. In quite soft soil the drop-shaft sinks with its own weight; when necessary, added weights of pig-iron, rails, etc., are applied at the top. If the first lining refuses to sink farther a second is lowered inside of it. The drop-shaft rests on a massive wooden or iron shoe, generally of triangular cross-section, which cuts into the soil as the weight of the structure increases and the excavation proceeds. When the drop-shaft is built of concrete, its great weight may become unmanageable in very soft soil, and it is hung from a framework on the surface. For deep shafts the lining must be of iron or steel, as wood is too weak and concrete too heavy. When only a reasonable amount of pumping is required, the soil is excavated by hand; otherwise dredging is resorted to. The leakage of water under the shoe may be stopped by concreting the shaft bottom or by various other methods. There are many modifications of the drop-shaft which cannot here be detailed. Sinking with caisson (*q.v.*) and compressed air is rarely adopted except in civil engineering operations where deep foundations are necessary; *e.g.*, bridge piers.

Watery soil in which a shaft is to be sunk is sometimes artificially frozen and excavated like rock. A number of drive-pipes are put down (*see* BORING), usually 6 to 8 in. diameter and about 3 ft. apart, in a circle whose radius is, say, 3 ft. greater than that of the shaft, and reaching to bed-rock or other firm formation. Each pipe is then plugged at the lower end and within it is placed an open pipe, 1½ in. in diameter, extending nearly to the bottom. Or, preferably, after the drive-pipes are down and cleaned out, a slightly smaller pipe, closed at its lower end, is inserted in each drive-pipe, the latter being afterwards pulled out. The inner 1½-in. open pipes are then inserted. The outer and inner pipes are connected with a refrigerating machine (*see* REFRIGERATION) and brine at a temperature of 0° is passed down the inner pipes and up through the outer pipes. The cold solution rising in the large pipes absorbs the heat from the surrounding watery soil, freezing concentrically round each pipe. The frozen masses finally join (in say 3 to 4 weeks), forming an unbroken wall. The enclosed soft soil may then be excavated by dredging. Generally freezing is continued until the solidification reaches the centre and to some distance beyond the circle of pipes, after which the frozen ground is drilled and blasted and the shaft is lined. This process has been successfully employed in stages to depths of about 2,000 ft. Nearly 100 shafts have been sunk by this process. In 1924 two shafts were sunk in Belgium by freezing to 2,025 ft. at a cost, including lining, of £230 per foot.

The cementation process (grouting) is applicable for both fissured rock and soft ground carrying much water, and has been used successfully in sinking a number of shafts, chiefly in Great Britain, Belgium and South Africa. Some of this work has been at depths of 1,200 to 1,600 ft. The process consists in injecting cement grout, under pressures of 1,000 to 3,000 lb. per sq.in., through boreholes into the watery strata. The cement on setting consolidates the ground, which is then drilled and blasted with little trouble from water. Two methods are employed: (1) the boreholes are put down inside of the perimeter of the projected shaft; (2) the boreholes are outside of the perimeter, as for the freezing process. In the first method the ground is treated to a predetermined depth, the shaft being sunk and lined to that depth, after which another set of holes is drilled from the shaft bottom to a greater depth and the process repeated.

SHAGALL, MARC (1888–), Russian painter, was born in Vitebsk, of a family of Jewish artisans. He became a pupil of Leon Bakst in St. Petersburg. He went to Paris in 1910, where he exhibited in the "Salon des Indépendants." Under the influence of cubism he painted a series of fantastic pictures, in which he showed extraordinary gifts for colour. He was in Russia from 1914 to 1922, when he went to Berlin and later settled in Paris. He engraved a cycle of prints entitled "My Life," and made a series of 100 etchings to illustrate Gogol's *Dead Souls.* Exhibitions of Shagall's work have been held in Paris, Berlin and other German cities and New York.

SHAGĪA (SHAIGIA, SHAIKĪYEH), a tribe of Semitic origin living on both banks of the Nile from Korti to the Third Cataract, and in parts of the Bayuda desert and partly nomad, partly agricultural. They claim descent from one Shayig Ibn Hamaidan of the Beni Abbas, and came from Arabia at the conquest of Egypt in the 7th century. Settled originally south of their present country they moved northward after 1772. For their services in the suppression of the Jā'alin revolt (1822), they obtained lands between Shendi and Khartum. At that time they were far more civilized than the neighbouring tribes. They had schools in which all Muslim science was taught, and were rich in corn and cattle. Their fighting men, mounted on horses of the Dongola breed, were feared throughout the eastern Sudan. Their chiefs wore coats of mail and carried shields of hippopotamus or crocodile skin. Their arms were lance, sword or javelin. The Shagīa are divided into twelve clans. They speak Arabic and generally preserve the Semitic type, though they are obviously of very mixed blood. The typical Shagīa has a sloping forehead, aquiline nose and receding chin. They gash the chests of their children.

See *Anglo-Egyptian Sudan,* edited by Count Gleichen (1905); A. H. Keane, *Ethnology of the Egyptian Sudan* (1884).

SHAGREEN. A species of untanned leather with a roughened, granular surface. The word is the English form; *cf.* Ger. *Schagrin,* Fr. *chagrin,* Ital. *zagrin, zigrino;* these are usually referred to Turkish and Persian *saghri,* lit. the back of a horse, and so applied to leather made from this part. The skin of the wild ass was especially used. The method of preparing the skins to secure the rough, granular surface is as follows. The seeds of a plant, usually some species of *Chinopodium,* are embedded in the skin while soft; the surface is then shaved down and soaked in water, when the edges of the indentations swell up. The leather is then dyed, green being a favourite colour. Shagreen is now commonly made of the skins of sharks and rays; the placoid scales of the shark skin giving the necessary roughened surface. Shagreen is used as an ornamental leather for making pocket-books, small cases and the like, and for the handles of swords, daggers, etc.

SHAHABAD, a district of British India, in the Patna division of Bihar and Orissa; area, 4,373 sq.m.; pop. (1921) 1,816,821. To the north is an alluvial flat constituting about three-fourths of the district, closely cultivated and thickly populated. The southern portion is occupied by the Kaimur hills, a branch of the great Vindhyan range. These hills consist of an undulating plateau largely covered with jungle, about 800 sq.m. in area; at Rohtasgarh they attain a height of 1,490 ft. above sea-level. The chief rivers are the Ganges and the Son, which unite in the north-eastern corner of Shahabad, and the Karamnasa, which divides it from the United Provinces. The chief crops are rice, millets, wheat, pulses, oilseeds, and sugar-cane. Shahabad is protected against drought by a system of canals which obtains its supply of water from the Son at Dehri, where a weir or *anicut,* 2½ m. long, has been built across the broad bed of the river; the irrigated area averages about 500,000 acres. The district is traversed by the main line of the East Indian railway, by the Grand Chord line which crosses the Son at Dehri-on-Son, and by two light railways, one connecting Arrah and Sasaram, the other Dehri and Rohtasgarh. The northern part of Shahabad is known as Bhojpur, which has given its name to a dialect of the Bihari language. Its inhabitants, the Bhojpuri, were formerly notorious for turbulence and predatory habits. Before 1857 they were recruited largely for the army, and during the Mutiny they broke out into a rebellion which was not put down till the end of 1858. There was an outbreak of lawlessness among the Hindus of this area in 1917, when they attacked their Mohammedan neighbours, pillaged 139 villages and were only checked by the use of military force. The administrative headquarters are at Arrah.

SHAH ALAM (1728–1806), Mogul emperor of Delhi, son of Alamgir II., was born on June 15, 1728, and was originally known as the Shahzada Ali Gohar. Being proclaimed a rebel by his father, he fled to Shuja-ud-Dowlah, wazir of Oudh, and on the death of his father in 1759 assumed the name of Shah Alam. He joined Shuja-ud-Dowlah against the British, but after his defeat at the battle of Buxar, he sought British protection. In 1765 he granted the *diwani* (superintendence of the revenue) of Bengal to Lord Clive for the East India Company in return for a payment of 26 lakhs a year. In 1771 he fell into the power of the Mahrattas, was installed emperor of Delhi, and lost the British subsidy. In 1788 the Rohilla chief Ghulam Kadir seized Delhi and put out Shah Alam's eyes. Sindhia restored him to the throne, and after the Mahratta war of 1803 he was again taken under British protection. He died on Nov. 10, 1806. (*See* also INDIA: *History.*)

See W. Francklin, *History of the Reign of Shah Alam* (Calcutta, 1798).

SHAH JAHAN (*fl.* 1627–1658), Mogul emperor of Delhi, the fifth of the dynasty. After revolting against his father Jahangir, as the latter had revolted against Akbar, he succeeded to the throne on his father's death in 1627. It was during his reign that the Mogul power attained its greatest prosperity. The chief events of his reign were the destruction of the kingdom of Ahmadnagar (1636), the loss of Kandahar to the Persians (1653), and a second war against the Deccan princes (1655). In 1658 he fell ill, and was confined by his son Aurangzeb in the citadel of Agra until his death in 1666. The period of his reign was the golden age of Indian architecture. Shah Jahan erected many splendid monuments, the most famous of which is the Taj Mahal at Agra, built as a tomb for his wife Mumtaz Mahal; while the Pearl Mosque at Agra and the palace and great mosque at Delhi also commemorate him. The celebrated "Peacock Throne," said

to have been worth £6,000,000, also dates from his reign; and he was the founder of the modern city of Delhi, the native name of which is Shahjahanabad.

SHAHJAHANPUR, a city and district of British India, in the Bareilly division of the United Provinces. The city is on the left bank of the river Deoha, and is a military cantonment. Pop. (1921), 72,616. It was founded in 1647 during the reign of Shah Jahan, whose name it bears, by Nawab Bahadur Khan, a Pathan. His mosque is the only building of antiquarian interest.

The District of Shahjahanpur has an area of 1,726 sq.m. It consists of a long and narrow tract running up from the Ganges towards the Himalayas, and is for the most part level. The principal rivers are the Gumti, Khanaut, Garai and Ramganga. To the north-east waste and forest preponderate over cultivated land. Between the Gumti and the Khanaut the country varies from a rather wild and unhealthy northern region to a densely inhabited tract in the south, with a productive soil cultivated with sugar-cane and other remunerative crops. From the Ramganga to the Ganges in the south is a continuous low country of marshy patches, alternating with a hard clayey soil that requires much irrigation in parts. In 1921 the population was 839,115.

Shahjahanpur was ceded to the English by the nawab of Oudh in 1801.

SHA-HO, BATTLE OF THE. This was the second of the three great battles which marked the main advance of the Japanese armies in Manchuria during the Russo-Japanese War, and is described under that heading. It was the only one in which the Russians succeeded in taking the offensive. The real battle was joined on Oct. 11, 1904, and ended on the 13th, with Kuropatkin's suspension of the Russian offensive, but fighting continued until the 18th as the Russians were first pressed back, then attempted a fresh offensive, and abandoned their effort after heavy losses.

SHAHPUR, a town and district of British India, in the Punjab. The town is near the left bank of the river Jhelum. The district of Shahpur has an area of 4,476 sq.m. Its most important physical subdivisions are the Salt range in the north, the valleys of the Chenab and Jhelum, and the plains between those rivers and between the Jhelum and the Salt range. In 1921 the population was 719,918. The chief commercial centre is Bhera. The district is traversed by two branches of the North-Western railway.

Shahpur passed into the hands of the English along with the rest of the Punjab in 1849. Since the introduction of irrigation from the Lower Jhelum Canal in 1901 the character of the district south of the Jhelum has entirely altered and the headquarters of the district has been transferred to the Colony town of Sargodha (pop. 17,728).

SHAH SHUJA (1780?–1842), king of Afghanistan, was the son of Timur Shah, and grandson of Ahmad Shah, founder of the Durani dynasty. After conspiracies that caused the dethronement of two brothers, Taman Shah and Mahmud Shah, he became king in 1803. He was, however, in his turn driven out of Afghanistan in 1809 by Mahmud Shah, and found refuge and a pension in British territory. Distrusting the attitude of the Amir Dost Mahommed towards Russia, Lord Auckland in 1839 attempted to restore Shah Shuja to the throne against the wishes of the Afghan people. This policy led to the disastrous first Afghan War. After the retreat of the British troops from Kabul, Shah Shuja shut himself up in the Bala Hissar. He left this retreat on April 5, 1842, and was immediately killed by the adherents of Dost Mahommed and his son Akbar Khan.

SHAIKIA: *see* Arabs.

SHAKERS, an American celibate and communistic sect, known as "The United Society of Believers in Christ's Second Appearing" and as "The Millennial Church." Some of the leaders prefer the name "Alethians," for they consider themselves children of the truth. The society had its beginning in a Quaker revival in England (1747) which resulted in the organization of a sect of which Jane and James Wardley were the leaders. They were succeeded by Ann Lee. The distinctive merit of celibacy became an original tenet of the Shakers in England. They did not prohibit marriage but refused to accept it as a Christian institution and considered it less perfect than the celibate state.

Under stress of persecution and in response to a revelation, "Mother" Ann led a band of six men and two women to America. They arrived in New York city on Aug. 6, 1774, and after two years' stay there, settled in the woods of Watervliet, not far from Albany, N.Y. In 1780 there was a religious revival in New Lebanon, N.Y., and some of the converts became disciples of Ann Lee. At this place, in 1787, the first Shaker society in the United States was organized; the society at Watervliet organized immediately afterwards. Ann Lee went from place to place preaching her new doctrine and became known as a faith-healer. At the time of her death (1784) she had disciples in New York, Massachusetts and Connecticut.

A group of Shakers came out of the Kentucky revival of 1800–02. The community at Mount Lebanon, N.Y. sent three of their number to Kentucky to bear witness to the people. Though at first bitterly opposed, these Shaker preachers made a sufficient number of converts to found five societies, "two in Ohio, two in Kentucky and one in Indiana." In 1894 the Mount Lebanon Society, N.Y., founded a colony at Narcoosee, Fla., called the Union Village Society. In 1910 it went into the hands of a receiver.

The Shakers held that God was both male and female, that Adam, having been created in the image of God, had in him the nature of both sexes, that even angels and spirits are both male and female. Christ, they believe, was one of the superior spirits and appeared in Jesus, the son of a Jewish carpenter, representing the male principle. In Mother Ann, daughter of an English blacksmith, the female principle in Christ was manifested, and in her the promise of the Second Coming was fulfilled. Christ's kingdom on earth began with the establishment of the Shaker Church.

The practical ideals of the community are the common possession of property, a life of celibacy, confession of sin, without which no one can become a member of the community, power over physical disease, and separation from the world. Disease they regard as a sin against God. Their separateness from the world is indicated by their manner of living in families of 30 to 90 individuals. Each family has its own house, the storeys being divided between the men and women. They make no room for adornments in the way of pictures or other works of art. In their prescribed mode of dress for men and women, they also protest against the fashions of a vain world. For a time they made their own clothing and wove their own cloth. They made leather in New York for several years; but were more successful in selling herbs and garden seeds, and in making apple sauce, weaving linen and knitting underwear. Many of them, however, considered it a mistake to have left agriculture and entered into manufacturing.

In 1874 there were 58 Shaker communities with 2,415 souls, owning 100,000 ac. of land; in 1905 the membership was reduced to about 1,000.

Ri.)

SHAKESPEARE, WILLIAM (1564–1616), English poet, player and playwright, was baptized in the parish church of Stratford-on-Avon in Warwickshire on April 26, 1564. The exact date of his birth is not known. Two 18th-century antiquaries, William Oldys and Joseph Greene, gave it as April 23, but without quoting authority for their statements, and the fact that April 23 was the day of Shakespeare's death in 1616 suggests a possible source of error. In any case his birthday cannot have been later than April 23, since the inscription upon his monument is evidence that on April 23, 1616, he had already begun his 53rd year. His father, John Shakespeare, was a burgess of the recently constituted corporation of Stratford, and had already filled certain

minor municipal offices. From 1561 to 1563 he had been one of the two chamberlains to whom the finance of the town was entrusted. Aubrey (1681) called him a butcher and Rowe (1709) a wool-dealer, but it is clear from formal documents that by occupation he was a glover, although he appears to have dealt from time to time in various kinds of agricultural produce, such as barley, timber and wool. He is also described as a yeoman, and it is possible that he combined a certain amount of farming with the practice of his trade. He was living in Stratford as early as 1552, in which year he was fined for having a dunghill in Henley street, but he does not appear to have been a native of the town, in whose records the name is not found before his time; and he may reasonably be identified with a John Shakespeare of Snitterfield, who administered the goods of his father, Richard Shakespeare, in 1561. Snitterfield is a village in the immediate neighbourhood of Stratford, and here Richard Shakespeare had been settled as a farmer since 1529. He may have come from Hampton Corley in Budbrooke, where a Richard Shakespeare is on the subsidy roll for 1525. It is probable that John Shakespeare carried on the farm for some time after his father's death, and possible that by 1570 he had acquired a small holding called Ingon in Hampton Lucy. But the Snitterfield farm seems to have passed subsequently to his brother Henry, who was buried there in 1596. There were also at Snitterfield a Thomas Shakespeare and an Anthony Shakespeare, who seems to have moved to Hampton Corley; and these may have been of the same family. A John Shakespeare, who dwelt at Clifford Chambers, another village close to Stratford, is clearly distinct. Strenuous efforts have been made to trace Shakespeare's genealogy beyond Richard of Snitterfield, but so far without success. Certain drafts of heraldic grants of the Shakespeare arms speak, in one case of John Shakespeare's grandfather, in another of his great-grandfather, as having been rewarded with lands and tenements in Warwickshire for service to Henry VII. No such grants, however, have been traced, and even in the 16th century statements as to "antiquity and service" in heraldic preambles were looked upon with suspicion.

The name Shakespeare is extremely widespread, and is spelt in an astonishing variety of ways. The verdict of competent palaeographers is to the effect that Shakespeare himself, in the extant examples of his signature, generally wrote "Shakspere" in full or in an abbreviated form, but possibly, in the main signature to his will, "Shakspeare." In the printed signatures to the dedications of his poems, on the title-pages of nearly all the contemporary editions of his plays that bear his name, and in many formal documents it appears as Shakespeare. This may be in part due to the martial derivation which the poet's literary contemporaries were fond of assigning to his name, and which is acknowledged in the arms that he bore. Certain forms often used at Stratford, however, such as Shaxpere and Schackspere, suggest a short pronunciation of the first syllable, and thus tend to support Dr. Henry Bradley's derivation from the Anglo-Saxon personal name, Seaxberht. It is interesting, and even amusing, to record that in 1487 Hugh Shakspere of Merton college, Oxford, changed his name to Sawndare, because his former name *vile reputatum est.* The earliest record of a Shakespeare that has yet been traced is in 1248 at Clapton in Gloucestershire. The name also occurs during the 13th century in Kent, Essex and Surrey, and during the 14th in Cumberland, Yorkshire, Cheshire, Nottinghamshire, Essex, Warwickshire and as far away as Youghal in Ireland. Thereafter it is found in London and most of the English counties, particularly those of the midlands; and nowhere more freely than in Warwickshire. There were Shakespeares in Warwick and in Coventry, as well as around Stratford; and the clan appears to have been very numerous in a group of villages about 12 miles north of Stratford, which includes Baddesley Clinton, Wroxall, Rowington, Haseley, Hatton, Lapworth, Packwood, Balsall and Knowle. William was in common use as a personal name, and Williams from more than one other family have from time to time been confounded with the dramatist. Many Shakespeares are upon the register of the gild of St. Anne at Knowle from about 1457 to about 1526. Amongst these were Isabella Shakespeare, prioress of the Benedictine convent of Wroxall, and Jane Shakespeare, a nun of the same convent. Shakespeares are also found as tenants on the manors belonging to the convent, and at the time of the Dissolution in 1534 one Richard Shakespeare was its bailiff and collector of rents. Conjectural attempts have been made on the one hand to connect the ancestors of this Richard Shakespeare with a family of the same name who held land by military tenure at Baddesley Clinton in the 14th and 15th centuries, and on the other to identify him with the poet's grandfather, Richard Shakespeare of Snitterfield. But Shakespeares are to be traced at Wroxall nearly as far back as at Baddesley Clinton, and Richard the bailiff seems to have retired to a farm at Haseley, which he had held since 1523. Probably he died there about 1558. It is not likely that he had also since 1529 been farming land at Snitterfield.

With the breaking of this link, the hope of giving Shakespeare anything more than a grandfather on the father's side must be laid aside for the present. On the mother's side he was connected with a family of some distinction. Part at least of Richard Shakespeare's land at Snitterfield was held from Robert Arden of Wilmcote in the adjoining parish of Aston Cantlow, probably a cadet of the Ardens of Parkhall, who counted amongst the leading gentry of Warwickshire. Robert Arden married his second wife, Agnes Hill, formerly Webbe, in 1548, and had then no less than eight daughters by his first wife. To the youngest of these, Mary Arden, he left in 1556 a freehold in Aston Cantlow consisting of a farm of about 50 or 60 acres in extent, known as Asbies. It is possible that he had already settled upon her other property in Wilmcote. At some date later than Nov. 1556, and probably before the end of 1557, Mary Arden became the wife of John Shakespeare. In Oct. 1556 John Shakespeare had bought two freehold houses, one in Greenhill street, the other in Henley street. The latter, known as the wool shop, was the easternmost of the two tenements now combined in the so-called Shakespeare's birthplace. The western tenement, locally regarded as the birthplace proper, may have been already in John Shakespeare's hands, as he seems to have been living in Henley street in 1552. It has sometimes been thought to have been one of two houses which formed a later purchase in 1575, but there is no evidence that these were in Henley street at all.

William Shakespeare was not the first child. A Joan was baptized in 1558 and a Margaret in 1562. The latter was buried in 1563 and the former must also have died young, although her burial is not recorded, as a second Joan was baptized in 1569. A Gilbert was baptized in 1566, an Anne in 1571, a Richard in 1574 and an Edmund in 1580. Anne died in 1579; Edmund, who, like his brother, became an actor, in 1607; Gilbert in 1612; Richard in 1613. Tradition has it that a relative of Shakespeare's used to visit London in the 17th century as quite an old man. One form of this makes him a brother, which is impossible.

During the years that followed his marriage, John Shakespeare became prominent in Stratford life. In 1565 he was chosen as an alderman, and in 1568 he held the chief municipal office, that of high bailiff. This carried with it the dignity of justice of the peace. John Shakespeare seems to have contemplated the assumption of arms, and usually appears in corporation documents as "Mr." Shakespeare, whereby he may be distinguished from another John Shakespeare, a "corviser" or shoemaker, who dwelt in Stratford about 1586–92. In 1571 as an ex-bailiff he began another year of office as chief alderman.

One may think, therefore, of Shakespeare in his boyhood as the son of one of the leading citizens of a not unimportant provincial market-town, with a vigorous life of its own, which, in spite of the dunghills, was probably not much unlike the life of a similar town to-day, and with constant reminders of its past in the shape of the stately buildings formerly belonging to its college and its gild, both of which had been suppressed at the Reformation. Stratford stands on the Avon, in the midst of an agricultural country, throughout which in those days enclosed orchards and meadows alternated with open fields for tillage, and not far from the wilder and wooded district known as the Forest of Arden. The middle ages had left it an heritage in the shape of a

free grammar-school, and here it is natural to suppose that William Shakespeare obtained a sound enough education, with a working knowledge of "Mantuan" and Ovid in the original, even though to such a thorough scholar as Ben Jonson it might seem no more than "small Latin and less Greek." In 1577, when Shakespeare was about 13, his father's fortunes began to take a turn for the worse. He became irregular in his contributions to town levies, and had to give a mortgage on property of his wife at Wilmcote as security for a loan from her brother-in-law, Edmund Lambert. Money was raised to pay this off, partly by the sale of a small interest in land at Snitterfield which had come to Mary Shakespeare from her sisters, partly perhaps by that of the Greenhill street house and other property in Stratford outside Henley street, none of which seems to have ever come into William Shakespeare's hands. Lambert, however, refused to surrender the mortgage on the plea of older debts, and an attempt to recover the Wilmcote property by litigation proved ineffectual. John Shakespeare's difficulties increased. He had long ceased to attend the meetings of the corporation, and as a consequence he was removed in 1586 from the list of aldermen. In this state of domestic affairs it is not likely that Shakespeare's school life was unduly prolonged. The chances are that he was apprenticed to some local trade. Aubrey says that he killed calves for his father, and "would do it in a high style, and make a speech."

Marriage.—Whatever his circumstances, they did not deter him at the early age of 18 from the adventure of marriage. Rowe recorded the name of Shakespeare's wife as Hathaway, and Joseph Greene succeeded in tracing her to a family of that name dwelling in Shottery, one of the hamlets of Stratford. Her monument gives her first name as Anne, and her age as 67 in 1623. She must, therefore, have been about eight years older than Shakespeare. Various small trains of evidence point to her identification with the daughter Agnes mentioned in the will of a Richard Hathaway of Shottery, who died in 1581, being then in possession of the farmhouse now known as "Anne Hathaway's Cottage." Agnes was legally a distinct name from Anne, but there can be no doubt that ordinary custom treated them as identical. The principal record of the marriage is a bond dated Nov. 28, 1582, and executed by Fulk Sandells and John Richardson, two yeomen of Stratford who also figure in Richard Hathaway's will, as a security to the bishop for the issue of a licence for the marriage of William Shakespeare and "Anne Hathwey of Stratford," upon the consent of her friends, with one asking of the banns. There is no reason to suppose, as has been suggested, that the procedure adopted was due to dislike of the marriage on the part of John Shakespeare, since, the bridegroom being a minor, it would not have been in accordance with the practice of the bishop's officials to issue the licence without evidence of the father's consent. The explanation probably lies in the fact that Anne was already with child, and in the near neighbourhood of Advent, within which marriages were prohibited, so that the ordinary procedure by banns would have entailed a delay until after Christmas. A kindly sentiment has suggested that some form of civil marriage, or at least contract of espousals, had already taken place, so that a canonical marriage was really only required in order to enable Anne to secure the legacy left her by her father "at the day of her marriage." But such a theory is not rigidly required by the facts. It is singular that, upon the day before that on which the bond was executed, an entry was made in the bishop's register of the issue of a licence for a marriage between William Shakespeare and "Annam Whateley de Temple Grafton." Of this it can only be said that the bond, as an original document, is infinitely the better authority, and that a scribal error of "Whateley" for "Hathaway" is quite a possible solution. Temple Grafton may have been indicated in the licence as the place of marriage, although Worcester licences usually named the place of residence of the bride. There are no contemporary registers for Temple Grafton, and there is no entry of the marriage in those for Stratford-on-Avon. There is a tradition that such a record was seen during the 19th century in the registers for Luddington, a chapelry within the parish, which are now destroyed. Shakespeare's first child, Susanna, was baptized on May 26, 1583, and was followed on Feb. 2, 1585, by twins, Hamnet and Judith.

Departure from Stratford.—In or after 1584 Shakespeare's career in Stratford seems to have come to a tempestuous close. An 18th century story of a drinking-bout in a neighbouring village is of no importance, except as indicating a local impression that a distinguished citizen had had a wildish youth. But there is a tradition which comes from a double source and which there is no reason to reject in substance, to the effect that Shakespeare got into trouble through poaching on the estates of a considerable Warwickshire magnate, Sir Thomas Lucy, and found it necessary to leave Stratford in order to escape the results of his misdemeanour. It is added that he afterwards took his revenge on Lucy by satirizing him as the Justice Shallow, with the dozen white louses in his old coat, of *The Merry Wives of Windsor*. From this event until he emerges as an actor and rising playwright in 1592 his history is a blank, and it is impossible to say what experience may not have helped to fill it. Much might indeed be done in eight years of crowded Elizabethan life. Conjecture has not been idle, and has assigned him in turns during this or some other period to the occupations of a scrivener, an apothecary, a dyer, a printer, a soldier and the like. The suggestion that he saw military service rests largely on a confusion with another William Shakespeare of Rowington. Aubrey had heard that "he had been in his younger years a schoolmaster in the country." The mention in *Henry IV.* of certain obscure yeomen families, Visor of Woncote and Perkes of Stinchcombe Hill, near Dursley in Gloucestershire, has been thought to suggest a sojourn in that district, where indeed Shakespeares were to be found from an early date. Ultimately, of course, he drifted to London and the theatre, where, according to the stage tradition, he found employment in a menial capacity, perhaps even as a holder of horses at the doors, before he was admitted into a company as an actor and so found his way to his true vocation as a writer of plays. Malone thought that he might have left Stratford with one of the travelling companies of players which from time to time visited the town. Later biographers have fixed upon Leicester's men, who were at Stratford in 1586–87, and have held that Shakespeare remained to the end in the same company, passing with it on Leicester's death in 1588 under the patronage of Ferdinando, Lord Strange and afterwards earl of Derby, and on Derby's death in 1594 under that of the lord chamberlain, Henry Carey, Lord Hunsdon. This theory hardly takes sufficient account of the shifting combinations and recombinations of actors, especially during the disastrous plague years of 1592 to 1594. It is not possible to establish a continuity between Strange's company and Leicester's, and while the names of many members of Strange's company in and about 1593 are on record, Shakespeare's is not amongst them. It is at least possible, as will be seen later, that he had about this time relations with the earl of Pembroke's men, or with the earl of Sussex's men, or with both of these organizations.

Earliest Writings.—What is clear is that by the summer of 1592, when he was 28, he had begun to emerge as a playwright, and had evoked the jealousy of one at least of the group of scholar poets who in recent years had claimed a monopoly of the stage. This was Robert Greene, who, in an invective on behalf of the play-makers against the play-actors which forms part of his *Groats-worth of Wit,* speaks of "an upstart Crow, beautified with our feathers, that with his *Tygers heart wrapt in a Players hide,* supposes he is as well able to bumbast out a blank verse as the best of you: and being an absolute *Iohannes fac totum,* is in his owne conceit the onely Shake-scene in a countrie." The play upon Shakespeare's name and the parody of a line from *Henry VI.* make the reference unmistakable. The London theatres were closed first through riots and then through plague, from June 1592 to April 1594, with the exception of about a month at each Christmas during that period; and the companies were dissolved or driven to the provinces. Even if Shakespeare had been connected with Strange's men during their London seasons of 1592 and 1593, it does not seem that he travelled with them. Other activities may have been sufficient to occupy the interval. The most important of these was probably an attempt to win

a reputation in the world of non-dramatic poetry. *Venus and Adonis* was published about April 1593, and *Lucrece* about May 1594. The poems were printed by Richard Field, in whom Shakespeare would have found an old Stratford acquaintance; and each has a dedication to Henry Wriothesley, earl of Southampton, a brilliant and accomplished favourite of the court, still in his nonage. A possibly super-subtle criticism discerns an increased warmth in the tone of the later dedication, which is supposed to argue a marked growth of intimacy. The fact of this intimacy is vouched for by the story handed down from Sir William Davenant to Rowe (who published in 1709 the first regular biography of Shakespeare) that Southampton gave Shakespeare £1,000 "to enable him to go through with a purchase which he heard he had a mind to." The date of this generosity is not specified, and there is no known purchase by Shakespeare which can have cost anything like the sum named. The mention of Southampton leads naturally to the most difficult problem which a biographer has to handle, that of the *Sonnets*. But this will be more conveniently taken up at a later point, and it is only necessary here to put on record the probability that the earliest of the sonnets belong to the period now under discussion. There is a surmise, which is not in itself other than plausible, and which has certainly been supported with a good deal of ingenious argument, that Shakespeare's enforced leisure enabled him to make of 1593 a *Wanderjahr,* and in particular that the traces of a visit to northern Italy may be seen in the local colouring of *Lucrece* as compared with *Venus and Adonis,* and in that of the group of plays which may be dated in or about 1594 and 1595 as compared with those that preceded. It must, however, be borne in mind that, while Shakespeare may perfectly well, at this or at some earlier time, have voyaged to Italy, and possibly Denmark and even Germany as well, there is no direct evidence to rely upon, and that inference from internal evidence is a dangerous guide when a writer of so assimilative a temperament as that of Shakespeare is concerned.

Connection with the Chamberlain's Company of Actors.—From the reopening of the theatres in the summer of 1594 onwards Shakespeare's status is in many ways clearer. He had certainly become a leading member of the Chamberlain's company by the following winter, when his name appears for the first and only time in the treasurer of the chamber's accounts as one of the recipients of payment for their performances at court; and there is every reason to suppose that he continued to act with and write for the same associates to the close of his career. The history of the company may be briefly told. At the death of the lord chamberlain on July 22, 1596, it passed under the protection of his successor, George, 2nd Lord Hunsdon, and once more became "the Lord Chamberlain's men" when he was appointed to that office on March 17, 1597. James I. on his accession took this company under his patronage as grooms of the chamber, and during the remainder of Shakespeare's connection with the stage they were "the King's men." The records of performances at court show that they were by far the most favoured of the companies, their nearest rivals being the company known during the reign of Elizabeth as "the Admiral's," and afterwards as "Prince Henry's men." From the summer of 1594 to March 1603 they appear to have played almost continuously in London, although they undertook a provincial tour during the autumn of 1597, when the London theatres were for a short time closed owing to the interference of some of the players in politics. They travelled again during 1603 when the plague was in London, and during at any rate portions of the summers or autumns of most years thereafter. In 1594 they were playing at Newington Butts, and probably afterwards at the Cross Keys in the city. It is natural to suppose that in later years they used the Theatre in Shoreditch, since this was the property of James Burbadge, the father of their principal actor, Richard Burbadge. The Theatre was pulled down in 1598, and, after a short interval during which the company may have played at the Curtain, also in Shoreditch, Richard Burbadge and his brother Cuthbert rehoused them in the Globe on Bankside, built in part out of the materials of the Theatre. Here the profits of the enterprise were divided between the members of the company as such and the owners of the building as "housekeepers," and shares in the "house" were held by Shakespeare and some of his leading "fellows." About 1608 another playhouse became available for the company in the "private" or winter house of the Blackfriars. This was also the property of the Burbadges, but had previously been leased to a company of boy players. A somewhat similar arrangement as to profits was made.

Shakespeare is reported by Aubrey to have been a good actor, but Adam in *As You Like It,* and the Ghost in *Hamlet* indicate the type of part which he played. As a dramatist, however, he was the mainstay of the company for at least some 15 years, during which Ben Jonson, Dekker, Beaumont and Fletcher, and Tourneur also contributed to their repertory. On an average he must have written for them about two plays a year, although his rapidity of production seems to have been greatest during the opening years of the period. He sometimes took his plots from earlier plays, but any theory which represents him as largely a "patcher" of the work of other men, or of his own, is open to grave doubt. Similarly, while the texts of his plays contain some theatrical interpolations, there is no reason to suppose that they were substantially revised by other hands before the Restoration. Occasionally he may have entered into collaboration, as, for example, at the end of his career, with Fletcher.

Stratford Affairs.—In a worldly sense he clearly flourished, and about 1596, if not earlier, he was able to resume relations as a moneyed man with Stratford-on-Avon. There is no evidence to show whether he had visited the town in the interval, or whether he had brought his wife and family to London. His son Hamnet died and was buried at Stratford in 1596. During the last ten years John Shakespeare's affairs had remained unprosperous. He incurred debts, partly through becoming surety for his brother Henry; and in 1592 his name was included in a list of recusants dwelling at or near Stratford-on-Avon, with a note by the commissioners that in his case the cause was believed to be the fear of process for debt. There is no reason to doubt this explanation, or to seek a religious motive in John Shakespeare's abstinence from church. William Shakespeare's purse must have made a considerable difference. The prosecutions for debt ceased, and in 1597 a fresh action was brought in Chancery for the recovery of the Wilmcote property from the Lamberts. Like the last, it seems to have been without result. Another step was taken to secure the dignity of the family by an application in the course of 1596 to the heralds for the confirmation of a coat of arms said to have been granted to John Shakespeare while he was bailiff of Stratford. The bearings were *or* on a bend *sable* a spear *or* steeled *argent,* the crest a falcon his wings displayed *argent* supporting a spear *or* steeled *argent,* and the motto *Non sanz droict.* The grant was duly made, and in 1599 there was a further application for leave to impale the arms of Arden, in right of Shakespeare's mother. No use, however, of the Arden arms by the Shakespeares can be traced. In 1597 Shakespeare made an important purchase for £60 of the house and gardens of New Place in Chapel street. This was one of the largest houses in Stratford, and its acquisition an obvious triumph for the ex-poacher. Presumably John Shakespeare ended his days in peace. A visitor to his shop remembered him as "a merry-cheekt old man" always ready to crack a jest with his son. He died in 1601, and his wife in 1608, and the Henley street houses passed to Shakespeare. Aubrey records that he paid annual visits to Stratford, and there is evidence that he kept in touch with the life of the place. The correspondence of his neighbours, the Quineys, in 1598 contains an application to him for a loan to Richard Quiney upon a visit to London, and a discussion of possible investments for him in the neighbourhood of Stratford. In 1602 he took, at a rent of 2s. 6d. a year, a copyhold cottage in Chapel lane, perhaps for the use of his gardener. In the same year he invested £320 in the purchase of an estate consisting of 107 acres in the open fields of Old Stratford, together with 20 acres of pasture and common rights; and in 1605 he spent another £440 in the outstanding term of a lease of certain tithes in Stratford parish, which brought in an income of about £60 a year.

London Associations.—Meanwhile London remained his headquarters. Here Malone thought that he had evidence, now lost, of his residence in Southwark as early as 1596, and as late as 1608. It is known that payments of subsidy were due from him in 1597 and 1599 in the parish of St. Helen's, Bishopsgate, and that an arrear was ultimately collected in the liberty of the Clink. He had no doubt migrated from Bishopsgate when the Globe upon Bankside was opened by the Chamberlain's men. There is evidence that about 1604 he "lay," temporarily or permanently, in the house of Christopher Mountjoy, a tire-maker of French extraction, at the corner of Silver street and Monkwell street in Cripplegate. A note by Aubrey, if it really refers to Shakespeare (which is almost certain), is of value as throwing light not only upon his abode, but upon his personality. Aubrey seems to have derived it from William Beeston the actor. It is as follows: "The more to be admired q[uod] he was not a company keeper, lived in Shoreditch, wouldn't be debauched, & if invited to court; he was in paine." Against this testimony to the correctness of Shakespeare's morals are to be placed an anecdote of a tiring-house amour picked up by a Middle Temple student in 1602 and a Restoration scandal which made him the father by the hostess of the Crown tavern at Oxford, where he baited on his visits to Stratford, of Sir William Davenant, who was born in Feb. 1606. His credit at court is implied by Ben Jonson's references to his flights "that so did take Eliza and our James," and by stories of the origin of *The Merry Wives of Windsor* in Elizabeth's desire to see Falstaff in love, and of an autograph letter written to honour him by King James. It was noticed with some surprise by Henry Chettle that his "honied muse" dropped no "sable tear" to celebrate the death of the queen. Southampton's patronage may have introduced him to the brilliant circle that gathered round the earl of Essex, but there is no reason to suppose that he or his company were held personally responsible for the performance of *Richard II.* at the command of some of the followers of Essex as a prelude to the disastrous rising of Feb. 1601. The editors of the First Folio speak also of favours received by the author in his lifetime from William Herbert, earl of Pembroke, and his brother Philip Herbert, earl of Montgomery.

He appears to have been on cordial terms with his fellows of the stage. One of them, Augustine Phillips, left him a small legacy in 1605, and in his own will he paid a similar compliment to Richard Burbadge, and to John Heminge and Henry Condell, who afterwards edited his plays. His relations with Ben Jonson, whom he is said by Rowe to have introduced to the world as a playwright, have been much canvassed. Jests are preserved which, even if apocryphal, indicate considerable intimacy between the two. This is not inconsistent with occasional passages of arms. The anonymous author of *The Return from Parnassus* (2nd part: 1602), for example, makes Kempe, the actor, allude to a "purge" which Shakespeare gave Jonson, in return for his attack on some of his rivals in *The Poetaster.*[1] It has been conjectured that this purge was the description of Ajax and his humours in *Troilus and Cressida.* Jonson, on the other hand, who was criticism incarnate, did not spare Shakespeare either in his prologues or in his private conversation. He told Drummond of Hawthornden that "Shaksperr wanted arte." But the verses which he contributed to the First Folio are generous enough to make all amends, and in his *Discoveries* (1623–37), while regretting Shakespeare's excessive facility and the fact that he often "fell into those things, could not escape laughter," he declares him to have been "honest and of an open, and free nature," and says that, for his own part, "I lov'd the man and do honour his memory (on this side idolatry) as much as any." According to a memorandum-book (1661–63) of the Rev. John Ward (who became vicar of Stratford in 1662), Jonson and Michael Drayton, himself a Warwickshire poet, had been drinking with Shakespeare when he caught the fever of which he died; and Thomas Fuller (1608–61), whose *Worthies* was published in 1662, gives an imaginative description of the wit combats, of which many took place between the two mighty contemporaries.

[1]Kempe (speaking to Burbadge), "Few of the university men pen plays well. They smell too much of that writer Ovid and that writer (*sic*) Metamorphosis, and talk too much of Proserpina and Jupiter. Why here's our fellow Shakespeare puts them all down; aye, and Ben Jonson too. O that Ben Jonson is a pestilent fellow. He brought up Horace giving the Poets a pill, but our fellow Shakespeare hath given him a purge that made him beray his credit."

Contemporary Reputation.—Of Shakespeare's literary reputation during his lifetime there is ample evidence. He is probably neither the "Willy" of Spenser's *Tears of the Muses,* nor the "Aetion" of his *Colin Clout's Come Home Again.* But from the time of the publication of *Venus and Adonis* and *Lucrece* honorific allusions to his work both as poet and dramatist, and often to himself by name, come thick and fast from writers of every kind and degree. Perhaps the most interesting of these from the biographical point of view are those contained in the *Palladis Tamia,* a kind of literary handbook published by Francis Meres in 1598; for Meres not only extols him as "the most excellent in both kinds (*i.e.,* comedy and tragedy) for the state," and one of "the most passionate among us to bewaile and bemoane the perplexities of Love," but also takes the trouble to give a list of 12 plays already written, which serves as a starting-point for all modern attempts at a chronological arrangement of his work. It is moreover from Meres that we first hear of "his sugred sonnets among his private friends." Two of these sonnets were printed in 1599 in a volume of miscellaneous verse called *The Passionate Pilgrim.* This was ascribed upon the title-page to Shakespeare, but probably, so far as most of its contents were concerned, without justification. The bulk of Shakespeare's sonnets remained unpublished until 1609.

About 1610 Shakespeare seems to have left London, and entered upon the definite occupation of his house at New Place, Stratford. Here he lived the life of a retired gentleman, on friendly if satirical terms with the richest of his neighbours, the Combes, and interested in local affairs, such as a bill for the improvement of the highways in 1611, or a proposed enclosure of the open fields at Welcombe in 1614, which might affect his income or his comfort. He had his garden with its mulberry tree, and his farm in the immediate neighbourhood. His brothers Gilbert and Richard were still alive. His sister Joan had married William Hart, a hatter, and in 1616 was dwelling in one of his houses in Henley street. Of his daughters, the eldest, Susanna, had married in 1607 John Hall (d. 1635), a physician of some reputation. They dwelt in Stratford, and had one child, Elizabeth, born in 1608. The younger, Judith, married Thomas Quiney, a vintner, also of Stratford, two months before her father's death. At Stratford the last few of the plays may have been written, but it is reasonable to suppose that Shakespeare's connection with the king's company ended when the Globe was burnt down during a performance of *Henry VIII.* on June 29, 1613. Certainly his retirement did not imply an absolute break with London life. In 1613 he devised an *impresa,* or emblem, to be painted by Richard Burbadge, and worn in the tilt on Accession day by the earl of Rutland, who had been one of the old circle of Southampton and Essex. In the same year he purchased for £140 a freehold house in the Blackfriars, near the Wardrobe, once a gate-house to the lodging of the prior of Blackfriars. This was conveyed to trustees, apparently in order to bar the right which his widow would otherwise have had to dower. In 1615 this purchase involved Shakespeare in a lawsuit to obtain the surrender of the title-deeds. Richard Davis, a Gloucestershire clergyman of the end of the 17th century, reports that the poet "died a papist," and the statement deserves more attention than it has received from biographers. There is indeed little to corroborate it; for an alleged "spiritual testament" of John Shakespeare is of doubtful origin, and Davis's own words suggest a late conversion rather than an hereditary faith. On the other hand, there is little to refute it beyond an entry in the accounts of Stratford corporation for drink given in 1614 to "a preacher at the Newe Place."

Will.—Shakespeare made his will on March 25, 1616, apparently in some haste, as the executed deed is a draft with many erasures and interlineations. There were legacies to his daughter Judith Quiney and his sister Joan Hart, and remembrances to friends both in Warwickshire and in London; but the real estate was left to his daughter Susanna Hall under a strict entail which

points to a desire on the part of the testator to found a family. Shakespeare's wife, who had of course dower in most of the real estate, is only mentioned in an interlineation, by which the "second best bed with the furniture" was bequeathed to her. Much nonsense has been written about this, but it seems quite natural. The best bed was an important chattel, which would go with the house. The estate was after all not a large one. Aubrey's estimate of its annual value as £200 or £300 a year sounds reasonable enough, and John Ward's statement that Shakespeare spent £1,000 a year must surely be an exaggeration. The sum-total of his known investments amounts to £960. Sir Sidney Lee calculates that his theatrical income must have reached £600 a year, but this is a considerable overestimate; it can hardly have been more than about £200. It must be remembered that the purchasing value of money in the 17th century was many times greater than at present. Shakespeare's interest in the "houses" of the Globe and Blackfriars probably determined on or before his death.

A month after his will was signed, on April 23, 1616, Shakespeare died, and as a tithe-owner was buried in the chancel of the parish church. Some doggerel upon the stone that covers the grave has been assigned by local tradition to his own pen. A more elaborate monument, with a bust by the sculptor Gerard Johnson, was in due course set up on the chancel wall. Anne Shakespeare followed her husband on Aug. 6, 1623. The family was never founded. Shakespeare's granddaughter, Elizabeth Hall, made two childless marriages, the first with Thomas Nash of Stratford, the second with John, afterwards Sir John, Barnard of Abington Manor, Northants. His daughter Judith Quiney had three sons, all of whom had died unmarried by 1639. There were, therefore, no direct descendants of Shakespeare in existence after Lady Barnard's death in 1670. Those of his sister, Joan Hart, could, however, still be traced in 1864. On Lady Barnard's death the Henley street houses passed to the Harts, in whose family they remained until 1806. They were then sold, and in 1847 were bought for the public. They are now held with Anne Hathaway's Cottage at Shottery as the Birthplace Trust. Lady Barnard had disposed of the Blackfriars house. The rest of the property was sold under the terms of her will, and New Place passed, first to the Cloptons, who rebuilt it; then to the Rev. Francis Gastrell, who pulled it down in 1759. The site now forms a public recreation-ground, and hard by is a memorial building with a theatre (recently burnt, but to be replaced) in which performances of Shakespeare's plays are given annually in April. Both the Memorial and the Birthplace contain museums, in which books, documents and portraits of Shakespearian interest, together with relics of greater or less authenticity, are stored.

No letter or other writing in Shakespeare's hand can be proved to exist, with the exception of three signatures upon his will, one upon a deposition (May 11, 1612) in a lawsuit with which he was remotely concerned, and two upon deeds (March 10 and 11, 1613) in connection with the purchase of his Blackfriars house. A copy of Florio's translation of Montaigne (1603) in the British Museum, a copy of the Aldine edition of Ovid's *Metamorphoses* (1502) in the Bodleian, and a copy of the 1612 edition of Sir Thomas North's translation of Plutarch's *Lives of the Noble Grecians and Romaines* in the Greenock Library, have all been put forward with more or less plausibility as bearing his autograph name or initials, and, in the third case, a marginal note by him. Aubrey records that he was "a handsome, well-shap't man," and the lameness attributed to him by some writers has its origin only in a too literal interpretation of certain references to spiritual disabilities in the *Sonnets*.

The Plays.—A collection of *Mr. William Shakespeare's Comedies, Histories and Tragedies* was printed at the press of William and Isaac Jaggard, and issued by a group of booksellers in 1623. This volume is known as the First Folio. It has dedications to the earls of Pembroke and Montgomery, and to "the great Variety of Readers," both of which are signed by two of Shakespeare's "fellows" at the Globe, John Heminge and Henry Condell, and commendatory verses by Ben Jonson, Hugh Holland, Leonard Digges and an unidentified I.M. The Droeshout engraving forms part of the title-page. The contents include, with the exception of *Pericles,* all of the 37 plays now ordinarily printed in editions of Shakespeare's works. Of these 18 were here published for the first time. The other 18 had already appeared in one or more separate editions, known as the Quartos.

The following list gives the date of the First Quarto of each such play, and also that of any later Quarto which differs materially from the First.

The Quarto Editions

Titus Andronicus (1594).
2 Henry VI. (1594).
3 Henry VI. (1595).
Richard II. (1597, 1608).
Richard III. (1597).
Romeo and Juliet (1597, 1599).
Love's Labour's Lost (1598).
1 Henry IV. (1598).
2 Henry IV. (1600).
Henry V. (1600).
A Midsummer Night's Dream (1600).
The Merchant of Venice (1600).
Much Ado About Nothing (1600).
The Merry Wives of Windsor (1602).
Hamlet (1603, 1604).
King Lear (1608).
Troilus and Cressida (1609).
Othello (1622).

Entries in the *Register* of copyrights kept by the Company of Stationers indicate that editions of *As You Like It* and *Antony and Cleopatra* were contemplated but not published in 1600 and 1608 respectively.

The Quartos differ very much in character. Some of them contain texts which are practically identical with those of the First Folio; others show variations so material as to suggest that some alteration, generally by way of shortening for stage purposes, took place. A group of First Quartos, including *Romeo and Juliet, Henry V., The Merry Wives of Windsor* and *Hamlet,* are generally known as the "Bad" Quartos, and to these should possibly be added *King Lear,* and almost certainly 2, 3 *Henry VI.,* entitled in this form *The Contention betwixt the two Famous Houses of York and Lancaster.* These are mostly shortened versions. They are also textually corrupt, and have probably a "surreptitious" origin in "reports" of playhouse performances, printed without the consent of the theatrical companies who owned the plays. Some scholars have supposed that the reporting was done by shorthand, but in most cases a memorized reconstruction by an actor or prompter seems more likely. There are those who also believe that they represent "early versions" of the plays. A similar desire to exploit the commercial value of Shakespeare's reputation probably led to the appearance of his name or initials upon the title-pages of *Locrine* (1595), *Sir John Oldcastle* (1600), *Thomas Lord Cromwell* (1602), *The London Prodigal* (1605), *The Puritan* (1607), *A Yorkshire Tragedy* (1608) and *Pericles* (1609). It is not likely that, with the exception of the last three acts of *Pericles,* he wrote any part of these plays, some of which were not even produced by his company. They were not included in the First Folio of 1623, or in a reprint of it in 1632, known as the Second Folio; but all seven were appended to the second issue (1664) of the Third Folio (1663) and to the Fourth Folio of 1685. Shakespeare is named as joint author with John Fletcher on the title-page of *The Two Noble Kinsmen* (1634), and with William Rowley on that of *The Birth of Merlin* (1662); there is no reason for rejecting the former ascription or for accepting the latter. Late entries in the Stationers' *Register* assign to him *Cardenio* (with Fletcher), *Henry I.* and *Henry II.* (both with Robert Davenport), *King Stephen, Duke Humphrey* and *Iphis and Ianthe;* but none of these plays is now extant. Modern conjecture has attempted to trace his hand in other plays, of which *Arden of Feversham* (1592), *Edward III.* (1596), *Mucedorus* (1598) and *The Merry Devil of Edmonton* (1608) are the most important; it is quite possible that he may have had a share in *Edward III.* A play on *Sir Thomas More,* which has been handed down in manuscript, contains a number of passages interpolated in various handwritings; and a theory that one of those is in that of Shakespeare, and gives indications of his orthography and methods of composition, has been the subject of much recent discussion. There is much to be said for it, but it can hardly be regarded as securely established.

Chronology.—Unfortunately the First Folio does not give the dates at which the plays contained in it were written or produced; and the endeavour to supply this deficiency has been one

of the main preoccupations of more than a century of Shakespearian scholarship, since the pioneer essay of Edmund Malone in his *An Attempt to Ascertain the Order in which the Plays of Shakespeare were Written* (1778). The investigation is not a mere piece of barren antiquarianism, for on it depends the possibility of appreciating the work of the world's greatest poet, not as if it were an articulated whole like a philosophical system, but in its true aspect as the reflex of a vital and constantly developing personality. A starting-point is afforded by the dates of the Quartos and the entries in the Stationers' *Register* which refer to them, and by the list of plays already in existence in 1598 which is inserted by Francis Meres in his *Palladis Tamia* of that year, and which, while not necessarily exhaustive of Shakespeare's pre-1598 writing, includes *The Two Gentlemen of Verona, The Comedy of Errors, Love's Labour's Lost, A Midsummer Night's Dream, The Merchant of Venice, Richard II., Richard III., Henry IV., King John, Titus Andronicus* and *Romeo and Juliet,* as well as a mysterious *Love's Labour's Won,* which has been conjecturally identified with several plays, but most plausibly with *The Taming of the Shrew.* There is a mass of supplementary evidence, drawn partly from definite notices in other writings or in diaries, letters, account-books and similar records, partly from allusions to contemporary persons and events in the plays themselves, partly from parallels of thought and expression between each play and those near to it in point of time, and partly from considerations of style, including the so-called metrical tests, which depend upon an analysis of Shakespeare's varying feeling for rhythm at different stages of his career. The total result is certainly not a demonstration, but in the logical sense an hypothesis which serves to colligate the facts and is consistent with itself and with the known events of Shakespeare's external life.

The following table is an attempt to arrange the original dates of production of the plays according to the theatrical seasons, from autumn to autumn, in which they may have fallen. It is framed on the assumption that, as indeed John Ward tells us was the case, Shakespeare ordinarily wrote two plays a year; but some slackening of production in the later years seems probable. It will be understood that neither the order in which the plays are given nor the distribution of them over the years lays claim to more than approximate accuracy.

CHRONOLOGY OF THE PLAYS

1590–91
(1, 2) 2, 3, *Henry VI.*

1591–92
(3) 1 *Henry VI.*

1592–93
(4) *Richard III.*
(5) *Comedy of Errors.*

1593–94
(6) *Titus Andronicus.*
(7) *Taming of the Shrew.*

1594–95
(8) *Two Gentlemen of Verona.*
(9) *Love's Labour's Lost.*
(10) *Romeo and Juliet.*

1595–96
(11) *Richard II.*
(12) *Midsummer Night's Dream.*

1596–97
(13) *John.*
(14) *Merchant of Venice.*

1597–98
(15, 16) 1, 2 *Henry IV.*

1598–99
(17) *Much Ado About Nothing.*
(18) *Henry V.*

1599–1600
(19) *Julius Caesar.*
(20) *Merry Wives of Windsor.*
(21) *As You Like it.*

1600–01
(22) *Twelfth Night.*
(23) *Hamlet.*

1601–02
(24) *Troilus and Cressida.*

1602–03
(25) *All's Well that Ends Well.*

1604–05
(26) *Measure for Measure.*
(27) *Othello.*

1605–06
(28) *Macbeth.*
(29) *Lear.*

1606–07
(30) *Antony and Cleopatra.*

1607–08
(31) *Coriolanus,*
(32) *Timon of Athens.*

1608–09
(33) *Pericles.*

1609–10
(34) *Cymbeline.*

1610–11
(35) *Winter's Tale.*

1611–12
(36) *Tempest.*

1612–13
(37) *Henry VIII.*
(38) *Two Noble Kinsmen.*

Composition.—A more detailed account of the individual plays may now be attempted. The figures here prefixed correspond to those in the table above.

1, 2. The relation of *The Contention of York and Lancaster* to 2, 3 *Henry VI.* and the extent of Shakespeare's responsibility for either or both works have long been subjects of controversy. The extremes of critical opinion are to be found in a theory which regards Shakespeare as the sole author of 2, 3 *Henry VI.* and *The Contention* as a shortened and surreptitious version of the original plays, and in a theory which regards *The Contention* as written in collaboration by Marlowe, Greene and possibly Peele, and 2, 3 *Henry VI.* as a revision of *The Contention* written, also in collaboration, by Marlowe and Shakespeare. A comparison of the two texts leaves it hardly possible to doubt that the differences between them are to be explained by reporting rather than by revision; but the question of authorship is more difficult. Greene's parody, in the "Shakescene" passage of his *Groats-worth of Wit* (1592), of a line which occurs both in *The Contention* and in 3 *Henry VI.,* while it clearly suggests Shakespeare's connection with the plays, is evidence neither for nor against the participation of other men, and no sufficient criterion exists for distinguishing between Shakespeare's earliest writing and that of possible collaborators on grounds of style. But the blank verse style of 2, 3 *Henry VI.* may quite well be an earlier stage of that found more fully developed in *Richard III.,* and it is difficult to assign to any one except Shakespeare the humour of the Jack Cade scenes. Views which exclude Shakespeare altogether may be left out of account. *Henry VI.* is not in Meres's list of his plays, but its inclusion in the First Folio is an almost certain ground for assigning to him some share in the work.

3. A rather different problem is afforded by 1 *Henry VI.,* and here it is difficult, in view of the variety of style in the play, and the poor level of much of it, to hold by Shakespeare's sole responsibility. The Temple Gardens Scene (ii. 4), which is that most obviously his, was probably a later addition. Thomas Nashe refers to the representation of Talbot on the stage in his *Pierce Penilesse, his Supplication to the Divell* (1592), and it is probable that 1 *Henry VI.* is to be identified with the "Harey the vj." recorded in Henslowe's *Diary* to have been acted as a new play by Lord Strange's men, probably at the Rose, on March 3, 1592. If so, it is a reasonable conjecture that 2, 3 *Henry VI.* were originally written at some date before the beginning of Henslowe's record in the previous February, and that 1 *Henry VI.* was added later as an introduction to them.

4. The *Henry VI.* series can only be intended to lead directly up to *Richard III.,* and this relationship, together with its style as compared with that of the plays of 1594–96, suggests the short winter season of 1592–93 as the most likely time for the production of *Richard III.* There is a difficulty in that it is not included in Henslowe's list of the plays acted by Lord Strange's men during that season. But it may quite well have been produced by the only other company which appeared at court during the Christmas festivities, Lord Pembroke's. The mere fact that Shakespeare wrote a play, or more than one play, for Lord Strange's men during 1592–94 does not prove that he never wrote for any other company during the same period; and indeed there is plenty of room for guesswork as to the relations between Strange's and Pembroke's men. The latter are not known to have existed before the latter part of 1592, and many difficulties would be solved by the assumption that they originated out of a division of Strange's, who had amalgamated with the Admiral's, and may have found their numbers too much inflated to enable them to undertake as a whole the autumn tour of that year. If so, Pembroke's probably took over the *Henry VI.* series of plays, since part of *The Contention,* under the name of the *True Tragedy of Richard Duke of York,* was published as performed by them, and completed it with *Richard III.* at Christmas. It will be necessary to return to this theory in connection with the discussion of *Titus Andronicus* and *The Taming of the Shrew.* The principal historical source for *Henry VI.* was Edward Hall's *The Union of the Noble and Illustre Families of Lancaster and York* (1542), and for *Richard III.,* as for most of Shakespeare's later historical plays,

the second edition (1587) of Raphael Holinshed's *Chronicles of England, Scotland and Ireland* (1577). An earlier play, *The True Tragedy of Richard the Third* (1594), seems to have contributed little if anything to *Richard III.*

5. To the winter season of 1592–93 may also be assigned with fair probability Shakespeare's first experimental comedy, *The Comedy of Errors,* and if his writing at one and the same time for Pembroke's and for another company is not regarded as beyond the bounds of conjecture, it becomes tempting to identify this with "the gelyous comodey" produced, probably by Strange's men, for Henslowe as a new play on Jan. 5, 1593. The play contains a reference to the wars of succession in France which would fit any date from 1589 to 1594. The plot is taken from the *Menaechmi* and to a smaller extent from the *Amphitruo* of Plautus. William Warner's translation of the *Menaechmi* was entered in the Stationers' *Register* on June 10, 1594. A performance of *The Comedy of Errors* by "a company of base and common fellows" (including Shakespeare?) is recorded in the *Gesta Grayorum* as taking place in Gray's Inn hall on Dec. 28, 1594.

6. *Titus Andronicus* is another play in which many scholars have refused to see the hand of Shakespeare, but the double testimony of its inclusion in Meres's list and in the First Folio makes it unreasonable to deny him some part in it. This may, however, only have been the part of a reviser, working upon the dialogue rather than the structure of a crude tragedy of the school of Kyd. In fact a stage tradition is reported by Edward Ravenscroft, a late 17th century adapter of the play, to the effect that Shakespeare did no more than give a few "master-touches" to the work of a "private author." The play was entered in the Stationers' *Register* on Feb. 6, 1594, and was published in the same year with a title-page setting out that it had been acted by the companies of Lords Derby (*i.e.,* Strange, who had succeeded to his father's title on Sept. 25, 1593), Pembroke and Sussex. It is natural to take this list as indicating the order in which the three companies named had to do with it, but it is probable that only Sussex's had played the extant version. Henslowe records the production by this company of *Titus Andronicus* as a new play on Jan. 23, 1594, only a few days before the theatres were closed by plague. For the purposes of Henslowe's financial arrangements with the company a rewritten play may have been classed as new. Two years earlier he had appended the same description to a play of *Tittus and Vespacia,* produced by Strange's men on April 11, 1592. At first sight the title suggests a piece founded on the lives of the emperors Titus and Vespasian, but there are some grounds, although far from conclusive, for supposing the play to have been an early version of *Titus Andronicus.* It is difficult to explain the company names on the title-page unless there had been some version earlier than that of 1594. Pembroke's men are known from a letter of Henslowe's to have been ruined by Aug. 1593, and it is to be suspected that Sussex's, who appeared in London for the first time at the Christmas of 1593, acquired their stock of plays and transferred these to the Chamberlain's men, when the companies were again reconstituted in the summer of 1594. Whatever work Shakespeare did on *Titus Andronicus* may have been accomplished in the interval between these two transactions. The Chamberlain's men were apparently playing *Andronicus* in June. The stock of Pembroke's men probably included, as well as *Titus and Vespasian,* both *Henry VI.* and *Richard III.,* which also thus passed to the Chamberlain's company. The source of the plot is unknown; there are only slight hints for it in Byzantine chronicles.

7. An old play of *The Taming of a Shrew,* which can be traced back as far as 1589, was published as acted by Pembroke's men in 1594. In June of that year it was being acted by the Chamberlain's, but more probably in the version by Shakespeare, which bears the slightly altered title of *The Taming of the Shrew.* This is a much more free adaptation of its original than had been attempted in the case of *Henry VI.,* and the Warwickshire allusions in the Induction are noteworthy. Some critics have doubted, probably with justice, whether Shakespeare was the sole author of *The Shrew,* and others have assigned him a share in *A Shrew,* but this theory has no substantial foundation. The origins of the play, which is to be classed as a farce rather than a comedy, are to be found ultimately in widely distributed folk-tales, and more immediately in Ariosto's *I Suppositi* (1509) as translated in George Gascoigne's *The Supposes* (1566). It may have been Shakespeare's first task for the newly established Chamberlain's company of 1594 to furbish up the old farce. Thenceforward there is no reason to think that he ever wrote for any other company.

8. No very definite evidence exists for the date of *The Two Gentlemen of Verona,* other than the mention of it in *Palladis Tamia.* It is evidently a more rudimentary essay in the *genre* of romantic comedy than *The Merchant of Venice,* with which it has other affinities in its Italian colouring and its use of the interrelations of love and friendship as a theme; and it may be roughly assigned to the winter of 1594–95. The plot is drawn from various examples of contemporary fiction, especially from the story of the shepherdess Filismena in Jorge de Montemayor's *Diana* (1559). A play of *Felix and Philiomena* had already been given at court in 1585.

9. *Love's Labour's Lost* has often been regarded as the first of Shakespeare's plays, and has sometimes been placed as early as 1589. There is, however, no proof that Shakespeare was writing so soon. The characters of *Love's Labour's Lost* are evidently suggested by Henry of Navarre, his followers Biron, Longueville and D'Aumont, who has probably been confused with the Catholic League leader, the duc de Maine. These personages would have been familiar at any time from 1591 onwards, but Navarrese history of 1578 has also been drawn upon, and the channel of transmission to Shakespeare is unknown. The absence of the play from the lists in Henslowe's *Diary* does not leave it impossible that it should have preceded the formation of the Chamberlain's company, but certainly renders this less likely; and its lyric character perhaps justifies its being grouped with the other lyric plays of 1594–96. No entry of the play is found in the Stationers' *Register,* and it is quite possible that the present First Quarto of 1598 was not really the first edition. The title-page professes to give the play as "corrected and augmented" and as given at the Christmas of 1597. It was again revived for that of 1604. No literary source is known for its incidents.

10. *Romeo and Juliet,* which was published in 1597 as played by Lord Hunsdon's men, was probably produced somewhat before *A Midsummer Night's Dream,* as its incidents seem to have suggested the parody of the Pyramus and Thisbe interlude. An attempt to date it in 1591 is hardly justified by the Nurse's reference to an earthquake 11 years before and the fact that there was a real earthquake in London in 1580. The text of the First Quarto is surreptitious, and was "corrected, augmented and amended" in the Second Quarto of 1599. There had been an earlier play on the subject, but the immediate source used by Shakespeare was Arthur Brooke's narrative poem *Romeus and Juliet* (1562).

11. *Richard II.* can be dated with some accuracy by a comparison of the two editions of Samuel Daniel's narrative poem on *The Civil Wars Between the Two Houses of Lancaster and York,* both of which bear the date of 1595 and were therefore issued between March 25, 1595, and March 24, 1596, of the modern reckoning. It is possible that a performance was given before Sir Robert Cecil in Dec. 1595. The second of these editions, but not the first, contains some close parallels to the play. From the first two quartos of *Richard II.,* published in 1597 and 1598, the deposition scene was omitted, although it was clearly part of the original structure of the play, and its removal leaves an obvious mutilation in the text. There is some reason to suppose that this was due to a popular tendency to draw seditious parallels between Richard and Elizabeth; and it became one of the charges against the earl of Essex and his fellow-conspirators in the abortive *émeute* of Feb. 1601, that they had procured a performance of a play on Richard's fate in order to stimulate their followers. As the actors were the Lord Chamberlain's men, this play can hardly have been any other than Shakespeare's. The deposition scene was not printed until after Elizabeth's death, in the Third Quarto of 1608.

12. *A Midsummer Night's Dream,* with its masque-like scenes of fairydom and the epithalamium at its close, has all the air of having been written less for the public stage than for some courtly wedding; and the compliment paid by Oberon to the "fair vestal throned by the west" makes it possible that it was a wedding at which Elizabeth was present. Many more or less plausible occasions have been suggested. The wedding of Mary countess of Southampton with Sir Thomas Heneage on May 2, 1594, would fit the May-day setting of the plot; but a widowed countess hardly answers to the "little western flower" of the allegory, and there are allusions to later events and in particular to the rainy weather of 1594–95. The wedding of William Stanley, earl of Derby, brother of the lord Strange for whose players Shakespeare had written, and Elizabeth Vere, daughter of the earl of Oxford, which took place at Greenwich on Jan. 26, 1595, would meet the conditions. But that of Thomas Berkeley and Elizabeth Carey, granddaughter of the company's patron Lord Hunsdon, on Feb. 19, 1596, is at least as likely. It has been fancied that Shakespeare was present when "certain stars shot madly from their spheres" in the Kenilworth fireworks of 1575, but if he had any particular recorded entertainment in mind it is more likely to have been the more recent one given to Elizabeth by the earl of Hertford at Elvetham in 1591. There appears to be no special source for the play beyond Chaucer's *Knight's Tale* and the widespread fairy lore of western Europe.

13. *King John* has no very clear indications of date, but 1596 seems likely, on account of its style, in spite of the *a priori* improbability of a play on an independent subject drawn from English history being interpolated in the middle of the Lancastrian series. It would seem that Shakespeare had before him an old play of the queen's men, called *The Troublesome Reign of King John.* This was published in 1591, and again, with "W. Sh." on the title-page, in 1611. For copyright purposes *King John* appears to have been regarded as a revision of *The Troublesome Reign,* and in fact the succession of incidents in the two plays is much the same. Shakespeare's dialogue, however, owes little or nothing to that of his predecessor.

14. *The Merchant of Venice,* certainly earlier than July 22, 1598, on which date it was entered in the Stationers' *Register,* and possibly inspired by the machinations of the Jew poisoner Roderigo Lopez, who was executed in June 1594, shows a considerable advance in comic and melodramatic power over any of the earlier plays, and is assigned by a majority of scholars to about 1596. The various stories of which its plot is compounded are based upon common themes of folk-tales and Italian *novelle.* It is possible that Shakespeare may have had before him a play called *The Jew,* of which there are traces as early as 1579, and in which motives illustrating "the greedinesse of worldly chusers" and the "bloody mindes of usurers" appear to have been already combined. Something may also be owing to Marlowe's play of *The Jew of Malta.*

15, 16. The first part of *Henry IV.* was published in 1598, the second not until 1600, but both parts must have been in existence before the entry of the first part in the Stationers' *Register* on Feb. 25, 1598, since Falstaff is named in this entry, and a slip in a speech-prefix of the second part, which was not entered in the *Register* until Aug. 23, 1600, betrays that it was written when the character still bore the name of Sir John Oldcastle. Richard James, in his dedication to *The Legend of Sir John Oldcastle* about 1625, and Rowe in 1709 both bear witness to the substitution of the one personage for the other, which Rowe ascribes to the intervention of Elizabeth, and James to that of some descendants of Oldcastle, one of whom was probably Lord Cobham. There is an allusion to the incident and an acknowledgment of the wrong done to the famous Lollard martyr in the epilogue to 2 *Henry IV.* itself. Probably Shakespeare found Oldcastle, with very little else that was of service to him, in an old play called *The Famous Victories of Henry the Fifth,* which had been acted by Tarlton and the queen's men at least as far back as 1588, and of which an edition was printed in 1598. Falstaff himself is a somewhat libellous presentment of the 15th century leader, Sir John Fastolf, who had already figured in *Henry VI.;* but presumably Fastolf had no titled descendants alive in 1598.

17. A note in the Stationers' *Register* during Aug. 1600 shows that *Much Ado About Nothing* was in existence, although its publication was then directed to be "stayed." It may plausibly be regarded as the earliest play not included in Meres's list. In 1613 it was revived before James I. under the alternative title of *Benedick and Beatrice.* Dogberry is said by Aubrey to have been taken from a constable at Grendon in Buckinghamshire. There is no very definite literary source for the play, although some of its incidents are to be found in Ariosto's *Orlando Furioso* and Bandello's *novelle,* and attempts have been made to establish relationships between it and two early German plays, Jacob Ayrer's *Die Schöne Phaenicia* and the *Vincentius Ladiszlaus* of Duke Henry Julius of Brunswick.

18. The completion of the Lancastrian series of histories by *Henry V.* can be safely placed in or about 1599, since there is an allusion in one of the choruses to the military operations in Ireland of the earl of Essex, who crossed on March 27 and returned on Sept. 28, 1599. The First Quarto, which, in spite of the fact that the play was "stayed" with *Much Ado About Nothing,* was published in 1600, is a surreptitious text, and does not include the choruses. A genuine version was first published in the First Folio.

19. That *Julius Caesar* also belongs to 1599 is shown, not only by its links with *Henry V.* but also by an allusion to it in John Weever's *Mirror of Martyrs,* a work written two years before its publication in 1601, and by a notice of a performance on Sept. 21, 1599, by Thomas Platter of Basle in an account of a visit to London. This was the first of Shakespeare's Roman plays, and, like those that followed, was based upon Plutarch's *Lives* as translated from the French of Jacques Amyot and published by Sir Thomas North in 1580.

20. It is reported by John Dennis, in the préface to *The Comical Gallant* (1702), that *The Merry Wives of Windsor* was written at the express desire of Elizabeth, who wished to see Falstaff in love, and was finished by Shakespeare in the space of a fortnight. A date at the end of 1599 or the beginning of 1600, shortly after the completion of the historical Falstaff plays, would be the most natural one for this enterprise, and with such a date the evidence of style agrees. The play was entered in the Stationers' *Register* on Jan. 18, 1602. The First Quarto of the same year gives a surreptitious text, which was replaced by that of the First Folio. The Windsor setting makes it possible that *The Merry Wives* was produced within the castle, and perhaps with the assistance of the children of Windsor chapel in the fairy parts. The plot has its analogies to various incidents in Italian *novelle* and in English adaptations of these.

21. *As You Like It* was one of the plays "stayed" fróm publication in 1600, and cannot therefore be later than that year. Some trifling bits of evidence suggest that it is not earlier than 1599. The plot is based upon Thomas Lodge's romance of *Rosalynde* (1590), and this in part upon the pseudo-Chaucerian *Tale of Gamelyn.*

22. *Twelfth Night* may be placed about 1600–01, since it quotes part of a song included in Robert Jones's *First Book of Songs and Airs* (1600), and is recorded by John Manningham to have been seen by him at a feast in the Middle Temple hall on Feb. 2, 1602. The principal source of the plot was Barnabe Riche's "History of Apolonius and Silla" in his *Farewell to Military Profession* (1581).

23. A play of *Hamlet* was performed, probably by the Chamberlain's men, for Henslowe at Newington Butts on June 9, 1594. There are other references to it as a revenge-play, and it seems to have been in existence in some shape as early as 1589. It was doubtless on the basis of this that Shakespeare constructed his tragedy. There is an allusion in *Hamlet* to the rivalry between the ordinary stages and the private plays given by boy actors, which points to a date not earlier than the revival of the plays at Paul's, which was probably in 1599, and another, to an inhibition of plays on account of a "late innovation," may also be explained by the revival rather than by the Essex rising of 1601, since the play is mentioned in a manuscript note by Gabriel

Harvey, probably written before the death of Essex. The play was entered in the Stationers' *Register* on July 26, 1602. The First Quarto was printed in 1603 and the Second Quarto in 1604. These editions contain texts whose differences from each other and from that of the First Folio constitute one of the most difficult of Shakespearian problems. The First Quarto is certainly surreptitious. Its title-page records performances in the Universities of Oxford and Cambridge and elsewhere, as well as in London. The ultimate source of the plot is to be found in Scandinavian legends preserved in the *Historia Danica* of Saxo Grammaticus, and transmitted to Shakespeare or his predecessor through the *Histoires Tragiques* (1570) of François de Belleforest (*see* HAMLET).

24. Few of the plays present so many difficulties as *Troilus and Cressida,* and it cannot be said that its literary history has as yet been thoroughly worked out. A play of the name, "as yt is acted by my Lord Chamberlens men" was entered in the Stationers' *Register* on Feb. 7, 1603, with a note that "sufficient authority" must be got by the publisher, James Roberts, before he printed it. This can hardly be any other than Shakespeare's play; but it must have been "stayed," for the First Quarto did not appear until 1609, and on Jan. 28 of that year a fresh entry had been made in the *Register* by another publisher. The text of the Quarto differs in certain respects from that of the Folio, but not to a greater extent than the use of different copies of the original manuscript might explain. Two alternative title-pages are found in copies of the Quarto. On one, probably the earliest, is a statement that the play was printed "as it was acted by the Kings Maiesties seruants at the Globe"; from the other these words are omitted, and a preface is appended which hints that the "grand possessors" of the play had made difficulties about its publication, and describes it as "never staled with the stage." Attempts have been made, mainly on grounds of style, to find another hand than Shakespeare's in the closing scenes and in the prologue, and even to assign widely different dates to various parts of what is ascribed to Shakespeare. But the evidence does not really bear out these theories, and the style of the whole must be regarded as quite consistent with a date in 1601. It has been thought that the description of Ajax and his humours in the second scene of the first act is Shakespeare's "purge" to Jonson in reply to the *Poetaster* (1601), alluded to, as already mentioned, in the *Return from Parnassus,* a Cambridge play acted probably at the Christmas of 1601–02. It is tempting to conjecture that *Troilus and Cressida* may have been played, like *Hamlet,* by the Chamberlain's men at Cambridge, but may never have been taken to London, and in this sense "never staled with the stage." The only difficulty of a date in 1601 is that a parody of a play on Troilus and Cressida is introduced into *Histriomastix* (*c.* 1599), and that in this Troilus "shakes his furious speare." But Henslowe had produced another play on the subject, by Dekker and Chettle, in 1599, and probably, therefore, no allusion to Shakespeare is really intended. The material for *Troilus and Cressida* was taken by Shakespeare from Chaucer's *Troilus and Criseyde,* Caxton's *Recuyell of the Historyes of Troye,* and Chapman's Homer.

25. It is almost wholly on grounds of style that *All's Well that Ends Well* is placed by most critics in or about 1602, and, as in the case of *Troilus and Cressida,* it has been argued, though with little justification, that parts of the play are of considerably earlier date, and perhaps represent the *Love's Labour's Won* referred to by Meres. The story is derived from Boccaccio's *Decameron* through the medium of William Paynter's *Palace of Pleasure* (1566).

26. *Measure for Measure* was played at court on Dec. 26, 1604. The evidence for this is a list of plays in one of the account-books of the Office of the Revels. This was formerly thought to have been forged, but is now satisfactorily rehabilitated. The play was probably produced when the theatres were reopened after the plague in 1604. The plot is taken from a story already used by George Whetstone, both in his play of *Promos and Cassandra* (1578) and in his prose *Heptameron of Civil Discourses* (1582), and borrowed by him from Giraldi Cinthio's *Hecatommithi* (1566).

27. A performance at court of *Othello* on Nov. 1, 1604, is noted in the same list as that recording *Measure for Measure,* and the play may be reasonably assigned to the same year. An alleged performance at Harefield in 1602 certainly rests upon a forgery. The play was revived in 1610 and seen by Prince Louis of Württemberg at the Globe on April 30 of that year. It was entered in the Stationers' *Register* on Oct. 6, 1621, and a First Quarto was published in 1622. The text of this is less satisfactory than that of the First Folio, and omits a good many lines found therein and almost certainly belonging to the play as written. It also contains some profane expressions which have been modified in the Folio, and thereby points to a date for the original production earlier than the Act to Restrain Abuses of Players passed in the spring of 1606. The plot, like that of *Measure for Measure,* comes from the *Hecatommithi* (1566) of Giraldi Cinthio.

28. *Macbeth* cannot, in view of its obvious allusions to James I., be of earlier date than 1603. The style and some trifling allusions point to about 1605 or 1606, and a hint for the theme may have been given by Matthew Gwynne's entertainment of the *Tres Sibyllae,* with which James was welcomed to Oxford on Aug. 27, 1605. The play was revived in 1610 and Simon Forman saw it at the Globe on April 20. The only extant text, that of the First Folio, bears traces of shortening, and has been interpolated with additional rhymed dialogues for the witches by a second hand, probably that of Thomas Middleton. But the extent of Middleton's contribution has been exaggerated; it is probably confined to act iii. sc. 5, and a few lines in act. iv. sc. 1. A ballad of *Macdobeth* is mentioned in the Stationers' records during 1596, but is not known. It is not likely that Shakespeare had consulted any Scottish history other than that included in Raphael Holinshed's *Chronicle;* he may have gathered witchlore from Reginald Scot's *Discoverie of Witchcraft* (1584) or King James's own *Demonologie* (1599).

29. The entry of *King Lear* in the Stationers' *Register* on Nov. 26, 1607, records the performance of the play at court on Dec. 26, 1606. This suggests 1605 or 1606 as the date of production, and this is confirmed by the publication in 1605 of the older play, *The True Chronicle History of King Leir,* which Shakespeare used as his source. Two Quartos of *King Lear* were published in 1608, and contain a text rather longer, but in other respects less accurate, than that of the First Folio. The material of the play consists of fragments of Celtic myth, which found their way into history through Geoffrey of Monmouth. It was accessible to Shakespeare in Holinshed and in Spenser's *Faerie Queene,* as well as in the old play.

30. It is not quite clear whether *Antony and Cleopatra* was the play of that name entered in the Stationers' *Register* on May 20, 1608, for no Quarto is extant, and a fresh entry was made in the *Register* before the issue of the First Folio. Apart from this entry, there is little external evidence to fix the date of the play, but it is in Shakespeare's later, although not his last, manner and may very well belong to 1606. It is possible that it motived some changes introduced by Samuel Daniel into a new edition of his *Cleopatra* issued in 1607.

31. In the case of *Coriolanus* the external evidence available is even scantier, and all that can be said is that its closest affinities are to *Antony and Cleopatra,* which in all probability it directly followed in order of composition. Both plays, like *Julius Caesar,* are based upon the *Lives* of Plutarch as translated by Sir Thomas North.

32. There is no external evidence as to the date of *Timon of Athens,* but it may safely be grouped on the strength of its internal characteristics with the plays just named, and there is a clear gulf between it and those that follow. It may be placed provisionally in 1607, although some critics put it next after *Lear.* The extraordinary incoherencies of its action and inequalities of its style have prevented modern scholars from accepting it as a finished production of Shakespeare, but there agreement ceases. It is sometimes and perhaps most reasonably regarded as an incomplete draft for an intended play; sometimes as a Shakespearian fragment worked over by a second hand either for the stage

or for printing in the First Folio; sometimes, but not very plausibly, as an old play by an inferior writer which Shakespeare had partly remodelled. It does not seem to have had any relations to an extant academic play of *Timon* which remained in manuscript until 1842. The sources are partly in Plutarch's *Life of Marcus Antonius,* partly in Lucian's dialogue of *Timon or Misanthropos,* and partly in William Paynter's *Palace of Pleasure* (1566).

33. Similar difficulties, equally unsolved, cling about *Pericles.* It was entered in the Stationers' *Register* on May 20, 1608, and published in 1609 as "the late and much admired play" acted by the king's men at the Globe. The title-page bears Shakespeare's name, but the play was not included in the First Folio, and was only added to Shakespeare's collected works in the Third Folio, in company with others which, although they also had been printed under his name or initials in quarto form, are certainly not his. In 1608 was published a prose story, *The Painful Adventures of Pericles Prince of Tyre.* This claims to be the history of the play as it was presented by the king's players, and is described in a dedication by George Wilkins as "a poore infant of my braine." The production of the play is therefore to be put in 1608 or a little earlier. It can hardly be doubted on internal evidence that Shakespeare is the author of the verse-scenes in the last three acts, with the exception of the doggerel choruses. It is probable, although it has been doubted, that he was also the author of the prose-scenes in those acts. To the first two acts he can at most only have contributed a touch or two. It seems reasonable to suppose that the non-Shakespearian part of the play is by Wilkins, by whom other dramatic work was produced about 1607. The prose story quotes a line or two from Shakespeare's contribution, and it follows that this must have been made by 1608. The close resemblances of the style to that of Shakespeare's latest plays make it impossible to place it much earlier. But whether Shakespeare and Wilkins collaborated in the play, or Shakespeare partially rewrote Wilkins, or Wilkins completed Shakespeare, must be regarded as yet undetermined. Unless there was an earlier Shakespearian version now lost, Dryden's statement that "Shakespeare's own Muse her Pericles first bore" must be held to be an error. The story is an ancient one which exists in many versions. In all of these except the play, the name of the hero is Apollonius of Tyre. The play is directly based upon a version in Gower's *Confessio Amantis,* and the use of Gower as a "presenter" is thereby explained. But another version in Laurence Twine's *Patterne of Painefull Adventures* (*c.* 1576), of which a new edition appeared in 1607, may also have been consulted.

34. *Cymbeline* shows a further development than *Pericles* in the direction of Shakespeare's final style, and can hardly have come earlier. A description of it is in a note-book of Simon Forman, who died in Sept. 1611, and describes in the same book other plays seen by him in 1610 and 1611. But these were not necessarily new plays, and *Cymbeline* may perhaps be assigned conjecturally to 1609. The masque-like dream in act v. sc. 4 must be an interpolation by another hand. This play also is based upon a widespread story, probably known to Shakespeare in Boccaccio's *Decameron* (day 2, novel 9), and possibly also in an English book of tales called *Westward for Smelts.* The historical part is, as usual, from Holinshed.

35. *The Winter's Tale* was seen by Forman on May 15, 1611, and as it clearly belongs to the latest group of plays it may well enough have been produced in that or the preceding year. A document amongst the Revels Accounts, also now cleared of the imputation of forgery, gives Nov. 5, 1611, as the date of a performance at court. The play is recorded to have been licensed by Sir George Buck, who began to license plays in 1607. The plot is from Robert Greene's *Pandosto, the Triumph of Time, or Dorastus and Fawnia* (1588).

36. The wedding-masque in act iv. of *The Tempest* has suggested the possibility that it may have been composed to celebrate the marriage of the princess Elizabeth and Frederick V., the elector palatine, on Feb. 14, 1613. But the document amongst the Revels Accounts gives the precise date of Nov. 1, 1611, for a performance at court. Sylvester Jourdan's *A Discovery of the Bermudas,* containing an account of the shipwreck of Sir George Somers in 1609, was published about Oct. 1610, and this or some other contemporary narrative of Virginian colonization probably furnished the hint of the plot.

37. It may now be accepted as a settled result of scholarship that *Henry VIII.* is the result of collaboration, and that one of the collaborators was Fletcher. There is no good reason to doubt that the other was Shakespeare, although attempts have been made to substitute Philip Massinger. The inclusion, however, of the play in the First Folio must be regarded as conclusive against this theory. There is some ground for suspicion that the collaborators may have had an earlier work of Shakespeare before them, and this would explain the reversion to the "history" type of play which Shakespeare had long abandoned. His share appears to consist of act i. scc. 1, 2; act ii. scc. 3, 4; act iii. sc. 2, ll. 1–203; act v. sc. 1. The play was probably produced in 1613, and originally bore the alternative title of *All is True.* It was being performed in the Globe on June 29, 1613, when the thatch caught fire and the theatre was burnt. The principal source was Holinshed, but Hall's *Union of Lancaster and York,* Foxe's *Acts and Monuments of the Church,* and perhaps Samuel Rowley's play of *When You See Me, You Know Me* (1605), appear also to have contributed.

38. The tale of the First Folio dramas is now complete, but an analysis of *The Two Noble Kinsmen* leaves no reason to doubt the accuracy of its ascription on the title-page of the First Quarto of 1634 to Shakespeare and John Fletcher. This appears to have been a case of ordinary collaboration. There is sufficient resemblance between the styles of the two writers to render the division of the play between them a matter of some difficulty; but the parts that may probably be assigned to Shakespeare are acts i. scc. 1–4; ii. 1; iii. 1, 2; v. 1, 3, 4. Fletcher's morris-dance in act iii. sc. 5 is borrowed from that in Beaumont's *Mask of the Inner Temple and Gray's Inn,* given on Feb. 20, 1613, and the play may perhaps be dated in 1613. It is based on Chaucer's *Knight's Tale.*

THE POET

Shakespeare's writings outside the field of drama are not numerous. The narrative poem of *Venus and Adonis* was entered in the Stationers' *Register* on April 18, 1593, and 17 editions, dating from 1593 to 1675, are known. The *Rape of Lucrece* was entered in the *Register* on May 9, 1594, and the nine extant editions range from 1594 to 1655. Each poem is prefaced by a dedicatory epistle from the author to Henry Wriothesley, earl of Southampton. The subjects, taken respectively from the *Metamorphoses* and the *Fasti* of Ovid, were frequent in Renaissance literature. It was once supposed that Shakespeare came from Stratford-on-Avon with *Venus and Adonis* in his pocket; but it is more likely that both poems owe their origin to the comparative leisure afforded to playwrights and actors by the plague-period of 1592–94. In 1599 the stationer William Jaggard published a volume of miscellaneous verse which he called *The Passionate Pilgrim,* and placed Shakespeare's name on the title-page. Only two of the pieces included herein are certainly Shakespeare's, and although others may quite possibly be his, the authority of the volume is destroyed by the fact that some of its contents are without doubt the work of Marlowe, Sir Walter Raleigh, Richard Barnfield and Bartholomew Griffin. In 1601 Shakespeare contributed *The Phoenix and the Turtle,* an elegy on an unknown pair of wedded lovers, to a volume called *Love's Martyr, or Rosalin's Complaint,* collected and mainly written by Robert Chester.

The Sonnets.—The interest of all these poems sinks into insignificance beside that of one remaining volume. The sonnets were entered in the *Register* on May 20, 1609, by the stationer Thomas Thorpe, and published by him under the title *Shakespeares Sonnets, never before Imprinted,* in the same year. In addition to 154 sonnets the volume contains the elegiac poem *A Lover's Complaint.* If this is Shakespeare's, which is very doubtful, it probably dates from the *Venus and Adonis* period. In 1640 the sonnets, together with other poems from *The Passionate Pilgrim* and elsewhere, many of them not Shakespeare's, were republished by John Benson in *Poems Written by Wil. Shake-*

speare, Gent. Here the sonnets are arranged in an altogether different order from that of 1609 and are declared by the publisher to "appeare of the same purity, the Authour himselfe then living avouched." No other Shakespearian controversy has received so much attention as that concerning itself with the date, character and literary history of the sonnets. This is intelligible enough, since upon the issues raised depends the question whether these poems do or do not give a glimpse into the intimate depths of a personality which otherwise is at the most only imperfectly revealed through the plays. On the whole, the balance of authority is in favour of regarding them as in a very considerable measure autobiographical. This view has undergone the fires of much destructive argument. The authenticity of the order in which the sonnets were printed in 1609 and even Shakespeare's authorship of some of them have been doubted; and their subject-matter has been variously explained as being of the nature of a philosophical allegory, of an effort of the dramatic imagination, or of a heartless exercise in the forms of the Petrarchan convention. This last theory rests upon the false psychological assumption, which is disproved by the whole history of poetry and in particular of Petrarchan poetry, that the use of conventions is inconsistent with the expression of unfeigned emotions; and it is hardly to be set against the direct conviction which the sonnets carry to the most finely critical minds of the strength and sincerity of the spiritual experience out of which they were wrought. This conviction makes due allowance for the inevitable heightening of emotion itself in the act of poetic composition; and it certainly does not carry with it a belief that all the external events which underlie the emotional development are capable at this distance of time of inferential reconstruction. But it does accept the sonnets as reflecting a part of Shakespeare's life during the years in which they were written, and as revealing at least the outlines of a drama which played itself out for once, not in his imagination but in his actual conduct in the world of men and women.

There is no advantage to be gained by rearranging the order of the 1609 volume, even if there were any basis other than that of individual whim on which to do so. Many of the sonnets are obviously linked to those which follow or precede them; and although a few may conceivably be misplaced, the order as a whole does not jar against the sense of emotional continuity, which is the only possible test that can be applied. The last two sonnets, however, are merely alternative versions of a Greek epigram, and it is a hazardous assumption that all of the rest have a common subject-matter. On this assumption, however, they have generally been interpreted somewhat as follows. There are two series, which are more probably parallel than successive. The shorter of these (cxxvii.–clii.) appears to be the record of the poet's relations with a mistress, a dark woman with raven brows and mourning eyes. In the earlier sonnets he undertakes the half-playful defence of black beauty against the blond Elizabethan ideal; but the greater number are in a more serious vein, and are filled with a deep consciousness of the bitterness of lustful passion and of the slavery of the soul to the body. The woman is a wanton. She has broken her bed-vow for Shakespeare, who on his side is forsworn in loving her; and she is doubly forsworn in proving faithless to him with other men. His reason condemns her, but his heart has not the power to throw off her tyranny. Her particular offence is that she, "a woman coloured ill," has cast her snares not only upon him, but upon his friend, "a man right fair," who is his "better angel," and that thus his loss is double, in love and friendship. The longer series (i.–cxxvi.) is written to a man, appears to extend over a considerable period of time, and covers a wide range of sentiment. The person addressed is younger than Shakespeare, and of higher rank. He is lovely, and the son of a lovely mother, and has hair like the auburn buds of marjoram. The series falls into a number of groups, which are rarely separated by any sharp lines of demarcation. Perhaps the first group (i.–xvii.) is the most distinct of all. These sonnets are a prolonged exhortation by Shakespeare to his friend to marry and beget children. The friend is now on the top of happy hours, and should make haste, before the rose of beauty dies, to secure himself in his descendants against devouring time. In the next group (xviii.–xxv.) a much more personal note is struck, and the writer assumes the attitudes, at once of the poet whose genius is to be devoted to eternizing the beauty and the honour of his patron, and of the friend whose absorbing affection is always on the point of assuming an emotional colour indistinguishable from that of love. The consciousness of advancing years and that of a fortune which bars the triumph of public honour alike find their consolation in this affection. A period of absence (xxvi.–xxxii.) follows, in which the thought of friendship comes to remedy the daily labour of travel and the sorrows of a life that is "in disgrace with fortune and men's eyes" and filled with melancholy broodings over the past. Then (xxxiii.–xlii.) comes an estrangement. The friend has committed a sensual fault, which is at the same time a sin against friendship. He has been wooed by a woman loved by the poet, who deeply resents the treachery, but in the end forgives it, and bids the friend take all his loves, since all are included in the love that has been freely given him. It is difficult to escape the suggestion that this episode of the conflict between love and friendship is the same as that which inspired some of the "dark woman" sonnets. Another journey (xliii.–lii.) is again filled with thoughts of the friend, and its record is followed by a group of sonnets (liii.–lv.) in which the friend's beauty and the immortality which this will find in the poet's verse are especially dwelt upon. Once more there is a parting (lvi.–lxi.) and the poet awaits as patiently as may be his friend's return to him. Again (lxii.–lxv.) he looks to his verse to give the friend immortality. He is tired of the world, but his friend redeems it (lxvi.–lxviii.). Then rumours of some scandal against his friend (lxix.–lxx.) reach him, and he falls (lxxi.–lxxiv.) into gloomy thoughts of coming death. The friend, however, is still (lxxv.–lxxvii.) his argument; and he is perturbed (lxxviii.–lxxxvi.) by the appearance of a rival poet, who claims to be taught by spirits to write "above a mortal pitch," and with "the proud full sail of his great verse" has already won the countenance of Shakespeare's patron. There is another estrangement (lxxxvii.–xc.), and the poet, already crossed with the spite of fortune, is ready not only to acquiesce in the loss of friendship, but to find the fault in himself. The friend returns to him, but the relation is still clouded by doubts of his fidelity (xci.–xciii.) and by public rumours of his wantonness (xciv.–xcvi.). For a third time the poet is absent (xcvii.–xcix.) in summer and spring. Then comes an apparent interval, after which a love already three years old is renewed (c.–civ.), with even richer praises (cv.–cviii.). It is now the poet's turn to offer apologies (cix.–cxii.) for offences against friendship and for some brand upon his name apparently due to the conditions of his profession. He is again absent (cxiii.) and again renews his protestations of the imperishability of love (cxiv.–cxvi.) and of his own unworthiness (cxvii.–cxxi.), for which his only excuse is in the fact that the friend was once unkind. If the friend has suffered as Shakespeare suffered, he has "passed a hell of time." The series closes with a group (cxxii.–cxxv.) in which love is pitted against time; and an *envoi,* not in sonnet form, warns the "lovely boy" that in the end nature must render up her treasure.

Mystery of "Mr. W. H."—Such an analysis can give no adequate idea of the qualities in these sonnets, whereby the appeal of universal poetry is built up on a basis of intimate self-revelation. The human document is so legible, and at the same time so incomplete, that it is easy to understand the strenuous efforts which have been made to throw further light upon it by tracing the identities of those other personalities, the man and the woman, through his relations to whom the poet was brought to so fiery an ordeal of soul, and even to the borders of self-abasement. It must be added that the search has, as a rule, been conducted with more ingenuity than judgment. It has generally started from the terms of a somewhat mysterious dedication prefixed by the publisher Thomas Thorpe to the volume of 1609. This runs as follows:—"To the onlie begetter of these insuing sonnets Mr. W. H. all happinesse and that eternitie promised by our ever-living poet wisheth the well-wishing adventurer in setting forth T. T." The natural interpretation of this is that the inspirer or "begetter" of

the sonnets bore the initials W. H.; and contemporary history has accordingly been ransacked to find a W. H. whose age and circumstances might conceivably fit the conditions of the problem which the sonnets present. It is perhaps a want of historical perspective which has led to the centring of controversy around two names belonging to the highest ranks of the Elizabethan nobility, those of Henry Wriothesley, earl of Southampton, and William Herbert, earl of Pembroke. There is some evidence to connect Shakespeare with both of these. To Southampton he dedicated *Venus and Adonis* in 1593 and *The Rape of Lucrece* in 1594, and the story that he received a gift of no less than £1,000 from the earl is recorded by Rowe. His acquaintance with Pembroke can only be inferred from the statement of Heminge and Condell in their preface to the First Folio of the plays, that Pembroke and his brother Montgomery had "prosequuted both them and their Authour living, with so much favour." The personal beauty of the rival claimants and of their mothers, their amours and the attempts of their families to persuade them to marry, their relations to poets and actors, and all other points in their biographies which do or do not fit in with the indications of the sonnets, have been canvassed with great spirit and some erudition, but with no very conclusive result. It is in Pembroke's favour that his initials were in fact W. H., whereas Southampton's can only be turned into W. H. by a process of metathesis; and his champions have certainly been more successful than Southampton's in producing a woman, a certain Mary Fitton, who was a mistress of Pembroke's, and was in consequence dismissed in disgrace from her post of maid of honour to Elizabeth. Unfortunately, the balance of evidence is in favour of her having been blond, and not "black." Moreover, a careful investigation of the sonnets, as regards their style and their relation to the plays, renders it almost impossible on chronological grounds that Pembroke can have been their subject. He was born on April 9, 1580, and was therefore much younger than Southampton, who was born on Oct. 6, 1573. The earliest sonnets postulate a marriageable youth, certainly not younger than 18, an age which Southampton reached in the autumn of 1591 and Pembroke in the spring of 1598. The writing of the sonnets may have extended over many years, but it is impossible to doubt that as a whole it is to the years 1593–98 rather than to the years 1598–1603 that they belong. There is not, indeed, much external evidence available. Francis Meres in his *Palladis Tamia* of 1598 mentions Shakespeare's "sugred sonnets among his private friends," but this allusion might come as well near the beginning as at the end of the series; and the fact that two, not of the latest, sonnets are in *The Passionate Pilgrim* of 1599 is equally inconclusive.

The only reference to an external event in the sonnets themselves, which might at first sight seem useful, is in the following lines (cvii.):—

> The mortal moon hath her eclipse endured,
> And the sad augurs mock their own presage;
> Incertainties now crown themselves assured,
> And peace proclaims olives of endless age.

This has been variously interpreted as referring to the death of Elizabeth and accession of James in 1603, to the relief caused by the death of Philip II. of Spain in 1598, and to the illness of Elizabeth and threatened Spanish invasion in 1596. Obviously the "mortal moon" is Elizabeth, but although "eclipse" may well mean "death," it is not quite so clear that "endure an eclipse" can mean "die."

Nor do the allusions to the rival poet help much. "The proud full sail of his great verse" would fit, on critical grounds, with Spenser, Marlowe, Chapman and possibly Peele, Daniel or Drayton; and the "affable familiar ghost," from whom the rival is said to obtain assistance by night, might conceivably be an echo of a passage in one of Chapman's dedications. Daniel inscribed a poem to Southampton in 1603, but with this exception none of the poets named is known to have written either for Southampton or for Pembroke, or for any other W. H. or H. W., during any year which can possibly be covered by the sonnets. Two very minor poets, Barnabe Barnes and Gervase Markham, addressed sonnets to Southampton in 1593 and 1595 respectively, and Thomas Nashe composed improper verses for his delectation.

But even if external guidance fails, the internal evidence for 1593–98 as approximately the sonnet period in Shakespeare's life is very strong indeed. It has been worked out in detail by two German scholars, Hermann Isaac (now Conrad) in the *Shakespeare-Jahrbuch* for 1884, and Gregor Sarrazin in *William Shakespeares Lehrjahre* (1897) and *Aus Shakespeares Meisterwerkstatt* (1906). Conrad's work, in particular, has hardly received enough attention even from recent English scholars, probably because he makes the mistakes of taking the sonnets in Bodenstedt's order instead of Shakespeare's, and of beginning his whole chronology several years too early in order to gratify a fantastic identification of W. H. with the earl of Essex. This, however, does not affect the main force of an argument by which the affinities of the great bulk of the sonnets are shown, on the ground of stylistic similarities, parallelisms of expression, and parallelisms of theme, to be far more close with the poems and with the range of plays from *Love's Labour's Lost* to *Henry IV.*, than with any earlier or later section of Shakespeare's work. This dating has the further advantage of putting Shakespeare's sonnets in the full tide of Elizabethan sonnet-production, which began with the publication of Sidney's *Astrophel and Stella* in 1591 and Daniel's *Delia* and Constable's *Diana* in 1592, rather than during years for which this particular kind of poetry had already ceased to be modish. It is to the three volumes named that the influence upon Shakespeare of his predecessors can most clearly be traced; while he seems in his turn to have served as a model for Drayton, whose sonnets to Idea were published in a series of volumes in 1594, 1599, 1602, 1605 and 1619. It does not of course follow that because the sonnets belong to 1593–98 W. H. is to be identified with Southampton. On general grounds he is likely, even if above Shakespeare's own rank, to have been somewhat nearer that rank than a great earl, some young gentleman, for example, of such a family as the Sidneys, or as the Walsinghams of Chislehurst.

It is possible that there is an allusion to Shakespeare's romance in a poem called "Willobie his Avisa," published in 1594 as from the pen of one Henry Willoughby, apparently of West Knoyle, in Wiltshire. In this Willoughby, enamoured of an innkeeper's wife, apparently at Sherborne, takes counsel with "his familiar friend W. S. who not long before had tryed the curtesy of the like passion, and was now newly recovered of the like infection." But there is nothing outside the poem to connect Shakespeare with a family of Willoughbys or with the neighbourhood of West Knoyle or Sherborne. Various other identifications of W. H. have been suggested, which rarely rest upon anything except a similarity of initials. There is little likelihood in a theory broached by Sir Sidney Lee, that W. H. was not the friend of the sonnets at all, but a certain William Hall, who was himself a printer, and might, it is conjectured, have obtained the "copy" of the sonnets for Thorpe. Rather more plausible is Sir William Harvey, the third husband of Southampton's mother. But, although it is just possible that "begetter" might mean, not "inspirer," but "procurer for the press," the interpretation is shipwrecked on the obvious identity of the person to whom Thorpe "wishes" eternity with the person to whom the poet "promised" that eternity. The external history of the sonnets must still be regarded as an unsolved problem; the most that can be said is that their subject may just possibly be Southampton, and cannot possibly be Pembroke.

The Evidence on Record.—In order to obtain a glimmering of the man that was Shakespeare, it is necessary to consult all the records and to read the evidence of his life-work in the plays, alike in the light of the simple facts of his external career and in that of the sudden vision of his passionate and dissatisfied soul preserved in the sonnets. By exclusive attention to any one of these sources of information it is easy to build up a consistent and wholly false conception of a Shakespeare; of a Shakespeare struggling between his senses and his conscience in the artistic Bohemianism of the London taverns; of a sleek, bourgeois Shakespeare to whom his art was no more than a ready way to a position of respected and influential competence in his native town;

of a great objective artist whose personal life was passed in detached contemplation of the puppets of his imagination. Any one of these pictures has the advantage of being more vivid, and the disadvantage of being less real, than the somewhat elusive and enigmatic Shakespeare who glances at us for a perplexing moment, now behind this, now behind that, of his diverse masks. It is necessary also to lay aside Shakespeareolatry, the spirit that could wish with Hallam that Shakespeare had never written the sonnets, or can refuse to accept *Titus Andronicus* on the ground that "the play declares as plainly as play can speak, 'I am not Shakespeare's; my repulsive subject, my blood and horrors, are not, and never were his.'" The literary historian has no greater enemy than the sentimentalist. In Shakespeare we have to do with one who is neither beyond criticism as a man nor impeccable as an artist. He was for all time, no doubt; but also very much of an age, the age of the later Renaissance, with its instinct for impetuous life, and its vigorous rather than discriminating appetite for literature. When Ben Jonson said that Shakespeare lacked "art," and when Milton wrote of his "native wood-notes wild," they judged truly. The Shakespearian drama is magnificent and incoherent; it belongs to the adolescence of literature, to a period before the instrument had been sharpened and polished, and made unerring in its touch upon the sources of laughter and of tears. Obviously nobody has such power over our laughter and our tears as Shakespeare. But it is the power of temperament rather than of art; or rather it is the power of a capricious and unsystematic artist, with a perfect dramatic instinct for the exposition of the ideas, the characters, the situations, which for the moment command his interest, and a perfect disregard for the laws of dramatic psychology which require the patient pruning and subordination of all material that does not make for the main exposition. This want of finish, this imperfect fusing of the literary ore, is essentially characteristic of the Renaissance, as compared with ages in which the creative impulse is weaker and leaves room for a finer concentration of the means upon the end. There is nearly always unity of purpose in a Shakespearian play, but it often requires an intellectual effort to grasp it and does not result in a unity of effect. The issues are obscured by a careless generosity which would extend to art the boundless freedom of life itself. Hence the intrusive and jarring elements which stand in such curious incongruity with the utmost reaches of which the dramatic spirit is capable; the conventional and melodramatic endings, the inconsistencies of action and even of character, the emotional confusions of tragicomedy, the complications of plot and subplot, the marring of the give-and-take of dialogue by superfluities of description and of argument, the jest and bombast lightly thrown in to suit the taste of the groundlings, all the flecks that to an instructed modern criticism are only too apparent upon the Shakespearian sun. It perhaps follows from this that the most fruitful way of approaching Shakespeare is by an analysis of his work rather as a process than as a completed whole. His outstanding positive quality is a vast comprehensiveness, a capacity for growth and assimilation, which leaves no aspect of life unexplored, and allows of no finality in the nature of his judgments upon life. It is the real and sufficient explanation and justification of the pains taken to determine the chronological order of his plays, that the secret of his genius lies in its power of development and that only by the study of its development can he be known. He was nearly 30 when, so far as we can tell, his career as a dramatist began; and already there lay behind him those six or seven unaccounted-for years since his marriage, passed no one knows where, and filled no one knows with what experience, but assuredly in that strenuous Elizabethan life with some experience kindling to his intellect and formative of his character. To the woodcraft and the familiarity with country sights and sounds which he brought with him from Stratford, and which mingle so oddly in his plays with a purely imaginary and euphuistic natural history, and to the book-learning of a provincial grammar-school boy, and perhaps, if Aubrey is right, also of a provincial schoolmaster, he had somehow added, as he continued to add throughout his life, that curious store of acquaintance with the details of the most diverse occupations which has so often perplexed and so often misled his commentators. It was the same faculty of acquisition that gave him the extensive range of his varied vocabulary.

His first group of plays is largely made up of essays in conventions of stage-writing which had already achieved popularity. In the Yorkist trilogy he takes up the burden of the chronicle play, in *The Comedy of Errors* that of the classical school drama and of the page-humour of Lyly, in *Titus Andronicus* that of the crude revenge tragedy of Kyd, and in *Richard III.* that of the Nemesis motive and the exaltation of the Machiavellian superman which properly belong to Marlowe. But in *Richard III.* he begins to come to his own with the subtle study of the actor's temperament which betrays the working of a profound interest in the technique of his chosen profession. The style of the earliest plays is essentially rhetorical; the blank verse is stiff and little varied in rhythm; and the periods are built up of parallel and antithetic sentences, and punctuated with devices of iterations, plays upon words, and other methods of securing emphasis, that derive from the bad tradition of a popular stage, upon which the players are bound to rant and force the note in order to hold the attention of a dull-witted audience. During the plague-vacations of 1592 to 1594, Shakespeare tried his hand at the ornate descriptive poetry of *Venus and Adonis* and *Lucrece;* and the influence of this exercise, and possibly also of Italian travel, is apparent in the next group of plays, with their lyric notes, their tendency to warm southern colouring, their wealth of decorative imagery, and their elaborate and not rarely frigid conceits. Rhymed couplets make their appearance, side by side with blank verse, as a medium of dramatic dialogue. It is a period of experiment, in farce with *The Taming of the Shrew,* in satirical comedy with *Love's Labour's Lost,* in lyrical comedy with *A Midsummer Night's Dream,* in lyrical tragedy with *Romeo and Juliet,* in lyrical history with *Richard II.,* and in romantic tragicomedy with *The Two Gentlemen of Verona* and with the masterpiece of this singular genre, *The Merchant of Venice.* It is also the period of the sonnets, which have their echoes both in the phrasing and in the themes of the plays; in the black-browed Rosaline of *Love's Labour's Lost,* and in the issue between friendship and love which is variously set in *The Two Gentlemen of Verona* and in *The Merchant of Venice.* But in the latter play the sentiment is already one of retrospection; the tempest of spirit has given way to the tender melancholy of renunciation. The sonnets seem to bear witness, not only to the personal upheaval of passion, but also to some despondency at the spite of fate and the disgrace of the actor's calling. This mood too may have cleared away in the sunshine of growing popularity, of financial success, and of the possibly long-delayed return to Stratford. Certainly the series of plays written during the next few years are light-hearted plays, less occupied with profound or vexatious searchings of spirit than with the delightful externalities of things. The histories from *King John* to *Henry V.* form a continuous study of the conditions of kingship, carrying on the political speculations begun in *Richard II.* and culminating in the brilliant picture of triumphant efficiency, the Henry of Agincourt. Meanwhile Shakespeare develops the astonishing faculty of humorous delineation of which he had given foretastes in Jack Cade, in Bottom the weaver, and in Juliet's nurse; sets the creation of Falstaff in front of his vivid pictures of contemporary England; and passes through the half-comedy, half melodrama of *Much Ado About Nothing* to the joyous farce of *The Merry Wives of Windsor,* and to his two perfectly sunny comedies, the sylvan comedy of *As You Like It* and the urban comedy of *Twelfth Night.*

There then comes a change of mood, already heralded by *Julius Caesar,* which stands beside *Henry V.* as a reminder that efficiency has its seamy as well as its brilliant side. The tragedy of political idealism in Brutus is followed by the tragedy of intellectual idealism in Hamlet; and this in its turn by the three bitter and cynical pseudo-comedies: *All's Well That Ends Well,* in which the creator of Portia, Beatrice, Rosalind and Viola drags the honour of womanhood in the dust—*Troilus and Cressida,* in which the ideals of heroism and of romance are confounded in the portraits of a wanton and a poltroon—and *Measure for Measure,*

in which the searchlight of irony is thrown upon the paths of Providence itself. Upon the causes of this new perturbation in the soul of Shakespeare it is perhaps idle to speculate. The evidence of his profound disillusion and discouragement of spirit is plain enough; and for some years the tide of his pessimistic thought advances, swelling through the pathetic tragedy of *Othello* to the cosmic tragedies of *Macbeth* and *King Lear*, with their Titan-like indictments not of man alone, but of the heavens by whom man was made. Meanwhile Shakespeare's style undergoes changes no less notable than those of his subject-matter. The ease and lucidity characteristic of the histories and comedies of his middle period give way to a more troubled beauty, and the phrasing and rhythm often tend to become elliptic and obscure, as if the thoughts were hurrying faster than speech can give them utterance. The period closes with *Antony and Cleopatra* and *Coriolanus*, in which the ideals of the love of woman and the honour of man are once more stripped bare to display the skeletons of lust and egoism, and in the latter of which signs of exhaustion are already perceptible; and with *Timon of Athens*, in which the dramatist whips himself to an almost incoherent expression of a general loathing and detestation of humanity. Then the stretched cord suddenly snaps. *Timon* is apparently unfinished, and the next play, *Pericles*, is in an entirely different vein, and is apparently finished but not begun. At this point only in the whole course of Shakespeare's development there is a complete breach of continuity. One can only conjecture the occurrence of some spiritual crisis, an illness perhaps, or some process akin to what in the language of religion is called conversion, which left him a new man, with the fever of pessimism behind him, and at peace once more with Heaven and the world.

The final group of plays, the Shakespearian part of *Pericles*, *Cymbeline*, *The Winter's Tale*, *The Tempest*, all belong to the class of what may be called idyllic romances. They are happy dreams, in which all troubles and sorrows are ultimately resolved into fortunate endings, and which stand therefore as so many symbols of an optimistic faith in the beneficent dispositions of an ordering Providence. In harmony with this change of temper the style has likewise undergone another change, and the tense structure and marmoreal phrasing of *Antony and Cleopatra* have given way to relaxed cadences and easy and unaccentuated rhythms. It is possible that *The Winter's Tale* and *The Tempest*, Shakespeare's last plays, with the unimportant exceptions of his contributions to Fletcher's *Henry VIII.* and *The Two Noble Kinsmen*, were written in retirement at Stratford. At any rate the call of the country is sounding through them; and it is with no regret that in the last pages of *The Tempest* the weary magician drowns his book, and buries his staff certain fathoms deep in the earth. (E. K. C.)

TEXTUAL CRITICISM

The early editors were concerned with two points—to produce an eclectic text and to cure verbal difficulties by conjecture. Pope (1723–25) made the text "correct" and regular. Theobald (1733) reduced the "science of criticism" to three points, "the emendation of corrupt passages, the explanation of obscure and difficult ones, and an inquiry into the beauties and defects of composition." He collated the early texts and made some famous emendations, e.g., "*a' babbled* of green fields" in *Henry V.*, II. iii. 17. Warburton's uncritical method was satirized by Thomas Edwards (1747). On the resort to conjecture Dr. Johnson finely said (1765): "It has been my settled principle that the reading of the ancient books is probably true, and therefore is not to be disturbed for the sake of elegance, perspicuity, or mere improvement of the sense." Capell (1768) was scholarly. The Johnson-Steevens text of 1773 was re-issued in 1786 by Isaac Reed. Edmund Malone (1790, 1821) exposed the corruption caused by misprints, ignorance of Shakespeare's phraseology, and ignorance of the texts Shakespeare used; and he discussed critical problems such as the genuineness of the *Henry VI.* plays. Of later editors Alexander Dyce was sound and careful. But the Cambridge Shakespeare (by W. G. Clark, John Glover and Aldis Wright, 1863–66; re-issued by Wright, 1891–93) gathered up in a complete critical apparatus the results of the older learning and almost became a *textus receptus*.

The new scholarship is bibliographical. In 1908 W. W. Greg proved from the technical evidence of water-marks, devices and type, that nine quartos—*The Merchant of Venice* and *A Midsummer Night's Dream* (Roberts, "1600"), *King Lear* (Butter. "1608"), *Henry V.* ("1608") *Pericles* and *The Merry Wives* ("1619"), and the spurious *Whole Contention*, *A Yorkshire Tragedy*, and *Sir John Oldcastle*—were printed by William Jaggard in 1619. In *Shakespeare Folios and Quartos* (1909) A. W. Pollard rounded off the evidence with a new classification of the Quartos into "Good" and "Bad," showing that Heminge and Condell in compiling the copy for the First Folio replaced the "Bad Quartos" by good playhouse texts, used independent mss. of four plays, but otherwise sent to press the texts of the "Good" First Quartos or of later editions of these then on the market. The authoritative text for each play was thus accurately determined.

The significance of the old rhetorical punctuation was shown by Percy Simpson in *Shakespearian Punctuation* (1911) and A. W. Pollard in *King Richard II.: A New Quarto* (1916).

In *Shakespeare's Fight with the Pirates* (1917) A. W. Pollard showed the possibility that the "Good Quartos," some of which were printed from prompt-copies, were set up from Shakespeare's autograph.

Palaeography came in with Sir Edward Maunde Thompson's *Shakespeare's Handwriting* (1916). He identified as Shakespeare's the handwriting of one scene in the *Book of Sir Thomas More* (Harley ms. 7368, folios 8, 9). The evidence was restated and amplified in *Shakespeare's Hand in the Play of Sir Thomas More*, edited by A. W. Pollard (1923). In this book J. Dover Wilson classified the peculiar spellings of the "Good Quartos," showed that misprints in them were misreadings of the English script which Shakespeare wrote, and produced parallels from the scene in the play. Sir Edward's claim has been criticized, but only one critic, Samuel A. Tannenbaum, in *Problems in Shakespeare's Penmanship* (1927), has attempted to tackle the handwriting. (P. Si.)

THE BACON-SHAKESPEARE THEORY

The thesis that the plays and poems ascribed to Shakespeare were the work of Francis Bacon appears to have been first thrown out in *The Life and Adventures of Common Sense* (1769) by Herbert Lawrence, without attracting critical attention. It emerged again in 1848, in J. C. Hart's *The Romance of Yachting* (N.Y.), taking stronger shape later in an article, "Who Wrote Shakespeare?" in *Chambers' Journal* (Aug. 5th, 1852). In all forms it appears to proceed upon *a priori* belief that the "Stratford actor" *could not* have possessed the scholarly and other qualifications supposed to be revealed in the works ascribed to him. This primary negative position is taken for granted alike in the merely negative "anti-Stratfordian" polemic of later years, and in the series of recent theories which undertake to supersede the claim for Bacon by similar claims made for the earls of Rutland, Derby and Oxford, successively.

The negative position would appear to have been originally suggested by the hyperbolical accounts given of the playwright by quite orthodox Shakespearians, as an accomplished classical scholar and a trained lawyer, abreast of all the philosophy and science of his time. The definite claim for Bacon's authorship was first fully set forth by William Henry Smith, who published in 1856, in the form of a letter to Lord Ellesmere, what appeared in 1857 in extended form, but still as a small book, under the title, *Bacon and Shakespeare: An Enquiry Touching Players, Playhouses and Play-Writers in the Days of Elizabeth.* Smith's procedure was to insist: (1) on the scantiness of our knowledge of Shakespeare's life, and at the same time to assume (2) that we know he cannot have possessed the culture required for the composition of the plays; noting further (3) that Bacon had the necessary culture; taking for granted (4) that he had all the requisite poetic and dramatic faculty; and assuming (5) that there need be no difficulty in believing that during 20 years he was secretly producing plays for Shakespeare's company at the risk of discrediting himself as a serious statesman. (6) For the rest, parallel passages (mostly

irrelevant) in Bacon's works and the Folio are cited to suggest that the plays really came from Bacon's pen, though Smith did not claim to have proved this.

The later evolution of the Baconian case involved the ascription to Bacon of the works of Marlowe and most of the other Elizabethan dramatists; the theorists, from Smith onwards, having, in general, no perception of the nature of versification; and to the list were further added Lyly's *Euphues,* Spenser's poems, the *Arte of English Poesy* ascribed to Puttenham, the whole works of Nashe, and Burton's *Anatomy of Melancholy.* As students may discover for themselves, the phraseology supposed at first to have been special to the works of Bacon and Shakespeare is normal in Elizabethan literature. Accordingly, when "Baconian" phrases were found in Florio's translation of Montaigne, Ignatius Donnelly ascribed that translation to Bacon; and Sir Edwin Durning Lawrence rounded the theory by the larger inference that Bacon was the real author of Montaigne's *Essais* in the original, having composed them as a youthful exercise in French.

Started in England, the Baconian campaign was, for a time, specially furthered in the United States by the work of Judge Nathaniel Holmes on *The Authorship of Shakespeare* (1866–86). Later, I. Donnelly contributed in his large work, *The Great Cryptogram* (1888), the theorem that Bacon had embedded in the plays a cipher narrative declaring his authorship. That claim, which was met by the demonstration that on Donnelly's methods any narrative could be extracted from any book of sufficient size, was rejected even by many Baconians. But Donnelly's simpler procedure of deducing identity of authorship from use of really common words and phrases was accepted and acclaimed by Lord Penzance (*On the Bacon-Shakespeare Controversy,* 1902) who dismissed the cipher. The summary of the movement is that, whereas it originated in a comprehensive ignorance of Elizabethan literature apart from Bacon and Shakespeare, the extension of knowledge forced upon its adherents has led to the ascription by them of practically the whole literature to Bacon.

Though the extravagances and the exposures of the procedure presumably checked acceptance of the theory, it was diligently developed until recent years, and is still represented by a Bacon Society and its periodical, *Baconiana.* Mrs. E. W. Gallup's cipher (*The Bi-Literal Cypher of Francis Bacon,* 1900) was an enterprising advance on Donnelly's; but when it was pointed out that the cipher had made Bacon employ Pope's future translation of Homer, faith was chilled; and the "anti-Stratfordian" temper found new outlets. In 1912 appeared the work of Prof. Celestin Demblon, of Brussels, *Lord Rutland est Shakespeare,* ascribing the authorship of the plays to Roger Manners, 15th earl of Rutland. This appears to have been suggested by the previous German work of Karl Bleibtreu, *Der wahre Shakespeare* (1907). In 1919 came the rival theory of Prof. Abel Lefranc of the Collège de France, *Sous le masque de "William Shakespeare"; William Stanley, VIe Comte de Derby,* introducing a third claimant; and in 1920 a fourth was presented by J. Thomas Looney, in his *Shakespeare Identified in Edward de Vere, the Seventeenth Earl of Oxford.* Since that date there has been a lull in the production of claimants. Each of the works cited negates the others, though all assume that the Stratford actor cannot possibly be the true author.

The theories, advanced by Baconians, proceed thus from a negative supposition. For instance, there is no proof that any of the four peers, above mentioned, ever wrote a line of blank verse. The "Shakespearean" reply to the Baconian theories may be stated. It is asserted by the orthodox authorities that Baconians merely evade the incontrovertible evidence for the authorship by "Shaxper" or Shakespeare of the poems published by him as his work, and the bulk of the contents of the folio volume of plays published as his, though criticism has long recognized that a number are adaptations or collaborations. Over and above other contemporary tributes to the actor-author, we have insuperable testimony in the poems by Ben Jonson prefixed to the Folio, wherein the "orthodox" claim for Shakespeare as a trained classical scholar is forestalled by the friendly avowal that he had "small Latin and less Greek." (This testimony W. H. Smith declared to be quite inapplicable to the playwright, but applicable to Bacon as an inferior Latinist.)

The further claim for the playwright as exceptionally skilled in legal technicalities was possible only through inattention to the contemporary drama. Students can see for themselves that in three or four plays of Jonson and Chapman, though neither was a lawyer, there is much more parade of technical legal knowledge than is to be found in the entire Folio. Such parade was, in fact, a common feature of the drama, poetry and prose literature of the age. All the "anti" theories, finally involve the assumption that the plays and poems could be more or less widely *known* to be the secret work of one or another aristocrat, while Jonson, the most widely associated literary man of the age, knew nothing about it. Thus a kind of thesis which finds its motive in the assumed improbability of the possession of abnormal literary genius by an actor who had left school at 14, has accumulated through all its variants a mass of improbabilities not to be matched in speculative research on any other field. It is, in fact, only as an extraordinary growth of critical extravagance that the Bacon-Shakespeare movement and its *sequelae* can hold literary attention.

Bibliography.—The literature of the Bacon-Shakespeare debate and kindred speculation runs to many hundreds of volumes in various languages, and a multitude of articles in periodicals. In addition to the pro-Baconian and other works above cited may be named:—Delia Bacon, *The Philosophy of the Plays of S. unfolded* (1857, anti-S. but not definitely Baconian); *The Promus of Formularies and Elegancies by Francis Bacon,* edited by Mrs. Henry Pott (1883, from previously unpublished mss.); W. H. Wyman, *Bibliography of the Bacon-S. Controversy* (Cincinnati, 1884, 255 entries); R. M. Theobald, *S. Studies in Baconian Light* (rep. 1901); G. C. Bompas, *The Problem of the S. Plays* (1902); Edwin Borman, *Francis Bacon's Cryptic Rhymes, and the Truth they Reveal* (1906); Sir E. Durning-Lawrence, Bt., *Bacon is S.* (1910); H. C. Batchelor, *Francis Bacon wrote S.* (1912); W. T. Smedley, *The Mystery of Francis Bacon* (1912); Parker Woodward, *Sir Francis Bacon, Poet-Philosopher-Statesman-Lawyer-Wit* (1920); E. W. Smithson, *Baconian Essays* with introd. and two essays by Sir G. G. Greenwood (1922). The last named writer has produced several "anti-Stratfordian" but non-Baconian works, of which the chief are *The S. Problem Restated* (1908) and *Is there a Shakespeare Problem?* (1916).

Among anti-Baconian works may be named:—*William S. not an Impostor, By an English Critic* (J. G. H. Townsend, 1857)—the first rejoinder in book form; T. D. King, *Bacon versus S., a Plea for the Defendant* (1875); Mrs. C. C. Stopes, The *Bacon-S. Question* (rev. ed., 1889); E. Marriott, *Bacon or S., An Historical Enquiry* (1879); L. Schipper, *S. und dessen Gegner* (Münster, 1895); W. C. Devecmon, of the Maryland bar, *In re S.'s "Legal Acquirements"* (1899); Judge Willis, *The S.-Bacon Controversy* (1902), and *The Baconian Mint* (1903); Charles Crawford, *The Bacon-S. Question,* in 2nd series of his *Collectanea* (1907); Dean Beeching, *William S., Player, Playmaker and Poet: A Reply to Mr. George Greenwood* (1908); Andrew Lang, *S., Bacon and the Great Unknown* (1912); J. M. Robertson, *The Baconian Heresy,* a confutation (1913).

THE PORTRAITS OF SHAKESPEARE

The mystery that surrounds much in the life and work of Shakespeare extends also to his portraiture. The fact that the only two likenesses of the poet that can be regarded as carrying the authority of his co-workers, his friends, and relations—yet neither of them a direct life-portrait—differ in certain essential points, has opened the door to controversy and encouraged the advance and foolish acceptance of numerous wholly different types. The result has been a swarm of portraits which may be classed as follows: (1) the genuine portraits of persons not Shakespeare but not altogether unlike the various conceptions of him; (2) memorial portraits often based on one or other of accepted originals, whether those originals are worthy of acceptance or not; (3) portraits of persons known or unknown, which have been fraudulently "faked" into a resemblance of Shakespeare; and (4) spurious fabrications made for imposition upon the public.

The two portraits which can be accepted without question as authentic likenesses are—the Bust (really a half-length statue) with its structural wall-monument in the choir of Holy Trinity Church, Stratford-on-Avon, and the copper-plate engraved by Martin Droeshout as frontispiece to the First Folio of Shakespeare's plays (and used for three subsequent editions) published in 1623, although first printed in the previous year.

BY COURTESY OF (1, 4) THE NATIONAL PORTRAIT GALLERY, LONDON, (3) THE GOVERNORS OF THE SHAKESPEARE MEMORIAL THEATRE, STRATFORD-ON-AVON, (5) M. H. SPIELMANN, (6) GEO. M. CUSHING, (11) COPR. THE GARRICK CLUB; PHOTOGRAPHS, (2) DONALD MCLEISH, (8) HAROLD BAKER

BIRTHPLACE AND PORTRAITS OF WILLIAM SHAKESPEARE

1. The "Droeshout Print" of Shakespeare, prefixed to the first folio edition of his plays in 1623
2. The birthplace of Shakespeare, in Stratford-on-Avon
3. The "Flower Portrait" called the "Droeshout original," in the Shakespeare Memorial Museum, Stratford-on-Avon
4. The "Chandos" portrait attributed to Richard Burbage, from a painting in the National Portrait Gallery, London
5. The "Cosway Zuccaro" copied in miniature by Charlotte Jones in 1823. The miniature is in England but the portrait is in America
6. The "Boston Zuccaro," or "Joy Portrait," now in Boston, U.S.A. The picture has been attributed to an artist of the Flemish school
7. Marble statue of Shakespeare by Prof. O. Lessing erected in Weimar, Germany, in 1904
8. Bust and monument of Shakespeare erected in the north wall of the choir of Holy Trinity church, Stratford-on-Avon. Before 1623 it was executed in England by Garret and Nicholas Johnson, of Flemish race
9. Statue by Louis Hasselriis, a Danish sculptor; this was executed about the beginning of this century and is now in Kronborg Castle, Denmark. Early twentieth century
10. Statue by Frederick W. MacMonnies, in the Library of Congress, Washington, D.C., executed in 1898
11. Bust by Augusto Possaglio of Florence, presented to the Garrick Club, London, in 1876

The Stratford bust and monument must have been erected on the north wall of the chancel or choir within, at most, the six years that followed Shakespeare's death in 1616, as it is mentioned in the prefatory memorial lines by Leonard Digges in the First Folio: probably, three or four years earlier. The design in its general aspect was one often adopted by the "tombe-makers" of the period, though not originated by them, and according to Dugdale was executed by a Fleming resident in London since 1567, Garratt Johnson (Gerard Janssen), a denizen. The bust is believed to have been commissioned by the poet's son-in-law, Dr. John Hall, and, like the Droeshout print, must have been seen by and likely enough had the approval of Mrs. Shakespeare, who did not die until August 1623. It is thought to have been modelled from either a life or death mask, and inartistic as it is has the marks of facial portraiture and is not a generalization such as was common in funereal sculpture. According to the practice of the day, especially at the hands of Flemish sculptors of memorial figures, the bust was coloured; this is sufficient to account for the technical summariness of the modelling and of the forms. Thus the eyebrows are but slightly indicated by the chisel, and a solid surface represents the teeth of the open mouth: the brush was evoked to supply effect and detail. To the colour, as poorly reapplied after the removal of the white paint with which Malone had had the bust covered in 1793, must be attributed a good deal of the wooden appearance which is now a shock to many. The bust is of soft stone, but a careful examination of the work reveals no sign of the alleged breakage of the nose and repair to which some writers have attributed the apparently inordinate length of the upper lip. This appearance is to a great extent an optical illusion, the result partly of the smallness of the nose and, mainly, of the thinness of the moustache that shows the flesh above and below. Some repair was made to the monument in 1649, and again in 1748, but there is no mention in the church records of any meddling with the bust itself. Owing, however, to the characteristic inaccuracy of the print by one of Hollar's assistants in the illustration of Dugdale's *Antiquities of Warwickshire* (1656), certain writers have been misled into the belief that the whole monument and bust were not merely restored but replaced by others which we see to-day. As other prints in the volume are known to depart grossly from the objects represented, and as Dugdale, like Vertue, was at times equally loose in his descriptions and presentments, there is no reason to believe that the bust and the figures above it are other than those originally placed in position. Moreover, in style, they are strictly of their period. Other engravers, following the Dugdale print, have further stultified the original, but as they differ among themselves, little importance need be attached to the circumstance. A warning should be uttered against many of the so-called "casts" of the bust. George Bullock took a cast in 1814 and Signor A. Michele another about forty years after, but those attributed to W. R. Kite, W. Scoular, and others, are really misleading copies.

Mention should here be made of the "Kesselstadt Death Mask," now at Darmstadt, as that has been claimed as the true death-mask of Shakespeare, and by it the authenticity of other portraits has been gauged. In three places on the back of it is the inscription, +A°D$\bar{\text{m}}$ 1616, and this is the sole actual link with Shakespeare. The cast first came to light in 1849 when Dr. Becker bought it in a broker's rag shop in Mainz and coolly assumed it to be the unnamed "plaster of Paris cast" which had appeared in the death-sale at Mainz of Count Kesselstadt in 1847. Upon this an ill-judged theory has been elaborated, but nothing has been carried beyond the point of bare conjecture, while the arguments against the authenticity of the cast are strong and cogent. The handsome and refined aspect of the mask accounts for much of the favour in which it has been held.

The "Droeshout print" derives its importance from its having been executed at the order of Heminge and Condell to represent, as a frontispiece to the *Plays*, and put forth as his portrait, the man and friend to whose memory they paid the homage of their adventure. The volume was to be his real monument, and the work was regarded by them as a memorial erected in a spirit of love, pride, and veneration. Mrs. Shakespeare must have seen the print; Ben Jonson extolled it—his dedicatory verses, however should be regarded in the light of conventional approval. An authentic portrait, since lost, must necessarily have been the basis of the engraving. Sir George Sharf, judging from the contradictory lights and shadows in the head, astutely concluded that the original must have been a shadowless limning which the youthful engraver attempted to put into chiaroscuro with but partial success. That this is truly the case is shown by the so-called "unique proof" discovered by Halliwell-Phillipps, and now in Mr. H. C. Folger's collection in America. Another copy is in the Bodleian Library. In this plate the head is far more human, and the bony structure corresponds. In the "proof," moreover, there is a thin, wiry moustache, afterwards widened in the print as used; and in several other details there are divergencies. In this engraving by Droeshout the body is too small for the head, and the dress is out of perspective: an additional argument that the unpractised engraver had only a drawing of a head to work from, for while the head shows the individuality of portraiture the body is as clearly guesswork. The "first proof" is conclusive evidence against the contention that the "Flower Portrait" at the Shakespeare Memorial Museum, Stratford-on-Avon—too boldly entitled the "Droeshout original"—is the original painting from which the engraving was made and is, therefore, the actual life-portrait for which Shakespeare sat. We find that several details in the proof—the incorrect illumination, the small moustache (such as we see, at the same period, in Isaac Oliver's miniature of Shakespeare's contemporary, Richard Sackville, 3rd earl of Dorset, dated 1616), the shape of the eyebrow and of the deformed ear, etc.—have been corrected in the painting, in which further improvements are also imported. The conclusion is therefore irresistible. It is possible that the picture may be the earliest painted portrait of the poet—probably executed in the earlier half of the 17th century; but the inscription—*Willm̃ Shakespeare,* 1609—is suspect on account of being written in cursive script, the only known example at the date to which it professes to belong. The most interesting parallel to this portrait is perhaps that by William Blake, now in the Manchester Corporation Art Gallery; and one of the cleverest imitations of an old picture in the "Buttery" or "Ellis portrait," acquired by an American collector in 1902. It is curious that the "Thurston miniature" done from the Droeshout print gives the moustache of the "proof,"—the same moustache as appears in the late Sir James Fergusson's oil portrait of Shakespeare.

Two other portraits of the same character of head and arrangement are the "Ely Palace portrait" and the "Felton portrait." The "Ely Palace portrait" was discovered in 1845 in a broker's shop, and was bought by Thomas Turton, bishop of Ely, who died in 1864. It bears the inscription "A 39+1603," and it shows a moustache and a right eyebrow identical with those in the Droeshout "proof." Some hailed it as the original of the print; others dismissed it as a "make-up": at the same time it has not been proved a fraud. The "Felton portrait," which made its first appearance in 1792, had the championship of the cynical Steevens and other authorities, as the original of the Droeshout print, while a few of those who believed in the "Chandos portrait" denounced it as "a rank forgery." On the back of the panel was traced in a florid hand "Gul. Shakespear 1597 R.B." (by others read "R.N."). If R. B. were correct, it is contended the initials indicate Richard Burbage, Shakespeare's fellow-actor. (Boaden's copy, made in 1792, repeating the inscription on the back, has "Guil. Shakspeare 1587 R.N.") The spelling of Shakespeare's name—which in succeeding ages has been governed by the fashion of the day—has a distinct bearing on the authenticity of the panel. At the first appearance of the "Felton portrait" in a London sale-room it was bought by Samuel Felton of Drayton, Shropshire, for five pounds, along with a pedigree which carried its refutation along with it. Nevertheless, it bears evidence of being an honest painting of somebody done from life. Richardson, the printseller, issued fraudulent engravings of it by Trotter and others (by which it is best known) adding a body in the Droeshout costume and then maintaining that the work was the original of the Droeshout print and therefore a life-portrait of Shakespeare.

The "Janssen" or "Somerset portrait" is in many respects the most interesting painted likeness called "Shakespeare," as it is undoubtedly the finest of all the paintings in the series. It is certainly a genuine as well as a very beautiful picture, and bears the inscription—$\frac{\text{Æ}^{t}\,46}{1610}$—but doubt has rightly been expressed whether the 6 of 46 has not been tampered with, altered from 0 to fit Shakespeare's age. It was first truly revealed in the photograph of the original published in 1909 (in *The Connoisseur*) by permission of the owner, the late Lady Guendolen Ramsden, daughter of the duke of Somerset, the previous possessor. Charles Jennens, the eccentric amateur editor of *King Lear* issued in 1770, was the first known owner; he shrank from the challenge to produce the picture. It is more than likely that Janssen was the painter of it at his best; but it is idle to claim it as a likeness of Shakespeare. A number of good copies of it exist, all but one made in the 18th century: the "Croker Janssen" now lost, unless it be Lord Darnley's; the "Staunton," the "Buckston," the "Marsden Janssen," and the copy in the possession of the duke of Anhalt. These are all above the average merit of such work.

The portrait which has made the most popular appeal is that called the "Chandos," successively known as the "d'Avenant," the "Stowe," and the "Ellesmere;" it is now in the National Portrait Gallery. Tradition, tainted at the outset, attributes the authorship of it to Richard Burbage, who is alleged to have given it to his fellow-actor Joseph Taylor, who bequeathed it to Sir William d'Avenant, Shakespeare's godson. As a matter of fact, Taylor died intestate. Thenceforward, whether or not it once belonged to d'Avenant, its history is clear. At the great Stowe sale of the effects of the duke of Buckingham and Chandos (who had inherited it) the earl of Ellesmere bought it and then presented it to the nation. Many serious inquirers have refused to accept this romantic, Italian-looking head here depicted as a likeness of Shakespeare of the Midlands, if only because in every important physiognomical particular, and in face-measurement, it is contradicted by the Stratford bust and the Droeshout print. Oldys, indifferent to tradition, attributed it to Janssen, an unallowable ascription. That it has not been radically altered by the restorer is proved by the fine copy painted by Sir Godfrey Kneller, and by him presented to John Dryden. D'Avenant had died in 1668, and so could not, as tradition contends was the case, have been the donor. In Malone's time the picture was already in the possession of the earl Fitzwilliam. This at least proves the esteem in which the Chandos portrait was held by some so far back as the end of the 17th century, only 70 years after Shakespeare's death.

From among the innumerable copies and adaptations of the Chandos portrait a few emerge as having a certain importance of their own. That which Sir Joshua Reynolds is traditionally said to have made for the use of Roubiliac, then engaged on his statue of Shakespeare for David Garrick (now in the British Museum), and another alleged to have been done for Bishop Newton, are now lost. One by Ranelagh Barret was presented in 1779 to Trinity College Library, Cambridge. Dr. Matthew Maty, principal librarian of the British Museum, presented his copy, almost certainly by Roubiliac, to the museum in 1760. There are also the smooth but rather original copy (with drapery added) belonging to the earl of Bath at Longleat; the Warwick Castle version; the Lord St. Leonards; another copy in coloured crayons, formerly in the Jennens collection, afterwards belonging to Lord Howe, by van der Gucht; the Shakespeare Hirst picture, based on Houbraken's engraving, and the Baverstock portrait. The full-size chalk drawing by Ozias Humphry, R.A., at the Birthplace, Malone guaranteed to be a perfect transcript.

The "Lumley portrait" represents a heavy-jowled man with pursed-up lips, and with something of the expression but little of the vitality of the Chandos, the original of which George Rippon, when its owner, declared it to be (*c.* 1848). It was claimed to have belonged to John, Lord Lumley, of Lumley Castle, Durham, who died in 1609, but the evidence wholly fails. When in Rippon's possession the picture was so superbly chromo-lithographed by Vincent Brooks that copies of it, mounted on old panel or canvas, and varnished, have often changed hands as original paintings. It is thinly painted and scarcely looks the age that is claimed for it; but it is an interesting work which, in 1875, entered the collection of the late Baroness Burdett-Coutts and has since passed to America.

To Frederigo Zuccaro are attributed three of the more important portraits now to be mentioned; upon him also have been foisted several of the more impudent fabrications herein named. The "Bath" or "Archer portrait"—it having been in the possession of the Bath Librarian, Archer, when attention was first drawn to it in 1859—is worthy of Zuccaro's brush. It is Italian in feeling and in type, with an inscription ("W. Shakespeare") in an Italian but apparently more modern hand, and it is curious that in certain respects it bears some resemblance not only to the Chandos, and to the Droeshout and Janssen portraits, but also to the "death-mask"; yet it differs in essentials from all. If this refined and dandified and beautifully-painted portrait represents Shakespeare at about the age of 30, that is to say in 1594, the actor-dramatist had made astonishing progress in the world; but Zuccaro came to England in 1574, and as his biographers state "did not stay long." The conclusion appears to be definite. It is another of the Baroness Burdett-Coutts's portraits which have been acquired in America.

Stronger objection applies to the "Boston Zuccaro" or "Joy portrait," now in Boston, U.S.A.—a picture with a not wholly convincing pedigree, and tradition. It is in very fair condition and appears to be a good picture of the Flemish school; but the declaration that it was found in the Globe Tavern which was frequented by Shakespeare and his associates must be held subject to the circumstance that no such tavern is known with any certainty ever to have existed.

The "Cosway Zuccaro" portrait is also in America; but the reproduction of it exists in England in the miniature of it by Cosway's pupil, Charlotte Jones, painted in 1823, as well as in the rare mezzotint by Hanna Greene. Somewhat resembling Shelley in caricature, it suggests an unusual portrait (if authentic) of Shakespeare. The inscription on the back, "Guglielm: Shakespear," with its mixture of Italian and English, resembles in wording and spelling that adopted in the case of several pictures, the reliability of which is disputed. Wivell attributed it to Lucas Franchois.

Of the "Burdett-Coutts portrait" (the fourth interesting portrait of Shakespeare formerly the possession of the Baroness and then of Mr. Burdett-Coutts) there is no history whatever to record. The picture is admirably executed, but the face is weak and is the least satisfactory part of it. Shakespeare's shield, crest, with red mantling, and the figure "37" beneath it, appear on the background, in the manner adopted in 17th century portraits. From this picture the "Craven portrait" seems to have been derived.

Equally striking is the "Ashbourne portrait," well known through G. F. Storm's mezzotint of it. It is sometimes called the "Kingston portrait" as the first known owner of it was the Rev. Clement U. Kingston, who issued the engraving in 1847. It is an important three-quarter length, representing a refined, fair-haired Englishman, in black, standing beside a table at the corner of which is a skull whereon the figure rests his right forearm. It is an acceptable likeness of Shakespeare, in the manner of Paul von Somer. The inscription "AETATIS SVAE. 47. A° 1611," and the suspect decoration of *cross* spears on a book held by the right hand, are also raised from the ground, so that it would be injudicious to decide that these are not later additions. In 1928 it passed into American possession.

More famous, but less reputable, is the "Stratford" or "Hunt portrait," in the Birthplace at Stratford. It had been in the Hunt family for many years and represented a black-bearded man. Collins, the picture cleaner, removed the top figure from the dilapidated canvas with spirit and found beneath it the painted version of the Stratford bust. Then Collins (always a suspect in this matter) proceeded with the restoration, and by treatment of the hair made the portrait more than ever like the bust; and the picture thereupon was claimed to be the original from which the bust was made, although the style of the painting suggests a date not later than the latter half of the 18th century.

The "Duke of Leeds portrait," for many years at Hornby

castle, but without a history, slightly recalls the Janssen portrait. There is nothing but the "wired band" to connect it with Shakespeare. Much the same may be said of the "Welcombe portrait," which was bought by Mark Phillips of Welcombe and came into the possession of the late Sir George Trevelyan. It is a fairly good picture, having some resemblance to the "Boston Zuccaro" with something of the Chandos. Two other portraits at the Shakespeare Memorial should be named: the "Venice portrait," which was bought in Paris and is said to have come from Venice, bearing on the back an Italian undecipherable inscription—it seems to have no connection with Shakespeare; and the "Jacob Tonson portrait," 1735, which was probably executed for Tonson's 4th edition of Shakespeare, but not used.

The "Soest portrait" (often called Zoust or Zoest), formerly known as "the Douglas," the "Lister Kaye" or the "Clarges portrait," according to the owner of the moment, was for many years a public favourite, mainly through J. Simon's excellent mezzotint. Soest was not born until 1637, and according to Granger the picture was painted in Charles II.'s reign. A number of copies exist, two of which are at the Shakespeare Memorial.

Of the "Charlecote portrait," which was exhibited publicly at Stratford in 1896, the chief resemblance to Shakespeare lies in his baldness, and wired band. The fact that it was once in the possession of the Rev. John Lucy lent it a sort of reputation, although he bought it in 1853.

Similarly, the "Hampton Court portrait" derives such interest as it possesses from the fact that William IV. bought it as a portrait of Shakespeare, and lodged it in the Palace. Similarly unacceptable is the "H. Danby Seymour portrait" which was lent to the National Portrait Exhibition of 1866 (said to be still in the possession of that family). It is a fine three-quarter length in the Miervelt manner. The "Lytton portrait," a gift made to a former Lord Lytton after it had emerged from Windsor Castle, is mainly interesting as having been copied by Miller in his original profile engraving of Shakespeare. The "Rendelsham" and "Crooks" portraits also belong to the class of capital paintings representing some one other than Shakespeare; and the same may be said of the "Grafton" or "Winston" portrait, the "Sanders," the "Gilliland" (an old man's head absurdly advanced by Wivell), the striking "Thorne Court portrait," the "Aston Cantlow," the "Burn," the "Gwennet," and the "Wilson" portraits, and others.

Miniature-painting has assumed a certain importance in relation to the subject. The "Welbeck Abbey," or "Harleian miniature," is that which Walpole caused to be engraved by Vertue for Pope's edition of Shakespeare (1723–1725), but which Oldys declared, incorrectly, to be a juvenile portrait of James I. According to Scharf, it belonged to Robert Harley, 1st earl of Oxford, but whence it came is not known. It has been denounced as a piece of arrant sycophancy that Pope adopted this beautiful but unauthenticated portrait, simply in order to please the aristocratic patron of his literary circle. It measures 2 in. high; Vertue's exquisite engraving, executed in 1721, enlarged it to 5¼ in., and became the "authority" for numerous copies, British and foreign. The "Somerville" or "Hilliard miniature," long owned by Lord and Lady Northcote, is claimed to have descended from Shakespeare's friend, Somerville of Edstone, grandfather of the poet Somerville. It was first known in 1818 when in the possession of Sir James Bland Burges. It is certainly by Hilliard, but it hardly conforms to the appearance of the poet. The well-known "Auriol miniature," now in America, is one of the least sympathetic and the least acceptable of the so-called Shakespeare miniatures. Before it came into the hands of the collector, Charles Auriol, its history is unknown. The other principal miniatures of interest, but lacking authority, are the "Waring," the "Tomkinson," the doubtful "Isaac Oliver," the "Mackey" and "Glen" miniatures, and those presented to the Shakespeare Memorial by Lord Ronald Gower, T. Kite, and Henry Graves. These are all contemporary or early works. In this category are a number of enamels by accomplished artists, the chief of them Henry Bone, R.A., H. P. Bone, and W. Essex.

Several recorded painted portraits have disappeared, other than those already mentioned; these include the "Earl of Oxford portrait" and the "Challis portrait." The "Countess of Zetland's portrait," which had its adherents, was destroyed by fire.

There is a class of honestly produced memorial paintings in which earnest attempts have been made to reconstitute the face and form of the poet, combining within them the best and most characteristic features of the earliest portraits. The most successful of these is that by Ford Madox Brown, in Manchester. Those by J. F. Rigaud, R.A., and Henry Howard, R.A., take lower rank. The "Booker portrait," which gained wide publicity in Stratford, might be included here as well as the heads by P. Krämer and Rumpf, which are among those executed in Germany.

Unproved portraits have been at times as ardently accepted as those with some solid claim to consideration. The "Shakespeare Marriage picture" was discovered in 1872. It is a genuine Dutch picture of man and wife weighing out money in the foreground—a frequent subject—while through an open door Shakespeare and, presumably, Ann Hathaway are seen going through the ceremony of handfasting. The inscription and the Shakespeare head (probably the whole group and open door) are unproved. The "Rawson portrait," inscribed with the poet's name, is unproved; it is really a beautiful little study of the Lord Keeper Coventry by Janssen. The "Matthias Alexander portrait" shows a modern head on an old body. The "Belmount Hall portrait" with its pseudo-Garrick ms. inscription on the back, is in the present writer's opinion, doubtful. In the early part of the 19th century two clever "restorers," Holder and Zincke, made a fairly lucrative trade of producing imaginary portraits of Shakespeare and others. Many of these impostures won acceptance, sometimes by the help of the fine engravings which were made of them. Such are the "Stace" and the "Dunford" portraits—so named after the dealers who put them forward: of the latter a copy is in existence known as the "Dr. Clay portrait." The former is based upon the portrait of Robert Carr, earl of Somerset. There are the two "Winstanley portraits," the "Bishop Newton," the "Cygnus Avoniae," the "Norwich" or "Boardman," the "Bellows" or "Talma" portraits—most of them, as well as others, traceable to one or other or both of the enterprising restorers thus named. About a dozen are reinforced, as corroborative evidence, with verses supposed to have issued from the pen of Ben Jonson. These are all to be attributed to one ready pseudo-Elizabethan writer whose identity is known. With these pictures, apparently, should be ranged the composition, now in America, purporting to represent Shakespeare and Ben Jonson playing chess.

The "fancy-portraits" are also numerous. The 18th-century small full-length "Willett portrait" is at the Shakespeare Memorial—a charmingly touched-in little figure. There are many representations of the poet in his study in the act of composition—they include those by Benjamin Wilson (Stratford Town Hall), John Boaden, John Faed, R.A., Sir George Harvey, R.S.A., C. Bestland, B. J. N. Geiger, and the painter of the Warwick Castle picture, etc.; others have for subject Shakespeare reading, either to the Court or to his family, by John Wood, E. Ender, R. Westall, R.A., etc.; or the infancy and childhood of Shakespeare, by George Romney (three pictures), T. Stothard, R.A., John Wood, James Sant, R.A.; and Shakespeare before Sir Thomas Lucy, by Sir G. Harvey, R.S.A., Thomas Brooks, A. Chisholme, etc. These, and kindred subjects such as "Shakespeare's Courtship," have provided infinite material for Shakespeare-loving painters.

The engraved portraits on copper, steel, and wood number many hundreds. Vertue and Walpole speak of an engraved portrait by John Payne (*fl.* 1620, the pupil of Simon Pass and one of the first English engravers who achieved distinction); but no such print has been identified and its existence is doubted. Walpole perhaps confounded it with that by W. Marshall, a reversed and reduced version of the Droeshout, which was published as frontispiece to the spurious edition of Shakespeare's poems (1640). An engraving, to all but expert eyes unrecognizable as a copy, was made from it in 1815, and another later, by Swaine. William Faithorne (d. 1691) is credited with the frontispiece to Quarles's edition of "The Rape of Lucrece, by William Shakespeare, gent." (1655). It was copied for Rodd by R. Sawyer and republished in 1819. It represents the tragic scene between Tarquin and Lucrece, and

above is inset an oval medallion, being a rendering of the Droeshout portrait reversed. Of the earliest engravings from the Chandos portrait, the first is by L. du Guernier (Arlaud type) and that by M. (father of G.) van der Gucht; they are introduced into a pleasing composition. These, like Vertue's earlier prints, look to the left; subsequent versions are reversed. Perhaps the most popular and important up to that time is the line-engraving (to the right) by Houbraken, a Dutchman, done for Birch's "Heads of Illustrious Persons of Great Britain" (1747–1752). This free rendering of the Chandos portrait is the parent of the numerous engravings of "the Houbraken type." Since that date many plates of a high order, from many of the principal portraits, have been issued, in the majority of cases being extremely inaccurate.

Numerous portraits in stained glass have been inserted in the windows of public institutions. Typical of them are the German Chandos windows by Franz Mayer (Mayer & Co.) at Stationers' Hall, and in St. Helens, Bishopsgate (Professor Blaim); that of the Droeshout type in the great hall of the City of London school, and another by John R. Clayton in St. James's, Shoreditch. The Droeshout window by Savill, in the Empire theatre, London, has been removed to be placed, it is said, in the Drury Lane theatre. Ford Madox Brown's design is one of the best ever executed.

We now come to the sculptured memorials. After Gerrard Johnson's bust no statuary portrait seems to have been executed until 1740, when the statue in Poets' Corner, Westminster Abbey, was set up by public subscription, mainly through the activity of the earl of Burlington, Dr. R. Mead, and the poet Pope. It was "invented" by William Kent and carried out by Peter Scheemakers. It is technically good, and is interesting as being the first sculptured portrait of the poet based upon the Chandos picture. A free repetition, reversed and with many changes of detail, is erected in a niche on the exterior wall of the town-hall of Stratford-on-Avon. The marble copy, much simplified, in Leicester Square, is by Fontana, a gift to London by Baron Albert Grant. By L. F. Roubiliac is the statue which in 1758 David Garrick commissioned him to carve and which he bequeathed to the British Museum. Three terra-cotta models for the statue are in the Victoria and Albert Museum and in private hands; a marble reproduction of it also exists. To Roubiliac also must be credited the celebrated "Davenant Bust" of blackened terra-cotta in the possession of the Garrick Club. This fine work of art derives its name from having been found bricked up in the old Duke's theatre in Portugal Row, Lincoln's Inn Fields, which 180 years before was d'Avenant's. The fine alto-relievo representation of Shakespeare, by T. Banks, R.A., between the Geniuses of Painting and the Drama, is now in the garden of New Place, Stratford-on-Avon. It is remarkable that Banks's was the first British hand to model a portrait of the poet.

In more recent times numerous attempts have been made to reconstitute the figure of Shakespeare in sculpture. One of the most ambitious of these is Lord Ronald Gower's elaborate memorial group presented by himself to Stratford and set up outside the Memorial Theatre in 1888. In 1864 J. E. Thomas modelled the colossal group of Shakespeare with attendant figures of Comedy and Tragedy that was erected in the grounds of the Crystal Palace, and in the same year Charles Bacon produced his huge Centenary Bust. The chief statues, single or in a group, in London still to be mentioned are the following: that by H. H. Armstead, R.A., in marble, on the southern podium of the Albert Memorial; by Hamo Thornycroft, R.A. (1871), on the Poets' Fountain in Park Lane; by Messrs. Daymond on the upper storey of the City of London School, on the Victoria Embankment; and by F. E. Schenck, a seated figure, on the façade of the Hammersmith Public Library. The Droeshout portrait is the basis of the head in the bronze memorial by Professor Lantéri set into the wall on the conjectural site of the Globe Theatre (1909) and of the excellent bust by Mr. C. J. Allen in the churchyard of St. Mary the Virgin, Aldermanbury, in memory of Heminge and Condell (1896). A recumbent statue, with head of the Droeshout type, executed by H. McCarthy, was, through the efforts of Dr. R. W. Leftwich and the generosity of Mr. S. Saltus (an American lover of the poet) erected, in 1912, in the south aisle of Southwark Cathedral. Among statues erected in the provinces are those by H. Pegram in the building of Birmingham University (1908) and by M. Guillemin for the Nottingham University buildings. An imposing Shakespeare Monument by Sir Bertram Mackennal, has been erected in Melbourne.

Several statues of importance have been set up in other countries. The bronze by M. Paul Fournier in Paris (presented by an English resident) marks the junction of the Boulevard Haussmann and the Avenue de Messine (1888). The seated marble statue by Professor O. Lessing was erected in Weimar by the German Shakespeare Society; and a seated statue in stone roughly hewn with characteristic breadth by the Danish sculptor, Louis Hasselriis, has for some years been placed in the apartment of the Castle of Kronborg, in which, according to the Danish tradition, Shakespeare and his company acted for the king of Denmark; the present castle, however, was not built till a later period. America possesses some well-known statues. That by J. Q. A. Ward is in Central Park, New York (1872). In 1886 W. O. Partridge modelled and carved the seated marble figure for Lincoln Park, Chicago; and later, Frederick MacMonnies produced his very imaginative statue for the Library of Congress, Washington, D.C. This is in some measure based on the Droeshout engraving. William R. O'Donovan also sculptured a portrait of Shakespeare in 1874. Undue consideration was given by some to the bust made by William Page of New York in preparation for a picture of the poet he was about to paint. As he was no sculptor the bust is no more successful than the picture. The bust by R. S. Greenough, based in part on the "Boston Zuccaro" portrait, must be included here, as well as the romantic marble bust by Augusto Possaglio of Florence (presented to the Garrick Club by the tragedian Salvini in 1876); the imaginative work by Altini (Duke of Northumberland, Alnwick Castle) and the busts by F. M. Miller, E. G. Zimmermann, Albert Toft, J. E. Carew and P. J. Chardigny of Paris. The last named was a study made in 1850, for a proposed statue, 100 ft. high. Attention has been accorded for several years past to the large pottery bust in high relief attributed to John Dwight's Fulham Pottery (*c.* 1675); the present writer, however, has established that it is by Lipscombe, in the latter portion of the 19th century.

For the less significant sections of portraiture—the wood-carvings (including the medallion traditionally said to have been cut by Hogarth and inset in the back of the "Shakespeare Chair" presented to Garrick); the medals, coins, and token-money; porcelain and pottery—figures, busts, etc.; engraved gems; and numerous other items, space cannot here be found. The curious reader is referred to the article in the eleventh edition of this work for numerous details touching the whole subject.

Bibliography.—The most important books on Shakespeare portraiture are as follows: G. Steevens, *Proposals for Publishing the Felton Portrait*, 1794, 8vo; J. Britton, *On the Monumental Bust*, 1816, 8vo; J. Boaden, *Authenticity of Various Pictures and Prints offered as Portraits of S.*, 1824, 4to; A. Wivell, *The Monumental Bust*, 1827, 8vo, and *Inquiry into the S. Portraits*, 1840, 8vo; H. Rodd, *The Chandos Portrait* [1849], 8vo; R. H. Forster, *Remarks on the Chandos Portrait*, 1849, 8vo; J. P. Collier, *Dissertation upon the Imputed Portraits*, 1851, 8vo; C. Wright, *The Stratford Portrait of S.*, 1861, 8vo; J. H. Friswell, *Life Portraits of W.S.*, 1864, 8vo; Sir G. Scharf, *On the Principal Portraits of S.*, 1864, 12mo; E. T. Craig, *S. and his Portraits, Bust and Monument*, 1864 and 1886, 8vo, and *S.'s Portraits phrenologically considered*, Philadelphia, 1875, 8vo; G. Harrison, *The Stratford Bust*, Brooklyn, 1865, 4to; W. Page, *Study of S.'s Portraits*, 1876, sm. 4to; J. P. Norris, *Bibliography of Works on the Portraits of S.*, Philadelphia, 1879, 8vo; *The Death Mask of S.*, 1884, and *The Portraits of S.*, Phil., 1885, 4to (very inaccurate); Amédée Pichot, *S., avec les portraits authentiques* (*Revue Britannique*), Paris, 1888; Edwin Bormann, *Der S.-Dichter: wer war's und wie sah er aus*, Leipzig, 1902 (Baconian); A. A. Bekk, *Des Dichters Bild*, Berlin, 1902, 8vo; John Corbin, *A New Portrait of S.* (the "Ely Palace"), 1903, 8vo; M. H. Spielmann, *The Portraits of S.*, 1907, 8vo, and *The Title-page of the First Folio*, 1924; W. B. Kempling, *S. Memorials in London*, 1923; Sir G. Greenwood, *The Stratford Bust and the Droeshout Engraving*, 1925 (*anti-S^n*); M. C. Salaman, *S. in Pictorial Art* (The Studio, 1926). See also Jaggard's *S. Bibliography* (Stratford, 1911); *Cat. of Portraits of W.S.* (Grafton Galleries, London, 1917); and, for an account of the portraits in the Barton Collectn., Boston Pub. Library, A. M. Knapp in their *S. Cat.* (1880). (M. H. S.)

GENERAL CLASSIFIED BIBLIOGRAPHY

The following classified list is an attempt to indicate the more important books still valuable for study. For full lists *see* W. Jaggard's *Shakespeare Bibliography* (Stratford, 1911), supplemented by the *Jahrbuch* of the German Shakespeare-Gesellschaft, which records later books, with articles in periodicals; also the annual *Bibliography* of the Modern Humanities Research Association, and the *Year's Work in English Studies* of the English Association.

I. TEXTS

The chief Quartos are reproduced in *S. Quarto Facsimiles* (1883–89, Quaritch), and the First Folio in facsimiles of 1902 (Clarendon Press) and 1910 (Methuen), and a good reprint of 1862 (Booth). Eighteenth century learning from the editions of N. Rowe (1709), A. Pope (1723–25), L. Theobald (1733), W. Warburton (1747), S. Johnson (1765), E. Capell (1767), G. Steevens (1773), E. Malone (1790) and others is collected in the *Third Variorum* edition (1821), edited by J. Boswell from Malone's papers. T. R. Lounsbury, *The First Editors of S.* (1906) describes the beginnings of textual criticism. Of innumerable later editions the most important are, for textual collation the Cambridge (1863–66, 1891–93, ed. W. G. Clark, J. Glover and W. A. Wright) and for general commentary the *New Variorum* (1871, etc., ed. H. H. Furness, in progress) and the *Arden* (1899–1924, various eds.). Less full, but handy for the ordinary reader, are the *Eversley* (1899–1903, ed. C. H. Herford), the *Temple* (1894–96, ed. I. Gollancz), and the *Yale* (New York, 1918–27, various eds.). The *"New" Cambridge* (1921 etc., ed. A. T. Quiller-Couch and J. D. Wilson, in progress) is interesting but speculative. The best unannotated one-vol. texts are the *Globe* (1874, etc., ed. W. G. Clark and W. A. Wright), the *Oxford* (ed. W. J. Craig) and the *Cambridge* (U.S.A., 1906, ed. W. A. Neilson); ascribed plays are in *The Shakespeare Apocrypha* (1908, ed. C. F. Tucker Brooke). The best separate editions of the *Sonnets* are by E. Dowden (1881); H. C. Beeching (1904); W. H. Hadow (1907); R. M. Alden (1916); T. G. Tucker (1924); and of the *Poems* by G. Wyndham (1898).

II. BIOGRAPHY

Most of the documentary evidence is in J. O. Halliwell-Phillipps, *Outlines of the Life of S.* (ed., 1898), and more briefly in D. H. Lambert, *Cartae Shakespeareanae* (1904) and C. F. T. Brooke, *S. of Stratford* (1926). The fullest narrative *Life* is by Sir Sidney Lee (ed., 1925); that by F. Q. Adams (1923) is also useful. Contemporary notices and allusions are in J. J. Munro, *S. Allusion Book* (1909). Valuable studies are G. R. French, *Shakespeareana Genealogica* (1869); F. G. Fleay, *Life and Work of S.* (1886); C. C. Stopes, *S's Family* (1901); *S's Environment* (1914); C. I. Elton, *W. S., his Family and Friends* (1904); J. W. Gray, *S's Marriage and Departure from Stratford* (1905); E. Law, *S. as Groom of the Chamber* (1910). Conflicting views are in T. Carter, *S. Puritan and Recusant* (1897) and Father H. S. Bowden, *Religion of S.* (1899). The "Ireland" forgeries are discussed in E. Malone, *Inquiry into the Authenticity of Certain Papers* (1796); the "Collier" forgeries in C. M. Ingleby, *Complete View of the S. Controversy* (1861); and the genuineness of some suspected documents is established in E. Law, *Some Supposed S. Forgeries* (1911) and *More about S. Forgeries* (1913).

III. ENVIRONMENT

Reference should be made to the general bibliographies for ENGLISH LITERATURE; ELIZABETHAN DRAMA and THEATRE. Here may be noted as of special value for the illustration of *S.*:—On the drama, A. W. Ward, *History of English Dramatic Literature* (2nd ed., 1899); W. W. Greg, *Henslowe's Diary* (1904–08), *Henslowe Papers* (1907); F. E. Schelling, *English Drama*, 1558–1642 (1908); W. Creizenach, *Geschichte des neueren Dramas*, vols. iv. v. (1909, 1916); F. S. Boas, *S. and his Predecessors* (1896);—on the stage, J. T. Murray, *English Dramatic Companies* (1910); C. C. Stopes, *Burbage and S's Stage* (1913); A. H. Thorndike, *S's Theater* (1916); J. Q. Adams, *Sn. Playhouses* (1920); E. K. Chambers, *Elizabethan Stage* (1923); W. W. Braines, *Site of the Globe Playhouse* (1924); T. W. Baldwin, *Organisation and Personnel of the S. Company* (1927); *S. and the Theatre* (1927, by various hands); on local conditions, T. F. Ordish, *S's London* (1904); Sir S. Lee, *Stratford-on-Avon* (1907); E. I. Fripp, *Master Richard Quyny* (1924); *Minutes and Accounts of the Corporation of Stratford-upon-Avon* (Dugdale Soc., 1921, etc., in progress); and on contemporary civilization, *S's England* (2nd ed., 1926).

IV. PROBLEMS OF THE TEXTS

Much recent study on the nature and origination of the extant texts is summarized in C. H. Herford, *Sketch of Recent S. Investigation* (1923). Bibliographical data are given in W. W. Greg, *List of English Plays* (1900); H. C. Bartlett, *Mr. W. S.* (1922). The relation of the Folios and Quartos, the possibilities of textual error, and the production of "surreptitious" texts are discussed in A. W. Pollard, *S. Folios and Quartos* (1909); *Rich. II. a New Quarto* (1916); *S's Fight with the Pirates* (1917, 1920); *Foundations of S's Text* (1923); W. W. Greg, *Merry Wives* (1910), *Two Elizabethan Stage Abridgements* (1923); *Studies in the First Folio* (1924, by various hands); L. Kellner, *Restoring S.* (1925); and *S's* script, especially in relation to *Sir Thomas More*, in E. M. Thompson, *S's Handwriting* (1916); A. W. Pollard and others, *S's Hand in the Play of S.T.M.* (1923); S. A. Tannenbaum, *The Booke of S.T.M.* (1927), *Problems in S's Penmanship* (1927). Scepticism as to *S.* authorship takes an extreme form in J. M. Robertson, *S. and Chapman* (1917). *Problem of Merry Wives* (1917); *Problem of Hamlet* (1919), *Hamlet once more* (1923). *The S. Canon* (1922–25), with an *Introduction* (1924), *Problems of the S. Sonnets* (1926); and is criticized in E. K. Chambers, *Disintegration of S.* (1924).

V. LITERARY APPRECIATION

The best of the earlier criticism is in J. Dryden, *Essays* (1900, ed. W. P. Ker); D. Nichol Smith, *Eighteenth Century Essays on S.* (1903), *S. Criticism; a Selection* (1916, including Lamb, Hazlitt, De Quincey); W. Raleigh, *Johnson on S.* (1908); J. W. Mackail, *Coleridge's Literary Criticism* (1908). Modern studies, from various standpoints are E. Dowden, *S. his Mind and Art* (1874); A. C. Swinburne, *Study of S.* (1880); G. G. Gervinus, *S. Commentaries* (1883); W. Pater, *Appreciations* (1889); B. Ten Brink, *Five Lectures on S.* (1895); G. Sarrazin, *S's Lehrjahre* (1897), *Aus S's Meisterwerkstatt* (1906); R. G. Moulton, *S. as a Dramatic Artist* (1897); *S. as a Dramatic Thinker* (1907); G. Brandes, *W. S.* (1898, 1909); T. R. Lounsbury, *S. as a Dramatic Artist* (1902); A. C. Bradley, *Sn Tragedy* (1905), *Oxford Lectures in Poetry* (1909); W. Raleigh, *S.* (1907); J. Masefield, *W. S.* (1911); A. T. Quiller-Couch, *S's Workmanship* (1917); R. M. Alden, *S.* (1922); B. Croce, *Ariosto, S., and Corneille* (1922); E. K. Chambers, *S.: A Survey*, (1925); H. Granville Barker, *From Henry V. to Hamlet* (1925). *Prefaces to S.* (1927); E. E. Stoll, *S. Studies* (1927).

VI. LANGUAGE AND VERSIFICATION

The best *Glossary* is that of C. T. Onions (1919), based on the *Oxford English Dictionary*, and the best *Concordance* that of J. Bartlett (1894). Special dictionaries are F. G. Stokes, *Characters and Proper Names in S.* (1924); E. H. Sugden, *Topographical Dict. of S. and his Fellow Dramatists* (1925). Grammar, punctuation and metre are dealt with in E. A. Abbott, *Sn Grammar* (1888); W. Franz, *S. Grammatik* (3rd ed., 1924); P. Simpson, *Sn Punctuation* (1911); C. M. Ingleby, *S. the Man and the Book*, Part ii. (1881, with F. G. Fleay's corrected statistics of metre); J. B. Mayor, *Chapters on English Metre* (1886); G. König, *Vers in S's Dramen* (1888); D. L. Chambers, *Metre of Macbeth* (1903); B. A. P. Van Dam and C. Stoffel, *W. S. Prosody and Text* (1900); A. Kerrl, *Metrischen Unterschiede von S's K. John and J. Caesar* (1913); M. A. Bayfield, *S's Versification* (1920).

VII. SOURCES AND KNOWLEDGE

Sources of *S's* plots are collected in W. C. Hazlitt, *S's Library* (1875); *S. Classics* (1903–13, by various eds.); W. G. Boswell Stone, *S's Holinshed* (1896); W. W. Skeat, *S's Plutarch* (1892); R. H. Carr, *Plutarch's Lives*. His range of reading is studied in H. R. D. Anders, *S's Books* (1904), and special aspects in R. Farmer, *Essay on the Learning of S.* (1767); P. Stapfer, *S. and Classical Antiquity* (1880); R. K. Root, *Classical Mythology in S.* (1903); M. W. MacCallum, *S's Roman Plays and their Background* (1910); C. Wordsworth, *S's Knowledge and Use of the Bible* (4th ed., 1892); T. Carter, *S. and Holy Scripture* (1905); J. A. R. Marriott, *English History in S.* (1918); J. M. Robertson, *Montaigne and S.* (1909); G. C. Taylor, *S's Debt to Montaigne* (1925); H. Green, *S. and the Emblem Writers* (1870); R. Jente, *Proverbs of S.* (1926); and his experience of life in W. L. Rushton, *S. a Lawyer* (1858); Lord Campbell, *S's Legal Acquirements* (1859); W. C. Devecmon, *In re S's Legal Acquirements* (1899); C. Allen, *Notes on the Bacon S. Question* (1900); J. C. Bucknill, *Medical Knowledge of S.* (1860); *Mad Folk of S.* (1867); J. Moyes, *Medicine and Kindred Arts in the Plays of S.* (1896); W. Blades, *S. and Typography* (1872); E. W. Naylor, *S. and Music* (1896); G. H. Cowling, *Music on the S'n Stage* (1913); E. Noble, *S's Use of Song* (1926); D. H. Madden, *Diary of Master William Silence* (1907, on field sports); W. L. Rushton, *S. an Archer* (1897); H. N. Ellacombe, *S. as an Angler* (1883); *Plant-lore and Garden-Craft of S.* (3rd ed., 1896); F. G. Savage, *Flora and Folk-lore of S.* (1923); T. F. Dyer, *Folk-lore of S.* (1884); A. Nutt, *Fairy Mythology of S.* (1900); J. E. Harting, *Ornithology of S.* (1871); W. H. Seager, *Natural History in S's Time* (1896); W. B. Whall, *S's Sea Terms Explained* (1910); A. B. Jameson, *S's Heroines* (2nd ed., 1879); H. Martin, *Some of S's Female Characters* (1885); A. M. Mackenzie, *Women in S's Plays* (1924). (E. K. C.)

SHALE OIL. The shale oil industry, although known in France in the early part of the 19th century, owes its existence in its present form to Dr. James Young, who, in 1850, obtained his well-known patent for producing paraffin oil and paraffin from bituminous coal by slow distillation. This process was even worked in America until the discovery of petroleum. The industry has been centred in the Mid-Lothian area of Scotland since 1862

and an average of about three million tons of raw shale has been raised for many years. The oil shale of Scotland is dark grey with a laminated or horny fracture. Its specific gravity is about 1·75. The oil consists chiefly of paraffins and olefins.

Shales are widely distributed throughout the world. The French industry is older than that of Scotland; the deposits in New South Wales are very much richer than those of Europe and yields of over 100gal. per ton have been quoted; in Germany there are vast quantities of lignites and brown coals that are being worked vigorously; while in Colorado and Utah there is an immense potential wealth of this material.

The world-wide exploitation of oil shale, however, is dependent entirely on the exhaustion of petroleum and there appears to be no immediate likelihood of any shortage in this direction. The world's annual production of mineral oil is approximately 150 million tons.

Shale Oil Refining.—Originally, horizontal retorts similar to those in coal-gas manufacture were employed. The first step in advance was made by Henderson in 1873 when vertical retorts with a capacity of 18cwt. were arranged in groups of four and charged in rotation. The outlet for the oil vapours was at the lower end of the retort, and steam was blown in copiously to assist in the uniform heating of the shale and to remove oil vapours. The later Henderson retorts worked continuously and were gas-heated. The upper part was of cast iron and heated to about 900° F whilst the lower part was fireclay maintained to about 1,300° F. The charge in the retort travelled downwards owing to the periodical removal of spent shale at the bottom and no shale passed into the fireclay section until it had yielded all its oil. In the lower section the high temperature and the presence of steam brought about the removal of the nitrogen in the shale in the form of ammonia. The vapours from the retorts passed through air condensers in which ammoniacal liquor and crude oil were separated. The uncondensed gas was stripped of its light gasolene and used as fuel.

Crude shale oil is dark in colour and has a specific gravity approaching 0·890 and a setting point of about 90° F. It contains about 80% of hydrocarbons together with pyridine bases and cresols. In the refining of shale oil, ample steam is used in the stills, which are continuous in operation. The various fractions are agitated with acid and soda and again redistilled into crude naphtha (up to 0·770 specific gravity) and to burning oil (up to 0·850 specific gravity) and into "heavy oil and paraffin" which is solid at ordinary temperature. The acid and soda treatment and redistillation is repeated on the lighter fractions, whilst the solid paraffin is separated by chilling and pressing from the lubricating oil base—so that finished naphtha, burning oil, solid paraffin and lubricating oils are ultimately obtained.

The following table gives an average yield:

Gasolene and naphtha	6·90%
Burning oils	31·84%
Intermediate and lubricating oils	23·97%
Crude paraffin wax	13·53%
Loss	24·57%

From the ammoniacal liquor ammonia is driven off by the application of heat and lime, the liberated gas is brought into contact with sulphuric acid and converted into ammonium sulphate, a by-product that has been of considerable importance in enabling the industry to hold its own against competition. (*See* Petroleum: *Gasolene.*) (A. E. D.)

SHALLOT (*Allium ascalonicum*) (family Liliaceae), a hardy bulbous perennial, which has not been certainly found wild and is regarded by A. de Candolle as probably a modification of *A. Cepa* (the onion), dating from about the beginning of the Christian era. It is extensively cultivated and is much used in cookery and is excellent when pickled.

SHALMANESER [Ass. *Ṣulmānu-aṣarid,* "the god Sulman (Solomon) is chief"], the name of three Assyrian princes.

Shalmaneser I., son of Hadad-nirari I., succeeded his father as king of Assyria about 1310 B.C. He carried on a series of campaigns against the Aramaeans in northern Mesopotamia, annexed a portion of Cilicia to the Assyrian empire, and established Assyrian colonies on the borders of Cappadocia. According to his annals, discovered at Assur, in his first year he conquered eight countries in the north-west and destroyed the fortress of Arinnu, the dust of which he brought to Assur. In his second year he defeated Sattuara, king of Malatia, and his Hittite allies, and conquered the whole country as far south as Carchemish. He built palaces at Assur and Nineveh, restored "the world-temple" at Assur, and founded the city of Calah.

Shalmaneser II. succeeded his father Assur-nazir-pal III. 858 B.C. His long reign was a constant series of campaigns against the eastern tribes, the Babylonians, the nations of Mesopotamia and Syria, as well as Cilicia and Ararat. His armies penetrated to Lake Van and Tarsus, the Hittites of Carchemish were compelled to pay tribute, and Hamath (Hamah) and Damascus were subdued. In 854 B.C. a league formed by Hamath, Arvad, Ammon, "Ahab of Israel" and other neighbouring princes, under the leadership of Damascus, fought an indecisive battle against him at Karkar (Qarqar), and other battles followed in 849 and 846. (*See* Jews § 10.) In 842 Hazael was compelled to take refuge within the walls of his capital. The territory of Damascus was devastated, and Jehu of Samaria (whose ambassadors are represented on the Black Obelisk now in the British Museum) sent tribute along with the Phoenician cities. Babylonia had already been conquered as far as the marshes of the Chaldaeans in the south, and the Babylonian king put to death. In 836 Shalmaneser made an expedition against the Tibareni (Tabal) which was followed by one against Cappadocia, and in 832 came the campaign in Cilicia. In the following year the old king found it needful to hand over the command of his armies to the Tartan (commander-in-chief), and six years later Nineveh and other cities revolted against him under his rebel son Assur-danin-pal. Civil war continued for two years; but the rebellion was at last crushed by Samas-Rimmon or Samsi-Hadad, another son of Shalmaneser. Shalmaneser died soon afterwards in 823 B.C. He had built a palace at Calah, and the annals of his reign are engraved on an obelisk of black marble which he erected there.

See V. Scheil in *Records of the Past,* new series, iv. 36–79.

Shalmaneser III. (or IV.) appears as governor of Zimirra in Phoenicia in the reign of Tiglath-pileser IV. (or III.) and is supposed by H. Winckler to have been the son of the latter king. At all events, on the death of Tiglath-pileser, he succeeded to the throne the 25th of Tebet 727 B.C., and changed his original name of Ululā to that of Shalmaneser. The revolt of Samaria took place during his reign (*see* Jews § 15), and while he was besieging the rebel city he died on the 12th of Tebet 722 B.C. and the crown was seized by Sargon.

For all these rulers *see* Babylonia and Assyria, Sections V. and VIII., and works quoted. (A. H. S.)

SHAMANISM, the name commonly given to the religion of the Ural-Altaic peoples. The shaman or priest (Tungus *saman,* Altain Turk *kama, cf.* Russian *kamlanie*) is (a) priest, (b) medicine man, (c) prophet. Family Shamanism is connected with the domestic ritual. Professional shamans are not definitely attached to a social unit. A supernatural gift is everywhere a necessary qualification, and in some cases the office is hereditary—if a descendant shows a disposition for the calling. Each family possesses one or more drums, and when these are beaten some member tries to communicate with the spirits. The possession is associated with hysteria. It is obtained in various ways, by dreams, visions, and fasting. Consecration rites are lengthy and expensive.

See M. A. Czaplicka, *Aboriginal Siberia* (1914).

SHAMASH or Šamas, the common Semitic word for "sun." In pre-Islamic times *Šamsu* was regarded throughout Arabia as a goddess and often called *ilā* "goddess," wife of the moon god Wadd, and mother of Athtar, the planet Venus. Her symbol in Arabia was a disk. Among the north Semitic races (Canaanitic and Aramaean) the name is *šemeš, šimšā,* and always masculine. Traces of Canaanitish worship are found in the Old Testament, for which *see* II Kings 23, 11, where the horses and the chariots of Canaanitish heathendom were removed by Josiah. The sun-god is symbolised by the horse in pre-Islamic Arabia also, and pillars called *ḥammanim,* bearing the sun disk, were set upon the altars of the Canaanitish Baʿals. In Arabia this deity has the

epithet "Mistress of heat," when she is the summer sun, and "Mistress of the distant region (south)," when she is the winter sun. When the Semites first appear in history in Babylonia they identified their sun god (*šamaš*) with the older Sumerian sun god, Utu, Babbar, and it is probable that this caused the change in gender throughout the north Semitic peoples. This contact of the Semite with the Sumerians occurred as early as 3200 B.C. He became here one of the great deities of ancient religion, and lost all earlier Semitic traces to be completely transformed into a Sumerian deity; as such his cult appears throughout Babylonian and Assyrian history and survived at various Syrian centres to a late period. The two chief centres of sun-worship in Babylonia were Sippara (Sippar), represented by the mounds at Abu Habba, and Larsa, represented by the modern Senkerah. At both places the chief sanctuary bore the name E-barra (or E-babbara) "the shining house"—a direct allusion to the brilliancy of the sun-god. Of the two temples, that at Sippara was the more famous, but temples to Shamash were erected in all large centres—as Babylon, Ur, Nippur and Nineveh.

The attribute most commonly associated with Shamash is justice. Khammurābi attributes to Shamash the inspiration that led him to gather the existing laws and legal procedures into a code, and in the design accompanying the code the king represents himself in an attitude of adoration before Shamash as the embodiment of the idea of justice. Several centuries before Khammurabi, Ur-Nammu of the Ur dynasty (*c.* 2600 B.C.) declared that he rendered decisions "according to the just laws of Shamash."

Together with Sin and Ishtar, Shamash forms a second triad by the side of Anu, Bel and Ea. The three deities, Sin, Shamash and Ishtār (*q.v.*), the sun, the moon and Venus form an astronomical triad corresponding to the same early Arabian triad. At times, instead of Ishtar, we find Adad (*q.v.*), the storm-god, associated with Sin and Shamash. In Sumero-Babylonian religion Shamash was regarded as the son of the moon god, Sin.

The consort of Shamash was known as Aya.

SHAMMAI, a Jewish scribe of the time of King Herod, whom tradition almost invariably couples with Hillel (*q.v.*), with whom he stood in striking contrast, not merely in legal-religious decisions and discussions, but also in character and temperament. The opposition between Shammai and Hillel was perpetuated by their respective schools, till, under Gamaliel II., the strife was decided at Jabneh in favour of the school of Hillel.

SHAMOKIN, a borough of Northumberland county, Pennsylvania, U.S.A., on Federal highway 120 and Shamokin creek, 45 m. (in an air line) N. by E. of Harrisburg. It has an airport (Richardson field) on the transcontinental mail route, and is served by the Pennsylvania and the Reading railways. Pop. (1920) 21,204 (89% native white); 1930 Federal census 20,274, with 20,000 more in Coal township, immediately adjoining. It lies at an altitude of 700 ft., in the midst of beautiful mountain scenery. The mining, preparation and handling of anthracite constitute the principal industry. Shamokin was incorporated as a borough in 1864. It took its name from that of the creek, which is probably a corruption of an Indian word meaning "full of eels."

SHAMYL (*c.* 1797–1871), the leader of the tribes of the Caucasus in the war against Russia. He was born about 1797 and, educated by the Mullah Djemaleddin, soon took a leading part in preaching a holy war against the Russians. He was both the spiritual and military leader of the tribes, who maintained the struggle for twenty-five years (1834–1859). Shamyl's romantic fight for independence, making him a sort of ally of England and France at the time of the Crimean War (1853–55), earned him a European reputation. But the capacity of the tribes for resistance was already failing, and when at the close of the Crimean War Russia was able to employ large forces on the Caucasus, the defenders were gradually subdued, Shamyl himself being captured in 1859. The rest of his life was spent in an easy captivity at Kaluga, St. Petersburg and Kiev. He died at Mecca during a pilgrimage in 1871. One of his sons took service in the Russian, the other in the Turkish army.

SHAN, a southern Mongoloid race, one of the most numerous and important of Asia, constituting a large proportion of the population of Assam, Burma, Siam and probably southern China. Their own name for themselves is Tai (*Thai*), "Free." "Shan" is probably a Chinese term meaning mountaineer and the same word as Siam, where, however, the name for the race is *Lao*. In Assam they are called *Ahom; Paï* and *Ngiou* are other terms used in China and Burma. They seem to have come originally from the Kinlung mountains north of Szechwan, and to have fused with the Chinese, and with the leucoderm aborigines who survive all over the uplands between Tibet and the coast of Cochin-China. The expansion of the Shans towards the sea, at the expense of the Mon-Khmer nation, took place about the seventh century A.D. The Chinese invasion of Burma in the thirteenth century gave them the predominant position in ASIA: *Farther Asia*, which they held till the sixteenth century. Assam they invaded in the thirteenth century and held until the eighteenth.

They are widely diffused, and having amalgamated with other races are to be found in varying grades of culture, but although without political cohesion they display marked ethnical uniformity. Their written languages, based on the Devanagari script, may be also connected with the picture-writing system of the Lolo (*q.v.*). In the case of the Ahoms the language is virtually extinct, though many *"putis"*—books written on strips of palm leaf—are extant.

In religion the Shans are Buddhists, except in Assam where most of them have been Hinduized. The body is usually cremated, sometimes buried. They are notorious for gambling, but otherwise fairly industrious, growing cotton, tea and irrigated rice, breeding horses, catching elephants, mining for jade and amber. They are renowned for metal-work, swords in particular. The men tattoo their bodies as a rule and incise the skin for the insertion of precious stones as talismans. Their political organization is mostly in small states under princelings known as *Tsawbwa*. Polygamy is permitted, but monogamy is usual; and though the family is patrilineal, the bridegroom frequently resides with the bride's parents. They use a variation of the Chinese calendar system, reckoning by cycles of sixty years, each cycle containing five stems of twelve years each. Their language is highly tonal.

See Colquhoun, *Among the Shans* (1885); Scott and Hardiman—*Gazetteer of Upper Burma and the Shan States* (1900); Cochrane, *The Shans* (1915). (J. H. H.)

SHANGALLA, a name loosely applied by Abyssinians to the non-Arab and non-Abyssinian tribes living in the fertile belt which bounds Abyssinia on the west. The principal tribes are the Legas, Bertat, Gumus, Kadalos and Sienetjo. In some, Galla blood predominates: others are Negroids.

SHANGHAI, the commercial metropolis of China and one of the world's greatest seaports (31° 15′ N., 121° 27′ E.). The geographical position of Shanghai in respect both to the natural arteries of trade in China and to its wider space relations with the chief commercial regions of the world is extraordinarily favourable. To a degree unparalleled in any other great country is the foreign trade of China concentrated by geographical conditions into a single sea-gate. The magnificent natural waterways, which form the drainage basin of the Yangtze kiang, give to the great port at its outlet to the Pacific a vast hinterland, characterised by the unique range of its production and the magnitude of its population, estimated at 180 millions. The hinterland of Shanghai is not indeed limited to the Yangtze basin, vast though that is, for the port gathers up a large share of the coastwise commerce of the ports of Chekiang and Fukien, backed by the high ranges of south-east China which hinder their communications with the interior; while a part of the north China plain is also more closely connected with it than with any other outlet. It may be said that about one-half of China, and economically the more important half, is ultimately served by Shanghai; and its contribution to the revenue of the Maritime Customs is four times as great as that of

any other Chinese port. Its general world position is also extremely advantageous. It is the nearest port of China to Japan proper. It lies approximately midway along the rich monsoonal margin of Eastern Asia, from Malaya to Primorsk, while the fringing group of archipelagoes from the Philippines to Japan contribute greatly to the importance of the China seas. From a wider standpoint it is about equidistant, reckoned by shipping routes, from the two most developed industrial regions of the world, western Europe and eastern North America.
